POWDER.—F. o. b. San Francisco: No. 1, 70% nitroglycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1**, 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2, 35%, carload lots, 9½c; less than one ton, 11½c. No. 2**, 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2.00 per keg.

RED LEAD.—500 lbs. and over at one purchase, ₱ lb. 7½c; less than 500 lbs., 7¾c.

SILVER.—Chloride, ₱ oz., 90c@$1.00; nitrate, 54c

SODIUM.—Metal, ₱ lb., $1.

TUNGSTEN.—Best, ₱ lb., $1.20.

URANIUM.—Oxide, ₱ lb., $3.40.

Commercial Paragraphs.

THE Salt Lake Hardware Co. of Salt Lake City, Utah, were again awarded the gold medal on Keller assay balances at the Lewis and Clark exhibition at Portland, Or.

AT a directors' meeting of the Crocker-Wheeler Co., manufacturers and electrical engineers, on the 13th inst., at Ampere, N. J., the regular quarterly dividend of 1¼% was declared.

AT the Lewis and Clark Exposition at Portland, Or., F. W. Braun & Co. of San Francisco and Los Angeles, Cal., were awarded a gold medal on their exhibit of assay and chemical laboratory apparatus, consisting mainly of the following: Braun's disc pulverizer, Chipmunk crusher, combination assay furnaces, hydrocarbon burners, Marvel crude oil burners and cupel machines.

THE S. H. SUPPLY CO., Denver, Colo., have made recent shipments of the following American air compressors: 8-drill tandem compound machine to Arizona; 6-drill tandem compound to Wyoming; 5-drill straight line to Sunnyside, Coal Co., Louisville, Colo.; 3-drill straight line to United Mines and Exp. Co., Central City, Colo. This company is also furnishing a complete 40-stamp mill, including concentrating plant, to Sonora, Mex., and a 20-stamp mill to the same company.

THE superior jury at the Lewis & Clark Exposition, Portland, Or., has approved seventeen different and several awards in the electrical department, relating to the exhibits of the General Electric Co., which is stated to have been the largest manufacturer exhibiting in that department. The highest award granted by the jury was a gold medal. The company states that it received a gold medal for the best exhibit in the electrical department and also gold medals on each of the seventeen features of the exhibit. For its new metalized carbon filament incandescent lamps, the company also received a gold medal. This exposition in common with other recent American expositions was lighted by Edison incandescent lamps, furnished by the General Electric Co.

THE Pelton Water Wheel Co. of San Francisco and New York has a contract with the Oro Water, Light & Power Co. of Oroville, Cal., for two Pelton units of 2000 H. P. capacity each, direct connected to electric generators, the wheels operating under 465-foot head. The water wheel arrangement embraces the double overhung type of construction, which is typical of Pelton apparatus. The current is to be used for both light and power, the latter involving the operation of gold dredgers, in which the fluctuations of power and load are sudden and heavy. Other recent orders include a wheel equipment for a power and pulp company of Washington, consisting of a triple Pelton unit for direct connection to heavy pulp grinders in the paper mills. The wheels are mounted on a steel shaft 18 feet in length, provided with an oil thrust bearing of special design. Takata & Co. have ordered a 300 H. P. unit for Tokio, and a large wheel has just been furnished the Ingersoll-Sergeant Drill Co. for direct connection to one of their compressers. The Pelton Water Wheel Co. will enlarge its works, and has bought a block of land in South San Francisco, where a modern machine shop is now being built.

Trade Treatises.

Catalogue G of The Deming Co. of Salem, Ohio, illustrates and specifies an extensive line of power pumps of the triplex, deep well and other types. Pumps for many purposes are handsomely pictured.

Air Cooled Duntley Electric Drills are illustrated and described in special circular No. 52 of the Chicago Pneumatic Tool Co., Fisher Bldg., Chicago, Ill. A table of tests shows its adaptability for rapid and economical drilling of cast iron and steel plate.

The Ingersoll-Sergeant Drill Co. of 11 Broadway, New York City, issue an interesting booklet on "Stone Working Tools" from the pneumatic tool department. It illustrates the application of air power to the various processes of stone carving, polishing and dressing.

The tenth Catalogue of Assayers' and Chemists' Supplies, from the Denver Fire Clay Co. of 1742-46 Champa St., Denver, Colo., gives illustrations and prices of a great variety of muffles, crucibles, scorifiers, furnaces, chemical and physical apparatus and general laboratory supplies.

Books Received.

As extracts from "Mineral Resources of the United States," the United States Geological Survey has issued "The Production of Mineral Waters in 1904" and "Production of Gas, Coke, Tar and Ammonia at Gas Works and in Retort Coke Ovens in 1904," by E. W. Parker.

Obituary.

W. A. ROBERTS, a mining man of extended experience throughout the Pacific coast States, died at Hornbrook, Cal., on October 12th.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market street, San Francisco, has official reports of the following United States patents issued to Pacific Coast inventors:

FOR THE WEEK ENDING OCTOBER 3, 1905.

801,057.—SAW SWAGE—C. J. Anderson, Eureka, Cal.
801,129.—REDUCING ORES—H. Arden, San Francisco.
800,791.—WATER PURIFIER—F. K. Bowden, San Jose, Cal.
800,842.—GLOVE—F. H. Busby, San Francisco.
800,982.—SAFETY PIN—E. A. Campbell, Los Angeles, Cal.
801,061.—GAS GENERATOR—E. A. Chamberlin, Los Angeles, Cal.
800,793.—FEED WATER REGULATOR—C. H. Chandler, Seattle, Wash.
800,794.—HOPPLE AND TAIL HOLDER—J. G. Conneli, Hoquiam, Wash.
800,907.—TELEPHONE MOUTHPIECE—W. B. Curtis, San Francisco.
801,063.—RAILWAY TIE—H. S. Delamere, Cloverdale, Cal.
801,065.—SQUARE—R. M. Dixon, Stockton, Cal.
800,910.—ELEVATOR—B. Flood, Los Angeles, Cal.
801,077.—CLOTH STRETCHER—L. B. Girard, Los Angeles, Cal.
800,846.—COMB—E. D. Hamilton, Montavilla, Or.
800,912—NAIL—M. Hermelink, San Francisco.
800,804.—OIL BURNER—C. R. Herrington, San Francisco.
801,015.—FLUE CUTTER—C. J. Johnson, Seattle, Wash.
800,852.—SAW JOINTER—M. Kapp, Bellingham, Wash.
800,746.—PLANT PROTECTOR—C. Landon, Yuma, Ariz.
800,807.—SOLDER—H. P. Larson, Portland, Or.
800,808.—HAY RAKE—C. E. Lindberg, Seattle, Wash.
800,872.—HOE—J. O. Newcomb, French Camp, Cal.
800,936.—DREDGER BUCKET—T. O'Leary, Oakland, Cal.
800,943.—EGG CARRIER—D. B. Replogle, Los Angeles, Cal.
801,106 —VIOL ORGAN—E. Ringer, Tacoma, Wash
800,882 —WINDOW—D. Schuyler, Los Angeles, Cal.
800,947 —FIBER PICKER—A. M. Sheakley, Stockton, Cal.
801,118.—TELEGRAPH RECEIVER—G. T. Swenson, San Pedro, Cal.
801,119.—PENCIL HOLDER—E. P. Van Alstyne, Bisbee, Ariz.
800,775.—CULVERT—W. J. Walsh, Miller, Cal.
801,120.—WINDOW FRAME—T. F. Ware, Reno, Nev.
801,122.—LAWN MOWER—J. West, Seattle, Wash.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS United States and Foreign Patent Agency, the following are worthy of special mention:

POCKET CALCULATOR.—No. 801,354. Oct. 10, 1905. F. S. Beckett, San Francisco, Cal. This invention relates to improvements in calculating devices, and pertains particularly to a chart in the form of a pocket tape designed for computing, multiplying, dividing, ascertaining the roots and powers of numbers, etc. The object of the invention is to provide a simple, compact, handy device for calculating mathematical problems and which may be readily carried in the vest pocket. It consists of a flexible tape longitudinally divided along one side into two scales, one scale graduated to a series of natural numbers, the other to the corresponding logarithms of said numbers or their fractions, and the graduations so arranged that a portion of the numbers of one scale are equally spaced, while the spaces between the corresponding figures of the other scale vary, and other details of construction designed to produce the desired result.

Dividends.

Oct. 14 the Bunker Hill & Sullivan Mining & Concentrating Co. declared dividend No. 98, of $180,000, payable on Nov. 4. This makes total paid since Jan. 1, 1905, $2,955,000, and total to date $5,226,000.

Common Sense

teaches us that RUBBER against an article creates friction. In fact, we wear rubber soles—use rubber on steps, etc., to prevent slipping—to create friction.

Why do you use ENGINE PACKING with rubber on top—on the bottom—and in between—where it is rubbing against the rod all the time—creating excessive friction—loss in power—fuel—money?

No such mistake in

"EUREKA" PACKING.

The rubber is where it should be—embedded in flax—which takes the wear—the lubricants prevent friction.

Isn't it up to you to try GENUINE "EUREKA," particularly as the price is one-half less?

Danger in Mines.

With each succeeding year the statistics of mine operation continue to show loss of life through underground accidents. Constant effort is being made in most mining regions to provide greater safety to miners, and means are taken to lessen the likelihood of accidents from certain causes, such, for instance, as overwinding, breaking of hoisting ropes, caving of ground and many other like contingencies with which all miners have become more or less familiar. These precautions, however, appear to be insufficient, for accidents continue to occur. To one who carefully investigates the majority of accidents in mines it becomes at once apparent that these accidents are usually of a kind that could not well have been anticipated or they would not have happened. Miners have become familiar with the dangers which are a part of underground life, and the old saying, "familiarity breeds contempt," is as applicable to underground dangers in mines as it is to men.

A large percentage of accidents is due to carelessness of the men themselves. Miners walk carelessly into shafts—a gate is placed between the shaft and the station floor—and the next man will as carelessly step from a skip into the yawning compartment adjoining and fall to his death. Roof falls occur where all felt secure. Runs happen when and where little expected, or the necessary protective means would be employed to avert the disaster. The natural tendency is to pass legislative enactments that will protect miners from these dangers. Mine inspectors are appointed to see that such accidents cannot occur, or, at least, that by proper inspection their frequency be diminished, but it is not apparent that the percentage of accidents, relative to the number of men employed, is less in those States having inspectors than in those having no such officials.

The superintendent of a mine is as anxious to avoid an accident as the miners working under him. He can see no advantage in a cave, a run, a flood, or other unexpected and expensive interruption of work, any more than can the mine inspector, and if he understands his business he will take all the precautions necessary to avert it. If men put up frail staging, which gives way when the miners are at work standing upon it, the miner is as much to blame as any one, unless he be an inexperienced hand, in which case he should not have been intrusted with work of so important a character. Some mining companies provide a code of rules as a guide to the conduct of miners when underground. These rules are devised as a protective measure, not only to the men, but to secure the company from loss through carelessness of the workmen, and any infringement of the rules results in the prompt dismissal of the guilty party if he is discovered. Often one careless man will endanger the lives of a score or more of his fellow workmen. Not that he would intentionally injure any one of them, much less himself, but he is simply careless and neglects the most ordinary precautions.

In the handling of high explosives the careless miner excels. It is not uncommon to find an old and experienced miner opening a 50-pound box of nitropowder with a pick, or serenely fixing his primers while puffing contentedly at a pipe. He will take a small box containing a dozen or more sticks of powder, and fuses with caps attached, climb a ladder to a stope and give box and all a careless toss over a pile of obstructing rock or timber at the top of the passage way. He has done it many a time before without serious result, and he comes to believe it perfectly safe to continue such dangerous practice. Nothing can protect such men from serious injury sooner or later but sheer good luck, which may some day desert him.

Gold Production of the World.

Carefully compiled statistics indicate that the present gold production of the world is about one million dollars daily. This large increase in the gold output of the mines of the world is due more to the application of modern methods and machinery to low grade deposits than to the operation of mines of phenomenal richness. Mines producing unusually rich ore are generally short lived, as compared with those of low grade. The former have a meteoric existence—flash into prominence and in a few months are exhausted and are soon forgotten—while the large low-grade mines continue to produce year after year, for a generation or more. The improvement in dredging machinery has made available a source of gold not previously possible to operate at a profit—the placers of the valley lands, where grades are almost nil, and where the amount of gold disseminated in the gravel is so small as to make limited or small scale operations commercially impossible. Twenty-five years ago, the cheapest mining done in the world was by means of hydraulicking in some of the largest mines of this class in California, but the cost of operating a modern dredger is not more per cubic yard than the average of the most economically conducted hydraulic mine of those former years. Not only does the dredger work as cheaply, but the cost of installation is far less than that of one of the large hydraulic plants, many of which cost from $200,000 to $500,000 or more. A large modern dredger can be built for $75,000, and, under ordinary conditions, will handle from 50,000 to 65,000 cubic yards per month. Dredgers are operating or are in construction in almost every country in the world where extensive low-grade placer deposits exist, and where the conditions are favorable to this method of gold mining.

The modern methods of rock mining, too, have aided materially in increasing the activity noticeable in the gold mining industry. In iron mining, methods have been devised to meet existing conditions and to cheapen the cost of production. It has been found that some of these economical methods are also applicable to gold mining practice and a lowering of cost of production has usually followed the introduction of these methods wherever the experiment has been tried. It is the low-grade mines which are becoming so important a factor in the swelling and maintaining of the world's gold production.

Metallurgical science is also aiding in this direction. In former years gold ores not readily treated by amalgamation were shipped to smelters, or if this could not be done at a profit, they were allowed to remain in the mine because they were unprofitable, awaiting a more propitious day. The improvements in concentration have made it possible to successfully eliminate a large percentage of waste from such ores, the values being collected in a small volume of enriched material—concentrates. These may be shipped to smelters or treated at the mine by chlorination, or by some of the wet processes, among which the cyanide process, with its varied modifications, is most important.

Improvements in every branch of the industry have made available ore deposits previously of no commercial value. There still remain other deposits, which, for the same reasons as in the past, are at present unavailable, but which, by further reduction of the cost of mining and further improvements in metallurgical processes whereby the cost is diminished and the recovery of gold values increased, will become a source of revenue and swell the world's gold output.

There are those who think they can see in this tremendous output of precious metal, the greatest in the history of the world, a danger to the standard of monetary values by reason of overproduction. This condition, which in the past did at several times in the history of the civilized world actually occur, is not likely to be repeated in the present age. The constantly expanding commercial life of the world demands a continually increasing supply of gold, and this all the mines of the earth are not more than capable of supplying. The real danger appears to lie in exactly the opposite direction—the failure of the mines to keep up with the demand. It is not at all likely that this condition will soon obtain, but, eventually, the gold deposits now known must have been exhausted, and we must then look to those deposits, at present either unknown or too low grade to be profitably exploited, to maintain the supply.

PRESENT effort is being made in British Columbia to continue the existing import duty on American products, and especially the bounty on lead, which latter has thirty months more of life under former legislation. The Dominion lead bounty in 1904 was $326,000; in 1903, $191,000. Canada's total lead production in 1904 was valued at $1,637,000; of this amount British Columbia produced $1,422,000. The increase of import duties on white lead has occasioned a great advance in lead ore production; there is now throughout British Columbia over $20,000,000 invested in silver-lead mining plants. The assertion is made that under present conditions the lead bounty virtually represents a protection of 20%. The Province will ask, through its mining legislators, for the removal of the duty on steel rails when used for mining purposes, a 50% reduction on the present tariff on candles and explosives and a reduction of the tariff on mining machinery, the latter designed to afford fair competition on the part of American mining machinery manufacturers. The British Columbia smelting men are particularly strenuous in the request that there be suitable reduction in the present mining machinery tariff, which does not inure to the benefit of the Province. The fact is also pointed out that the cost of dynamite is the American price with 60% duty added on importations from the United States. This last item is largely a matter of commercial relations between makers of dynamite on both sides of the boundary line; but, as a matter of mine development, it would seem that the requests of the British Columbia miners are just and equitable, and that due regard for the mining interests of the Dominion would warrant compliance with the requests for change and modification.

The Value of Iron-Bearing Sands.

At the present time a great deal is being said and published about the "newly discovered" values in the iron sands of rivers and beaches of the Pacific Coast States. It is by no means a new discovery, for the existence of these iron sands has been known for the past half century, and no attempts have been made to separate these iron sands from the accompanying earthy minerals. The increasing demand for platinum (and its growing scarcity) was one of the things which induced the United States Geological Survey to undertake the testing of the sands from the gold districts of California and Oregon, where platinum was known to occur, in the hope that new sources of this metal might be discovered and, incidentally, it was decided to carefully search the sands for such other elements of value as they might contain. The work of conducting the investigation was placed in the hands of Dr. David T. Day at the Portland, Or., Exposition which recently closed. With the aid of the newly introduced electromagnetic separators and of several types of excellent mechanical concentrators, many tests were made on sands from nearly all of the Western States and some of these sands were found to be comparatively rich in gold, monazite, zircon and other minerals, but chiefly in magnetite in the form of black grains. The streams producing the greatest abundance of these iron sands were found to be those which flowed through the vast fields of basaltic lava, which cover thousands of square miles in Oregon, Idaho and Washington. Magnetite is a prominent constituent of nearly all dark-colored, basic, igneous rocks, and the erosion of areas of this character supplies a vast quantity of iron ore, in the form of grains of magnetite, to the streams tributary to such areas. Gold, platinum, monazite, zircon and other metals and earthy minerals of high specific gravity, and also a portion of the magnetite, must have been derived from granite and other crystalline rocks underlying the lava beds.

A good concentration was found possible in most cases on the mechanical concentrating machines, but the fine differentiation of the minerals of high specific gravity was effected on the electro-magnetic separators by the employment of electric currents of varying intensity on the respective magnets of the series in each machine. In this manner sands consisting originally of quartz and other minerals of comparatively low specific gravity were separated from those of high gravity, and this partially concentrated material was then run through the electromagnetic machines with a close separation of whatever minerals were still present. These were usually found to be varying proportions of magnetite, chromite, gold, platinum, monazite, garnets, zircon, etc. The most abundant concentrate, in every case, was magnetite. The tests have merely proven what has been known for fifty years, viz., that these sands contained a large amount of iron ore in the form of magnetite. The presence of the other valuable minerals was only suspected in most instances, and not positively known, particularly in the case of the monazite, which is a mineral with which the Western miner, up to the present time, has not become familiar.

While it may be gratifying to know that there lies in these Western rivers, and on some of the ocean beaches, a great store of high-grade iron ore, it remains to be demonstrated that it can be utilized in the production of iron and steel in large quantity in successful competition with iron and steel made in the East and in Europe in blast furnaces. It is a significant fact that in the iron production of 1902, for instance, the total output of iron ore in the United States was about 35,500,000 tons, of which 30,500,000 was red hematite, 3,300,000 was limonite and but 1,688,000 was magnetite. About 27,000 tons of iron carbonate ores were also treated. This indicates that in the Eastern iron mining region the hematite and limonite ores are preferred to magnetite.

Although electric smelting is comparatively in its infancy, having, as yet, scarcely emerged from the experimental stage, yet it is to this branch of metallurgy that we must turn to make available the magnetic iron ores of those Western rivers. Magnetite, when pure, produces more metal from a given weight than any other kind of iron ore, and for this reason

should be more valuable. As compared with the production of iron from other classes of ore in the blast furnace, magnetite might also be considered as possessing other advantages, providing the economic problem is solved by the new electro-metallurgy. In the making of about 18,000,000 tons of pig iron in 1902 there were required about 73,000,000 tons of raw materials, of which only about 33,000,000 tons were iron ore, the remainder being coke, coal and limestone.

In the manufacture of iron and steel from the black magnetic sands of the Western rivers two factors appear as absolutely essential to commercial success. These are cheap and abundant water power for the generation of the electrical current, and a deposit of magnetic sand easily and cheaply available and of an extent sufficiently great to justify the installation of a suitable plant. It has been demonstrated that good iron and steel can be made direct from the ore by electrical methods of smelting, but upon how large a scale this can be accomplished remains still to be proven. Experiments in this direction are now in progress, and while the outlook is most promising much still remains to be demonstrated on the economic side of the proposition.

THE national Government of Mexico and the Governors of the several mining States of that Republic are doing all that can be done, apparently, to promote legitimate mining enterprise in their country. Mexico is recognized as a country possessing great mineral wealth and vast undeveloped resources. The success of modern companies operatign mines there, both old and new, is attracting much attention abroad, and a constant stream of foreign money is pouring into Mexico to buy, equip and operate mines. The United States has mineral resources more vast than those of Mexico and second to no country under the sun, but the same energetic interest is not taken in the development of these resources by our Government, or by the States, as that shown in Mexico. There the mineral lands and the operation of the mines are directly under the eye of the Government, while in the United States mining is only one of a great many large resources of the country, and the mining industry is largely left to work out its own destiny in the hands of individual owners, and all that has been accomplished here is due to this unassisted personal effort and to the mines themselves.

MEXICAN mines find great favor in the eyes of British investors at the present time, while similar American propositions are "not in fashion" in London, just now. The complaint has been made in England that disaster has too frequently followed investment in the mines of the United States. One does not have to seek far to ascertain the cause of British losses in American mines. English experts are constantly scouring this country in search of what appears to be good mining property. Not infrequently they find a mine that will stand up to rigid investigation. The proposition is placed in the hands of promoters—English not American promoters—who find no difficulty in setting a valuation on the property 400% to 500% higher than its development will warrant. They, with equal facility, place the stock, preferred and common, as well as bonds of the company and the venture is a success, from the promoter's standpoint. The investors have bought a million dollar mine from their own people at a $5,000,000 price. The mine fails to meet with expectations, the investors lose on a falling market and American mines get the odium of it all. History repeats itself, and, unless rare caution be exercised by English investors in Mexico, it is not difficult to foretell what will happen in connection with Mexican investment within a very few years, for it is an easy matter for the "frenzied" promoters to transfer their methods from Kafir or American to Mexican mines.

ALTHOUGH the lead-silver mines of the Cœur d'Alene district of Idaho have established the reputation of being the greatest producers of lead-silver ores in the world, the indications are that these mines will eclipse all previous records during the year 1905. Several important strikes of high-grade ore have recently reached the outside world, and their development will help to swell the already large output in no small degree. The district is largely operated through lengthy drainage adits, which have greatly cheapened the cost of production in that district.

The Law of Location.

It is a natural supposition that after the many years of experience in mining in the West, miners generally would be perfectly familiar with the law relating to mines, and yet some are surprisingly ignorant of those features which have a most important bearing on the subject of location—the initial point in securing mining property on the public domain. The laws relating to aliens, to the extra-lateral right, and to some other legal phases of mining, are not so readily understood, the most astute attorneys being themselves often at a loss how to proceed with safety to their clients, but the statutes defining the location of claims is simple and easily understood. To such an extent is this a fact that the logical inference is, that in some cases the miner purposely fails to understand, or frames a law of his own which suits his ends better than the plain language of the statutes. The laws regulating the location of mining claims and securing title to them by the performance of certain acts are plain and easily understood, and for this reason the conflicts constantly arising over the ownership of mining ground should not occur at all. The fault often lies with the locator himself, who carelessly fails to comply with the requirements of the statutes and sets up an insufficient number of corner monuments or posts—sometimes none at all, or putting them at the proper places, they are so frail as to be readily destroyed or so inconspicuous as to remain unobserved by others seeking mining ground. Often too much dependence is placed on the discovery stake, upon which is posted the claims of the locator, who states thereon the name of the location and the extent of the territory he locates under the law. This is insufficient and will not meet the requirements of the law. Stakes must also be set out at the corners and at the end centers of the claim. These stakes or monuments must be plainly visible from one to the other, and if, when standing at any of the stakes, the next adjacent stake can not be seen, because of intervening brush, rocks or rising ground, then additional intermediate stakes must be set, so that, in the language of the statutes, the boundaries of the location may be plainly traced.

Discovery is the inception of the miner's right. This should first be made and the location laid out to conform to existing conditions — as to strike of the vein, etc.—as nearly as may be ascertained. Often it is difficult or impossible to determine without considerable work the direction of strike of a vein or ore deposit, and then the miner must stake the claim to the best of his ability and judgment. A claim may be laid out prior to discovery, but it must be remembered that in such event the legal date of location begins at the time discovery is actually made, and not from previous date of location. Such location may be permissible when the outcrop of the vein is obscure, but a location without previous discovery is difficult to hold against trespassers.

The mining law should be amended in this respect that the bona fide locator may have sufficient time, based upon continued work, within which he may hold his claim against others while searching for the vein or deposit of mineral believed to lie beneath the surface. Occurrences of this character are numerous in regions of bedded deposits, deep placers and flat veins, but no law exists on the statute books which makes provision for discovery under such conditions.

The most confusing feature of mining legislation is the lack of uniformity of State laws. The several States have the power to enact laws regulating the location and development of mineral lands, providing such enactments do not conflict with the United States laws, and most of the States have taken advantage of this to pass laws calculated to promote the development of their mineral resources, by requiring a stated amount of actual development within a limited time — sixty to ninety days, generally — this requirement being made a part of the act of location. Laws of this character have been proven to be beneficial to the legitimate and more speedy development of the mineral lands of those States, as it does not permit the location of mineral ground without the performance of any work for nearly two years, which is possible under the Federal laws. The only unfortunate phase of the State laws is the lack of uniformity. That which is legal and proper in Colorado may not be sufficient in Arizona, or in Idaho.

In view of this fact, the miners in several States should familiarize themselves with the Federal laws relative to making mining locations, and also with the laws of the State and district in which they live, and then, having a knowledge of these laws, seek to comply with them in the fullest degree, and there would be far less mining litigation than there now is.

Science in Mining.

There seems to be a disposition on the part of many well-meaning people to cavil at the work of scientific men in geological science and mining practice, and they who are thus disposed apparently take particular delight in pointing out that "the scientists are again at fault" in their judgment of this or that mining district—that their prophesies are entirely disproven. So common have such remarks become that many are misled into believing that these strictures are well deserved. The fact is that really accomplished scientific observers are usually too slow in expressing an opinion where they have insufficient data upon which to base their judgment, or to hazard a theory as a possibility.

It is the pretenders—those without real scientific knowledge or training—who are so prompt to thrust themselves to the front with unsolicited opinions as to the possibilities of that or this district. These parvenu scientists represent the extremists in theory—one side claiming the most extravagant things for the newly discovered district, the others dismally predicting disaster for the same region. Meanwhile the real scientist is carefully noting the result of development, and in time finds sufficient grounds upon which to base a tenable theory.

When Cripple Creek, Colo., was first discovered the fake scientists were quickly on the ground, looking wise and gloomily shaking their heads, while predicting that the "values would not go down." Their optimistic brethren were also there, and quickly announced that the vast wealth of the district was without precedent, and the veins would never be bottomed by a device within the range of human possibility, and the values would not decrease in depth. Needless to say, the latter were in the popular favor. Both were wrong, and this may be said of them wherever they appear.

Science is based upon observed facts, not upon irrational theory, nor to a great extent upon analogy. The same experience is now the lot of the new rich mining districts of southern Nevada. The misfit scientists are there in full force, predicting good, bad and indifferent things, and are freely quoted by the uninitiated, while the real seeker after knowledge is eagerly seeking the facts, yet reserving his judgment, that he may not fall into the erring ways of his less modest imitators.

FOR years the Homestake mine shafts at Lead, South Dakota, have been equipped with cages—generally with two decks. On these the loaded cars are run and hoisted, and the empty cars returned to the levels below. No skips are in use, which is probably due more to tradition than to any lack of appreciation of the value of skips. The miners are accustomed to cages, and many of them never have seen a skip in a shaft, but the Homestake management is said to be seriously considering the advisability of putting 10-ton skips in the Ellison shaft, to replace the cages in use there. So large are these cages that the sides are made of solid sheets of steel instead of the usual frame of steel rods. The vibration was found to be too great with the ordinary type of cage. The contemplated change will necessitate considerable expense in underground arrangements, but the advantage of skips over cages, where such large tonnages are handled, has become so obvious that the contemplated change is likely soon to be made, and when it is decided to make it, it is probable that the skips will be installed without the loss of an hour's time or the hanging up of a single one of the thousand stamps in the mills of the company.

CONCENTRATES.

MILL PLATES for inside the battery are usually about $\frac{3}{8}$ inch in thickness, the outside plates being from $\frac{1}{16}$ to $\frac{1}{8}$ inch thick.

✤✤✤✤

A GOLD DREDGER was in operation some years since in northern Italy, and the enterprise is said to have been successful.

✤✤✤✤

WHEN molybdenite occurs finely disseminated, but in small amount, in rock, it is not likely that the mineral contained can be recovered at a profit. The same thing may be said of graphite.

✤✤✤✤

THE loss of gold by volatilization increases rapidly with the rise of temperature above its melting point, which is higher than that of silver and a little below that of copper.

✤✤✤✤

SOME recent experiments made with nickel-steel wires for hoisting purposes have shown that carbon steel is superior to that containing nickel. The presence of nickel up to 6.28% in the steel does not prevent rusting.

✤✤✤✤

"BLUE BILLY" is a purple "ore," resulting from the calcination of pyrites and the residuum from roasting ferriferous and manganiferous zinc ores and is mixed with other iron ores in the manufacture of pig iron.

✤✤✤✤

BATTERY GUIDES must not be allowed to become so badly worn that the stamps interfere with each other in passing. The guides must be kept in such condition that the stems pass without unnecessary friction; but too much space should not be allowed, or broken stems are likely to result.

✤✤✤✤

WHEN square sets are placed in a mine, the timbers must be strongly braced and blocked against the surrounding walls and ore faces—ends, sides and top—or blasting may knock out several timbers of one or more sets and do a great amount of damage, beside increasing the danger from caving.

✤✤✤✤

POTASSIUM is a constituent of many minerals, but particularly of orthoclase feldspar. It is a complex silicate of potassium and aluminum. When potassium combines with aluminum and sulphuric acid the product is known as alum. When it combines with nitric acid it is called saltpeter or potassium nitrate.

✤✤✤✤

THE tabulated statement of assays of black sand appearing in the issue of Oct. 7 is evidently of the sand just as it was received by Dr. David T. Day at the Portland Exposition, and it is presumably the sand which has been going to the tailrace after sluicing, the greater portion of the gold having been caught in the riffles of the sluice boxes.

✤✤✤✤

IN no instance is a quartz mill fed as regularly and properly by hand as by a good properly regulated automatic feeder. All experienced mill men understand the advantage of regular feeding. Without it the discharge cannot be evenly maintained, and the even flow of pulp over the plates will be interrupted unless the feeding is regular.

✤✤✤✤

THE Attorney General of Nevada has given the following opinion concerning the taxation of patented mining property in that State: "The County Treasurer can refuse legally to accept less than one-half of the full taxes due on each patented mine, irrespective of the number of owners. He should give but one original receipt, but if duplicate receipts of the original are demanded the County Treasurer should give same to each individual owner."

✤✤✤✤

THE necessity for a chuck tender in machine drilling is largely due to the lack of ability and knowledge of the machine on the part of the drill runner. An expert machine man will frequently drill holes 5 to 7 feet deep with no assistance from the chuck tender other than making the necessary changes of drills as the work advances. A drill runner, who carelessly starts his hole and allows it to become fitchered, needs the services of not only a chuck tender but an instructor.

✤✤✤✤

IN roasting pyritic concentrates, the presence of a small percentage of siliceous sand is advantageous. It is well also that the ore should not be too fine, but rather that it should contain about 25% of grit of a texture which will just pass through a No. 25 gauze, one that contains twenty-five holes per lineal inch; this facilitates the perfect roasting of the ore, rendering it spongy and thus promoting the easier circulation of heat and evolution of gases. The perfect roasting of the ore is, of course, essential to close extraction by subsequent amalgamation, and for this reason too great care cannot be exercised in conducting this stage of the operation.

✤✤✤✤

IN a Nova Scotia coal mine a shaft, 12 feet 6 inches by 24 feet, was sunk during September, 1905, a distance of 113 feet. During the month 146 feet of shaft were timbered. Considering the size of the shaft this is probably the most vigorous shaft sinking on record, though in the distance sunk in a single month about 100 feet behind some of the record work in this direction done on the Rand in South Africa, where the shafts are less than one-half of the superficial area of the Nova Scotia shaft.

✤✤✤✤

AT Doornkloof, South Africa, a diamond drill hole has been bored 5560 feet deep, the core being $1\frac{5}{8}$-inch diameter. It required fourteen months to put the hole down, three shifts working eight hours daily. When a depth of 5000 feet had been attained, it required nearly four hours to haul out and disconnect the rods, which were in 50-foot lengths. An equal time was required to replace them and continue drilling. A hole has recently been put down to test the banket on the Rand, which has reached a depth of 5582 feet. It was bored in nine months.

✤✤✤✤

THE essential manufacture of the materials in hydraulic cement are calcium carbonate and clay. These ingredients are various in their original form. The calcium carbonate may be in the form of marble, of travertine, chalk or any other material supplying an essentially pure carbonate of lime. The clay is usually derived from clay banks most easily available. In some localities there exists a natural rock which contains the several ingredients in the proper proportions. Furnace slag is also largely used in some localities, in the manufacture of Portland cement.

✤✤✤✤

IN charges of black powder, that portion of the fuse which enters the powder should be wrapped with some fire proof substance to prevent the fuse spitting into the powder, and exploding it prematurely. In the case of dynamite, the primer can be placed on top of the charge and held in place with clay tamping. Should the primer be placed in the middle or bottom of the charge, the chance of burned holes and stinkers is materially increased. Any one on burning a piece of fuse will notice the fire burn through the fuse at short intervals, and wherever this happens in the charge, it sets the powder on fire.

✤✤✤✤

THE climatic and probably the geological conditions under which the ancient river channels of California were formed were very different from those existing in that State at the present time. The larger ancient streams flowed in broad shallow valleys, and there must have been a far greater amount of water than at present. Some of the channels were not unlike the modern streams, having steep grades and narrow rims, but some of the great rivers were from 1000 feet to over a mile wide, with gravel 300 to over 1000 feet deep. Ice may have been an important factor in the formation of those streams. In some of these streams boulders of immense size are often found surrounded by gravel and cobbles of uniformly small size.

✤✤✤✤

CYANOGEN is a compound of carbon and nitrogen ($C_2 N_2$). Carbon does not combine with nitrogen under ordinary conditions, but if these two elements are allowed to come into contact at very high temperatures in the presence of metals they combine to form substances known as cyanides. The cyanide of potassium is not made from orthoclase (potash feldspar). Potassium cyanide is prepared by fusing in an iron crucible a mixture of thoroughly dry potassium-ferro-cyanide (8 parts), with dry potassium carbonate (3 parts). As soon as the escape of the carbonic acid gas ceases and the metallic iron has settled, a clear fused mass of cyanide and cyanate of potassium remains, which may be poured into a suitable mould.

✤✤✤✤

REMSEN thus summarizes the knowledge of bases, acids and salts: An acid contains hydrogen; a base contains a metal; when an acid acts upon a base the hydrogen and metal exchange places; the substance formed by substituting hydrogen for the metal is water; the substance obtained from the acid by substituting a metal for the hydrogen is neither an acid nor a base, but is generally neutral. An acid is a substance containing hydrogen, which it readily exchanges for a metal, when treated with a metal itself, or with a compound of a metal, called a base. A base is a substance containing a metal combined with hydrogen and oxygen. It easily exchanges its metal for hydrogen when treated with an acid. The products of the action of an acid on a base are, first water, and second, a neutral substance called a salt.

✤✤✤✤

THE natural color of gold is yellow, and all pure refined gold has this color. The idea that gold from different districts has different colors is not based upon facts, but is due to the metal being alloyed with silver or copper, which gives it variety of shades of yellow, from a whitish silvery yellow to reddish color. Refined gold is of uniform color, no matter from what part of the world it may come. It is the only metal that has this yellow color. Some alloys of tin and copper, copper and zinc, and other mixtures have a golden yellow. Brass, for instance, is almost the counterpart of gold in color, but may be easily distinguished from the latter by its lower specific gravity, and by being readily attacked by most of the mineral acids, while gold is only soluble in nitro-hydrochloric acid, no single acid having any effect on it. Precipitated gold in a finely divided state assumes various colors—violet, purple, ruby, brownish and black. On heating to redness these colors disappear and the pure yellow color again appears.

PLACER MINING in Siberia is carried on usually under considerable difficulty, owing to the lack of grade, which is characteristic of most of the valley gold districts. The sluices are short, seldom being over 100 feet in length. The upper end of the line of boxes is raised on a trestle, in order that the line of boxes may be given the necessary grade. The gold-bearing gravels occur for most part in low, flat valleys, in which the streams flow sluggishly or the water lies in marshy tracts, with no perceptible current. Ordinarily the ground is worked in a series of terraces or benches, each about 5 feet in height. The gravel is either carried by men or is hauled in some kind of vehicle to the sluices. This method of working would be very expensive if it were not for the fact that labor is very cheap in Siberia. It may be that the gravels could be successfully mined by dredging in many of these districts as dredgers are already successful at work in some of them.

✤✤✤✤

THE capacity of an air compressor to compress free air is determined by calculating the piston displacement per minute. This is ascertained by multiplying the area of the piston in feet by the distance traveled in feet per minute; this gives approximately the displacement per minute. Calculate what volume this air will occupy at the working pressure, and this will be the required volume of the receiver. Example: The maximum piston displacement of compressor per minute equals 65 cubic feet; working pressure equals 80 pounds (gauge). To determine the volume of 65 cubic feet of free air when compressed to 80 pounds pressure, the following formula may be used:

$$V_2 = \frac{14.7 V_1}{P_2 + 14.7}$$

In which V_1 equals maximum piston displacement in cubic feet per minute equals 65. P_2 equals working pressure (gauge) equals 80 pounds. V_2 equals volume of the air at the higher pressure. Substituting in this formula we have:

$$V_2 = \frac{14.7 \times 65}{80 + 14.7}$$

equals 10 cubic feet, which would be the volume of a receiver 18 inches in diameter and 6 feet long.

✤✤✤✤

THE interesting case of a flat vein crossed and intersected by a fissure at a high angle, near Phillipsburg, Mont., is a difficult proposition to size up from description alone. From the statement that the croppings of the flat vein for a depth of 12 to 15 feet extend for a distance on the strike of 125 feet, the impression is gained that the ore shoots in the flat vein have a strike essentially north-south. There may be several of these. Ore deposition in limestone is extremely uncertain, but in this instance the proposition appears to be simplified by the fact that the ore occurs between a shaly and a massive limestone. It is quite probable that the crossing fissure may be found to bear some direct relation to the disposition of the ore bodies on the contact. "Concentrates" believes it would be good judgment to sink on the south side of the fissure and on the line of intersection. The shaft could be excavated in this manner without much difficulty. Another way to explore the contact south of the fissure is by drifts run through the fissure from the shaft already sunk on the north side. There is no rule by which one can be guided in exploratory work of this character. The contact is known to be ore bearing, and the probability is that the shoots strike north-south; by exploring with inclines driven in an east-west direction these shoots should be discovered if they exist. That the fissure is responsible for the mineralization of the contact is only an assumption. If such is the case there should be some evidence of it at the line of intersection.

✤✤✤✤

A VEIN composed of quartz carrying considerable amounts of red hematite, specular hematite, limonite and nodular masses of copper (the latter occurring as chalcocite), it would be good prospecting and good business to follow the same and develop it both longitudinally and in depth in search of a pay shoot. Veins of this character not infrequently carry gold, and occasionally are rich, particularly in the vicinity of the copper nodules. A mine in San Bernardino county, Cal., the Rose, was of this character, and when the copper masses were encountered the values went up to as high as $500 gold per ton. In the same range of mountains, but 25 miles distant from the first mentioned mine, is another mine, the Lookout, where similar ore occurs, and there the values are also high, particularly when the copper appeared. These nodules varied in size from that of hazel nuts to lumps as large as the fist. On Castle creek, in Arizona, near the Tiptop district, specular iron occurred in considerable amount in the Roberts mine, and it carried payable gold values. In Brazil, an eminence known as Mount Itabira is largely formed of a highly ferruginous mica schist (specular iron) which is gold bearing. Other occurrences are the Carolinas, of Sutton, Canada, Norway, and the Gold Coast, West Africa. That the amount of specular iron is an index of the amount of copper that may be found in depth is very doubtful, for the reason that in some instances no copper at all is found in veins of this character. The theory that specular iron is the result of different processes from those forming other varieties of hematite is probably the expression of an individual opinion. Nearly all large iron mines produce more or less specular iron. Near Lynchburg, Va., are found iron deposits consisting of hematite, limonite and magnetite. Where the enclosing rocks are both limestone, the bed of ore is limonite; when limestone on one side and sandstone on the other, the ore is red hematite; where it is sandstone and schist, the ore is magnetite.

In Nova Scotia.—II.*

Written for the MINING AND SCIENTIFIC PRESS by T. A. RICKARD

Milling methods are simple, as they should be, for the usual product of the mines is the simplest type of gold-bearing quartz, containing a little pyrite, usually mispickel. In most cases the treatment consists of crushing under stamps, with one inside plate, followed by passage over the amalgamating table outside; and there it ends. At the Caribou a 40-stamp mill is treating quartz yielding from $2 to $4 per ton, giving a tailing which has ranged between 8 and 32 cents per ton during the last two years, despite the fact that extraction of gold ceases after the passage of the pulp over the apron—12 feet long. The ore carries about 1% of sulphides, chiefly pyrrhotite, with a little galena, blende and pyrite. At the Richardson mine the ore contains more sulphide and the treatment is more complex. Sixty stamps, in twelve mortars, provided with a front plate, discharge onto 12-foot aprons. Thence, without classification, the pulp goes to Wilfley tables—one table for each ten heads. The ore yields concentrate in the ratio of 3%, the assay value being $20, equivalent to one ounce of gold per ton.

At this mine the bromo-cyanide process is employed to treat the concentrate, which is not roasted. The salt used is a mixture of bromide and bromate of potassium; it also contains sodium chloride and is sufficiently variable in composition to hinder accurate chemical work. This reddish salt is dissolved in water, to which sulphuric acid is added in an amount that just avoids precipitating the liquid bromine. A given quantity of this solution (equal to one twenty fourth of the amount used per diem for the particular grade of concentrate under treatment), is put into an ordinary pickle bottle. To this a 10% solution of potassium cyanide is added slowly, so as not to crack the bottle with too sudden a generation of heat, until the wine-red color has changed to lemon-yellow, marking the end point of the reaction that forms the bromo-cyanide of potassium. This is then added to the working cyanide solution in the vats. The manager, H. S. Badger, informed me that the working solution can be used continuously without danger of reprecipitating the gold, until it contains $45 to $50 per ton; even a solution assaying $70 has been employed safely. Owing to this enrichment of the solution, the precipitation of the gold in the zinc boxes is rapid, the precipitate being so heavy as even to show the characteristic gold color. The concentrate is arsenical pyrite (mispickel) mixed with 20% of silica; when treated by ordinary cyanide solution, without roasting, it requires twenty-eight to thirty days for satisfactory extraction; with the bromo-cyanide, the treatment is completed within forty-eight hours and gives an extraction of 80% to 81%. The consumption of bromide salt is at the rate of three pounds per ton of concentrate, which is high. The bromo-cyanide solution is acid and therefore destructive to the KCy; if a neutral bromide salt could be used the loss would be diminished. Bromine itself is not obtainable because of danger in transport, the carboys being liable to breakage, especially during hot weather; therefore the railroad and shipping companies refuse to handle it.

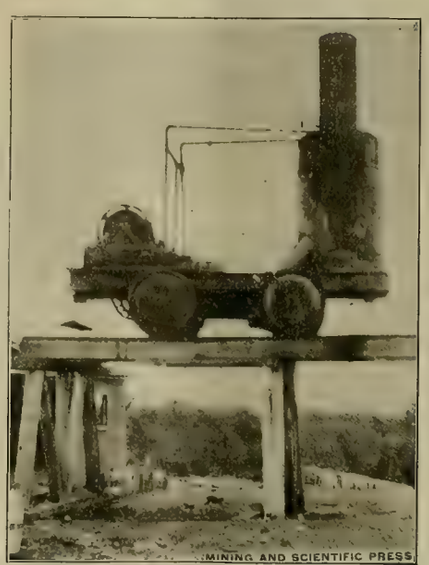
The following test, made at Brookfield, where this process was first tried in Nova Scotia, will be of interest: Fifty-three tons of concentrate, assaying $38 per ton, yielded in forty-eight hours a tailing carrying $1.50 per ton, showing a calculated extraction of 96%. The fifty-three tons contained $2014, and the resulting solution, by assay, carried $1634. After precipitation on zinc there was obtained 120 ounces slime, which on reduction with H_2SO_4 and roasting of the residue, yielded ninety-two ounces bullion, worth $18.20 per ounce.

As already stated, this method was first introduced at the Brookfield mill, but it has been replaced there by plain cyanidation. Several years ago Captain Adolph Thies installed a chlorination plant modeled on that which he had operated so long and so successfully at the Haile mine in South Carolina. It included three single hearth reverberatory furnaces, each with a hearth 8 feet wide and 70 feet long. Ferrous sulphate was the precipitant. But it was not an economic success—the fate of this particular barrel process everywhere, save at the Haile mine, where the ore is of exceptional character, the gold being fine and lying between the laminæ of the schist, so as to be readily soluble to chemical treatment, while the gangue itself is wholly insoluble; after chlorination, W. L. Libbey, the energetic manager of the mine, tried the bromo-cyanide method introduced by E. D. Maze, who had worked with Messrs. Sulman and Teed. This, in turn, gave way to plain cyanidation. Nevertheless, I expect, eventually, to see the application of bromine in the treatment of pyritic concentrate, because whether employed as a compound with cyanogen, or directly, in a manner analogous to chlorination, it has been found to accelerate solution of the gold and to facilitate the subsequent filtering.

*See illustrations on front page.

Another metallurgical problem now being solved in Nova Scotia is the treatment of gold-antimony ore. At West Gore, in Hants county, the Dominion Antimony Co. is working a series of lodes yielding an ore in which the gold is closely associated with both native antimony and the sulphide (stibnite). The gold is often visible. After sorting, the first-class ore carries 45% to 50% antimony and 2½ to 3 ounces gold per ton. The second-class stuff contains 20% to 30% antimony and $20 to $30 in gold. There is a fairly constant ratio between the two metals. Various methods have been tested, until finally J. S. MacArthur, whose name is identified with the cyanide process, originated a scheme which depends upon the solubility of stibnite in caustic soda. The mineral is dissolved in a dilute solution of caustic soda (NaHO), which is then neutralized with carbonic acid gas (CO_2), with the formation of a red precipitate of amorphous antimony sulphide (Sb_2S_3). The intention is to cyanide the residue to extract the gold, and the problem will be to get rid of the soda before cyanidation. This is confidently expected. In the meanwhile the selected ore is shipped to Swansea.

Operating costs in Nova Scotia are creditably low. At the Richardson, the total cost is $2.40 per ton, when supplying thirty stamps and the bromo-cyanide plant. At the Caribou, L. W. Getchell has reduced his cost, when running forty stamps, to between $2.50 and $3 per ton, despite a difficult problem in mining. At Brookfield, the total cost, with twenty heads and cyanidation, is $3 per ton. Milling ranges between 25 and 60 cents per ton at the three mines mentioned. Wood fuel is cheap—$2.25 per cord; but mines near tide water burn coal, as at the Richardson, where I saw a curious engine, affectionately known as the Nancy Hanks. The photograph shows



The Nancy Hanks—An Original Engine.

that she looks like the ingenious application of remnants of machinery, but the peculiarity of construction is due to the fact that the engine was designed for double duty, to push ten tons of coal over a primitive railroad and to hoist freight from vessels onto the wharf at Isaac's harbor. The forward axle is geared by sprocket chain to a short counter-shaft under the platform between the two axles; this counter-shaft is geared similarly to a shunt pinion sprocket wheel on the shaft of the engine, which can actuate either the hoist or the car axles. The Nancy Hanks has done pioneer work, but the cost of her maintenance has been, as might be supposed, excessive.

Labor is cheap in Nova Scotia. Drillmen get $1.70 to $1.75 per day, ordinary miners $1.35 to $1.60, working ten hours. There is complaint, by the operators, of a scarcity of workmen, despite the small number of active mines. This is owing to the fact that the men are independent and go off to their hay making, farming, or lobster fishing without apology, leaving the mine operators shorthanded. The lobster canneries pay $2 per day during the season. Low wages are due to the restricted demand for miners; so few properties are in operation, and even these are far apart. Nevertheless, the workmen are better off than their friends in the unionized camps of the West where high wages are obtained. The Nova Scotian pays from $2.50 to $3 per week for his board; he is sober, he has his farm or his fishing to help him; and I venture to say that taking a period of ten years he will save more money and be in better health than the men who get $3.50 per day, a large part of which goes to the saloon and the gambling den, while they have to pay for their board and their other expenses, a percentage which in the end largely offsets the higher wage. I have heard sneers against the Nova Scotian miners because they are, in part, fishermen and farmers. The natives of the province resemble the greatest miners the world has known, the Cornishmen, who, like them, live in a rugged country encompassed by the sea, so that they earn their livelihood on the deep as fishermen and in the depths as miners. The result has been that the Bluenose and the Cousin Jack have been pioneers the world over, as sailors and as prospectors. He who can force his way through the rock in search for ore and take his dory through tempestuous seas in pursuit of the finny spoil is a man—a man built on the scale of 12 inches to the foot.

Emigration is draining the best blood of Nova Scotia. The languishing condition of the gold mining industry has led many of the energetic to go to British Columbia and the Northwest. Of late, the demand for laborers in the wheat fields of western Canada has attracted the young men. Up to the end of August this year 3700 men had left Nova Scotia and New Brunswick on "harvest excursions" to Manitoba and Alberta; nor was the exodus at an end. The railroads offer unusual facilities, the rate to Winnipeg being only $10 for the trip. Every year several thousand vigorous men go westward and a large part do not return, but take up land on their own account. Nor is this migration altogether strange, the contrast between the Atlantic coast and the bountiful West affords excuse enough; if the West had been as near Europe as the East, then, there can be very little doubt, the eastern seaboard would have been regarded as a never-never land, an inhospitable region, fitted only for the most hardy and the most unhappy.

(TO BE CONTINUED.)

A Noted Pyrite Deposit.

Written for the MINING AND SCIENTIFIC PRESS by W. H. STORMS.

Almost within the city limits of Deadwood, S. D., is a notable occurrence of sulphide ore in what is known as the Whizzers mine. The property is a portion of a group of claims locally called the Montezuma and the Whizzers. The group consists of several claims, lying on the divide between Deadwood and Whitewood canyons.

The geology is simple, consisting of upturned schists of Algonkian age—hornblende and mica schists, and slates, quartzites and other metamorphic rocks of that remote period. The most pronounced feature of this formation in this vicinity is the bold outcrop of several quartzite reefs. These are particularly prominent and may be followed for long distances, their course only interrupted by the numerous canyons of the region. Sometimes the quartzites become slaty, and then for some distance their outcrop may be somewhat obscure; but ordinarily they reappear in massive ridges, often standing boldly above the surface from 10 to 50 feet in height. Occasionally these deposits are 100 feet or more in thickness.

These prominent quartzite reefs are of very common occurrence in the eastern half of the Algonkian area of the Black Hills. In some of them gold has been found and in several of them copper also occurs. Ordinarily they are extremely siliceous, but occasionally carrying considerable iron oxide in the outcrop—both hematite and limonite. In the early days of mining in the Black Hills some development work was done on these quartzites near Deadwood, and small bodies of massive pyrite and quartz carrying disseminated pyrite were found; but no systematic mining was undertaken, as the ore was low grade in gold and the copper content was too small to be commercially valuable.

When the Deadwood & Delaware smelter began operations, the supply of siliceous ore came from the Bald Mountain and Terry Peak region. The smelting of these ores required a large amount of iron ore and limestone. The limestone was readily available in a score of places within a mile of the smelter, but the greater portion of it was obtained on the line of the railroad, about 12 miles distant—a striking lesson in the economy of mining, though possibly it could not have been obtained any cheaper near the smelter, the railroad haul being 25 cents per ton. For a time the Homestake Co. supplied the necessary iron ore from the accumulation of years of concentrated sulphides in their mills. This supply was soon exhausted and search was made in the veins near Deadwood known to contain iron sulphide. Several mines were opened; some of them proved more valuable than others as producers of sulphides for the smelter.

The last of these deposits to be opened and the one most extensively developed was the Whizzers mine. At first a tunnel was run on a mineralized vein, which, though furnishing some good ore, was too small to meet the requirements. To the westward of this vein about 250 feet was a heavy iron gossan on the surface, and it was determined to explore this zone in search of ore. A tunnel was driven into the hill, which quickly entered a body of solid pyrite and continued for some distance, it being found that the ore body was continuous and evidently of considerable magnitude.

A second and larger tunnel was driven several feet higher than the original prospect drift, in order

that cars might be run from the mine directly over the ore cars on the railroad track. In 100 feet from the portal of this tunnel the deposit was encountered. From that point the drift has been continued for more than 600 feet, all in solid pyrite, carrying a small percentage of copper and variable values in gold. The vein was found on opening out the headings to be about 45 feet in width. It seems remarkably uniform in character—a dark-colored, pyritous hornblende schist, forming solid masses of mineral in many places, though usually containing over 80% iron sulphide. The walls are covered with an efflorescence of copper sulphate, showing that copper is present throughout the mass. In some of the ore chalcopyrite can be seen disseminated throughout the pyrite. A winze sunk near the hanging wall side of the ore body is in similar ore to that found above, though the copper content is somewhat higher. Gold was also found to increase somewhat at this point. Whether this single prospecting hole below the general level of the workings is an index of the character of the entire deposit in depth can only be surmised. The water flowing from the tunnel is strongly acid and impregnated with copper salts. Considerable copper could be obtained from this source if the owner would take the trouble to run the water through a line of sluices containing iron scrap; but no attempt in this direction has yet been made.

The mining methods by which the ore has been removed from the Whizzers are not such as would commend themselves to a manager with any regard to the future success of the property. The plan generally followed has been to put up a raise, build a timber chute at the foot of it, and then open out a large stope overhead, only enough ore being removed to allow the miners to keep within convenient reach of the back. When the stope had been carried up from 20 to 50 feet, the ore was all withdrawn, leaving large open excavations, without timbers or filling for support, and making future operations somewhat dangerous. There is still abundance of good ore available when desired; and this may be removed while the inaccessible portion in the large stope is placed within reach once more by filling the stopes from the surface, when extensive operations may be resumed on a larger scale.

The Montezuma mine, which constitutes a portion of the property, is on a parallel reef of quartzite and has as yet only superficial development.

Copper and gold both occur in the superficial portions of this outcrop, and more extensive development of this reef may find that large ore bodies also exist in that zone.

The smelter at Deadwood has been idle the past two years, having been closed down through difficulties with the labor unions, and the owners, the Golden Reward Mining Co., have not resumed operations. It may be, however, that the large body of pyritous ore in the Whizzers mine can be mined and matted with profitable results, as it contains both gold and copper. The proposition to make copper matte from this ore is now being considered, and the Whizzers mine may yet be operated independently. Siliceous ores are obtainable in abundance and limestone may be had for the quarrying in the vicinity.

The Drainage of Cripple Creek Mines.

Ever since the great benefits derived from driving what is known as the El Paso drainage tunnel in the Cripple Creek district of Colorado have been fully demonstrated and realized, engineers, mine superintendents and mine owners in that vicinity have been discussing the advisability of another lower and longer tunnel, which would effect the drainage of a much larger area, and make it possible to more economically and rapidly explore and work the deeper portions of the great system of veins which have proven so richly profitable in the portions above the present drainage level.

Before the El Paso tunnel was driven some of the deeper mines found it almost impossible to proceed to greater depth owing to the heavy inflow of water encountered in the shafts. Where shafts were sunk deeper it was only at largely increased expense. It was figured that if a tunnel were driven to connect with the lowest level of the El Paso mine, a large area would be drained to a depth of between 200 and 300 feet below the lowest level of the greater number of mines of the vicinity. The tunnel was successfully driven, and long before its completion the direct benefits due to drainage of the ground were apparent to all.

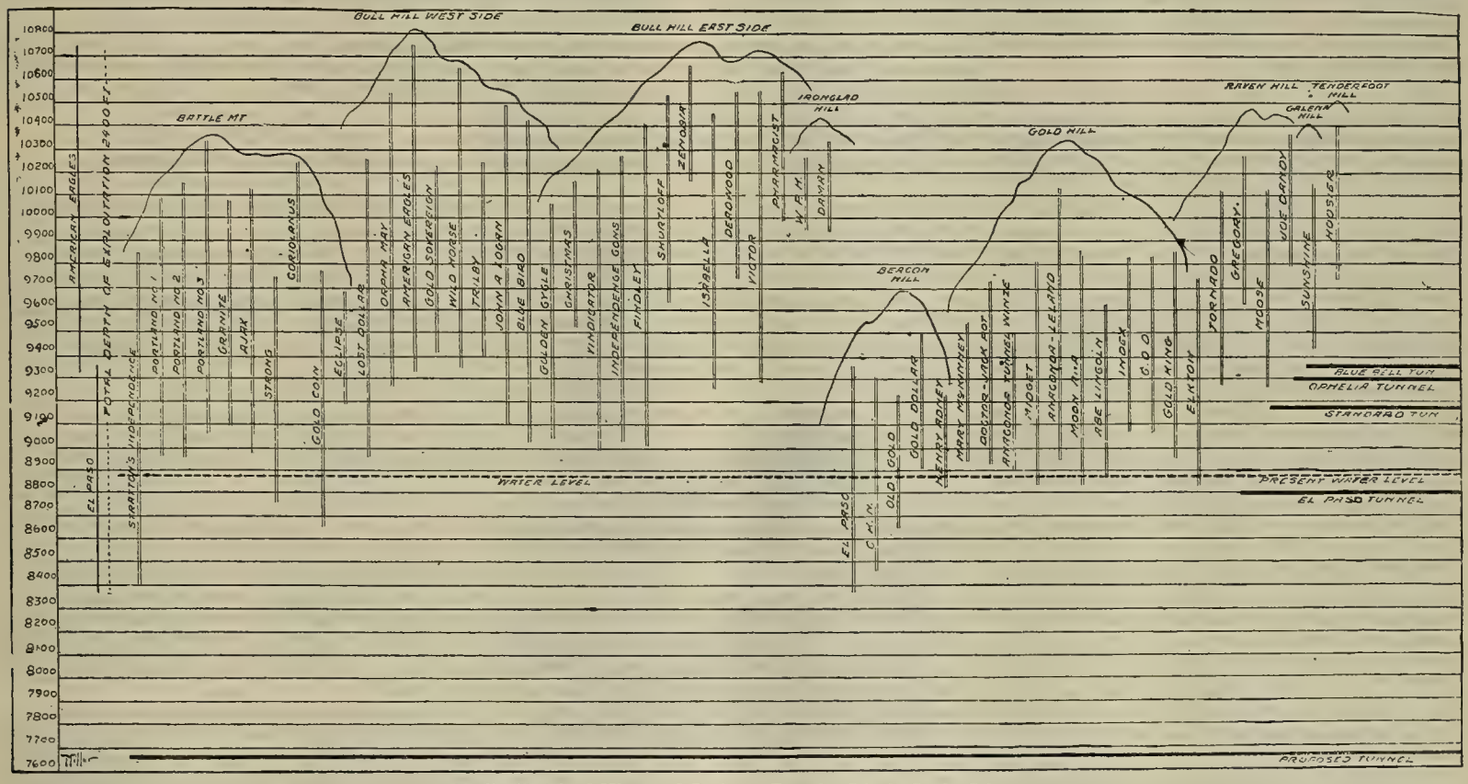
This enterprise having been carried to a successful termination, it is not strange that some of those most largely interested, foreseeing the need of a similar and deeper adit, some time since began to vigorously agitate the idea and urge its importance upon all those of the district who would be directly benefited by it. Drainage tunnels are not an experiment. They have been used to good advantage in other places in the United States, notably on the Comstock Lode at Virginia City, Nev., at the Ontario mine, Park City, Utah, and also in the Cœur d'Alene district of Idaho and elsewhere, as well as numerous instances in the drainage of European mines.

The lease of life gained by driving the El Paso tunnel is drawing to a close, the mine workings are mostly down to the tunnel level, and the ore reserves are no longer of such magnitude as to give confidence in the future prosperity of the district. When the El Paso tunnel was driven attention was then called herein to the future needs of the district, and the fact emphasized that the El Paso tunnel would afford only temporary relief. This statement is now verified in the present condition of the mines of the Cripple Creek district, and a deeper tunnel has already become a pressing need if the mining industry is to be perpetuated. Some of the important mines on the line of the El Paso tunnel are now practically exhausted down to that level, and others are rapidly approaching it.

The accompanying profile sketch, showing the important mines of that portion of the district, is reproduced from the Rocky Mountain News of Denver, for which the data were compiled. The sketch shows the relative position of the several shafts and their approximate depth, together with the proposed new tunnel, which will drain the mines over 1100 feet below the present drainage level. It is known that payable ore exists in nearly all of the more important mines to the greatest depth that has been reached by any of them. There are few important exceptions, and these exceptions have no extensive development below their lowest ore shoots, so it may be reasonably inferred that, with further deep exploration, these, too, will be found ore bearing at greater depth.

The need of the deeper tunnel is fully realized, and as the project is in good hands it, like the El Paso tunnel, is likely to become a reality. It is thought the completion of the tunnel now proposed will lengthen the period of life of the mines not less than ten years. It is thought by engineers of the district that, unless conditions change materially with greater depth, the cost of the new tunnel will be about $500,000. The El Paso tunnel cost about $85,000, and gained about 250 feet depth. The new tunnel will gain nearly five times that depth.

A report on the feasibility and cost of the proposed enterprise has been made to the associated mine owners by Engineer W. D. Brunton and the report favorably accepted by the association at a recent meeting held in Colorado Springs.



Profile Sketch of Mines and Drainage Tunnels, Cripple Creek, Colo.

Temperature of Feed Water.

Every steam engine, and every regimen of steam, has its own peculiar temperature of feed-water which gives the maximum economy of fuel, and which can only be experimentally ascertained. No experiments have been made to determine, in given different cases, this temperature. Probably it admits of wide variation without affecting the fuel economy, the gains sensibly equilibrating the resulting losses. The higher the feed-water temperature, the less tube surface is required in the condenser; but, then, the higher the feed-water temperature, the larger must be the capacity of the cylinder for developing equal powers, other things equal, owing to the increased back pressure against the piston with higher temperature of the condenser. The higher temperature of the feed-water increases the economic vaporization by the boiler in a higher degree than is due, numerically, to the increased temperature of that water, because the heating surface of the boiler having, in equal time, to transmit less heat, will, necessarily, utilize more of the heat in the gases of combustion than it would do with feed-water of lower temperature.

Further, with the same engine, for the production of a given power with equal reciprocating speed of piston, the boiler pressure must be carried higher, the higher the back pressure against the piston, and there is a distinct and measurable economic gain due to the greater dynamic effect of a given weight of steam of higher pressure over the same weight of steam of lower pressure, after allowing for the greater total heat of the former.

Placer Mining in Alaska.*

NUMBER XI.

Regarding the use of punched plates in working New Zealand gold-bearing marine deposits, H. W. Young says:

"The best size of perforation for hopper plates has been a matter of experiment by myself and others, variations from ¼ to ⅝ inch having been put to working tests. It is proved that holes of less than ⅝ inch diameter unduly limit the discharge through the plates, are liable to choke, and that there is no advantage whatever to be gained by their use. The discharge through $\frac{7}{16}$ inch holes is sufficient in amount, and the fine shingle particles which pass through with the sands and seldom exceed ¼ inch in diameter are not troublesome in their size and quantity. In fact, many consider that they are of benefit in keeping lively the sands on the tables. With holes exceeding $\frac{7}{16}$ inch in diameter, the size and quantity of small shingle become excessive, and the water passes away so rapidly as to prevent material from being carried forward over the plates."

The above remarks are of somewhat general application for the use of punched iron screens in any form of undercurrent where it is assumed that a portion of the gold, including any nuggets which may occur, has been previously saved. In northern deposits where dredgers have been installed, as in the Klondike and on Stewart river, punched iron screens used in revolving trommels have large holes, up to 1½ inch, even when a tailings stacker is used, while the average size in Oroville dredging practice is ⅝ inch.

A screen installed in one box of the main sluice of a plant on Ophir creek, Seward Peninsula, consisted of a number of longitudinally disposed round iron rods, acting as a grizzly, fitted above the bottom of the box, the gold being saved on mats below. This box, which was placed at the end of a 120-foot sluice, was said to save much fine gold.

When it is desirable to introduce the principle of the undercurrent, separate from the main sluice, the following device, adapted from one used in Siberia, as described by E. D. Levat, may be adopted. Its capacity is given as 172 cubic yards per shift. The principle of the undercurrent is here introduced, but the discharge, of both coarse and fine, is to the same heap. This contrivance uses no power, and the method of handling accumulations of tailings will be more expensive than in plants already in use. Where the steam scraper is so generally employed, however, as in the Klondike, for handling tailings, the innovation of the modified "kulibinka" here figured (Fig. 20) would not add over $1000 to the expense of installation, while the efficiency in saving the values would be greatly increased.

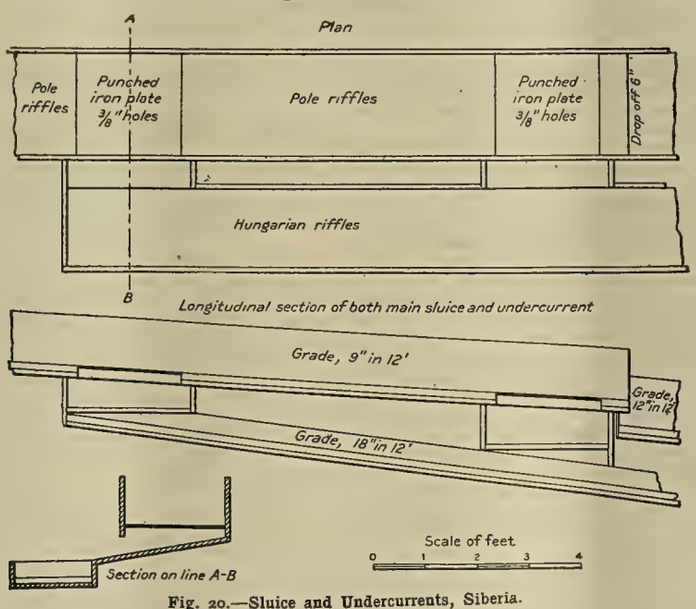


Fig. 20.—Sluice and Undercurrents, Siberia.

It has been shown that the Klondike sluice generally necessitates a man forking. The object of this forking is to take out the stones, from 6 to 18 inches in diameter, after their surface is washed. Mechanical devices for accomplishing this would be advantageous. Experience with gold dredgers has proved that the revolving screen or trommel, inside of which play powerful jets of water, accomplishes this screening process most successfully. The trommel is, however, expensive, and its various parts and castings must be specially made at elaborately equipped works. Therefore it is worth while to consider whether simpler and cheaper devices will not accomplish nearly as good results for the Alaskan miner.

A plant to accomplish good washing results with sticky clay and gravel, and which can be built of materials at hand, is shown in Fig. 21. This type of plant, founded on the idea of the Siberian pan, has a capacity of from 100 to 200 cubic yards in ten hours, and can be built in the winter months. Assuming that steam power is already at hand, it requires no outside material beyond the iron shoes and simple castings and the punched steel plate which forms the floor of the pan. Its operation will require 10 H. P., and, if the material is conveyed to it by self-dumping carrier, the services of two men are sufficient to take care of the tailings. The machine will not only break up and thoroughly wash clayey gravel, but with properly arranged tables below will save the bulk of the fine gold which has been set free from its matrix. The cost of a pan of the dimensions here figured will not exceed $2000, including the tables and sluices. The device for automatically clearing the bottom of the pan of large stones is not used in Siberia, where hand labor is cheap enough to dispense with it, the large stones being periodically removed by the lifting of gates in the periphery of the pan. The amount of water used in such a machine does not exceed 125 miner's inches.

The drawing of this machine is made diagrammatically, since the manner of its construction will depend on local conditions. A four-armed casting, keyed to the shaft and bolted to the horizontal timbers, is advisable. As used in remote districts in Siberia, the central shaft is frequently a wooden beam, and, instead of the iron shoes, heavy stones dragged with chains, as in the arrastre, may supplant them.

The above suggestions are made with reference to

working the rich gravels of the shallow northern placers. Gravel containing less than $2 to the cubic yard is rarely worked by the method of the cable and traveling bucket. Lack of natural grade makes it necessary that the miner elevate his material, and the impossibility of getting water under head makes the use of steam power imperative. The point is that when such elevation is attained, it should be made available to thoroughly wash the gravel. At present this is not done. Perhaps the suggestions here offered may be of benefit to some operators.

In the construction of washing plants of a larger and more expensive kind, the operator has the benefit of the experience developed in gold dredging. This now rather important industry has brought into service devices for gold saving, in the use of which one of the main objects is to utilize to the best advantage all available vertical and areal space.

The employment of large mechanical excavators for placer mining has a field in the Northwest. Such operations necessitate one or more permanent washing plants to receive the gravel from each machine. It has been demonstrated that the dredger is the only form of excavator which can economically transport its sluices as it moves. Therefore a plant, situated as safely as possible with reference to danger from floods, and economically with reference to tramway, dump and water supply, must be constructed frequently at a considerable expense.

The shaking screen, although it has received a thorough trial on gold dredgers, does not find as much favor as the trommel. It is not impossible that modifications of the principle of the shaking screen and of the shaking table may be developed which will act more efficiently in saving gold than the trommel. F. Francois has recently figured and described a "shaking sluice box" system of gold saving, for installation either in stationary washing plants or in dredgers. He claims a very high percentage of saving, and as additional advantages the elimination of the use of quicksilver and the employment of a small amount of water. He does not give the cost of the plant, however, nor any actual results of its operation in practice.

A trommel was used in a stationary washing plant erected in the Klondike in connection with a steam shovel and incline operation. A short description of this plant is appended, but it should be understood that for the average miner the installation of such a plant is impracticable on account of first expense and the difficulty of getting the complicated machinery. The plant used 125 miner's inches of water, led by a ditch from Bear creek; the capacity was said to be 500 cubic yards in ten hours. The material elevated to the platform at the upper end of the trommel was dumped into a hopper feeding the trommel. The water was led into the lower end of the trommel and fed through a perforated pipe. The largest holes in the revolving screen were 1 inch in diameter, and all oversizes passed through and into

*Bulletin 263 U. S. Geological Survey.

the hopper below the lower end, whence the tailings were hoisted in a self-dumping carrier, on a cable, for a horizontal distance of 200 feet and a vertical distance of 60 feet. The fines passed over 80 square feet of riffle tables, floored with expanded metal and cocoa matting, on a grade of 12 inches to 12 feet, followed by sluices with iron Hungarian riffles. The fines were, after passing out of the 96 feet of sluice boxes following the tables, elevated by a steam scraper to a pile 200 feet distant and 15 feet high. The expense of installation of such a plant will be not less than $5000, and will more likely be $10,000 in any part of the interior of Alaska.

In arranging a number of gold-saving tables to receive the discharge from a screen, great care should be taken to distribute the material equally to these tables, so that the duty of each may be the same. This in the best Oroville, Cal., practice is done by leading a small sluice trough from the main receiving sluice beneath the screen to each of the tables. In case of a second sizing, as in the Atlin dredger described below, the distribution is necessarily accomplished by a series of grizzlies in the main sluice. If small ducts or troughs are used, they should be provided with gates, the whole made of wood, like those used for distributing the pulp to the tables in concentrating mills. The attempt to distribute the fines directly from the trommel by means of iron gates is considered less satisfactory.

Riffles for the saving of fine gold in sluices are of many kinds and are of very ancient origin. Humboldt (Asie Centrale) refers to the method in use of working the placers of Colchis—that of employing wool in the sluices—as a possible explanation of the legend of the "Golden Fleece." It was in fact known that the kings of Imeret in the eighteenth century used wool for collecting gold in Tskinitskali and Abacha rivers in the Caucasus, while the Turkish gypsies use goatskin for gold saving on Belichta river.

The pole riffle made of saplings, with or without strap iron nailed to the top, has long been in favor in small placer operations in the United States, and is to-day employed in the primitive shoveling-in operations throughout the northern territory. An improvement on this riffle, simply made, aiding in the disintegration of clay, was seen by F. L. Hess in the Rampart district of Alaska, and a sketch furnished by him is shown in Fig. 22. Small squares of sheet

Fig. 22.—Pole Riffle With Knives for Cutting Clay.

iron $\frac{1}{16}$ inch by 2x2 inches are driven cornerwise into the poles.

A development from the wooden pole riffle is the iron or steel rail, laid longitudinally in the sluice box.

At the present day the saving of fine gold is receiving marked attention on gold dredgers, as the product of these machines frequently consists largely of gold in an exceedingly fine state of division.

The Oroville gold contains a much larger proportion of fine colors than the northern fields. From an undercurrent sample of Klondike gold, assuming that it represents 5% of the total recovery, screening tests appear to indicate that under 1% of the Klondike gold, and under 2% of the Fairbanks creek gold, will pass 150 mesh.

The fineness of the gold on Sulphur creek is shown by the table below:

FINENESS OF GOLD FROM SULPHUR CREEK.

Mesh.	Per Cent.
Under 150	10
150–100	60
100–80	20
80–60	10

Moreover, the gold, whatever its fineness of division, is generally round and shot-like and not flaky. Under such conditions, in view of the Oroville experience, losses such as undoubtedly occur in the northern practice are inexcusable.

The riffle shown in Fig. 23 is designed to hold a

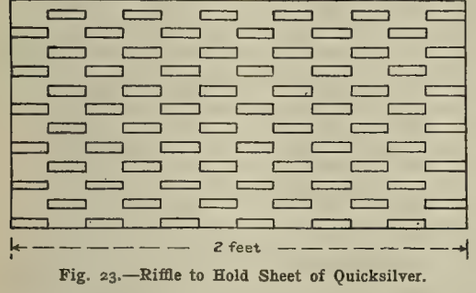

Fig. 23.—Riffle to Hold Sheet of Quicksilver.

divided sheet of quicksilver. Another form is made by boring 1½-inch augur holes to the depth of ½ inch. Some operators claim that a recurring quick jar imparted to the fine gold tables by means of an eccentric or other device aids the saving of gold. The efficiency of this principle is questionable.

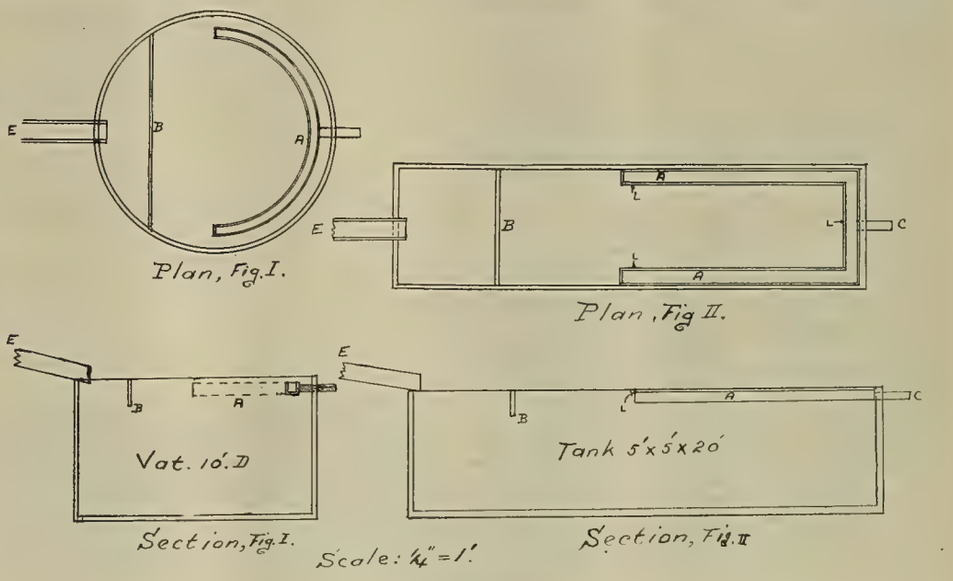
(TO BE CONTINUED.)

An Experience in Water Recovery.

TO THE EDITOR:—The "Experience in Water Recovery" by George S. Binckley is interesting, and, having had a very similar experience some eleven or twelve years ago, I believe I can offer a few suggestions that will insure clear water at all times.

The plant would be about as outlined and drawn by Mr. Binckley on page 123 of the Aug. 19th, 1905, number of the MINING AND SCIENTIFIC PRESS, only, instead of the pyramidal downtake box, a baffle board B, as shown in the accompanying drawings, should be put across the heavy-slimes box, or tank, about 2 feet from the end, into which the slimes are discharged, if round, and 4 feet if square, the delivery trough E discharging at the level of the top of tank, and near the edge.

If the discharge trough L is placed, as shown in sketch, just below the edge of the tank, say 2 inches lower than the top of the baffle board, and have at least 15 feet of skimming surface (the more the better), the water should be discharged practically clear from the second tank, or the one Mr. Binckley designates as the heavy-slimes tank. I believe this will prove to be so, in case the skimming launder be set in a semi-circle, 6 inches from the inner edge of vat, opposite to and farthest from baffle board B, as indicated at A in the plan (Fig. 1).



Water Settling Boxes.

Should slimes still pass over, the light-slimes tank or vat could be arranged identical to the one just described, and, from my experience with exceedingly slimy ores, I am certain no slimes would be conveyed to the mill water tank.

Fig. 1 is an excellent model, and the collecting trough A should be set 2 inches below the top of the vat, and should be made with the edges beveled in, as shown by Mr. Binckley.

The baffle board B need not be more than 1 inch thick and 12 inches deep; but it must absolutely cut off the flow of water and slimes, and should be set flush with the level of the top of the tank.

In the rectangular tank, which should be not less than 20 feet long and 5 feet wide, the baffle board B (Fig. 2) should be set 4 feet from the intake launder E. The discharge launder, or skimming trough, can be made 4 inches wide and 6 inches deep, with the side L cut 2 inches lower than the other side, the higher side being nailed to the top edge of the tank and level with it, thus leaving the side L 2 inches lower than the top of the tank. This will allow the thinnest of sheets of water to pass over into the collecting launder, creating a minimum of current, and the slimes particles, deflected down by the baffle board, will never rise to the surface, even though the slimes fill the tank to within 1 foot of the bottom of the baffle board. This is my experience; and at first I met with almost the identical difficulties that Mr. Binckley encountered.

I here adopt Mr. Binckley's model of collecting trough; for, where I used round vats, I cut down the upper edge of the vat itself 2 inches, leaving the inside edge sharp, with the bevel toward the outside, building a circular collecting launder around the outside, just below the lip of the skimming edge.

Where I have used rectangular tanks I have done the same, cutting down the edge of the sides and discharge end (the discharge end of the tank being about double the width of the intake end in a 25-foot long tank), collecting the clear water on the outside. Either way will do the work and give almost perfect results.

I have never seen the third—or fine-slimes—tank used, but can readily see that it would be of advantage with soft, earthy, decomposed ores, giving a large percentage of clay slimes. E. A. H. TAYS.

San Jose de Gracia, Sinaloa, Mexico, Sept. 18.

THE PROSPECTOR.

The slaty rock from Yreka, Cal., is a graphitic schist. The rock contains no molybdenite. The scales are graphite.

The ore from Sonora, Cal., is quartz containing iron, copper and zinc sulphide, the dark colored mineral being the zinc blende. The ore also contains gold. The silvery white mineral on one edge of the specimen is foliated talc.

Samples continue to arrive for determination without the name of the sender. One sack containing eight pieces of rock, each marked with red paint and a running number, has been received, but the tag accompanying it has been so badly mutilated that the sender's name is unknown.

The samples from Belgrade, Mont., are: No. 1, hornblende schist containing considerable finely disseminated pyrrhotite (magnetic iron sulphide). It may also contain gold, silver, nickel, cobalt and other minerals, and should be assayed for these metals by competent assayers. Ore of this character frequently occurs associated with sulphide copper ores. No 2 is quartz and lime spar (calcite). The specimen contains a very little pyrite and a few scales of molybdenite.

The rock samples from Phœnix, Ariz., marked W. L. H., are: No. 1, aplite (micaless granite); No. 2, Labradorite (soda-feldspar); No. 3, diabase; No. 4, a much altered greenstone, now consisting largely of what is known as pro-chlorite; No. 5 is quartz-diorite carrying pyrite and chalcopyrite.

It is not sufficient for a prospector going into (to him) an unknown portion of the desert region with only a general knowledge of the whereabouts of springs. While springs are not numerous, and perennial running streams are almost wholly unknown in the deserts of the southwest, the sources of water are usually numerous enough to make the passage of the intervening wastes safe if the traveler knows accurately where these springs are. Old Woman's spring, in San Bernardino county, Cal., flows enough water to supply a thousand people or more with all the water they require, and yet one may pass easily within a few hundred yards of it and not suspect its existence. Coyote Holes, a spring north of Calico, is even more obscure, and Paradise spring, which flows nearly 5 inches of water, could only be found by those who know where the springs are, being off the main routes of travel. A small spring exists on the north side of the large dry lake north of the Calico mountains, but it is probable that not over 50 people know of its existence. In Riverside county, about 12 miles northeast of Walters' station, on the Southern Pacific railroad and ¾ mile from the road leading to Cottonwood springs and Eagle mountain, is a small spring known to only a few travelers in that region. It is not so much the lack of springs on the desert as it is the exact knowledge of where these springs are that makes travel dangerous in that region. The instances here mentioned are but a few of the great number of obscure springs occurring on the Mojave and Colorado deserts. Those unaccustomed to the desert and unfamiliar with the water holes and springs should not venture out into these wastes without a guide who knows the road and trails where water may be obtained, and who also knows from experience how to travel on the desert and to make the best of any situation.

Sampling Products of Concentrating and Sliming Tables.*

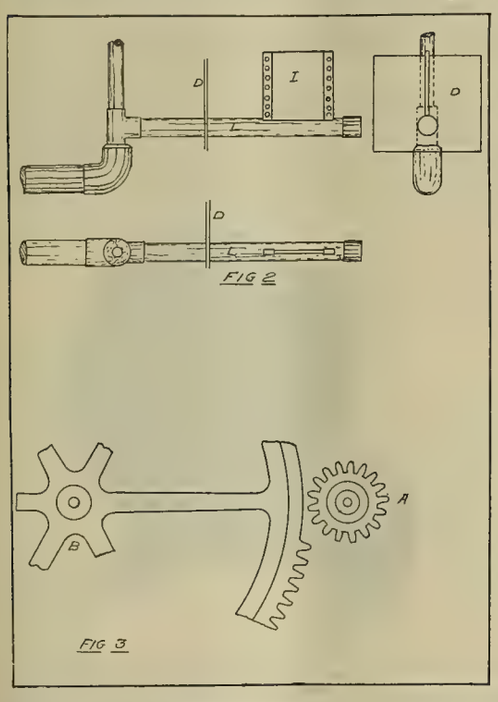
Written by J. C. Bailar.

In the discussion of this question it may be well to consider the sampling of the products of a stamp mill using plates, with tables for concentration of the tailings.

If there are no sampling works in connection with the mill, a sample of the ore may be taken by catching it as it comes from the stamps in a long pan placed in front of the screen.

For sampling the products of the amalgamating plates and concentrating tables almost every mill has its own device. In some the sample is taken by hand, in others by an automatic sampler.

The hand sample is usually taken by catching the water and pulp in a bucket as it comes from the launder. If taken in this manner the sample should be collected at regular intervals and the bucket should never be allowed to overflow. If the bucket overflows there is liable to be a concentration, as the lighter particles are more liable to be carried away than the heavier ones. After a sample is taken it should be allowed to settle until the water is perfectly clear, when it may be drawn off by suitable means. The settling may be hastened by warming.



Tailings Sampler.

Sometimes a sample is taken by passing a pan or bucket with a regular motion along the lower edge of the plate or concentrating table. This is not good practice, but, if it is necessary, care should be taken not to touch the edge of the plate or table, as the slimes clinging there may be far from an average of the ore. When possible, samples should be taken from the launder, and best from the end. When samples cannot be taken from the end of the launder they may be taken at any convenient point by a swinging or sliding gate which diverts all the water for a short time into the sample box. The objection to this device is that, while it may divert all the water, there is almost sure to be a small amount of ore close to the bottom of the launder that escapes.

*Journal Western Chem. and Met.

The automatic sampler consists of a spout or box that is carried at intervals under the end of the launder. Some of these samplers are driven by the power that operates the mill, some by water carrying the ore. Of these latter one very common device is an overshot wheel; another is a scoop-shaped box, so arranged that when it is full it tilts, emptying itself and at the same time causing the end of the sample spout to pass under the end of the launder. Still another device consists of two such boxes placed back to back with the spout for taking the sample between them, the whole resting upon a support so arranged that it can rock from side to side. (See Fig. 1.)

When the right-hand box is full it tilts to the right and the left-hand box is brought under the falling stream and when it is full the sample tilts to the left. At each tilting the sample spout passes under the end of the launder, taking a sample. Any of the above can be made by the mill carpenter. The overshot wheel is best where there is a large amount of water flowing and the tilting box where the amount is small.

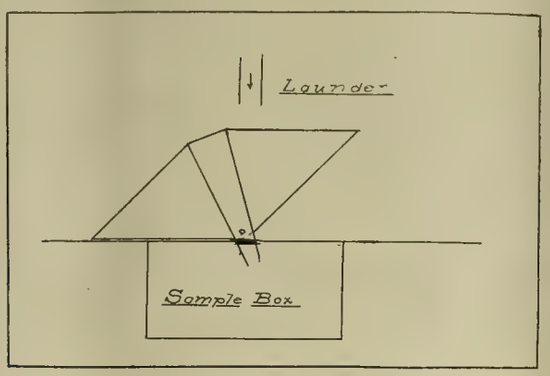


Fig. 1.

A very ingenious and satisfactory device in use by a Montana copper company consists of a 2-inch pipe about 6 feet long, closed at one end, and pivoted near the center so that it turns in a horizontal plane. At the closed end a slit is cut about ½ inch wide and 16 inches long. To the sides of this slit are fastened what might be termed "side boards" of sheet metal about 8 inches high and connected at the ends, forming a box 16 inches long, 8 inches high and ½ inch wide, opening at the bottom into the pipe. This is driven by an intermittent gear, consisting of a large wheel with some cogs on one side. With each revolution of this wheel these cogs engage a small cogwheel attached to the sampler, rotating the latter and causing the open end to pass under the falling stream. The sample falls into the opening in the pipe and passes out through the open end into the sample box. The sides of the opening in the pipe are not parallel, but form radii of the circle in which it moves. (See Figs. 2 and 3.)

In many of the mills of Gilpin county, Colo., the concentrates are thrown in a heap and sampled by thrusting into the pile a "pipe" or "spear" sampler. This is made by splitting an inch gaspipe about 3 feet long. When it is withdrawn from the pile it brings with it a "core" of ore. This is not always a fair sample of the section through which it passed, as the ore may clog in the end and push everything before it, not cutting out a clean section of the pile. It would give a much more accurate sample to dry this ore and sample it by some approved mechanical sampler.

The greater part of the errors made in sampling are so evidently wrong that it would seem unnecessary to call attention to them. Some of the more common are:

Allowing the bucket to overflow when taking a sample by hand.

Not sampling at regular intervals.

Not allowing the sample to settle before decanting off the water.

Sampling immediately after changing feed or water.

Scraping the lower edge of the table when taking a sample.

Not drying and properly cutting down the sample after it is taken.

The sampling department should determine not only the value of every product of the mill, but also the quantity, so that the foreman may know what becomes of every pound of ore and every gallon of water that enters his mill. Without this knowledge the most accurate sampling may be of little value.

In proof of the above statement may be cited the case, well known in the history of metallurgy, of a copper company of Ducktown, Tenn., which suffered large losses until they adopted the practice of weighing everything that went into the plant. After this the loss was quickly discovered and corrected.

The fact that the tailings from a mill run very low is not proof that all values are being saved. There should be a system of checks that will discover every loss as soon as it occurs.

History of Pyritic Smelting.*

NUMBER III.

By Robert C. Sticht.

The practice of returning matte to the pyrite furnace unroasted, either alone with quartz or together with ore, for the purpose of concentrating it, was practiced at Toston from the very beginning, and also subsequently at once at all the other plants that adopted pyrite smelting. They were all naive enough not to look upon this as in any manner a meritorious achievement, though this most facile and rapid method of enrichment appears not to have found an entrance into the conventional branches of copper smelting, in spite of its equal applicability.

Another point of some interest was the behavior of pyrrhotite, which is so much dreaded by the copper and lead smelter using the ordinary process. When the opportunity came, its very special suitability for pyrite smelting immediately showed itself, and once more demonstrated the superfluity of carrying apprehensions from one metallurgical branch into another which is not parallel with it.

The proof of permanency achieved at Toston now removed financial hesitation, and gave encouragement to the starting of a new company, the Boulder Smelting Co., which, under the supervision of the writer, erected a little one-furnace plant in Boulder valley, Mont., on the strength of a promising pyritous quartz lode carrying fair gold—the Hope mine at Basin, not far away. The reef subsequently attained a certain amount of celebrity on account of the abundant occurrence, in a pyritous portion, of grains and slugs of native gold. But this was after, not during the smelting experience. The ore was expected to form the financial mainstay of the metallurgical operations, the basic ore to be obtained from other sources. The furnace was blown in in July, 1892, but the conditions for true pyrite smelting, or even pyritic smelting only, were so unfavorable that operations quite rivalled those at Toston for erratic running and spasmodic puffs of activity. Almost the only basic ore that proved available without loss was stuff that the general market rejected, and which carried 21% zinc and 11% of lead. It was totally unfit for the methods in their early innocence, and still remains so for their present cunning. A very interesting hot-blast stove was installed, built on the efficient Groditz type, which has not been used in pyrite smelting anywhere else, although quite suitable for it, if well built, owing to the comparatively low temperatures which are sufficient. The principle was that of a series of concentric horizontal pipes, duly cross-connected in a combined horizontal and vertical zigzag manner, and so arranged that the blast was confined to the annular space between the pipes. The flame coursed around the outside and through the inside of each double pipe, and the whole was laid out on the counter-current principle, and enclosed in a simple brick structure, with a wood-fired fireplace below. The temperatures obtained when this stove worked well were very high, but false economy had caused the taking of too many liberties with the simplification of the pipe connections, so that the stove usually leaked unmercifully, and the pressure went down as low as 2 or 3 ounces at the furnace.

In the meantime, W. L. Austin had made a demonstration run at Leadville, Colo., in the spring of 1892, in an improvised experimental plant, at the old La Plata works, which sufficiently proved the profitableness of the method for it to be taken up by local parties, and a regularly appointed plant at once to be erected by them, on the basis of data gathered from Toston and Boulder and locality. This was the Bimetallic Smelting Co. Needless to say, the greater practical sagacity inherent in the local furnace crews—always an important feature in a new departure, and which was more abundant in a smelting district like Leadville than it had been at either of the purely agricultural districts of Toston and Boulder—assisted largely, so that, under the careful direction of Franklin Ballou, the method was finally placed in good odor, a desirable issue which neither of the Montana works had been able to achieve. Leadville ores, too, although by no means clean, were far more suitable, pyritically, than those of the northern State.

Encouraged by the example of the Bi-metallic smelter, a further plant was erected at Kokomo, near Leadville, by the Summit M. & S. Co., in 1892, but on a very zincky and friable pyrites, which also happened to be totally devoid of copper. This absence of copper, or any other vehicle for collecting, in the presence of zinc, gave serious trouble, and the writer was again called for to adjust matters late in 1892. Slags were rich in silver, separation was bad, and forehearths froze up. To counteract the evil it was natural to propose the addition of copper ore. But copper ores were scarce in the State of Colorado. The arrival of the single railway truckload which was procured, and had to travel all the way from Silverton, in the southern part of the State, to this inaccessible northern portion, at an elevation of over 10,000 feet above sea level, was awaited with

*Abstract of Proceedings Australasian Inst Mining Engineers.

great anxiety. The first shovelful of the ore, which contained about 30% of copper and about the same amount of lead, put into the furnace, however, at once relieved the entire slag distress, and subsequent truckloads relieved it permanently. It was here, also, at a moment when the conditions were favorable, that the gratification of running the furnace wholly without coke was experienced for the first time. This pleasure had, however, to be limited to 5 hours, for by that time the furnace showed signs of weakening on the heat side. The Kokomo enterprise lasted until the middle of 1893, when the depreciation of silver and the deviation of pyritic interest to more promising localities put an end to it.

Under the same auspices as the Kokomo works, another plant was erected in the San Juan district of Colorado, at Silverton, subsequently followed by one or two others, all, like the above, hot-blast pyrite plants treating basic iron pyrites and siliceous ores. But most of these had a short life, chiefly for want of proper ore, and also in consequence of rather poor machinery, since frugality compelled the financial pioneers of pyrite smelting to use it second hand to the greatest possible extent. Nevertheless, experience trained a few men to the work, from the practical point of view at least, and established the superfluity of any special method of furnace charging, as well as the fact that no special furnace construction whatever was required, and that the ordinary American Rachette type of furnace, suitable for matte-smelting, was fully adequate. A trifling change in blast connections was required by the use of hot air. The only point of importance, perhaps, was the multiplication of the number and the closer setting of the tuyeres. Hot air was produced in U-tube stoves, preferably heated by means of a cheap petroleum residue, but blast temperatures, though recorded high by the pyrometers, were, as a matter of fact, very low. Comparatively much coke was employed, and generally a belief soon arose that coke was cheaper than hot blast, and faith in the latter weakened.

It must be remarked that most of these plants were misapplications to ores that were not suitable. The pure pyrite method, as Dr. Peters early pointed out, will never be applicable to many of the more important mining districts, for, as a rule, heavy pyrite ores are scarce. Hot blast itself was by some regarded as the magic measure by means of which all smelting difficulties could be overcome and the most siliceous ores reduced to ready fusibility. The impression, in fact, arose that the method was particularly adapted for the smelting of a maximum of siliceous ore with a minimum of pyrites. The practical results, however, as the public could easily discern, did not justify such an inference.

In 1894 W. L. Austin patented an improvement of the original pyrite idea, which embraces comprehensive claims for a method of treating raw sulphides, etc., in a blast furnace, by means of rapid oxidation, and without the use of coke or coal, but with the introduction, through the tuyeres, of gasified carbonaceous fuel, or hydrocarbons, or powdered solid fuels, the purpose being the production of a reducing or semi-reducing atmosphere immediately in front of the tuyeres. This was to prevent the formation of ferric oxide there. At the same time limestone in lumps was to be mixed with the charge, not as a flux, but to prevent the sulphides from fusing together. The blast was intended to be cold, except for such heat as the fuel injection would impart to it, and the atmosphere before the tuyeres was to be reducing, the rest of the furnace, however, being expected to oxidize.

There has been no opportunity for noting how this innovation would fare at the hands of the ever-ready theoretical Germans, for in 1894 the latter were still occupied in proving the impossibility of smelting pyritically at all after the manner of the original idea without considerable carbonaceous fuel in the furnace. The original claims had not been taken seriously in America in this respect, and, with other features, were renounced even by the most interested. L. Kloz, in January, 1894, correctly set forth the position as it had actually developed in American practice, and defined the method as a means of working up argentiferous and auriferous pyrites with as much quartzose ore as the formation of a proper slag necessitated, and with the object of collecting the precious metals in a matte, together with the simultaneous combustion of a certain proportion of the sulphur (and iron). This was really partial pyrite smelting, and represented the degree of pyrite smelting into which the paucity of sulphides had driven the various plants. Several interesting and valuable essays descriptive of the pyrite process were published in the various journals by Mr. Austin, and the aspersions at home and abroad caused him to reply to Hering's assertion that pyrite smelting could not be carried out without carbonaceous fuel. He calculated the pyrometric intensity developed as 1836° C. for an excess of air of 50% and a blast heated to 400° C. Hering, however, not satisfied, retorted thermo-chemically, and definitely demonstrated that the claim (not advanced by Mr. Austin, however) that the process was adapted for working up a maximum of siliceous ore by means of a minimum of pyrites, and without carbonaceous fuel, was wrong, and that the process was more likely to be suitable for a maximum of pyritic ores with a proper modicum of silica, leaving the question of the total exclusion of coke in suspense. Here the whole matter has since rested. The controversy is only mentioned for the reason that it was the first sound scientific discussion of the thermal features of the process which found its way into print.

It is sufficiently clear that the earlier career of this newest and most interesting of all blast-furnace smelting was by no means a happy one. When the writer came to Mount Lyell in March, 1895, there was not a single plant in the United States running satisfactorily on the process in its purest form, and not one that promised an extended life. Scarcity of ore and metallurgical romance interfered with the extension of its application.

In 1895 the Mountain Copper Co., an English company, which, at Keswick, Cal., owns a pyrite deposit, similar to Mount Lyell, though carrying some zinc, also began pyrite work, and installed an ingenious system of treatment in which various novel mechanical ideas were first introduced, among them a method of heating the blast by means of the waste heat of the slag, etc. However, the time was not ripe for the proper mechanical execution of these novelties. The results were disastrous, and the naturally short-lived patience of the company caused an early return to the old roast-reduction process. This important desertion created a bias against pyritic smelting which has only of late years been overcome. In the same year James Douglas, in a Cantor lecture before the Society of Arts, fairly stated the objects of the process, and benevolently predicted a great future for it, notwithstanding its frequent semi-failures in the United States.

About the same time pyritic smelting operations at Tilt Cove, Newfoundland, by the Cape Copper Co., were successfully being conducted, but beyond the oft-repeated statements that no carbonaceous fuel whatever is being used, that the ore has 4% copper and 8% silica, and that the matte therefrom, by cold blast, contains from 6% to 8% of copper, also that the addition of silica is found to be objectionable, nothing definite has come to public knowledge about the practice.

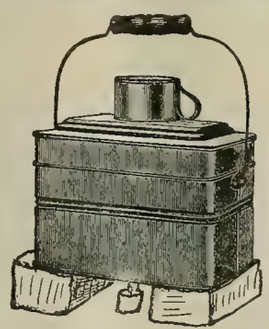
(TO BE CONTINUED.)

An Inexpensive Powder Thawer.

Written for the MINING AND SCIENTIFIC PRESS by MATT W. ALDERSON.

In the elevated mountain sections of the northern part of the United States it is necessary to have facilities for thawing dynamite the year round; for even in some of the warm summer months, where the magazine is kept on the surface, the temperature at any time is liable to go below the freezing point of such an explosive.

The company employing a large number of miners has no difficulty in securing a thawer which has large capacity and can be operated at small expense. The prospector, who roams over considerable territory,



Portable Powder Thawer.

and the operator who employs several men in different places on a property, often feel the need of thawers of small capacity, easily moved from one place to another. The writer has paid from $5 to $10 each for thawers to be utilized in this way and he has known of persons who did not care to go to expense in such matters, who have adopted expedients exceedingly dangerous. Thus, at one time, I remember walking into a tunnel where two men were at work with a candle box on end behind them, a shelf in the upper part of which was filled with powder being warmed by a lighted candle below. I made my visit exceedingly short and heaved a sigh of relief as I reached a safe distance. Just below I passed a shaft house in which a similar contrivance was in full blast. A few days later I passed the same place and the shaft house had disappeared. Fortunately, the explosion had occurred while there was no one near and the prospector was down in the shaft. He was showered by pieces of broken boards, but was not injured.

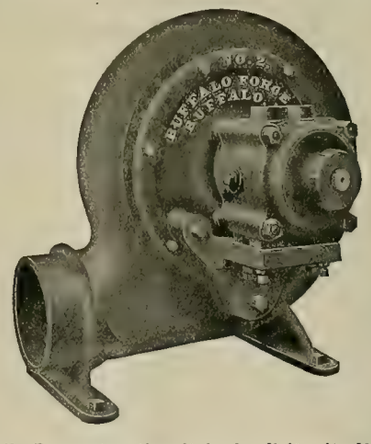
Powder manufacturers inform us that there is practically only one way in which dynamite may be safely thawed and that is by thawing it on the glue pot principle—in other words, where the tray or shelf carrying the powder is surrounded by water. The danger in thawing dynamite is in raising it to too high a heat, and any radiating heat, as a dry heat from flame or fire, may raise a portion of the powder to the point (360° F.) where it is certain to explode. Heated in a water jacket, the temperature will be equable and it is almost impossible to raise the heat to the danger point. Nevertheless, the prudent man uses judgment and care in heating even with a water thawer, and there is no necessity of ever heating the water beyond 100°, or say half way to the boiling point.

The writer has found a very convenient inexpensive powder thawer for the prospector and isolated miner in an ordinary lunch pail—the oblong kind, where the bottom of the pail may be used for water and the upper part to hold the powder. There are two sizes of these pails on the market, the larger of which is admirably adapted to the purpose. The tray of the upper part is long enough to admit the 8-inch sticks and wide enough to allow five to lie side by side. This is ordinarily all one man will use in half a shift, but there is no trouble in thawing fifteen or twenty sticks at a time, if the miner thinks he will need them. In ordinary weather, a piece of candle 2 inches in length will thaw the powder nicely and in a cold situation one will seldom need to exceed 4 inches. By lighting the candle when one goes to work, the powder will be nicely warmed and ready to use in from two to three hours.

I have paid for these thawers from 35 to 60 cents each. They are not heavily tinned, so with some mine waters they will soon rust and leak; but, on an average, they will last sufficient length of time to make their cost not exceed 5 cents each per month. This is expense which is no tax on the poorest prospector and it is a convenience he can not afford to do without. He can carry it into the hills with him as he goes, the powder thawing in the meantime, if he puts warm water in it before he starts; and, if the weather should be too cool for the powder to remain thawed till he needs it, all he has to do is to set two stones under the ends and place a piece of lighted candle between. As the capacity for water is limited, he will need to see that the lower part is filled frequently and it will do no harm if the tray is washed occasionally. The intelligent mine manager often carries on prospecting at points distant from regular work and where it would be inconvenient to have the men come to the general magazine for their supplies. With the simple thawer above described, each man at a distance may be fitted out independently at a saving of time and money to the management.

Blower and Engine Set.

The combination of blower and engine shown in the accompanying illustration is unique. At a first glance one might think it simply a blower with some sort of patent bearing, but on observation it will be found to be a blower direct connected to an engine, which its manufacturers claim "is entirely fool-



proof." In construction it is simplicity itself. The moving parts consist of a spider and four roller valves. When running these valves roll upon the bore of the cylinder and are held there by steam pressure and centrifugal force. Their action is that of check valves between the pressure and exhaust. The particular Cooley engine shown in this cut is 3 H. P. and runs at 2600 revolutions per minute; it is 8x9x8 inches in size and weighs forty-three pounds. Steam or compressed air can be used. The blower to which the engine in the cut is connected is a No. 2 Buffalo B volume type having a 6-inch discharge.

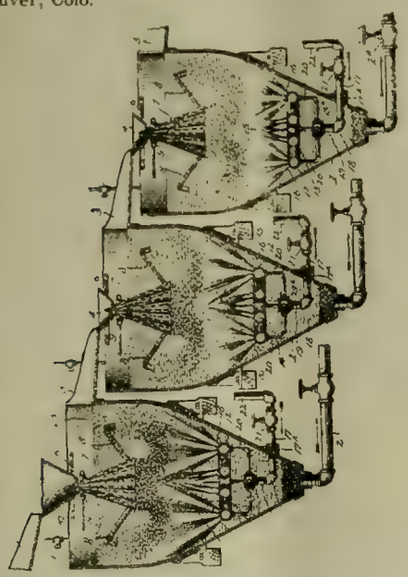
THE Michigan Copper mine in Ontonagon county, Mich., has always been considered a "mass" copper mine. The masses of copper have varied from a few pounds to one weighing 500 tons. The Minnesota, Cliff and other mines have produced large amounts of mass copper. These masses are cut up by men who make it their trade. Hammers and cold chisels are the implements employed in this work. Although these men develop great skill in their line, the expense of cutting up large masses of copper absorbs a large portion of the values.

Mining and Metallurgical Patents.

PATENTS ISSUED OCTOBER 10, 1905.

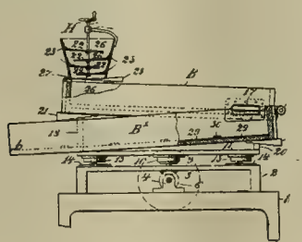
Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

HYDRAULIC CLASSIFIER.—No. 801,200; H. S. Bailey, Denver, Colo.



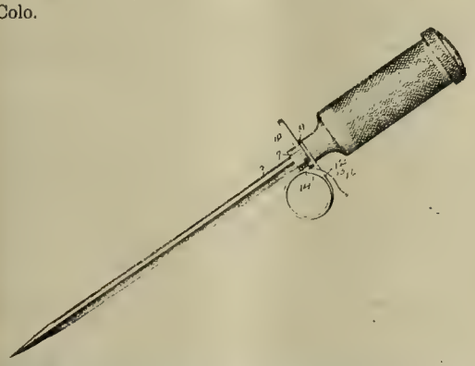
Hydraulic classifier, comprising chamber provided with overflow spout, valved discharge outlet in bottom portion of chamber, hopper in chamber, conical sieve in chamber below hopper, water supply ring surrounding conical sieve at apex, and plurality of water distributing pipes arranged below conical sieve, center pipe being provided with converging circular row of water projecting spray jets arranged to discharge collectively conical jet of water toward axial center of conical sieve, and outer pipe being provided with circular row of radially arranged jet apertures arranged to project plurality of spray jets of water in circular body upwardly between pyramidal jet and chamber.

PANNING SLUICE BOX.—No. 801,289; J. F. Wiswell, Medford, Mass.



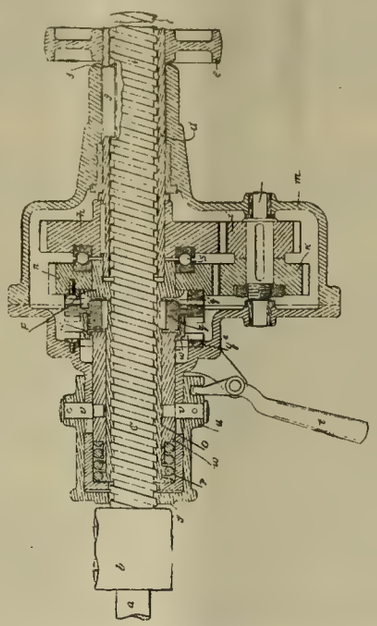
Apparatus for purpose specified, having platform, means for imparting orbital motion to platform, broad middle sluice box mounted in inclined position on platform and having in it low partition which divides it longitudinally, hopper at upper end of middle box, hopper provided with inclined baffles, two side sluice boxes, situated at respective sides of middle box and inclined in opposite direction, higher ends of sluice boxes being hinged to lower end of middle sluice box, means for varying inclination of respective boxes, and spouts connecting side boxes with middle box.

COMBINATION MINER'S CANDLESTICK AND MATCH-SAFE.—No. 801,465; J. B. Lindahl, Colorado Springs, Colo.



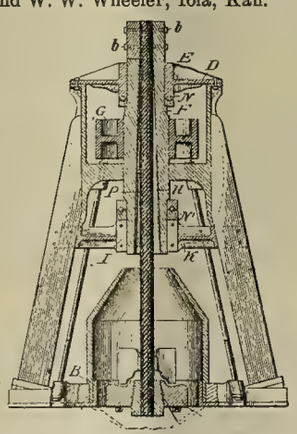
In miner's candlestick, combination of hollow handle, constituting match-case, removable cap inclosing one end of handle, opposite end of handle provided with threaded recess, spear removably positioned within recess, hook carried by spear, and candle-supporting member carried by spear comprising folded sheet of material provided with slitted end producing tongues of different lengths and of the same width, one of tongues provided with aperture, the opposite end of sheet provided with tongue having tapering end and body portion of same width as unapertured tongue formed upon opposite end.

MACHINE DRILL.—No. 801,805; W. Meissner, Charlottenburg, Germany.



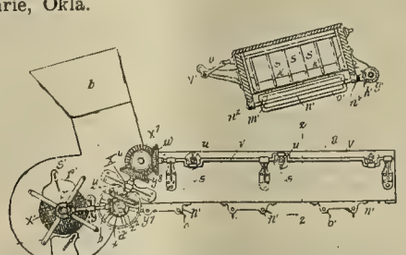
In drilling machine, combination with threaded member for supporting drill, of driving means for rotating member in single direction, threaded sleeve engaging threaded member, gearing interposed between driving means and sleeve for rotating sleeve in same direction with and faster than drill, sleeve being adapted when thus rotated to feed drill toward work, clutch rotating with sleeve, for connecting sleeve with and disconnecting it from gearing, and fixed clutch member adapted for engagement with aforesaid clutch and co-operating therewith to stop rotation of sleeve.

PULVERIZING CENTRIFUGAL MILL.—No. 801,592; L. Hunt and W. W. Wheeler, Iola, Kan.



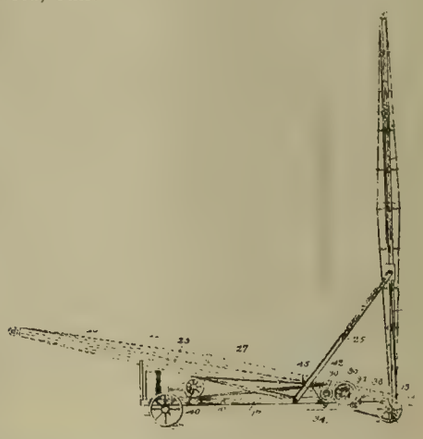
In pulverizing or crushing mill, roll shaft consisting of cable made of wire of suitable size and strength twisted into strands forming cable of proper diameter, in combination with roller body fastened thereto at lower end, and metallic tube or quill, having internal bore to correspond with curve or angle taken by shaft when rotating, shaft being suspended from quill at upper end, and rotating with quill.

ORE SEPARATOR.—No. 801,349; L. J. Vandervoort, Guthrie, Okla.



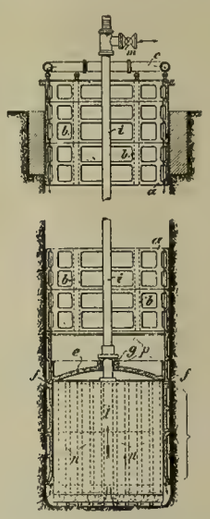
Combination, in ore separator, of inclined sluice-box having plane bottom provided with plurality of discharge openings, temporary closures for same, riffles rising from and inclined with relation to bottom and located below lower edge of openings, means for agitating contents of box comprising rotary beaters arranged at intervals below bottom of box and adapted to strike bottom, feed located at upper end of and above sluice-box, and means for delivering blast of air below feed and into upper end of sluice-box.

OIL WELL DERRICK.—No. 801,372; S. M. Foltz, Rawson, Ohio.



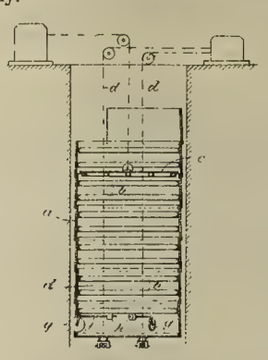
In portable derrick, wheeled frame, derrick member pivotally connected thereto and arranged to be lowered onto frame for transportation, slidable block carried by derrick, brace rod connecting block to frame, and means for pulling block downward toward pivot point of derrick to effect adjustment of latter to vertical position.

SHAFT SINKING APPARATUS.—No. 801,828; E. Frier and R. Nollenburg, Nordhausen, Germany.



In shaft sinking apparatus, combination with tubbing segments, channels or pipes therein, shoe at lower end of tubbing provided with perforations communicating with channels, projecting ring at lower end of tubbing, cover or lid bearing on ring, hollow boring rod extending to point near bottom of shaft, packing in cover and valve in boring rod above shaft.

SHAFT LINING.—No. 801,432; E. Albrecht, Hanover, Germany.



Shaft lining composed of series of superposed rings, weighted levers fulcrumed to bottom ring, rollers carried by levers that bear against shaft, and packing between shaft and rings.

MINING SUMMARY.

Specially Compiled and Reported for the MINING AND SCIENTIFIC PRESS.

G. E. Roberts, the director of the mint, has prepared a statement of the world's production of gold and silver for the calendar year 1904. This statement shows total gold valued at $347,150,700, an aggregate of 168,493,538 fine ounces of silver, and a commercial value of silver totaling $97,726,300, the coinage value of which is $217,850,200. The figures submitted show an increase of about $22,000,000 in gold over the bureau's estimate for 1903. The United States shows a gain of about $7,000,000 and South Africa of $18,000,000. The director says that both of these countries are still upon a rising scale of production. Australia, on the other hand, is an important producer which shows a tendency to reduce its contribution, although the falling off is not large and may be temporary. Considering the development in well-known fields, it seems a reasonable forecast to put the world's output in 1905 to exceed that of 1904 by $25,000,000, with another gain probable in 1906. The report says that the most important goldfield in the world is that of the Transvaal, and for that the data for working costs and profits are incomplete. The output for 1904 was $78,130,728, produced by seventy-four companies. Their working profits, after paying the 10% tax on profits to the Government, are reported at $26,402,163. The amount actually divided in dividends was $19,114,784.70. Only thirty-five companies paid dividends, these producing 70% of the total yield.

The tabulated statement follows:

	Gold. Value.	Silver. Ounces.	Silver. Value.
NORTH AMERICA.			
United States	$80,723,200	75,786,100	$33,516,000

ALASKA.

The gold season of 1905 is coming to a close. Assayer F. A. Wing has been preparing the tri-quarterly account. The gold receipts from January to September, 1905, inclusive, at the United States assay office amount to $14,109,528.01. In 1904 the receipts for the like period were $10,512,601.17. There came from the Yukon this season gold worth $6,146,000; last year the receipts therefrom were $7,295,000, there being a decrease of $1,149,000. From Nome there came this season $3,047,000 against $1,918,000 in 1904, a gain of $1,129,000. From Tanana there came $3,323,000, against only $176,000 in 1904. The number of deposits this year so far was 2426; in 1904, 2045, a gain of 381. The weight of the gold this year in troy ounces was 821,433.98; in 1904 the weight in the like period was 623,712.59. The gain for 1905 was thus 197,721 ounces. The September receipts were $2,690,-315.28; in September, 1904, the amount was $1,980,013.70.

ARIZONA.

Cochise County.

The Princeton Copper Co., H. Hamburg president and general manager, is to resume work on its eight copper claims in Ramsey canyon, near Bisbee. Operations were stopped a year ago when 1500 feet of work had been done.

The new No. 3 furnace of the Calumet & Arizona smelter at Douglas has been blown in. The present total capacity of the smelter is 900 tons of ore. The new smelter will give employment to 75 additional men. It is not the intention of the smelter to accept custom business, the entire capacity of the plant being required to handle the company's own ore. The blowing of the third furnace at the Calumet & Arizona smelter marks the completion of four furnaces, it being necessary to keep one reserve furnace for overhauling and repairs. A fifth furnace is now on the ground ready for installation. But it will not be erected at present, and probably not until such time as the ore volume from the five properties is sufficiently large to require the services of four furnaces.

Gila County.

The Keystone Copper Co. is building a 25-ton testing plant at Globe which is to be in operation by the first of the year. This small plant is to prove whether the process is adapted to the ores. After the ores are reduced to fines and roasted, a pulp is made, which passes to a slowly revolving chlorination barrel, where it remains for three hours. The electrical precipitation of the remaining solution will be upon carbons at first, instead of copper plates.

The Five Points Copper M. Co. has been formed to work the Clark and Lockwood & Van Wagenen claims, 14 miles west of Globe. The incorporators are J. C. Britt, A. M. Lockwood, J. C. Clark, A. T. Hammons and G. R. Hill. The property is being developed under the supervision of J. C. Britt.

Maricopa County.

H. Bennett is opening up the Buffalo-Arizona mine, 10 miles northeast of Morristown.——H. Boline, custodian of the Grand Traverse and Arizona, on Gold Hill, near Cave Creek, is expecting a superintendent to continue development suspended for the summer. The machinery is on the ground, and most of it in place.——John and William Osborn have resumed work on the Ben Hur at Cave Creek.——J. F. Smith, superintendent of the Phœnix mine, at Cave Creek, has men prospecting.——A. A. Mills, superintendent of the Kentucky & Oriental Co., of Gold Hill, is doing exploratory work.

Mohave County.

(Special Correspondence).—The Santa Fe Railroad Co. has made the rate to Chloride on oil, lumber, hay, grain and machinery, the same as that to Kingman A rate of $6 on ore to San Francisco has gone into effect and is to be followed by a rate of $2 per ton to Humboldt. The rates are on ores under $35 value per ton, ore heretofore of too low grade to handle.

Kingman, Oct. 24.

(Special Correspondence).—The shaft on the Holmes mine, 6 miles east of Hardyville, has struck the vein at a depth of 280 feet.

Hardyville, Oct. 25.

The Lucky Boy mine, near Kingman, is being unwatered and it is probable that a mill will be put in to handle the low grade ore. Fred Stull is in charge. —— L. Hoffman, superintendent of the Samoa mine, near Kingman, reports that the mine is showing up good ores in all the new works and that the shaft will be sunk another 100 feet.

Pima County.

Superintendent F. R. Close, of the Helvetia Co., reports that there are 150 miners at work in the company's mines, and that this number will be doubled next month. The 200-ton smelter at Helvetia will be blown in as soon as coke arrives. The company has a large amount of ore blocked out, which will be ample to keep the smelter going all winter.——The Old Dick, which is down to a depth of 800 feet, and the A1 Royale are being worked. It is likely that the company will build a railroad from Vail's to Helvetia, as it is quite costly to freight the product to Vail's in wagons. The distance is 16 miles.

Pinal County.

(Special Correspondence).—On Ask creek, Saddle Mountain mining district, near Dudleyville, S. D. Gordam is opening up a gold prospect and taking out and sacking shipping ore.

Dudleyville, Oct. 22.

The Kelvin Reduction Co., Frank Sharpe manager, is to build a reduction plant at Kelvin. Part of the plant will be the leaching process of twenty-five tons capacity.

Santa Cruz County.

(Special Correspondence).—The 100-ton smelter being built at the Mowry mines, 12 miles from Patagonia, will be blown in Nov. 1. The ore at these mines carries values in gold, silver and copper. The output of the smelter will be hauled to the railroad station at Patagonia, but a survey has been made for a narrow gauge road, which the company will build during 1906.

Patagonia, Oct. 23.

Yuma County.

(Special Correspondence).—The Valensuela Copper M. Co. at Quartzsite are putting in a 30-ton water jacket smelter. Water is to be taken from the mine. Richard Darling is general manager. The property is 70 miles from the Southern Pacific Railroad and 15 miles from the steamer landing on the Colorado river, supplies being received by water. The country rocks are limestone and schist, showing two contact veins, carrying values in copper, silver and gold in malachite, azurite and oxide ores.

CALIFORNIA.

Amador County.

(Special Correspondence).—The Wildman syndicate, operating at Sutter Creek, has been reorganized and a large amount of money provided to continue the development of this large property. Work in the Emerson vertical shaft commenced several years ago and sunk to 650 feet is to be resumed at once and the shaft continued to the 2500-foot level, which will not only make accessible the ore bodies in the deeper portion of the mine, but also cheapen the cost of mining materially. As soon as the development work now planned is sufficiently advanced to justify it the milling capacity of the consolidated mines will be increased to treat 1000 tons of ore daily, the present capacity being about 400 tons. The consolidation embraces the Wildman, Mahoney, Lincoln, Stewart and several other mines, as well as considerable ground held under agricultural patent. At present the Wildman lowest level is at 1400 feet, the Lincoln being down 2000 feet on the incline. The Emerson shaft will be sunk at least 800 feet lower than the present deepest workings on the property.

Sutter Creek, Oct. 17.

Work is to be resumed on the McKee gravel mine, near Oleta, by a Placerville company.——The Clark tunnel, near Oleta, being run by T. Mahon, is in 800 feet. An upraise is to be made to the channel.——The Rhetta or Bay State mine, 4 miles north of Plymouth, has been started up under an arrangement with the employes, to whom the company is indebted, who will operate on some pay ore. It is hoped in this way to pay off the debts incurred by the company.

Calaveras County.

The Ballanponte M. Co. is running a tunnel to cut the Table Mountan gravel channel, 1 mile east of Vallecito.——At Douglas Flat, near Vallecito, W. Moyle is sinking a shaft to tap the gravel channel.

Kern County.

Atkinson Bros. are working the Sunshine mine, near Randsburg. They have put in an air compressor and will put in power drills. A 15-ton cyanide plant is being put in to work the tailings, of which there are about 1300 tons now on the dump. —— F. D. Mann, superintendent of the Gold Coin and Stanford mines, is working twelve men and is in a good body of ore on the 250-foot level. The ore is high grade and is being milled at the company's mill in Johannesburg, known as the Red Dog mill. The Butte and other mines which have not yet put in mills of their own have their ore worked at the Red Dog mill. —— In Mountain Springs canyon, near Randsburg, a Nissen mill has been put in for the Mount Vernon M. Co. The company has sufficient water and is developing more. —— The well being sunk by the Yellow Aster Co. at Squaw Spring is down 1200 feet and the prospect for a good flow of water is good.

It is reported that the deep well that the Grace Oil Co. is drilling in the Kern river field is down 2910 feet with a 4½-inch casing. This line of casing is stuck and the work has been stopped until smaller casing can be obtained. It is the intention to go on with the well as soon as this special casing is received, and it will be sunk as deep as possible in the hope of striking a profitable deposit of high-grade oil. The drill has passed through a thick stratum of shale that was impregnated with gas.

The California Mines Corporation, which has a bond on the Baltic mine, near Randsburg, E. R. Abadie general manager and superintendent, has two shifts sinking in the main shaft, which is down 185 feet. When the 250-foot level is reached they will crosscut. The shaft will be continued down to the 500-foot level and drifts and crosscuts run at each 100-foot level. A 50-ton cyanide plant to work the tailings now on the dump is being put in.

Nevada County.

The California Miners' Association has decided that instead of holding all the conventions in San Francisco, as heretofore, it will meet in the mining sections of the State. The Association came into existence when it was desired by the miners to rehabilitate hydraulic mining. Placer, Sierra, Amador, Nevada, Yuba, Tuolumne and other mining counties rallied with financial and moral support and the movement that resulted enabled the Association to secure appropriations from the National Government and from the State of California to have dams established on the Yuba river to restrain mining debris. The Caminetti Act helped the smaller operators by the hydraulic process in certain localities, but never enabled the larger hydraulic mining enterprises to resume. When it became apparent in the mining counties where hydraulic mining had proved to be very profitable to individuals that the Caminetti Act, which was accepted as a compromise in the first instance, did not work to full satisfaction, the financial support that certain mining counties had given dropped off and the principal source of support came from San Francisco. In course of time miners spoke unfavorably of this. To regain favor, by showing the mining counties that an organization is for the benefit of the mining industry of the entire State, it has been voted by the California Miners' Association to hold conventions at various points. The annual convention of 1905 will be held at Nevada City, November 22, 23, 24 and 25. Committees of the California Miners' Association have been appointed at Nevada City and at Grass Valley to co-operate with the local committee to make the convention as much of a success as possible. Fred Searles, W. F. Englebright and Nat. P. Brown are appointed by the Association for the Nevada City committee and George Mainhart, A. D. Foote and C. G. Church will serve as committeemen at Grass Valley.

Lack of water for power threatens to shut down many of the mines at Grass Valley and Nevada City.

Placer County.

D. B. Groff, superintendent of the Diamond Creek Mining & Development Co., near Emigrant Gap, reports satisfactory progress at the mine. The Diamond Creek is a gravel mine, and work is now being done on a wing of the main channel.——Work is being done on the Heridia tract, 8 miles northeast of Lincoln, by G. H. Wright of San Francisco and G. Gray.

San Bernardino County.

J. T. Kerr and J. C. Button of Colton have sold to the Big Lode M. & M. Co. of Los Angeles the Big Lode No. 1 and Big Lode No. 2, 3 miles east of Rock Springs and 1 mile north of Old Holcomb valley.

San Diego County.

After having been unwatered, the Stonewall mine, near Julian, has been closed down.

Shasta County.

The Jim Loage mine, near Centerville, 6 miles from Redding, is being developed by H. W. Weldon and H. V. Burleson.

Sierra County.

(Special Correspondence). — The Pilgrim mine, at American Hill, was examined recently by O. A. Daube of New York City.——At the Alaska mine, at Pike City, a new vertical 3-compartment shaft has been started and is down 50 feet. They intend to sink to the 700-foot level before doing any drifting.

Downieville, Oct. 23.

At the Mabel mine, at American Hill, 7 miles east of Alleghany, the new tunnel is in 150 feet, and the company intends to run ahead 125 feet more and then make an upraise to the channel. A. J. McCoy is foreman.

A gold brick, weighing 176 pounds and valued at $43,-000, is said to be the result of a thirty-two days' run at the Tightner mine, near Alleghany. The bullion came from specimen rock. Only three men were employed in extracting the rock that gave this result. H. L. Johnson is the owner.

Trinity County.

The lawsuit over the Globe mine, in the Canyon Creek mining district, near Dedrick, has been compromised.

Tuolumne County.

A steam hoist is being put in at the App mine at Quartz. —— A station has been cut at the 1720-foot level of the Dutch mine at Quartz and a crosscut will be run east to the vein.——The Mt. Eden mine, near Tuolumne, has been bonded to Holland & Williamson.

COLORADO.

(Special Correspondence)—The mines in the higher altitudes are preparing for the winter campaign by taking in the necessary supplies. Already a heavy snowfall is reported from various districts, and it will not be long before the roads are impassable to some of the mines. By this means the mines are able to operate during the winter months, especially where they are under cover. ——A number of arrests have recently been made in the Cripple Creek district for high grading. If some means could be devised for meting out the proper punishment for the guilty ones, it would undoubtedly have a good effect on the remainder of the individuals who make a business of stealing or receiving the stolen ore. It is the opinion of some that there is an organized gang of the thieves working in that district. ——A strike was called on the Gold King mine and mill at Gladstone, in the Silverton district, a few days ago. After calling the strike the leaders of the strike are trying to effect a compromise with the management. What the outcome will be remains to be seen. Some months ago, when there was talk of a strike on this property, Superintendent Kinney gave the men to understand they could strike if they desired; if they did strike, there would be no compromise; the mine and mill would be closed indefinitely. The reports from that district are rather vague as to the cause of the strike, but it is understood that one of the agitators was requested to "move on." In order to "get even," the men were called out. The owners of the Gold King are also heavily interested in the Gold Prince, where a large concentrating mill is now being built. It is not known at this writing whether the strike will spread to that mine or not. During the stormy times in Telluride and Cripple Creek two years ago the Silverton camps were not molested, although there was some talk of calling the men out at that time. From information received here it is believed to be a personal affair, rather than among the men.

Denver, Oct. 23.

Boulder County.

The Wolf Tone M. Co. is putting in a hoist and 50 H. P. boiler on the Oregon shaft. This company is operating a number of mines and is operating the mill at Nederland on its own custom ores. The mill is equipped with twenty stamps. The concentrates are dried before shipping and the mill is reported to be doing a share of the reduction of ores from the local section. William Loach is manager with William Todd in charge of the mill. —— Manager C. F. Lake has closed down the Boulder County mill owing to the demoralized condition of the tungsten market. A recent decision in the courts, whereby the free importation of crude tungsten ores is permitted, has made the market rather unstable, and Mr. Lake prefers to close down the property rather than take chances with his product. It is reported that the tungsten producers of Boulder county will ask for protection on crude ore. —— W. I. Scott and associates, who are operating Graham lease No. 1 on the Rogers patent, have received a 20 H. P. double-friction hoister and a 30 H. P. boiler at Cardinal, which is being delivered to their lease. They will put up a new shaft house. They have made a 50-ton shipment to the Nederland mill. —— Manager T. L. Wood of the Cashier M. & M. Co., operating at Camp Albion, near Breckenridge, is on a visit to Boston to consult his associates regarding future operations of his company. He takes with him the report of the summer's work and expects to return authorized to make immediate arrangements for the erection of a 50-ton concentrating mill at Camp Albion. The mill will be built near the portal of the Snowy Range tunnel.

Clear Creek County

I. B. Nichols is operating the Josephine property at the base of Kelso mountain, near Silver Plume. He expects to increase the force. It is probable that a winze will be sunk on the ore body now being opened, and if water should be found in sinking an electrically driven pump will be put in, as the power line for the Stevens mill runs close to the mine.——Retimbering of the ore chute in the Pelican mine has been completed near Silver Plume, so that the mill can be again supplied with ore. The chute was lined with iron, and the work has been delayed on account of inability to get the iron from Denver as fast as it was needed. A chute will be built from the mouth of the Zero level to the foot of the dump so that the mill dirt can be run out of that level, loaded into wagons and hauled to the mill as an auxiliary supply.——Work has been commenced on the Mexico property, near Silver Plume, in which C. H. Morris is interested. Work is being done through the Diamond tunnel, from which a drift is being driven west on the Selkirk vein to get under former workings.——Jewell & McCall have started work on the Maine-Phœnix property, near Silver Plume, and are cleaning out the tunnel that was driven in early days to cut the Maine at a point east of the shaft.

The tunnel being driven by the Joplin M. Co. of Georgetown, of which B. J. O'Connor is superintendent, is in 125 feet. The drift is being run on the Washington lode, and according to surveys it will be necessary to drive 600 additional feet before the objective point will be reached. At that time a crosscut will be run for 100 feet to cut under the Gambetta workings. This tunnel will furnish an increased depth of 380 feet over the upper workings.

The Silver Plume Standard reports that ore shipments from the Stevens mill have been resumed and several teams are hauling the concentrates. The concentrator at the Wilcox tunnel is also in operation, making two mills on the Waldorf properties for handling the milling material in addition to a large force taking out smelting ore at the Tobin, Kitty Owsley and the Wilcox tunnel, so that the completion of the railroad now being built into the East Argentine district will enable large shipments to be made.——The Lorella M. Co., operating in East Argentine district, is reported to be meeting with excellent results in the development work that is being carried on. The Silver Edge vein has been cut 110 feet from the portal of the tunnel and a good body of smelting ore found. Drifts have been started east and west on the vein, which continues to make a good showing. The property will soon be equipped with a plant of machinery for more rapidly prosecuting work during the winter.——A temporary shutdown of the Dives Pelican mill at the portal of the Burleigh tunnel was rendered necessary last week, in order to retimber an ore chute in the mine through which the milling dirt from the upper workings was sent to the mill. This work is being carried on by three shifts of men, working eight hours each, and it is expected to soon have it completed. Considerable work is also being done in the mill to put it in shape for continuous operation as soon as it can be supplied with material again.——Preparations are being made to commence operations on the Mexican group.——The power plant of the St. Paul M. Co., which was recently put in, is reported to be in successful operation and a progress of about 5 feet per day is being made in the crosscut tunnel, which is being driven to open a number of lodes at various depths. It is expected to drive this tunnel about 2000 feet.——Manager William Stephens of the Indiana G. & S.M. & M. Co. expects to get work started on the company's property within a short time.

Custer County.

The new shaft to be sunk on the G. P. D. claim of the Valley M. Co., near Silver Cliff, will soon be under way, the location having been selected and the surveys made. It is proposed that the new shaft will tap the south drift of the Dakota Bill.

Gilpin County.

At the After Supper mine, near Black Hawk, the Banzai M. Co. have sunk the shaft 410 feet, and it is to be sunk to a depth of 435 feet, where drifts will be driven for sump purposes The drift at a depth of 240 feet is to be connected with the 140-foot level. L. R. Tatum of Denver is manager and A. Watters of Nevadaville is in charge of the underground workings.——J. F. Hopkins of Denver has started operations on the Sleepy Hollow property, in Gregory district, which has been idle for years. The main shaft is down 800 feet, and as soon as it has been retimbered another 100 feet will be sunk.—— The Castleton mine, at the head of Virginia canyon, is being operated by Cleveland, Ohio, parties under a lease and bond, under the management of W. M. Kirk of Russell Gulch. Operations have been delayed by water. Work is now being carried on in the 425-foot levels. The shaft is to be sunk 200 feet deeper.

The Black Hills & Denver G. M. Co. is driving its Park tunnel, which is now in over 700 feet, with one shift, using electric drills. M. H. French of Denver is manager and J. A. Bush of Tolland is superintendent. The company is also driving the Grant tunnel into Mineral hill. This tunnel is in over 400 feet.——Sinking has been stopped at the Chicago-Carr property on Bobtail hill, in the Gregory district, at a depth of 560 feet, where levels are being extended on both sides of the shaft, with prospects of soon getting into some good ores, reports Manager B. M. Myers. The intention is to commence sinking again.

The Eagle mill in Black Hawk, which was leased from the owner, F. Came, by the Eagle Mill & Ore Co., has been making test runs with a new process for low grade ores. According to a statement made by J. G. Eversman of Denver, the tests that have been made at the mill on low grade ores have proven satisfactory.—— An air compressor and other machinery is to be put in at the Ingram mine in the Pine Creek district, near Central City.——The Rochester, at the mouth of Pine creek, is being operated with a small force.——The Boston-Occidental Co. are working the Mascot mine and mill at American City, near Central City. The company is also shipping smelting ore over the Moffatt road to the smelter at Denver.

The Gower Mines Syndicate, who have been working the Clay County mine in Lake gulch, near Central City, have made a rich strike in the 350-foot west level of the property. The main shaft is 650 feet deep, but where the large body of ore has been cut is in a winze in the 350 west level. This winze has been sunk 14 feet and shows a body of ore 4 feet wide, which carries a very high percentage of gray copper and also lead and copper.

Gunnison County.

Idaho capital has a lease on the Volunteer mine, near Gunnison, and the water is being pumped out preparatory to extensive development.

Lake County.

The Morocco shaft in Leadville is being cleaned out preparatory to shipping ore. Sinking has been started on the Bohn shaft, and the 350 feet that will be opened should be completed by the end of the year. This shaft is being sunk to catch the Penrose ore shoot to the south. Both drifts of the Cloud City are in the line, the south drift just entering the parting quartzite. Small streaks of iron are found in both drifts.

At the 500-foot level of the Flagstaff mine at Leadville, after driving a drift 300 feet from the shaft a good body of lead carbonate ore has been opened.——The shaft on the Porter claim at Leadville is down 200 feet and a drift has been run to the southwest.——A new shaft is being sunk on the Yankee Doodle and is down 150 feet.

Park County.

(Special Correspondence).—The London mine is shipping two cars per day of high-grade ore.——Other shippers are the New York, Wheeler, Moose, Russia and Shelby. This last is a zinc producer and is shipping to the Empire Zinc Co. at Canon City. There are other mines that could furnish a fair grade of zinc ore, and by the use of the magnetic concentrator possibly become dividend payers.——The Snowstorm placer has quit hydraulicking for the season. They have one drill testing gravel and 20 men with four teams enlarging ditches, repair work, etc., making ready for the season of 1906.——The Cincinnati P. M. Co. has one drill at work testing gravel from the mouth of Sacramento creek up the Platte river, preparatory to putting in dredgers.

Alma, Oct. 23.

Rio Blanco County.

The gilsonite veins of Utah are said to enter the western part of Rio Blanco county and considerable of the product has been mined and shipped. Near Rangely elaterite exists, W. C. Miller having lately discovered three veins on Piceance creek in seams 4 inches wide. Nearby are deposits of sand asphaltum. Meeker capitalists have spent $75,000 in developing petroleum in Raven park, but their wells have not yet reached the main deposit. Of the seven holes put down, each has seepage oil that would pay all development expenses if it could be saved and marketed. The Union Oil Co. of Meeker and the Requena Syndicate of San Francisco, Cal., will do considerable new work this fall and winter on their Raven park oil holdings. Skull creek basin and Blue mountain contain paying quantities of uranium and vanadium. These rare ores are found in sandstone formation, the veins being from 2 to 4 feet wide.

Routt County.

The gravel beds of the Jack Rabbit springs, 20 miles northwest of Craig, are being worked by Blivins Bros. They are tapping the subterranean flow of the Jack Rabbit springs and using a steam dredger of 65 H. P. with a capacity of 1000 cubic yards per day.——North of the Jack Rabbit springs the Board Gulch springs are the water supply of 1100 acres of placer ground belonging to Howard Bros. and C. C. Merrill. A steam dredger will be put in on these properties in the spring. North of the Board Gulch springs T. Emerson has 800 acres of placer ground, with a maximum bedrock depth of 18 feet. With a 6 H. P. gasoline engine he is developing a bedrock pay streak. Improved machinery is to be put in next year.

San Juan County.

The Saratoga mill, between Silverton and Ouray, will be converted into a matte smelter for the treatment of the ores from the Ironton district. The Saratoga mill was one of the most complete and costly establishments of the kind ever built in the San Juan country, but failed to satisfactorily treat the ores of the section in which it was located, and was shut down several years ago and has remained idle ever since.

The Silverton M. Co. will develop their property on Sultan mountain, near Silverton, during the winter. The crosscut tunnel being run is in 3800 feet, 1300 feet of this distance having been run within the past year. The main tunnel is being pushed to cut the Belcher vein.

The Little Ida claims, in California gulch, north of Silverton, in the Animas Forks mining district, has been sold by Fisher, Carlow & Triplett, to Denver parties, for $10,000, and as soon as Surveyor W. C. Marshall of Denver has finished a resurvey and replatting of the ground and the process of patenting the claims is started, the first payment of $2500 will be paid.——The 5000-foot tunnel started by Richard Winnerah on the property owned by the Frisco Mines Co., on Houghton mountain, which is to be completed within two years, and cost $82,000, is expected to cut forty-six leads in Houghton mountain.

San Miguel County.

The Tomboy shaft, near Telluride, is down 300 feet, and it is the intention of the management to sink it 300 feet deeper. From this shaft a level is being run on the Argentine and Cincinnati vein. The Red Cloud, owned by the company, is on the same lead, and when the tunnel gets under this claim it will be 1500 feet vertically beneath the surface. The company's 60-stamp mill is running steadily.

Summit County.

The enlarged and improved concentrating mill on the Washington Joilet property, on Nigger hill, near Breckenridge, is ready for crushing, stamping and concentration. Originally the mill was 56x71 feet and contained twenty stamps, four Wilfley tables, engine, boiler and other necessary appliances for treating lead-gold ore. The new addition to the mill building is 28x71 feet, which brings the structure up to 84x71 feet. The added machinery consists of three Wilfley tables, three hydraulic sizers, one Callow settling tank and one Sperry slimes saver. C. S. Newson is manager. —— The Dunkin property, on Nigger hill, has been leased and will be operated by J. C. Baird.

Teller County.

The Dillon shaft at Cripple Creek is to be continued from the 800 to the 1000-foot level. —— A depth of 430 feet has been reached in the shaft of the City of Cripple Creek G. M. Co. of Cripple Creek. Considerable water is being pumped. At a depth of 500 feet crosscuts will be started. The company is operating under a 20-year franchise, which gives it the right to mine beneath the streets and alleys of Cripple Creek. —— Operations have been resumed at the Camilla mine on Beacon and Guyot hills, Cripple Creek. —— Drifting has been started by F. T. Caley, lessee in the Arapahoe claim of the Jerry Johnson Co. on the north slope of Ironclad hill, Cripple Creek, at a depth of 450 feet. He is following the vein cut by the shaft recently. —— The Sioux Falls Milling Co. of Cripple Creek is successfully treating Copper mountain ore with cyanide. The value varies from $2 to $10 in gold per ton. It costs $1.60 a ton to mine and treat it and it is understood that the percentage of extraction is high.—— An ore house is being built at the Midway mine, on the saddle of Bull and Ironclad hills, by O. Fogleman, lessee.

IDAHO.

Blaine County.

State Mine Inspector R. N. Bell has returned from a trip to the upper Salmon river country At the Dollar Hide mine, 24 miles northwest of Ketchum, twenty-five men are at work. This is a zinc and silver-lead mine, and carries one of the strongest ore shoots in the Wood river region. One of its ore shoots is 250 feet long, with an average width of 2 feet. Another ore shoot is 150 feet long, and a third 100 feet long. The principal development consists of two crosscut tunnels, with drifts along the vein and raises connecting the two main drifts. The ore is a heavy mixture of zinc, iron and lead sulphides, with quartz, and carries from forty to sixty ounces in silver. This property is being operated by C. C. Rutherauff of New York, who has built a 30-ton concentrating mill on the Warm Spring side of the divide.——In the Boyle Mountain mining district, 14 miles west of Ketchum, the Lucky Boy mine is being operated by the Lanyon Zinc Co., under lease, with Owen O'Rourke in charge.——The new Payette district, in Omaha gulch, is reached most easily from Stanley, from which there is a wagon road 7 miles to Stanley

lake, which is 7 miles by trail from the mines. Claims already opened up give fine values in lead and zinc.

Idaho County.

Twenty men are employed at the Anaconda mine, 12 miles from Newsome. A new 5-stamp mill will be ready soon. The Graham & Ross Co. is in charge.

Cyanide plants are being put in at the Dewey and Sunnyside mines, near Roosevelt.——The State wagon road from Council to Big creek is almost completed.——Roberts & Stonebraker have formed the Crooked River M. & M. Co., to work mines on Crooked river, 4 miles from Big creek.

The Comstock M. Co. is working the Comstock mine near Dixie. The 4-stamp mill and cyanide plant are in operation.——The McKinley M. Co. is putting in a mill at its mines on Salmon river near Lucile.——A double-compartment shaft is being sunk at the Anaconda mine near Newsome by the Ross-Graham M. Co., under the superintendence of W. H. Hill.

Kootenai County.

The Echo M. Co. is developing claims west of Sandpoint. Wm. Elsasser is manager.——The Panhandle smelter at Ponderay, on Lake Pend d'Oreille, is to be started about Nov. 1. The initial capacity will be 100 tons of ore daily. The water-jacket lead-silver furnace measures 36x120 inches at the tuyeres. The steel stack is 125 feet high. The dust chambers, built of stone, are 8x10x160 feet.

Owyhee County.

The Stormy Hill M. Co. has been formed by C. W. Hill of Silver City, M. A. Carton, G. S. Ballard, J. G. Slauson and W. E. Hayes, all of Utica, N. Y., to develop the War Eagle and Stormy Hill mines, near Silver City.——The Potosi M. Co. is building a new shaft house and putting in pumps and machinery at its mines in Silver City. W. F. Sommercamp is superintendent.

Shoshone County.

Work has been resumed on the Little North Fork M. & M. Co.'s copper claims, near Wardner, with J. Kalbenback in charge. In the upper tunnel crosscuts will be driven until both walls are reached and the width of the ledge determined. In the lower tunnel the main ore body was not reached by the work carried on this year.

Work has been commenced on No. 4 tunnel on the Snowstorm mine, near Mullan. It will be run 3100 feet to reach the ore body. This will give a depth of nearly 2000 feet on the dip of the vein. The present lowest workings have a depth of 1000 feet. The company and the lessees are working nearly 150 men. A raise is being made from No. 3 to No. 2 tunnel and a shaft is being sunk from No. 2 to meet the raise. Besides the 3100-foot tunnel, T. L. Greenough advocates putting in electric power and other improvements.——The first zinc concentrates to be shipped from the Cœur d'Alenes will be sent to the Iola, Kan., smelter this month from the Success mine, formerly the Granite. Preparations are now being made at the mill to load two cars of concentrates. A wagon road half a mile long is being built to the Northern Pacific's Nine-mile branch. When the experimental tests at the mill proved to the satisfaction of H. F. Samuels, manager and principal owner, that the process installed would save zinc as well as lead values, machinery was put in. The mill has been working satisfactorily.

The Mayflower Mining Co. is developing its property, 2½ miles east of Wallace. J. H. Foss of Mullan, one of the owners, is in charge of the work, and is running two shifts on a long crosscut tunnel.——The Hunter mine and mill, near Mullan, will resume operations. Work on the new deep level tunnel has been stopped and with the resumption of work in the mine will be pushed ahead as rapidly as possible.——The management of the North Franklin Co., at Mullan, has decided to purchase new equipment for the mine.

KANSAS.

A recent report of the United States Geological Survey states that the production of spelter in the United States in 1904 amounted to 186,702 short tons, valued at $18,670,200, as compared with a production of 159,219 tons in 1903. The principal increase in the production of zinc has taken place in Kansas, where new plants were started by the Caney Zinc Co. at Caney; by the Chanute Zinc Co. at Chanute, and by the Cockerill Zinc Co. at Altoona. The La Harpe Smelting Co. at La Harpe, which started in 1903, had a full year's production. The plant of the Granby M. & S. Co. was enlarged. The large works of the Edgar Zinc Co. at Cherryvale, controlled by the United States Steel Corporation, reached their full product in 1904. In Illinois the Illinois Zinc Co. built an addition of 120 retorts; and the Mineral Point Zinc Co., controlled by the New Jersey Zinc Co., is building large new works at Depue. During 1904 the new works of the Graselli Chemical Co. of Cleveland were started at Clarksville, W. Va.

MICHIGAN.

Houghton County.

The Mass Con. M. Co.'s new shaft C is ready to operate at its full capacity. The track of the spur which the Mineral Range is running to the opening is completed. The shaft will be fully equipped by January 1. The sinking has reached the sixth level.

MONTANA.

Jefferson County.

The concentrator of the Cataract C. M. Co., 8 miles from Basin, at Bullion, has been started. The company has twenty-two claims in the Cataract district showing argentiferous and auriferous chalcopyrite. M. L. Hewett is manager and G. H. Bartlett the millwright in charge.

Lewis and Clarke County.

By the first of the year the Whitlach M. Co., which is operating the Whitlach-Union mine at Unionville, south of Helena, expects to have the new 20-stamp mill running. The Whitlach is down 500 feet, and the miners are developing on the 500 and 400-foot levels.

Madison County.

On account of cold weather the cyanide mill of the Watseca G. M. Co., at Rochester, has closed down for the winter, it being impossible to operate to advantage. The mill ran three months.

A. H. Wiseman of Ruby, who is interested in the Conrey Placer M. Co., which is operating several dredgers near Alder, states that the company began operations, working one dredger, in 1900. In 1902 they built and put in operation another dredger and now have in course of construction another dredger. The capacity of dredger No. 1 is 50,000 cubic yards of dirt per month; that of No. 2 is 65,000 per month, and that of the dredger now building, or No. 3, is 90,000. The work is in Alder gulch, 1½ mile east of Alder. The values in gold run from 15 to 20 cents per cubic yard on the sides of the valley and from 60 cents to $1 per yard in the center. They claim to save 95% of the values. Each dredger has an endless chain of forty-one scoop buckets which will dig into the earth at the rate of nine per minute. Each bucket on No. 1 has a capacity of 7½ cubic feet of dirt, on No. 2 of 10, and on No. 3 the capacity will be 12 cubic feet.

Missoula County.

H. J. Rossi and H. J. Read, who have made a $25,000 payment on the Monitor mine, near Saltese, have men at work under the foremanship of Theodore Brown. The shaft is being enlarged and retimbered and a large hoist will be put in.

Silver Bow County.

The Butte Cyaniding Co. has been formed by Gus Nickel, C. Riehl, D. P. O'Connor, A. C. Evans, W. R. Young and W. R. Evans, to take over the plant of F. W. Link & Co., who have been operating on Lexington tailings. Link and his associates have been using six 20-ton wooden tanks, but an iron tank having a capacity of 40 tons has been added, and another of the same size is to be added, making the total capacity 200 tons. During the year there have been treated in the plant 8000 tons of tailings, from which a little less than $4 in gold and 2 ounces in silver per ton were saved. The company has leased the tailings from the Alice mills, and will begin treating them at once. There are about 10,000 tons in the pile.——The Reins Copper, operating the Combination mine, east of Butte, is sinking its shaft and is down 900 feet.——Sinking is in progress at the Minnie Healey, a United Copper property adjoining the Leonard, in Butte.

Reconstruction of the North Butte Co.'s Speculator shaft will be completed by the end of the year, when the contract with the Amalgamated for the use of the High Ore shaft will cease. It is now necessary to tram the ore about 1000 feet to get over to the High Ore shaft. The North Butte has developed and is now working two veins, which are approximately parallel and separated by about 800 feet. The principal vein is the Edith May, originally developed on the company's Edith May claim. The Edith May vein has been opened nearly 900 feet and there still remains over 900 feet to go before the boundary limit of the property is reached. This vein is opened on the 1000-foot and 1200-foot levels. The Jessie vein is reached through a crosscut 800 feet long from the Edith May vein. The North Butte will seek greater depth in its shaft as soon as the reconstruction is completed, driving it down from the 1600-foot level to the 1800-foot level.

MISSOURI.

A recent bulletin of the United States Geological Survey states that in southeast Missouri further progress has been made by an increased activity among the older mines. The St. Joseph Lead Co., the largest individual producer of lead in the country, has gained in output by enlarging the old Bonne Terre mill, by putting into operation a new mill at the Hoffmann shaft which will be capable of handling 1000 short tons of ore per day, and by adding to the smelting facilities at the Herculaneum works. The Doe Run Co., which is closely allied with the St. Joseph Lead Co., has operated to full capacity. The Desloge Lead Co. has sunk a new shaft and has increased its mill capacity 50%. The Central Lead Co. produced only 3812 short tons of lead in 1904, as compared with 5536 tons in 1903, the falling off being due to the fact that the mines and works were idle for three months as the result of a strike to force a recognition of the first miners' union organized in the district. The effort failed. The Central Lead Co. has been sold to the American Smelters' Securities Co. The National Lead Co. now ships the product of the Derby mines to the new smelter at Collinsville, Ill., which went into operation during 1904. The Federal Lead Co. produces considerable quantities of ore and smelts large amounts of ore on toll. The Mine La Motte Co. did not produce as largely in 1904 as in previous years. The old Shibboleth Lead M. Co. of Cadet, Mo., has passed into the hands of the American Lead & Baryta Co.

NEVADA.

Douglas County.

B. F. Livingstone, superintendent of the Mammoth mine, near Carters station, near Gardnerville, intends putting in a mill to be erected to work the ore.

Esmeralda County.

(Special Correspondence).—The standing and wealth of this district have not been overstated. Two years ago the site which Goldfield occupies to-day was a brushy blank on the map of Nevada and the camp now has a population of 7000. There are some good stone and frame buildings, but the greater number of people live in tent houses and tents. Many substantial buildings are being erected. At Diamondfield some valuable showings are being made. The Reilly lease on the Florence expired recently and the claim is made that it returned to the leasers $750,000. Work on the lease commenced July 1, three and one-half months ago.

Goldfield, Oct. 23.

Eureka County.

Grading has been started on an extension of the Eureka & Palisade railway to the mines on Ruby hill.——Men in the Consolidated and Richmond mines at Eureka are examining the condition of the old workings, which were abandoned on account of the litigation that ruined the old company. As soon as this examination is made, the abandoned workings will be cleaned out.

Humboldt County.

At the Nevada-Superior properties, 20 miles northwest of Humboldt, Manager C. D. Rooklidge has put in a hoist and pumping plant. This shaft is down 125 feet, and is to be sunk to the 200-foot level. A station is to be cut and drifts run to the north and south from the 125-foot level.

Lincoln County.

Active development of the Santa Fe, near Searchlight, has begun after a long period of underground prospecting. A 25 H. P. hoist, a Cornish pump with a capacity of 6000 gallons an hour, an air compressor and drills are being put in. C. Leonard of Los Angeles is president, Geo. C. Mitchell vice-president, and B. Macready general manager.——Excavation has been started for a 10-stamp mill at the Cyrus Noble mine at Searchlight.——Sinking for the 600-foot level has been resumed in the Good Hope mine, near Searchlight. The company has let a contract for the first 100 feet to Wm. Allison and P. Williams. The sump in the 400-foot crosscut is complete, and catches the water from the vein, so that the new section of the shaft is comparatively dry.——Sinking has been resumed from a depth of 220 feet on the Parallel vein at Searchlight.——The Southwest M. Co. is working three shifts on the Techaticup mine at El Dorado. The station has been cut at the 450-foot level, and the shaft is being continued to the 550.

Nye County.

The rates for transportation of ores from Tonopah to Murray, Germania, Pallas, Bingham Junction, West Jordan and Sandy, Utah, and to California smelting points as shown by the rate sheet, are as follows: On ore of an actual value not exceeding $25 per ton, $6.50; over $25 but not exceeding $40, $8 per ton; $40 but not exceeding $50, $9.75 per ton; over $50 but not exceeding $100, $15.45 per ton; over $100 but not exceeding $150, $17.10 per ton; over $150 but not exceeding $200, $17.50 per ton; over $200 but not exceeding $300, $18.50 per ton. The haul from Goldfield to Tonopah is additional and is as follows: On ores not exceeding in value $25, $1.50 per ton; over $25 but not exceeding $50, $2 per ton; over $50 but not exceeding $75, $2.25 per ton; over $75 but not exceeding $100, $2.50 per ton; over $100 but not exceeding $200, $2.75 per ton; over $200 but not exceeding $300, $3.50 per ton. In addition a flat rate of $10 per ton is charged for smelting all ores.

Washoe County.

D. M. Harvey, superintendent of the Keystone-Nevada mines at Olinghouse, is working fifteen men. They are developing water rights and a stamp mill will be built south and east of the Ora mine.——H. Lincoln will develop the Golden Eagle, near Olinghouse.——The Buster mines, near Olinghouse, will be operated soon.

In the Pyramid district, 40 miles north of Reno, the Pacific Con. M. Co. has been developing their copper properties under the superintendence of R. W. Parry. The main tunnel is in 2000 feet.

NEW MEXICO.

Lincoln County.

It is reported that work is to be resumed on the Vera Cruz mine, near Nogal, by J. H. Canning.

Luna County.

(Special Correspondence).—The Deming smelter operated by the Luna Lead Co., of Deming, has been blown in. The management of the Deming smelter has made rates to small lead mines that permit the mining and shipping of low grade ores, which were heretofore considered unprofitable.

Deming, Oct. 23.

McKinley County.

The American Fuel Co. has established a new coal mining camp near Gallup, which will be known as Heaton. A new mine has been opened, a large number of men are employed and new men are being added daily. The camp is a short distance from the old camp of Gibson.

Otero County.

Men have been put to work on the Excelsior at Jarilla by O. D. Warnock, general manager. A 4-foot vein of sulphides is being exposed.——The Southwestern Co. announces that it will have its smelter at Jarilla completed and blown in by January 1.——The Jarilla Development Co. has given order to its secretary, Paul Ream, to begin work on the Ferro Oro property, on the west side of the Jarillas.——Work is being pushed on the 500-foot level of the Nannie Baird at Jarilla. The level is being driven toward the west and is in good ore.

Sierra County.

A $10,000 concentrating plant is to be built on the North Percha, near Kingston, for the Virginia, Templar and Keystone mines. The capacity of the plant is to be 100 tons daily. Some of the old dumps are to be treated. The mines are owned principally by A. W. Harris, and J. H. Moffat is superintendent.

Socorro County.

E. C. McDermitt, acting for a corporation of which David Moffat of Denver, Colo., is a director, has purchased the property of the Helen M. Co. at Graham and Mogollon, and has ordered the machinery for a 75-ton reduction plant. The plant will be put up at Graham to treat the tailings from the mill, after which ore from the Confidence mine will be treated as an experiment. The main shaft of the Confidence is down 600 feet. The mine is lighted by electricity and has an electric hoist.

OREGON.

Baker County.

Manager R. E. Norton of the Golconda mine, near Bourne, has increased the working force and has started the power plant to furnish electric power to the Columbia mine.

The double-compartment shaft of the Indiana mine, 20 miles from Baker City, is down 330 feet, and drifting is being done on the 100, 200 and 300-foot levels. W. J. Mesner is manager.——It is reported that a reduction plant is to be put in at the Strasburg mine, near Alamo,

next year. W. H. Remington and F. Clarno of Portland are interested.

Crook County.

Development work is to be resumed at the Red Jacket mine, near Ashwood. D. W. Leech of Woodburn is interested. A 10-ton furnace, recently completed 28 miles from Prineville, was put in commission for a test run recently, and, while handling the first charge of ore, turned out two flasks of quicksilver. Work was then suspended while the superintendent constructed a drier, which had not been provided when operations were commenced.

Grant County.

The Dixie Meadows mill, near Comer, has been enlarged, and hereafter crushing will be done with fifteen stamps and auxiliary rolls. Manager Reese has developed the ore shoot to a depth of 350 feet.

At the Bull of the Woods mine at Susanville, another ore shoot has been opened. The old shoot was stoped to a depth of 200 feet. The tunnel on the 200-foot level of the shaft, from which rich ore was mined, has been extended 500 feet farther on the ledge, where another rich body of ore has been opened.

Josephine County.

The Gold Standard copper mine, 4 miles from Merlin, has been sold by H. E. Booth to Metzger & Haviland of Toledo, Ohio.——On the Silver Creek properties, near Merlin, F. E. Metz, manager of the mine, is tunneling 1500 feet to tap gravel.——At the Lucky Queen mine, 2½ miles from Merlin, a 10-stamp mill is in place ready for operation.——The Baby mine, on Jump-Off-Joe, has a 5-stamp mill in operation and the Mount Pitt mine is said to be opening up a body of rich ore.

The Takilma smelter has closed for the winter on account of the condition of the roads. An air compressor is being put in and a second matting furnace is expected to be in place for next season's run. Development work will be continued all winter at the Queen of Bronze, where rich copper ore was uncovered recently. Since the people of the district are made to feel that this important industry is compelled to suspend work because of bad roads, greater interest is aroused in the work of affording the smelter every possible convenience for steady work. Assurance is given that the smelter could have run for a considerable time yet, possibly all winter, if it was closely connected with the railway. The investigations made for installing a traction engine outfit on the road proved that this was impossible, for the bridges and culverts were too weak to sustain the weight.

The Frank Sickels placer mine, at the mouth of Deer creek, southern Josephine county, has been sold to J. C. Anderson and R. D. Morris of Los Angeles. The property consists of old channel bars as well as river bottom, the low bars being from 8 to 10 feet deep and the high bars of the old channel from 8 to 40 feet. The new owners will dig a large ditch, which will furnish abundant water for the greater portion of the year.

Lane County.

Manager C. H. Park, of the Treasure mine at Blue river, has finished the aerial tram which is to connect the milling plant with the mine workings, and November 1 is the date set for the commencement of operations. The tram extends from the main drift a distance of 1500 feet down the mountain, covering a difference in elevation of 400 feet. The new plant consists of twelve rapid-drop stamps and no concentrating tables. The maximum depth attained in the present workings is between 500 and 600 feet, but the ore is thoroughly oxidized to the deepest level and all values are expected to be caught on the plates.

SOUTH DAKOTA.

Lawrence County.

The Imperial M. Co. of Deadwood, owning mines in the Terry's Peak region and a mill at Deadwood, has bought the McGovern group, near Portland, which they have been working under bond for a year past. It is stated that a good portion of the money paid the sellers of the property came from the net results of operations during the year.——Near Maitland A. J. Simmons is sinking a shaft on the Echo property. It is reported that the shaft is already in good ore, with indications for a large body of good mineral, the further development of which will soon call for milling facilities.

Pennington County.

R. J. Truax, who is interested in wolframite prospects, has leased the custom mill at Keystone, and will make a test of wolframite ore.

James Cochran is overhauling his milling plant at the Cochran mine, 3 miles from Rochford.——The Montezuma Co. at Rochford is endeavoring to get its business in shape to continue the development of the mine, and to perfect arrangements whereby a suitable milling plant may be provided.——The development of the Blue Lead copper property, near Sheridan, is proceeding. A winze is being sunk near the face of the main drift, to determine the character and extent of the ore in depth.

UTAH.

Juab County

Irwin Spriggs, A. E. Larson and O. Baker have filed a suit against the Bullion-Beck M. Co. of Eureka. They were leasers at the Beck mine, and in following a small stringer of ore broke into a stope from which a great deal of rich ore had been taken apparently by the Eureka Hill Co. There is considerable rich ore left in this stope, but the Bullion-Beck Co. refused to allow the leasers to continue work until suit was brought against the Eureka Hill M. Co. for the amount of ore which has been unlawfully removed. A suit has been brought by the leasers to recover damages for a share of the ore now remaining in the stope. If the Bullion-Beck Co. receives damages for ore which they did not know existed until the leasers made the discovery, it might be presumed that the leasers will be entitled to their share of the money. —— G. W. Riter of the Eureka Hill mine has leased a large portion to local people. Practically everything down to the 800-foot level is now open to leasers. Recently the Eureka Hill M. Co. tried leasing in the upper workings of its mine, and the results have been so satisfactory that it was decided to give the leasers a chance in the lower levels. The hoist is to be started.

Salt Lake County.

At the Fortuna of Bingham, Superintendent J. Start is working principally in the Freedom level, a drift from the upper working tunnel. A new gasoline hoist has been put in. A shaft is to be sunk from the Keystone.

Dispatches from Boston state that American Smelting & Refining Co.'s interests have bought in the open market between 30,000 and 40,000 shares of the Boston Consolidated Co.'s stock. Private negotiations are declared to be under way for the purchase by the smelter interests of control of the company to make it part of a consolidation of Bingham mines. The ultimate object is to make Bingham a rival of Butte as a copper camp, and of Salt Lake valley the greatest smelting center in the world. The mines it is proposed to take into the combination, with their approximate estimated market value, are as follows: Utah Copper Co., $10,000,000; Ohio Copper Co., $750,000; Boston Consolidated, $10,000,000. To these may be added the Newhouse mines in Beaver county, with an estimated market value of $10,000,000, making it require $30,750,000, roughly estimated, to swing the consolidation. The first two companies named are already under bond to the American Smelters Security Co., the smelting company's mining corporation. When the new concentrating mill and smelter now being constructed at Garfield are completed and in full operation, it is expected that not less than 12,000 tons a day of ore will be coming from the Boston Consolidated and Utah Copper mines, and that the annual production of copper two years from date and thereafter will not be less than 150,000,000 pounds, having a value of $20,000,000 to $25,000,000. This is in addition to the output of other Bingham companies, which exceeded 31,000,000 pounds last year. The total production of the Amalgamated Copper Co. in 1904 was 240,000,000 pounds, and it is decreasing, while the entire State of Michigan, second on the list of copper producing States, turned out 142,153,171 pounds, or less than this one company can place on the market annually after two years. This production means sending 600 big cars of ore a day from the consolidated mines. Estimates of the number of men to be employed are roughly made as follows: Mining and shipping ore, 4000; milling and smelting, 3,000—total, 7000. Annual wages, figured at average of $2.25 a day, $5,748,750.

H. S. Joseph, manager of the Silver Shield Co. at Bingham, has bought from the Boston Con. Co. land near the mouth of the Shield tunnel for a millsite. The mill will have a capacity of fifty tons of ore a day.

In his report to the stockholders of the United States Co., President Evans says that the company has purchased the Mammoth mines in California, and has built a modern smelter there of 500 tons capacity. They have also built a lead smelter of three furnaces adjoining its copper smelter in Utah, to which it is now adding three more lead furnaces. It has added two copper furnaces to its Utah copper smelter, is about to build a third copper furnace and has built a reverberatory furnace for treating flue dust, etc., which is working satisfactorily. Its subsidiary companies own the group of mines in Bingham, the Centennial-Eureka mine at Tintic, a lime quarry believed to be large enough to supply all the lime rock needed for smelting in Utah, the Mammoth mine in Kennett, California, a copper and lead smelter in Utah, a copper smelter at Kennett, and a controlling interest in the DeLamar refinery at Chrome, New Jersey. All these properties are in active operation, except the Kennett smelter, one furnace of which has started. The net earnings of the companies for the sixteen months from March 1, 1903, to July 1, 1904, were $1,045,719.78, and for the twelve months from July 1, 1904, to June 30, 1905, were $1,092,987.82. The net earnings during the last twelve months were affected by the break down of the blowing engines and by several stoppages incident to improvements made at the Utah plant. Managing Director A. F. Holden, in his report to the president, stated that the condition of the Telegraph, Old Jordon, Centennial-Eureka and Mammoth mines is satisfactory and that the ore reserves are being developed to take the place of the ore removed. The quarries of the United States Lime Co. have been furnishing the smelter with its entire supplies of lime. A crushing plant costing $30,000 is the only requirement at this plant. At the United States smelter they are running six copper furnaces and three lead furnaces in addition to ten roasters and one reverberatory furnace. The entire plant is working smoothly. Five additional roasters are being completed for the lead plant and five more will be built. Orders have been given also for doubling the number of lead blast furnaces. During the year from Oct. 1, 1904, to Oct. 1, 1905, the smelter produced 71,445 ounces of gold, 2,107,956 ounces of silver, 14,965,438 pounds of copper and 10,200,826 pounds of lead. Much improvement has been made in controlling our flue dust losses, thus eliminating a large factor in the so-called smoke trouble in Salt Lake Valley. The large supply of custom ores will necessitate building a third sampling mill. The following board of directors were elected: Frederick Ayer, William H. Coolidge, R. D. Evans, Eugene N. Foss, Albert F. Holden, Nehemiah W. Rice, James J. Storrow, E. C. Swift, S. W. Winslow.

Summit County.

No more water is being tapped in sinking the King Con. shaft at Park City.

Tooele County.

In a drift on the 200-foot level of the Consolidated Mercur Co.'s mines a fine body of oxide ore was broken into recently.

Utah County.

The Whirlwind M. & M. Co. of American Fork, operating the Whirlwind mine in American Fork canyon, has resumed work.

Washington County.

A. L. Adams, owner of the Paymaster mine, 18 miles west of St. George, has shipped eighty-one bars of copper bullion from the 150-foot level. He intends to sink on the vein to a depth of 450 feet, where he will cut the workings of the Dixie and use the tunnel.

WASHINGTON.

Ferry County.

The British Columbia Copper Co., operating the smelter at Greenwood, and the Mother Lode mine, in Deadwood camp, B. C., has taken a bond on the Napoleon, at Boyds, 6 miles from Marcus. The Napoleon was originally bonded by P. Burns & Co., who have been shipping for some time from their First Thought mine, near Orient, to the Northport smelter. The Napoleon ore, containing an excess of iron and sulphur, besides other values, was useful for mixing with the siliceous ore of the First Thought; but with the closing of the Northport smelter, P. Burns & Co. had made arrangements to sell the bond on the Napoleon to the British Columbia Copper Co., and that company now has Harry Johns at the property in charge of the work and shipments of about twenty tons daily are being made to the company's Greenwood smelter.

Franklin County.

Gold in paying quantities has been discovered at Richland, 8 miles north of Pasco, by John Prentice, and engines and machinery have been purchased to begin operations.

Okanogan County.

Ore recently taken to Loomis shows a high percentage of tungsten. Ore concentrated and sent to Philadelphia gave 73% tungsten. Henry Bahrs, manager Copper World Extension Co., and C. D. Baldwin report that there is a well-defined 3-foot vein traceable on the surface, which in several places where it was opened carried tungsten. Log cabins have been built and arrangements made for development during the winter.——H. G. Cupples with ten men has commenced the survey of the Methow-Barron State wagon road, for which the last Legislature appropriated $10,000, contingent upon Okanogan county appropriating one-half of that sum and completing the survey. After spending the entire summer in making preparations, the county commissioners, after the attorney-general had filed suit against Okanogan county to compel the acceptance of the appropriation, made an order for the survey of the road and an appropriation to cover the county's portion of the expenditure. Okanogan county will expend $5000 along with the State fund of $10,000, and it is estimated that the survey will cost between $1500 and $2000. The Methow-Barron road will extend from the mouth of the Methow river to the summit of the Cascade mountains, where Okanogan joins Whatcom. Barron is west of the summit in Whatcom county and is the center of the Slate Creek mining district. The road will be 65 miles long.

Pierce County.

The Tacoma Smelter Co.'s new stack is 307 feet 6¾ inches high, and cost $28,000. The stack was built to carry away the poisonous fumes from the smelting works at Tacoma. In its construction 1225 barrels of cement were used, in addition to which the structure contains 105,000 pounds of T iron, 705 cubic yards of sand and 231 cubic yards of gravel. The concrete foundation is 36½ feet square and 6 feet thick. For the chimney proper the mixture was one part cement and three parts sand. The chimney is constructed in two parts. From the foundation to a height of 90 feet there are two distinct shells, one built within the other, while for the rest of its height it is built with a single shell. The purpose of the double shell is to protect the structure from cracks due to extreme variations of temperature. The inner shell, which is separated from the outer one by an air space of 5 inches, is designed to shield the outer shell from the direct effect of the intense heat at the base of the chimney, while the outer serves as a like protection to the inner shell, by shielding from cold weather, which might cause it to crack by cooling too suddenly.

Stevens County.

The Review M. & M. Co. will resume work on the old Mountain View property, near Northport. W. E. Harris is president and manager.

FOREIGN.

AFRICA.

The September gold production of the Witwatersrand mines was 416,487 fine ounces. This was 12,094 ounces less than the August and 3,018 ounces less than the July production. This may be accounted for by the fact that September had but thirty days, while July and August had thirty-one. There are fewer Kaffir laborers and the supply of Chinese does not keep pace with the Kaffir falling off.

CANADA.

BRITISH COLUMBIA.

Boundary District.

The properties which the British Columbia C. Co. is developing on Copper mountain, near Chesaw, have been closed down for the winter. Work will be resumed in the spring.

The tonnage from Boundary mines for the week ending October 21 was: Granby mines 16,448 tons, Mother Lode 4160 tons, Providence 30 tons; total for week 20,638 tons, total for year to date 709,492 tons.——Arrangements have been made by the Dominion C. Co. to take 100 H. P. from the Cascade works to operate the company's compressor now in use with steam at the Brooklyn mine in Phœnix. A larger and more modern compressor plant is to be put in by the Dominion C. Co., which will also be driven by electricity. The management of the Dominion C. Co. has been considering the advisability of operating the company's present smelter at Boundary Falls, which was blown out last May by the Montreal & Boston Con.—this company's predecessor in ownership—but lack of adequate slag dumping ground has stood in the way. This week, however, this matter has been arranged and dumping ground has been secured, and it is now the intention to blow in the smelter.

Work has been resumed on the Rathmullen group,

near Grand Forks, under the direction of R. H. Hewes. ——The I. X. L., on McKinley mountain, near Franklin, is to be worked this winter by F. MacFarlane.

East Kootenay District.

The work of repairing the damage done by the recent fires at the St. Eugene is being pushed. The blacksmith shop is up and everything is in readiness for building the shaft house. A new hoist, a duplicate of the old one, has been ordered. In the meantime a temporary hoist will be brought from Rossland and will be used until the new one arrives. Sinking the shaft an additional 160 feet will be commenced. The mill will be closed down and no shipments will be made until everything is in shape again. The cause of the fire is unknown.

Rossland District

The Rossland Miner reports the tonnage of ore shipped and crushed at the Rossland mines for the week ending October 21 and for the year to date was as follows:

Mine.	Week.	Year.
Le Roi	1,650	95,926
Le Roi (milled)	630	3,030
Center Star	1,710	81,450
War Eagle	1,260	55,550
Le Roi Two	180	6,652
Le Roi Two (milled)	....	8,230
Spitzee	....	4,809
Velvet-Portland	....	1,977
Gopher	....	180
Homestake	....	30
Lily May	....	90
Inland Empire	....	30
Cascade-Bonanza	....	90
White Bear	....	1,100
White Bear (milled)	....	2,920
Crown Point	....	270
Jumbo	200	8,629
Totals	5,630	270,963

The Center Star shaft, which is being extended down from the tenth level, has reached a point 100 feet below that level, and is to be extended farther. The tenth level has not been opened. At the west end of the Center Star a large glory hole has been made. The ore is blasted out and falls through a shaft to the first level, from where it is trammed to the main shaft and hoisted to the surface.——A new wire cable is being put on at the main War Eagle shaft.——The secretary of the Le Roi Two Co. has issued a circular from the London office of the company stating that permission had been obtained from the directors of the Le Roi Mining Co. to explore the deep levels of the Le Roi Two from the lower levels of the Le Roi. Probably the workings on the 1350-foot level of the Le Roi, which are closest to the Le Roi Two ground, will be used. As the Le Roi and the Le Roi Two shafts are started from the same level, the workings of the Le Roi 1350-foot level extended into the Josie ground will be practically on the 1350-foot level. The deepest workings in the Le Roi Two at present are 900 feet, and the proposed work when done will give a depth of 450 feet below that level.——The Spitzee pumps are kept in operation and a few men are at work around the mine, pending the reorganization of the company and the readjustment of its financial affairs.——Development of the ore shoot on the 1550-foot level of the Le Roi continues with good results. The ore shoot on the 1450-foot level is also receiving attention. The Black Bear shoot, which has been found on the ninth level, promises to yield a more than ordinarily large tonnage. All of the ore from the Le Roi, amounting to 1650 tons, was sent to the Canadian smelting works at Trail, this being the first week that the entire output of the mine has gone to Trail.——The Trail copper furnaces were kept in full blast on ore from Rossland, the Boundary and Larson, Idaho. The work of installing the additional copper furnace is being pushed as rapidly as possible. The lead stacks are kept in operation, although there threatens to be a shortage, which will occur before the St. Eugene begins to again produce its lead concentrates.

Vancouver Island.

Manager Kiddie of the Crofton smelter, which was closed for six months this year, will blow in in November and will treat the Britannia mine's ore thereafter. Custom work will also be taken and the amount of ore treated gradually increased. The Britannia output may be 500 tons a day.——The Van Anda mines on Texada island are starting up again.

YUKON TERRITORY.

Consul-General Foster of Ottawa, Ontario, writes that an order in council, dated July 27, and recently made public, abolishes for ten years the royalty on gold produced from any quartz claim or group of claims in the Yukon Territory in respect to which an expenditure of money has been made to the amount of not less than $25,000 within five years after the date of the order in council or within five years after the date of issue, hereafter, of the patent for such claim. The royalty on the gross output of copper mined in the Yukon is permanently abolished in respect to those claims upon which an expenditure of money has been made to the amount of $50,000 within ten years after the date of the order in council or after the issue, hereafter, of the patent for such claims. The royalties previously payable were 2½% on all gold shipped from the Yukon Territory and 5% on all copper mined in said Territory. The gold, for the purpose of estimating such royalty, was valued at $15 per ounce.

MEXICO.

The Treasury Department has issued complete mining statistics to Dec. 31, 1904, from which the following figures are compiled. On that date there were in existence 19,471 legally registered titles. The classification of these properties consists mainly as follows:

Mineral.	No. of Properties.	Hectares.
Gold	1,478	20,187
Gold-silver	5,208	53,409
Silver	5 153	44,454
Gold-silver-copper	861	16,198
Gold-silver-lead	913	12,072
Gold-copper	234	3,572
Silver-copper	671	10,798
Silver-copper-lead	254	4,379
Silver-lead	2,924	30,639
Copper	768	20,269
Copper-iron	176	3,619
Copper-lead	21	532
Iron	351	14,472
Lead	67	1,073
Mercury	160	5,749
Tin	30	632
Sulphur	105	4,069
Antimony	45	2,087

In addition to the foregoing there are titles for manganese, bismuth, granite-tourmaline, opals and turquoise properties. The situation of these properties in the various States and Territories is:

Northern States—	No. of Properties.	Hectares.
Coahuila	455	8,580
Chihuahua	3,319	40 971
Nuevo Leon	475	9,395
Sonora	2,670	45,767
Totals	6,919	104,715
Central States—		
Aguascalientes	202	1,116
Durango	2,827	25,024
Guanajuato	784	10,216
Hidalgo	753	6,489
Mexico	414	4,972
Morelos	52	650
Puebla	150	1,929
Queretaro	130	2,060
San Luis Potosi	375	8,865
Tlaxcala	2	18
Zacatecas	1,502	14,525
Totals	7,191	76,869
Gulf States—		
Tamaulipas	99	2,540
Veracruz	55	1,006
Pacific States and Territories—		
Baja California	641	5,513
Colima	39	985
Chiapas	19	293
Guerrero	629	14,067
Jalisco	1,039	8,338
Michoacan	455	13,433
Oaxaca	1,273	11,489
Sinaloa	866	7,580
Tepic	246	1,938
Totals	5,207	63,638

Chihuahua.

There is being shipped from the State of Chihuahua to the smelters in the United States 1600 tons of zinc ore per month. The Calera M. Co. is shipping 1000 tons per month from the mines at Minaca to the Empire Zinc Co. at Pueblo, Colo., and McDonald & McKenzie are shipping 600 tons per month from San Sostenes to La Harpe, Kan. Interest is being shown in zinc mining in that State, and the prospects are that the industry will be developed during the coming year. It is stated that a new zinc sampling works may soon be established in Chihuahua to facilitate the handling of the ore. At present all of the ore has to be shipped to the smelters for sampling, greatly delaying settlement.

It is reported that a New Haven, Conn., company is examining mines belonging to Tiburcio Garcia, in the Mina district, near Guadalupe y Calvo. A. E. Roberts of Mexico City is interested. The group is known as the Galeana group. The mines are on the Humayo river. ——La Fayette Bros. of Chetopa, I. T., have opened up gold properties northwest of Guadalupe y Calvo.

Guerrero.

Superintendent G. D. Case, of the Mitchell M. Co. of New York, operating the La Dicha mines, near Acapulco, states that a run of the furnace for twenty-one days gave a gross return of $131,600. They are getting out twenty-eight tons of 65% matte each day. This result is brought about by the self-fluxing nature of the ore, which requires no barren flux to run it through the furnace. Plans and specifications are being made for the building of a 2500-ton plant, and this will be put in as rapidly as it can be built and shipped to the mines.

Mexico.

H. P. Lewis, general manager National Metal Co., expects to be able to start the company's new separating and refining plant at Noalco by November 1st.

Sonora.

A controlling interest in the Refugio copper mines, near Cananea, has been bought for Archibald & Marshall of London, who will develop the property after prospecting with diamond drills.

Zacatecas.

A cyanide plant with a daily capacity of 100 tons will be put in at the El Bote mine, near Zacatecas, to work the tailings. The ore from the El Bote mine is being treated by pan amalgamation, and it is said that 18% of the silver and 25% of the gold assay values are lost. The average ore runs 1½ kilos silver and 15 grams gold to the ton, and at the present time the reduction plant is handling about 2000 tons monthly. If the cyanide treatment proves satisfactory, the plant will be enlarged. The El Bote was opened twenty years ago, and one shaft is down 900 feet. There is another shaft 800 feet deep, and a ventilating shaft extends for the same distance. A Cornish pump has just been put in at the 800-foot level. J. S. Pattinson, the manager, is employing 700 men.—— It is reported that W. C. Palmer of Zacatecas is arranging to form a company to work the Mala Noche mine, 3 miles from the Zacatecas capital.

SOUTH AMERICA.

Bolivia.

In 1904 the Oruro district produced 8000 tons of metallic tin. The Tres Cruces district is being opened up with satisfactory results. Bolivia is the largest tin producer in America.

Books Received.

The United States Geological Survey has issued "Columbia River and Puget Sound Drainage" as a report of stream measurements during 1904. It is No. 135 of the Water Supply and Irrigation Papers.

"A Handbook of the Mineral Resources of the State of Jalisco, Republic of Mexico," by T. E. Smith. Price 50 cents. It contains descriptions of the leading mines and districts of the State. A map would add to its usefulness.

Personal.

J. T. MARRINER is in Korea.

J. E. SPURR is at Mexico City.

G. W. MAYNARD is at Tucson, Ariz.

T. A. RICKARD arrived at El Oro, Mex., on the 20th inst.

J. B. HASTINGS is returning to Denver from Guerrero, Mex.

R. H. ANDERSON has been examining mines in Jalisco, Mex.

J. L. WARNER has charge O. K. mine at Rossland, B. C.

H. C. SANDIFER has returned from New York to Mexico City.

A. W. BUTLER is superintendent Matoon M. Co., near Baker City, Or.

J. A. LEWANDOWSKI is manager Savage G. & C. Co. at Paradise, Ariz.

R. T. HILL has changed his office to 807 Trinity building, New York.

GEORGE SCHROTER is examining the Pelegrina mine at Guanajuato, Mex.

R. L. EDWARD is manager Kittie Burton Co. at Ulysses, Lemhi Co., Idaho.

OTTO WILL has resigned as manager Eureka mine at Bullion, near Hailey, Idaho.

A. J. BRENT, interested in Humboldt county, Cal., mines, is in San Francisco, Cal.

J. M. GOODWIN of Silver City, Idaho, is examining mines in Humboldt county, Nev.

A. H. GRACEY has resigned as manager Oyster-Criterion mine, near Camborne, B. C.

J. A. VEATCH of Napa, Cal., has gone to Magdalena, Sonora, Mex., on mining business.

H. S. DRINKER was installed as president Lehigh University at Lehigh, Penn., on Oct. 12.

W. C. HOWARD, superintendent Pyramid mines, near Kingman, Ariz., is in San Francisco, Cal.

H. B. STURTEVANT has been appointed superintendent Lincoln Con. M. Co. of Tucson, Ariz.

V. G. HILLS, who has been examining mines in Arizona, has returned to Cripple Creek, Colo.

J. H. HINDRY, manager La Esperanza at El Oro, Mex., is taking a holiday at Santa Barbara, Cal.

J. H. MCKENZIE, consulting engineer Le Roi mine at Rossland, B. C., has been in San Francisco.

C. H. DOOLITTLE, manager Bingham & New Haven mines at Bingham, Utah, is in New York City.

JOHN SEWARD of New York City has been examining the Caballo mine at Inde, Durango, Mexico.

J. H. DRISCOLL, manager Santa Fe mines at Hopewell, N. M., has returned to Salt Lake City, Utah.

MARTIN HOUK, manager Trilby M. Co., near Silverton, Colo., has returned to the mine after a trip East.

F. K. BAXTER has accepted a position on the staff of the Mammoth Copper Co. at Kennett, Shasta county, Cal.

R. D. RHODES has charge of the Mammoth smelter of the United States S. & R. Co. at Kennett, Shasta county, Cal.

J. J. HOBAN of Idaho Springs, Colo, manager Sterling M. & T. Co., is in Scranton, Pa., on company business.

J. J. CASE, manager Cerro de Pasco smelter, has returned to Peru from an extended visit in the United States.

E. C. KNIGHT has been given the management American S. & R. Co.'s new smelter at Velardena, Durango, Mexico.

E. J. WILSON, manager Arizona Smelting Co., with headquarters at Prescott, Ariz., has been in San Francisco, Cal.

J. L. MADDEN of the San Juan Mining Co., operating about 40 miles southwest of Austin, Nev., is in San Francisco, Cal.

JOHN CHAMPION, superintendent Yak tunnel, Leadville, Colo., is visiting Calumet and other mining camps of Michigan.

W. J. MORPHY of Chicago, and interested in the Granite Hill mines, near Grants Pass, Or., is in San Francisco, Cal.

N. C. BONNEVIE of Denver, Colo., and Chas. Janin of San Francisco, Cal., have returned to Denver from Gunnison county, Colo.

R. B. MCCONNEY, manager Denver, Colo., office of Allis-Chalmers Co., Milwaukee, Wis., is in Chicago, Ill., and Milwaukee, Wis.

FRANKLIN R. CARPENTER of Denver, Colo., is in Nova Scotia, investigating the commercial possibilities of large deposits of pyrite.

KUNO DOERR has been appointed manager American S. & R. Co.'s smelter at Aguascalientes, Mexico, in place of O. A. Westlund, resigned.

W. A. PRITCHARD has left San Francisco, Cal., for an extended tour of the mining districts of Mexico. He expects to be absent several months.

H. L. HUSTON has accepted the position of consulting

engineer of the Ohio-Tonopah M. Co., with headquarters at the Overland mine, Gold Hill, Nev.

W. S. DILLON has resigned as manager American Mexico M. & D. Co., at San Lorenzo, Coahuila, Mexico, and has been succeeded by G. E. Fitzgerald.

B. H. BENNETTS has been named as superintendent of the Garfield smelter of the American S. & R. Co., near Salt Lake City, Utah, with F. C. Knight as assistant.

THEO. VAN WAGENEN, who since his return from South Africa has been engaged in mine examinations in Mexico, is now examining mining property near Globe, Ariz.

GOVERNOR GOODING of Idaho has announced the following list of appointments as delegates to the American Mining Congress at El Paso, Texas, on November 14: J. W. Alshie, I. N. Sullivan, J. J. Deming, Charles S. Himrod, A. B. Crusen, T. J. Jones, August Paulson, E. H. Moffatt, F. Steadman, Al Page, R. W. McBride, W. O. Page, Lyttleton Price, E. R. Dewey.

COLORADO delegates to the American Mining Congress at El Paso, Tex., are: R. W. Bonynge, J. B. Grant, Denver; W. A. Haggott, Idaho Springs; I. Howbert, Colorado Springs; W. W. Davis, Leadville; V. C. Alderson, Golden; B. A. Langridge, Boulder; F. M. Woods, Victor; J. F. Callbreath, Jr., George Leyner, Denver; Charles Cavendar, Leadville; W. Z. Kinney, Silverton; E. M. De La Vergne, Colorado Springs; E. A. Colburn, Denver; T. B. Burbridge, Cripple Creek; S. D. Nicholson, Leadville; Frank Peck, Colorado Springs; Wm. Bainbridge, Cripple Creek; E. R. Hendrie, Denver; William Lennox, Colorado Springs; J. M. Downing, Aspen; Regis Chauvenet, Denver; L. H. Wygant, Jr., Deaver; Nelson Franklin, Victor; L. R. Johnson, Boulder; E. L. Davis, Telluride; B. B. Lawrence, Denver; Frank Bulkley, Denver; George Keener, Colorado Springs; W. J. Cox, Ouray; G. S. Newman, Aspen; Benj. Ferris, Pueblo; J. W. Finch, D. W. Brunton, E. L. White, Denver; Wm. Loach, Nederland.

Trade Treatises.

The Angels Iron Works of Angels Camp, Cal., in their "Guide Book" describe the Pacific battery stem guide, having no bolts, nuts, set screws, wedges or keys.

The Westinghouse Machine Co. of East Pittsburg, Pa., has issued a neat booklet illustrating the construction of Westinghouse storage batteries for signal service.

The Mine & Smelter Supply Co., of Denver, Colo., has issued two interesting illustrated bulletins on "Copper Converting Machinery" and "Smelting Machinery," No. 11 and No. 12, respectively. Besides picturing apparatus they contain much relevant information.

Of interest to every assayer and chemist is the 342 page, standard size catalogue of the Denver Fire Clay Co., Denver, Colo., illustrating and describing furnaces, scorifiers, muffles, crucibles, and general laboratory supplies. It will be sent on request to any address.

Bulletin Number Ten of the Jeffrey Mfg. Co. of Columbus, O., is a beautifully illustrated text describing the construction of the Jeffrey electric mine locomotives. It pictures many types for various purposes, and shows both surface and underground installations. The book will form a valuable addition to a library devoted to the problems of ore transportation.

The Allis-Chalmers Co. of Milwaukee, Wis., sends a number of handsome bulletins. No. 1402 describes in detail the construction and operation of their steam shovel. No. 1403 portrays the Hancock jig and includes pictures of a plant where the jig is successfully used. No. 1404 shows the McDougal roasting furnace, an inclosed firebox type. No. 1607 and 1608, from the pumping engine department, illustrate, respectively, a high duty, horizontal, double acting, crank and fly-wheel, plunger pump driven by cross-compound, Reynolds Corliss engine, and a single-stage centrifugal pump, motor driven. Catalogue No. 123 pictorially details sawmill carriages and accessory machinery.

Commercial Paragraphs.

THE Westinghouse Machine Co. of East Pittsburg, Pa., have received recently thirty-six orders for gas engines, ranging from 10 B. H. P. to 1000 B. H. P., and aggregating 6647 B. H. P.

THE Eel River Power & Irrigation Co. of Ukiah, Cal., write to the Rix Compressed Air & Drill Co. of San Francisco, Cal., as follows: "We have been using your Torpedo drills exclusively this summer in driving our 7x7 tunnel. In July we drove 362 feet in one heading, and 389 feet in August. This was all in standing ground. —WARREN EGBERT, Supt."

THE DeRemer Water Wheel Co. of Denver, Colo., have closed contracts for the following water power installations: High Creek Electric Light & Power Co., Richmond, Utah, two 400 H. P. DeRemer water wheels with governor regulation; Marguerite M., M. & L. Co., San Luis valley, Colo., one 100 H. P. DeRemer water wheel; Bourne G. M. Co., Bourne, Idaho, to equip a 11-foot 6-inch foreign wheel with twenty-four 18-inch DeRemer water wheel buckets.

THE Broderick & Bascom Rope Co. of St. Louis, Mo., write that they were awarded gold medals by the Lewis & Clark centennial exposition at Portland, Or., in the following seven groups: Wire ropes, cables for transmission of power, aerial cables for transportation of ore, hawser steel cables for marine use, wire ropes for hauling timber and logging purposes, wire rope and aerial cables for mining purposes, and also a gold medal for originality of design and practical demonstration of entire exhibit, besides a gold medal for tramways.

THE Wellman-Seaver-Morgan Co. of Cleveland, Ohio, has just been awarded the contract to furnish for the Wheeling & Lake Erie Railway at Huron, Ohio, a complete ore handling plant, consisting of four Hulett ore unloading machines, equipped with the Hulett patented excavating bucket. These machines will be able to span four tracks, having cantilever at the rear of the machines and folding boom at the front or water side of the machine. The plant is to be completed by May 1, 1906. The Wellman-Seaver Morgan Co. have recently closed a number of important contracts for steel works machinery for Great Britain, and mining outfits for Nevada and Mexico.

Latest Market Reports.

SAN FRANCISCO, October 27, 1905.

METALS.

SILVER. — Per oz., Troy: London, 28⅛d (standard ounce, 925 fine); New York, bar silver, 62¾c, refined (1000 fine); San Francisco, 62¾c; Mexican dollars, 51c, San Francisco; 48c, New York.

This week's silver quotations show an advance in the market price of the metal, having gone from 62⅝ cents last week to 62¾ cents, the present quotation. Even these small additions to the value of the white metal are very welcome to the producer of silver.

COPPER.—New York: Standard, $16.37½; Lake, $16.37½@16.75; Electrolytic, $16.32½; Casting, $16.00@16.37½. San Francisco: $16.75. Mill copper plates, $17.50; bars, 18@24c. London: £71 15s spot per ton.

The copper market remains firm and practically unchanged from the quotations of last week. The price hovers around $16.50 and $16.75, with no indication that it will move either up or down in the immediate future.

LEAD.—New York, $5.40; St. Louis, $4.50; San Francisco, $5.00, carload lots; 5½c 1000 to 4000 lbs.; pipe 7½c, sheet 8, bar 6¾c. London: £14 17s 6d ℔ long ton.

SPELTER.—New York, $6.25; St. Louis, $6.00; London, £28 12s 6d ℔ ton; San Francisco, ton lots, 7c; 100-lb lots, 7¼c.

TIN.—New York, pig, $32.35@32.65; San Francisco, ton lots, 34c; 500 lbs., 35c; 200 lbs., 36c; less, 37½c; bar tin, ℔ lb., 40c. London, £148 12s 6d.

PLATINUM.—San Francisco, crude, $18.50 ℔ oz.; New York, ingot, $20.50 ℔ Troy oz. Platinum ware, 75@$1.00 ℔ gram.

QUICKSILVER.—New York, $40.00@$40.50, large lots; London, £7 5s 0d; San Francisco, local, $38.00@39.00 ℔ flask of 75 lbs.

BABBITT METAL.—San Francisco, No. 1, 10½c; No. 2, 8c; No. 3, 7½c; extra, 17½c; genuine, 32½c; Eclipse, 35c.

SOLDER.—Half-and-half, 100-lb. lots, 22.00c; San Francisco, Plumbers', 100-lb. lots, 19.15c.

ZINC.—Metallic, chemically pure, ℔ lb., 50c; dust, ℔ lb., 10c; sulphate, ℔ lb, .04c.

NICKEL.—New York, 55@60c ℔ lb.; ton lots, 40@47c.

ALUMINUM.—No. 1, 99%, small lots, 37c ℔ lb.; 100 lbs., 35c; 1000 lbs. 34c; ton lots and over, 33c, Pittsburg. No. 2, 90%, small lots, 34c; ton lots and over, 31c, Pittsburg.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, $16.35; gray forge, $14.60; San Francisco, bar, 3½c ℔ lb., 3¾c in small quantities.

STEEL.—Bessemer billets, Pittsburg, $26.00@$27.00; open hearth billets, $27.00@$28.00; San Francisco, bar, 7c to 13c ℔ lb.

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 7¾c; less than 500 lbs., per lb., 8c; in 25-lb. tin pails, ½c ℔ lb. above keg price; in 1 and 5-lb. tin cans, 100 lbs. per case, ½c per lb. above keg price. Dry Lead.—In bbls., 1 ton and over, 7½c; do. in kegs, 8c.

LIME.—Santa Cruz, $1.35 country, $1.25 city ℔ bbl.

CEMENT.—Imported, $3.00@4.00 ℔ bbl.; California, carload lots, $1.80 f. o. b. at works; small lots, $2.10 ℔ bbl. in sacks, 4 sacks to bbl., 5c for each sack returned.

LUMBER.—(Retail): Pine, ordinary sizes, $24.00@25.00; extra sizes higher; redwood, $28.00@30.00; lath, 4 feet, $4.50@5.00; pickets, $21.00; shingles, $2.50 for No. 1, and $2.25 for No. 2; shakes, $13.50 for split and $15.00 for sawed; rustic, $28.00@35.00.

NAILS.—This week the basic prices are: Wire, $2.77; Cut, $3.25. Meanwhile the nominal quotations per keg (list prices) are: No. 20d to 60d, Wire, $3.35; Cut, $3.55; 10d to 16d, Wire, $3.45; Cut, $3.35; 8d, Wire, $3.50; Cut, $3.50; 6d and 7d, Wire, $3.60; Cut, $3.60; 4d and 5d, Wire, $3.70; Cut, $3.70; 3d, Wire, $3.85; Cut, $3.85; 2d, Wire, $4.10; Cut, $4.10. Special rates for carload lots.

GENERAL SUPPLIES.

ANTIMONY.—New York, Cookson's, 13½c; Hallett's, 14½c; San Francisco, 1000-lb. lots, 14c; 300@500-lbs. 12c; 100-lb. lots, 13c.

BISMUTH.—Subnitrate, ℔ lb., $2.10.

BONE ASH.—Extra No. 1, 5@6c ℔ lb; No. 1, 4@5c.

BORAX.—Concentrated, 7@8c ℔ lb; powdered, 9@10c; fused, 25@30c; crystal, 7c.

CANDLES.—Spear Brand, 16 oz. adamantine, 40s., 11c ℔ set; 14 oz. adamantine, 40s., 10c; 12 oz. adamantine, 40s, 9c; 10 oz. adamantine, 40s, 8c; 16 oz. stearic, 40s, 12¾c ℔ set; 14 oz. stearic, 40s, 11½; 12 oz. stearic, 40s, 10¼c; 10 oz. stearic, 40s, 9¼c. 100-case lots and over, ¼c less. Not less than 50-case lots, ¼c less. Boxes of 20s, price ¼c advance.

CAPS.—3x, $5.50@6 per 1000; 4x, $6.50@7; 5x, $8@8.50; Lion, $9@9.50, in lots not less than 1000.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 23@24c ℔ lb.; carloads, 23@23½c; in tins, 30c; soda ash, $2.00 ℔ 100 lbs.; hyposulphite of soda, 3@3½c ℔ lb.; caustic soda, in drums, 3@3½c ℔ lb.; Cal. s. soda, bbls., $1.10@1.20 ℔ 100 lbs.; sks., 90c@$1.00; chlorate of potash, 12@13c; nitrate of potash, 6¾@7c; caustic potash, 10c in 40-lb. tins; roll sulphur, 2½@2¾c; powdered sulphur, 2½@2½c; flour sulphur, French, 2¾@—c; alum, $2.00@2.25; California refined, 1¼@2c; sulphide of iron, 8c ℔ lb.; copper sulphate, 5¼@5¾c; chloride of lime, spot, $2.50@2.75; sulphuric acid, in carboys, 66% B, 1¾@2c ℔ lb.; nitric acid, carboys, 8c ℔ lb.

CHROMIUM.—90% and over, ℔ lb., 80c.

COAL.—San Francisco, coast, yard prices: Wellington, $8.00; Seattle, $6.50; Coos Bay, $5.50; Southfield, $8.00. Cargo lot, Eastern and foreign: Wallsend, $7.50; Brymbo, $7.50; Pennsylvania, hd., $14.00; Scotch, $8.00; Cumberland, $13.00; Cannel, $8.50; Welsh Anthracite, $13.00; Rock Springs, $8.50, long ton; Colorado Anthracite, $14.00. Coke, $11.50 per ton in bulk, $13.00 in sacks; Sunnyside, $8.50, long ton.

FIRE BRICK.—Domestic, carloads ℔ 1000, f. o. b., factory square, $25.00; soap and split, $22.50; arch and wedge, $27.50; skewback, $30.00; circle, $32.00.

FIRE CLAY.—Domestic, ℔ ton 2000 lbs. in 125-lb. bags double, and dry ground, f. o. b., factory, $8.50.

FUSE.—Triple tape, $4.00 per 1000 feet; double tape, $3.55; single tape, $3.10; Hemp, $2.85; Cement No. 2, $3.10; Cement No. 1, $2.75, in lots of 3000 and up.

OILS.—Linseed, boiled, bbl., 54c; cs., 59c; raw, bbl., 52c; cs., 57c; Lucol oil, boiled, bbl., 48c; cs., 53c; raw, bbl., 46c; cs., 51c. Kerosene—Pearl, per gal., 17½c; Astral, 17½c; Star, 17½c; Extra Star, 20½c; Eocene, 19½c; Elaine, 26c; Water White, in bulk, 11c; Mineral Seal, iron bbls., 18c; wooden bbls., 20½c; cs., 24c; Mineral Sperm, cs., 26½c; Deodorized Stove Gasoline, bulk, 14½c, do., cs., 21c; 86° Gasoline, bulk, 25c; do., cs., 31c; 83° Naphtha or Benzine, deodorized, in bulk, per gal., 12½c; do., in cs., 19c; Lard Oil, E. W. S., bbl., 75c; cs., 80c; Neats-foot Oil, pure, bbl., 63c; cs., 78c; Sperm, crude, 63@68c; Natural White, 68c; Bleached, do., 68@73c; Whale Oil, cs., 52@67c.

LITHARGE.—Pure, in 25-lb. bags, 9½@10½c ℔ lb.

MAGNESIUM.—Pure, N. Y., $1.60.

MANGANESE.—Black oxide, ℔ lb., 2¾@4c.

MERCURY.—Bichloride, ℔ lb., 77c.

MOLYBDENUM.—Best, $2.75 ℔ lb.

PHOSPHORUS.—American, ℔ lb., 70c.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitroglycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1**, 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2, 35%, carload lots, 9½c; less than one ton, 11½c. No. 2**, 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2.00 per keg.

RED LEAD.—500 lbs. and over at one purchase, ℔ lb. 7½c; less than 500 lbs., 7¾c.

SILVER.—Chloride, ℔ oz., 90c@$1.00; nitrate, 54c

SODIUM.—Metal, ℔ lb., $1.

TUNGSTEN.—Best, ℔ lb., $1.20.

URANIUM.—Oxide, ℔ lb., $3.40.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market street, San Francisco, has official reports of the following United States patents issued to Pacific Coast inventors:

FOR THE WEEK ENDING OCTOBER 10, 1905.

801,564.—MUG—H. H. Allen, San Francisco.
801,707.—POCKET CALCULATOR—F. S. Beckett, San Francisco.
801,567.—CANE—H. H. Bernhard, Chico, Cal.
801,710.—SPECULUM—I. C. Carstensen, Oakesdale, Wash.
801,360.—OIL BURNER—E. Christensen, Portland, Or.
801,369.—DOOR FASTENER—Dickson & Ely, Castlerock, Wash.
801,775.—TRIPLE VALVE—J. Dellander, San Francisco.
801,584.—CHANDELIER—T. D. Greene, Davenport, Wash.
801,830.—ORNAMENTAL STRUCTURE—T. F. Hall, San Jose, Cal.
801,831.—SIPHON BOTTLE—D. Landau, San Francisco.
801,463.—CRATE—J. G. Lettelier, Los Angeles, Cal.
801,464.—CRATE—J. G. Lettelier, Los Angeles, Cal.
801,532.—WHEEL ADHESION—R. C. Lowry, Seattle, Wash.
801,741.—BICYCLE FORK—M. McIntyre, Canyonville, Or.
801,601.—HARROW—L. M. Morrow, Wasco, Or.
801,549.—BOOT HEEL—U. Santini, San Francisco.
801,553.—ROTARY ENGINE—N. B. Smith, Seattle, Wash.
801,617.—TYPEWRITER—T. C. Smith, Spokane, Wash.
801,410.—DISK PLOW—G. Spaulding, San Francisco.
801,414.—WEIGHING MACHINE—F. Stebler, Riverside, Cal.
801,346.—EVAPORATOR—H. C. Tabrett, San Francisco.
801,751.—SPARK ARRESTER—E. Tomer, Hanford, Cal.
801,493.—DEAD CENTERS—J. Whittington, Baker City, Or.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS United States and Foreign Patent Agency, the following are worthy of special mention:

TOILET SEAT ATTACHMENT.—No. 802,106. Oct. 17, 1905. J. Y. Matteson, Fruitvale, Cal. This invention consists of an improved toilet seat having in combination a hollow annulus having a diaphragm or partition across the rear portion, arms fixed to said annulus extending rearwardly and having hinge pins about which they are turnable, one of said arms being hollow and forming a swivel joint, a supply pipe connected with said joint and having a controlling cock, and a discharge passage upon the opposite side of the partition whereby a heating medium at the rear of the seat at one side of the partition is caused to circulate to the front of the seat and thence to the rear again before being discharged, said passage having a smaller capacity than the inlet passage.

GUN MOUNT.—No. 802,123. Oct. 17, 1905. M. C. Taylor, San Francisco, Cal. This invention consists in a gun mount, a shield convergent to the front, open at the rear, a yoke or frame having upturned ends in which the ends of the shields are journaled, a floor within the shield having parallel ribs between which the rear ends of the gun are fitted whereby the parallelism of the gun is maintained, mechanism by which the shield may be tilted in a vertical plane and mechanism by which the yoke and shield may be tilted in a vertical plane transverse to the first-named plane.

GOLD SAVING APPARATUS.—No. 801,968. Oct. 17, 1905. J. A. Clark, Yankee Hill, Cal. This invention is designed particularly for use in hydraulic and other placer mines. It consists in the combination with a sluice and a concentrating table upon which the sluice delivers, of a screen frame on the table comprising upper and lower side plates between which the screen is removably clamped, said upper plates having drop portions extending over and beyond the inner edge of the lower plates and rigid connections between the plates on the opposite sides of the frame, and means for securing the screen to these connections. There are other details of construction combined and adapted to bring about the desired result.

ROSE'S
Complete Practical Machinist.

19th Edition.

The Complete Practical Machinist: Embracing Lathe Work, Vise Work, Drills and Drilling, Taps and Dies, Hardening and Tempering, The Making and Use of Tools, Tool Grinding, Marking Out Work, Machine Tools, etc By Joshua Rose, M. E. Illustrated by 395 engravings, 19th edition, greatly enlarged, with new and valuable matter. 12mo, 504 pages. Price, **$2.50 By mail, free of postage, to any address in the world.**

ABSTRACT OF CONTENTS.—Chapter I. Cutting Tools for Lathes and Planing Machines. II. Cutting Speed and Feed. III. Boring Tools for Lathe Work. IV. Screw Cutting Tools. V. Lathe Dogs, Carriers or Drivers. VI. Turning Eccentrics VII. Hand Turning VIII. Drilling in the Lathe. IX. Boring Bars. X. Slotting Machine Tools. XI. Twist Drills. XII. Tool Steel. XIII. Taps and Dies. XIV. Vise Work; Tools. XV. Fitting Connecting Rods. XVI. Milling Machines and Milling Tools. XVII. Grindstone and Tool Grinding. XVIII. Lining or Marking Out Work. XIX. Machine Tools XX. To Calculate the Speed of Wheels, Pulleys, etc. XXI. How to Set a Slide Valve. XXII. Pumps. Index.

By the same author:

Rose.—Mechanical Drawing Self-Taught. 330 illustrations. 8vo.....$4 00
Rose.—The Slide Valve Practically Explained. Illustrated 12mo..... $1 00
Rose.—Modern Steam Engines. Illustrated by 453 engravings. 4to. New ed. revised. .$6 00
Rose.—Steam Boilers. A Practical Treatise on Boiler Construction and Examination. 73 illustrations. 8vo..... .....$2 50

☞ *Elaborate Illustrated Circulars of the above Important Books will be mailed to anyone in any part of the World who will furnish his address.*

☞ *The above books sent by mail free of postage at the publication prices to any address in the world.*

☞ *A catalogue of books on Steam and the Steam Engine, Mechanics, Machinery, Machinists' Work, Tool Making, etc., sent by mail to any address.*

SOME NEW
No. 1 Up-to-Date Technical Books.

DAWIDOWSKY-BRANNT.—Glue, Gelatine, Animal Charcoal, Phosphorus, Cements, Pastes and Mucilages: Comprising the Raw Materials and Manufacture of Skin and Bone Glue; Different Varieties of Glue; Animal Charcoal; Phosphorus; Gelatine and Products prepared from it; Isinglass and Fish Glue; Methods of Testing Glue and Gelatine, and the Preparation and Application of Cements, Pastes and Mucilages for Use in the Workshop, Laboratory and Office. By F. Dawidowsky, Technical Chemist. Edited from the German, with Extensive Additions, including a Description of the Most Recent Processes, by William T. Brannt, Editor of "The Techno-Chemical Receipt Book." Illustrated by Sixty-Six Engravings. Second Edition, Revised, and Largely Rewritten.

☞ *Price $3.00, net, by mail to any address in the world; or by express C. O. D., price $3.00 net, freight paid to any address in the United States.*

MAUCHLINE.—The Mine Foreman's Handbook of Practical and Theoretical Information on the Opening, Ventilating, and Working of Collieries. Questions and Answers on Practical and Theoretical Coal Mining. Designed to Assist Students and Others in Passing Examinations for Mine Foremanships. By Robert Mauchline, late Inspector of Mines to the Tennessee Coal and Iron Co. Third Edition, Thoroughly Revised and Enlarged by F. Ernest Brackett, American Mining Engineer.

134 engravings. 8vo., 378 pages. Price $3.75 by mail, free of postage, to any address in the world. By express, freight paid, C. O. D., to any address in the United States or Canada.

BERSCH.—Cellulose, Cellulose Products, and Artificial Rubber. From the German by William T. Brannt. 41 engravings, 8vo., $3.00.

BRANNT.—A Practical Treatise on the Distillation and Rectification of Alcohol. 105 engravings, 8vo., $4.00.

FLEMMING.—Practical Tanning. A Handbook of Modern Processes, Receipts and Suggestions for the Treatment of Hides, Skins and Pelts of Every Description. By Louis A. Flemming, American Tanner. 8vo., $4.00.

THALLNER.—Tool Steel. A Concise Handbook on Tool Steel in General. From the German. 69 engravings. 8vo., $2.00.

☞ *The above books sent by mail, free of postage, at the publication prices to any address in the world.*

☞ *An elaborate circular of each of the above books will be sent to any one in any part of the world who will apply*

Trials of the Amalgamator.

The average gold millman has ideas of his own and his personality usually asserts itself in his mill work sooner or later. Many gold mine superintendents have a firm belief, probably established by experience, that a man who has acted in the capacity of amalgamator in a silver mill has no business in a gold mill. In certain individual cases this is, no doubt, a well founded prejudice, but that a man may not be as good an amalgamator in a gold mill as in a silver mill seems absurd—possibly, however, he would be a somewhat better millman if he were to learn the art in the plate mill before coming in contact with what seems to the gold millman the extravagant use of quicksilver, as practiced in the silver mill. The methods of amalgamation are wholly different in the two classes of mills, and the transferring of a silver millman to a gold mill is sometimes followed by curious results. Whatever the silver mill amalgamator may do in a gold mill, he is scarcely likely to do any worse than the gold millman who religiously feeds a given amount of "silver" to the battery at stated intervals, regardless of the condition of the plates. He is the "rule of thumb" man, and to him all exterior signs of the mill battery do not appeal. He feeds quicksilver by the watch, and not by the condition of the plates. It is true that the silver millman in the gold mill, unless he has had special training, is likely to overfeed the quick. An instance occurred some time since at a well-known mine in the tropics. An American amalgamator was engaged to take charge of the mill. He was an experienced gold millman. On the day of his arrival he found his predecessor, ably assisted by two or three natives, on their knees on the plates. The mill foreman was plowing up ridges of amalgam, silver plating and raw copper, with the aid of an old axe, while the natives industriously endeavored to emulate his good example with steel chisels. The newly arrived amalgamator looked upon the proceeding with some misgivings, and inquired if that was about the regular thing. When he took charge of the mill the following day he at once introduced the methods of mill practice with which he was familiar, and which he knew to be successful under ordinary conditions. Before noon the superintendent appeared, and at once told him that he would have to do differently if he expected to accomplish results. He was told that the retired millman was a very competent man — an old and experienced silver millman—and that his mill practice was of the best and up to date. The new man was astonished to find that he was not using one-fifth enough quicksilver, of which there was abundance—no need to be afraid to use it. He called attention to the fact that he had the plates in good condition and that evidently things were going well, and finally asked permission to run the mill in his own way, for a day or two, at any rate, and then if results were not satisfactory he would willingly adopt some other method. For three days he was allowed to work in his own fashion, but the morning of the third day the superintendent again appeared in a greatly disturbed frame of mind. He said the whole thing was "going to the dogs," that the ore contained no values, for there was nothing in the tailings, whereas it was customary to get at least $5 to $6 per ton in them. The new millman called attention to the amalgam accumulating in the safe from the daily dressing of the plates, and this tangible result of his mill methods compensated for the lack of values in the tailings. This circumstance is in no manner exaggerated, but it illustrates two important phases of mining—the first, that the superintendent chosen to look after the business of this company knew so little of its practical operations, and the other is that a silver millman is prone to overfeed the battery of a gold mill unless he has had special training in the latter branch of the business.

THE use of crude petroleum as a fuel in power and metallurgical operations is increasing yearly, and in some districts, at least, promises to displace all other classes of fuel. Its successful application to reverberatory furnace practice was a long step in the right direction, and has stimulated the endeavor to apply this class of fuel to blast furnace operations. Several ingenious inventors have already attempted this difficult task. One type of furnace may be described as intermediate between a cupola and a reverboratory, the hearth being inclined at a high angle. The other type of furnace, although a stack, to all intents and purposes, is, in its operation, a radical departure from the ordinary blast furnace practice, being what is known as the "downdraft" furnace. In this device the ore is reduced to a fine granular condition, and is fed at the top and comes in contact with the intensely hot flame of the petroleum-steam jet which is projected downward from near the top of the furnace. The theory of the operation is in the belief that the ore particles will be oxidized and reduced to liquid condition before reaching the crucible of the furnace. The volatile elements will pass off to be condensed in several chambers, each being precipitated at a different temperature, which it is hoped to regulate so as to effect a differential separation of these several products. These include zinc, arsenic, antimony and other readily volatile minerals. The metals such as copper, lead, iron, etc., together with gold and silver, if present, are expected to be found in the lower part of the shaft, where they may be tapped in the usual manner. This process, although, as yet, in the experimental stage, indicates clearly the trend of modern furnace experimentation, and it is probable that something tangible may yet result from these efforts.

Motive Power at Mines.

The principal motive powers now employed in mine operations are either steam, water, or some form of gas or other type of explosive engine. By means of these, power is generated and applied in other ways —by ropes, by compressed air, or by electricity. When deciding upon what means shall be adopted to supply power to a mine, the problem should always be solved by selecting that which will afford the best economic results. In many situations no one of these several methods will supply every requirement. Either of them will operate a mill or a hoist, but there are generally pumping problems and traction problems to be worked out. Underground haulage is an important matter with all large mines. For this purpose, men as trammers, horses, rope-haulage, electric, steam, and compressed air motors are employed. The question which each manager is required to decide is, which system will give the most satisfactory and economical results. If the mine workings are large and well ventilated, and fuel is cheap, the ordinary type of mine steam locomotive would operate satisfactorily, no doubt. If the amount of material to be handled does not appear to justify a motor of any kind, horses or mules may be what is required.

As between compressed air and electric motors, the choice must be determined by the first cost of installation, the situation and the convenience of either system. On the Forest Hill divide, in Placer county, Cal., are two noted drift mines, the Hidden Treasure and the Red Point. These mines are situated similarly in many respects, the former being opened from the south side of the ridge and the latter from the north side. The haulage in the Hidden Treasure mines is accomplished by electric motors, and has proven eminently satisfactory. In the Red Point a compressed air motor was in use and was found equally satisfactory. The advantage in point of installation probably lies with the Red Point, as the plant was less expensive than that of the Hidden Treasure—due largely to the incidental relative situation. The water from the tunnels of the Hidden Treasure Co. is conveyed in pipe lines to a reservoir about 3 miles distant, where it is employed to develop power under 850 feet head. The water wheel is attached to a dynamo, and the electric current operates the motor cars and lights the mine workings and buildings.

At the Red Point mine the water flowing from the mine drives ventilating fans, and is again used at a lower elevation to drive an impulse wheel which supplies power to run a large air compressor of special design. This air is charged into the receiver of the motor which hauls the empty cars into the mine. The loaded cars run out on the grade in trains, being controlled by brakes, the motor not being required for the purpose of hauling out, though attached to the train. The system worked satisfactorily, and was similar to compressed air haulage elsewhere. The Red Point mine is at present being operated only in a small way, by leasers.

The two instances above cited are typical, and the situation at the two properties, though not very unlike, seems to have been met in each instance by the adoption of the method best suited to each case. There are many good things that may be said of the use of electricity or compressed air in and about mines without disparagement to the other. Both are good, and it is merely a matter of decision which to employ under conditions as they exist.

At the Homestake mines in South Dakota, compressed air haulage is in use both underground and on the surface. In former years steam locomotives were used to haul cars from the large open cuts to the mills, a portion of the route traveled being underground. The compressed air motors were introduced on account of ventilation.

In the Cripple Creek district of Colorado many of the larger mines are equipped with electric motors, and these are found to give inexpensive and satisfactory service.

In mine pumping operations the Cornish pump, at one time the most extensively used device for unwatering mines, has largely been displaced by direct acting steam or electric pumps, though in certain districts the Cornish pump still continues in favor. Where this is the case the plants are in position and have been there for years. They have been found efficient and satisfactory. The amount of water is not greatly variable in these mines, and never exceeds the capacity of the pumping plant, therefore there is no marked incentive to change to any other system. In cases where constantly increasing amounts of water are met with as the development of the mine becomes daily more extensive, some more expansive and readily applied system of pumping must be installed. To meet these requirements, the compact steam or electrically driven pumps are utilized, and both are satisfactory. In some districts bailing has almost wholly superseded pumping operations in mines, and some engineers do not hesitate to express the opinion that when properly equipped a mine may handle its water more cheaply by bailing than by any system of pumping.

Hoisting is one of the most important of all mine engineering problems. Here are found a greater range of power appliances than in any other department in mining. Hoisting is successfully accomplished by geared, friction and direct acting steam engines; by the same methods of application employing water power; by the use of compressed air—usually with electrically driven compressors — the initial power generally being water; and by electricity direct. Gas, gasoline and heat engines are also used largely in some districts where water and fuel are expensive.

Compressed air hoisting plants must necessarily be less efficient than where the power is applied direct from the motor, whether a water wheel, a steam engine or an electric motor, but this loss of efficiency is in some measure compensated for by the greater expansibility of the compressed air system. Should anything occur to interrupt the initial power, there is usually sufficient air in the receivers to enable the engineer to haul a cage or skip in transit to the surface. The electric motor, though having a higher efficiency than the compressed air plant, must stop immediately the current is interrupted. Still the electric hoists are growing in favor, and seem well adapted to certain districts and conditions. Many improvements in electrical hoisting machinery may be anticipated. With most managers it is not so much the question of water, steam, electric or other power, as which will be the most satisfactory and economical at any particular place. With this question in mind a consulting engineer may advise a water plant for some portions of California, a steam plant for the Black Hills, a gas engine plant for Arizona and electricity for Colorado, depending upon the mine's environment and the cost of power.

THERE appears to be an increasing tendency to attempt the treatment of raw auriferous sulphides by means of the cyanide process, or some modification of it. Experience at some mines has demonstrated that solution of bromo-cyanide is usually more effective for this purpose than the ordinary solution. The most important factors in the operation of this method of treatment appears to be abundant time of contact, with the solution and in some instances a repeated contact. The results obtained at various places is extremely variable, but a fair extraction seems possible in many cases where the material is ground sufficiently fine. Complete aeration of the sulphides after each contact with the solution appears to also be very important. In Western Australia various methods of treating the sulphides have been tried, but it has been found that by careful roasting before cyanidlng a very high percentage of extraction was generally obtainable — up to 99%. Although the roasting of the ores was an additional expense in the treatment, the increased saving of values more than offsets it.

THE needs of rapid transportation for passengers in the deserts of southern Nevada have resulted in the introduction of motor cars. A company owns a line of these vehicles, twenty in number, which make schedule trips between Goldfields and Bullfrog, in addition to which there are numerous private cars running on the same road. A good highway has been constructed between the most important towns, and traffic vehicles are not allowed to travel on it. The result is that one may now travel between these desert camps in comfort and in a surprisingly short time. The success of these auto-cars suggests the feasibility of their more extended use for traction

purposes, by means of which the expense of transporting mining supplies, machinery, etc., may not only be greatly facilitated, but cheapened. The energy being put into the development of these southern Nevada mining districts is likely to find a way out of every difficulty.

Pyritic Smelting.

With this number is concluded the abstract of the interesting paper on the "History of Pyritic Smelting," by Robert Sticht, manager of the Mount Lyell mines, Tasmania. In this contribution to the science of smelting the author has reviewed the ups and downs of one of the most useful and eventually successful accomplishments of metallurgy. One of the most interesting features of the entire proposition was the fact that after all the years of expensive experimentation and the numerous failures, when success was finally accomplished, it was along lines previously laid down in Europe many years ago. Even at that time the old operators were only a step from the success which they so earnestly desired, and strove to attain. Dr. Carpenter, who, as stated by Mr. Sticht, did so much for the science of pyritic smelting in his practice at Deadwood, South Dakota, says in his article on pyritic smelting in the Transactions of the American Institute of Mining Engineers, Vol. XXX, that he based his operations largely upon the operations as practiced at Kongsberg, Norway, and at Mansfield. The conditions at Deadwood were perhaps the most unusual attending any large operations in the world; but ingenuity overcame all of these difficulties and the result was complete success. Unfortunately, Mr. Sticht gives little space to the interesting practice at Mount Lyell, where he has made an unqualified success of the difficult metallurgical operations and reduced the smelting of those low grade and rebellious ores to an exact science.

In an official report the operations at Mount Lyell are thus briefly described: "The quantity of coke used in the blast-furnace smelting, when calculated on the ore, is about 5% in current work for the two-fold furnacing, and 6% on the ore, including all incidental coke for glowing-in purposes and similar occasional use, while on all the material fed to the furnaces (less coke itself) the percentage is only 3½% for the double smelting. It can hardly be maintained that so small an addition of coke has any vital bearing on the furnace reactions, from a heat point of view, and it is commonly remarked that the coke simply serves to keep the tuyeres from becoming too hard. It is fed along the long walls of the furnace with this special object in view. Such low percentages of coke are only possible owing to the application of the oxygen of the atmosphere to the ore mixture under conditions which make the oxygen perform a function somewhat different in its effect from that which it exercises in ordinary blast-furnace smelting, where a larger percentage of carbonaceous fuel is necessary. In all stages of the process the material (ore or matte) is constantly subjected to an oxidizing action, and not a reducing one. The process, therefore, in this respect is the direct inverse of ordinary smelting operations in the blast furnace. * * * * It may be said that the Mount Lyell ore smelting is nothing more than a bessemerizing of ores, or matte therefrom, direct in blast furnaces, but so managed as to be continuous and not intermittent, as is the bessemerizing operation (in converters), and also under perfect control, both as to the composition of slags and mattes, and the proper mechanical separation of these two products."

With such operations as those conducted at Mount Lyell, at Granby, B. C., at Cananea, Mexico, and formerly at Deadwood, S. D., there need be little fear of metallurgical problems arising in the treatment of pyritic ores which will long remain without a successful solution, if the ores themselves contain the elements of success.

THE complete destruction by fire of the surface plant of the Lightner mine at Angels, Cal., on the 30th ult., involving a loss of $150,000, accentuates the necessity of adequate fire protection about mines. A small percentage of the loss sustained would, it would be supposed, have afforded ample protection against fire. As usual, however, in the late summer and fall season in central California, the water supply is low, and many of those mines, ordinarily well protected by a sufficient fire service, are now deprived of it, and many of the mines are closed down for lack of power, where water is depended upon alone. In past years the mining companies have suffered heavy losses owing to the same cause. Fires originating many miles away from the mines have swept unresisted over hill and dale, enveloping forests, grass land and brushy slope alike, and destroying hoisting and milling plants unfortunately lying in its course. In Tuolumne county alone, several years ago, fifteen mines had their plants swept out of existence by fires which covered several hundred square miles of territory. It has become an old story in the central mining counties of California, and yet, as the years roll around, no adequate provision is made to impound sufficient water during the spring months to last throughout the summer and fall—until the rains of early winter set in and replenish the supply. The conservation of mountain water for mine use is a subject which receives only a tithe of the attention which it deserves.

The Theory of Concentration.

Mining men often remark the great number of concentrating machines that are on the market, and observe with some surprise that the number of devices for separating mineral of relatively high specific gravity from that which is low continues to increase. Scarcely a week passes that does not see a patent issued for some new device, the object of which is concentration of ores.

Naturally the inquiry presents itself: Why is there so great a variety of concentrators? There are oblong, square, circular and polygonal shapes in concentrators. There are buddles, jigs and bumping tables galore, beside a variety of other kinds too complicated in design to be readily described. There are end-shake and side-shake machines and those which oscillate. Vibratory motion is communicated in a variety of ways—by cams, cranks and other devices. Some have slow motions, others run rapidly—in fact, almost every conceivable device to effect a separation of heavy mineral from the light can be found already in existence, and others continue to arrive with astonishing frequency.

The most interesting thing about it all is that any one of these numerous makes of machines will do good work when in competent hands. An experienced and unprejudiced operator can effect a fair separation of heavy from light material with any of these machines, and some of them seem to lack little of perfection itself.

Beyond a doubt, the incentive which has resulted in such abundant evidence of the ingenuity and skill of the inventors is a belief on the part of each one that he can devise a machine which will make a perfect separation of the valuable minerals, usually of high specific gravity, from the less valuable and comparatively low specific gravity.

Unfortunately for the inventors and makers of concentrating machines generally, here lies a physical impossibility, for it has been repeatedly demonstrated, long since, that it is impossible to separate a coarse and an extremely fine particle of heavy mineral from a relatively light gangue at a single operation, with the same grade of machine, the same vibration and same amount of water. The combination of movements and volume of water which will accomplish the saving of the coarse particle will permit the fine particle to escape, and vice versa. The grade, vibration and flow of water which will carry off the sands and slimes of the gangue will also carry away with it the finest of the sulphides, and usually the richest. A concentrator man points with just pride to the clean concentrate his machine is producing. Examination shows it to be almost wholly free from gangue minerals. But what of the tailings? An equally careful examination may show them to contain considerable slimed sulphides—the richest portion of the ore. When the machine is set to save a reasonable percentage of these rich slimes, sands are also saved, and the concentrates are no longer clean.

The cause is readily discovered. A moment's thought will convince any reasonable person that it is a physical impossibility to save all the values in a pulp by passing the material over a single machine. The grade and volume of water which will carry away the coarse grains of sand will, in all probability, hold in suspension the microscopic particle of pyrite, galena, blende, or chalcopyrite. While this is true, it is equally true that when the fine particle of sulphide is saved, the grade and consequent force of the current of water will be insufficient to carry away the coarse grains of quartz, or other gangue mineral.

This being the case, the necessity for classifying the pulp from the crushing machines, before concentration is attempted, is evident. This can be accomplished by sizing screens or by the employment of hydraulic classifiers. In the case of some ores, both devices may be resorted to with success. At some of the largest concentrating mills, the crushed ores pass through sizing trommels, and from these screens the several sizes go to jigs set to treat each particular class. Further hydraulic classification is then followed by concentration on machines of some make. The result is that little of value eventually escapes. The entire scheme of concentration is arranged to operate automatically, and requires overseeing only.

In the treatment of most gold ores a much less elaborate plant is required. The ore is first sent to classifiers, and from these the discharge from beneath goes to one machine, the overflow going to another and sometimes entirely different make of concentrator. Here, again, is an opportunity to carry the concentration of values to a refinement exceeding the economic results, but, although there is little use in going to the latter extreme, it is self-evident that in order to effect successful concentration the pulp must be subjected to a classification of some kind. The concentrating of pulp from batteries direct, and the recleaning of the resulting concentrates on another machine, is simply another form of classification, but is not the best practice. If satisfactory results follow this method of treatment, it is almost a foregone conclusion that a more rational course would produce a closer saving at a reduced cost, which should be sufficient to recommend it to all who are in need of suggestions along these lines.

THE operation of machine drills is a matter which concerns almost every hard-rock miner. The great number of makes of drills of the various kinds—air, steam, electric, gas and hand-power machines—and the endless variety of conditions which the miner finds in his daily work underground, makes the operation of drills a constant study to the careful and observing man. Elsewhere herein is an article on the operation of machine drills on the Rand, in which the author calls attention to many important points. The suggestion that the pressure under which the drill operates be increased to somewhere near 100 pounds per square inch is one which will meet with universal approval among those who have operated drills under pressures below 70 pounds. Whatever may be the pressure indicated by the gauge in the compressor room, it will not be found to have the same pressure at the drilling face in the mine. Friction in pipe lines and leakage will reduce the pressure to an extent determined by existing conditions. The statement in the paper referred to—that some miners object to drilling more than four holes during a shift—simply illustrates a local labor situation, for the amount of work represented by four holes under ordinary conditions would scarcely be considered more than half a shift's work. The reference to the faulty work of hand miners, who are proficient in drilling with the right hand only, is similarly due to local practice and would not long be tolerated in any country where skilled labor is obtainable. The stopes in the mines of the Rand are all of comparatively small dimensions—rarely over 6 feet in height—and the banket dips at low angles, so that the conditions described and the operation of machine drills there must be recognized as typical of economic and geological conditions on the Rand, and as not being of general application elsewhere.

THE second tunnel connecting New Jersey and New York City was recently completed. This work was commenced about 25 years ago, and considerable progress made, but the many difficulties encountered and accidents occurring, with the resulting loss of life, caused a suspension of operations, which were only renewed in recent years, when, with the aid of modern scientific methods, the great work has been successfully completed. These tunnels are each a little over a mile in length.

CONCENTRATES.

A TOWNSITE PATENT, where valid mining locations have been made, does not grant the minerals to the townsite.

✤✤✤✤

FLOAT in miners' parlance is the name given to pieces of ore which have become detached from the ledge and lie upon the surface, or mixed with the debris between bedrock and the surface.

✤✤✤✤

APATITE is calcium phosphate. It occurs in many rocks, particularly in dark basic rocks like norite, where it appears in the form of slender needles. It is also found in good sized six-sided prisms in pegmatite dikes.

✤✤✤✤

FORMERLY the size of quartz mining claims in the Black Hills of South Dakota was 300 by 1500 feet. So many broad lodes were discovered that the law was amended, and the claims since located are 600 by 1500 feet.

✤✤✤✤

THE cost of breaking ore or rock in a mine or quarry is entirely dependent upon the conditions under which the mining or quarrying is done. It would be impossible to give even an approximate figure without a full knowledge of these conditions.

✤✤✤✤

THE Federal laws expressly provide that lands within forest reserves, which are shown to be mineral in character, may be located under the mining laws. This, however, does not apply to the national parks. Claims so so taken in a forest reserve may be patented.

✤✤✤✤

WORK performed upon an unpatented mining claim by leasers may be applied upon the annual assessment work by the owner of the claim, but work done by a trespasser, even though paid for later, may not be so applied. The work must be done by the owner, or at his instance.

✤✤✤✤

THERE is no book or pamphlet containing the mining laws of the State of Nevada and California separately. "Lindley on Mines" contains the mining laws of the several States. "Morrison's Mining Rights" also contains an epitome of the Federal and State laws, land office rulings, etc.

✤✤✤✤

WHERE mine pipes for either air or water have to be bent around corners, the flange joint will in every instance be found superior to screwed connections. The saving in time in making connections or disconnecting the same will save several times the additional cost of the flange fittings.

✤✤✤✤

THE basis of valuation of a mine must be naturally the amount of gross value it contains as referred to the cost of extracting the ore and turning it into money. A mine with a million dollars' worth of ore in sight which careful calculation shows will cost two millions to turn it into money is worse than worthless.

✤✤✤✤

THERE is no law specifically entitling the locator of a tunnel site to any surface ground for the purposes of dump, buildings, etc. The locator might proceed, however, under the mill-site law, by the terms of which he would be limited to a surface of five acres. This suggestion, however, is tentative. There is no decision or Land Office ruling on this subject.

✤✤✤✤

IN some districts the fire insurance companies refuse to write policies on mining or other industrial concerns using petroleum for fuel, where the tanks are set on an elevation so that the oil may run to the burners by gravity, as they claim the damage in case of fire is likely to be much greater under such conditions than in those instances where the oil is pumped to the burners.

✤✤✤✤

CHLORIDE OF SILVER is readily soluble in solutions of potassium cyanide, but the cyanide solutions must be considerably stronger than those required for treating the usual run of gold ores. Where the ore contains chloride of silver alone, with little or no gold, solutions of hypo-sulphite of soda are usually employed in the lixiviation of such ores, or they may be treated by pan amalgamation.

✤✤✤✤

THE courts generally have decided that the true measure of damages in the case of mine trespass, and the extraction of ore, depends upon circumstances of aggravation, and ranges from the net profits of working the ore, to the gross value of the ore after breaking it down in the stope. In all cases where there has been neither intent to defraud, or culpable negligence, the cost of mining should be deducted.

✤✤✤✤

GOOD AMALGAMATION can be done at almost any temperature between 35° and 100° F., but those who have experimented on the relation of results in amalgamation to the temperature of battery water say that the best results are obtainable at a temperature of 52° to 55° F. A certain amount of heat is always produced in the mortar by the falling stamps, but to what extent this raises the temperature of the battery water is not known.

✤✤✤✤

THE watt is the unit of electrical power and is 1–746 of one horse power. It equals the mechanical energy represented by 44.24 foot pounds. One ampere of current moving under the influence of one volt pressure, or any combination of volts and amperes, and that will make unity when multiplied together, is the equivalent in the expenditure of energy to the work a man would do in lifting one pound 44.24 feet high, or any work—any weight—raised any distance, in which the weight and the distance multiplied together make 44.24.

✤✤✤✤

ZINCBLENDE is not infrequently mistaken for galena, and it has been taken for tellurium when occurring in quartzose gold ores. It can usually be determined by its streak, which is always brownish, the streak of galena being the same as that of the ore itself. A drop of hydrochloric acid on blende causes an evolution of the hydrogen sulphide, which can readily be detected by its odor, resembling that of addled eggs. Zincblende is sometimes rich in gold and silver, but, like galena, its appearance is no index of its value in precious metals.

✤✤✤✤

WHERE A, B and C are partners in unpatented mining claims and A contracts debts of a personal character, it seems reasonable that A's interest in these claims may be attached for such debts, without prejudice to B and C. In such cases the law is usually plain, but the facts are often difficult to establish. It would be impossible to give a comprehensive answer without being acquainted with all the facts, and even then it may require the services of attorneys and the courts to reach a final decision. This is not a question of mining law but an ordinary civil case.

✤✤✤✤

IN drifting the machine bar should be placed horizontally and the machine clamped directly to the bar, as the arm is not necessary. The machine may be turned either above or underneath the bar. By boring the upper part of the round first, the muckers may remove any debris from the last round of holes. While this is being done the upper holes may be drilled. The rock removed, the bar may be taken down and placed in position for the lower holes of the round. This saves time for all hands engaged in the work and cheapens the cost of driving the drift.

✤✤✤✤

CONCRETE FOUNDATIONS for water or solution tanks are all right, but much more expensive than those of timber. There may be situations where the concrete would prove the most satisfactory. No wooden tank should be built so low as not to admit of passage beneath it for the purpose of inspection and repairs when necessary. Tanks may be provided by excavating in the ground and lining the pit with concrete, after the manner of cisterns. The tailings may be removed by mechanical excavator, hydraulic ejector or by sluicing out through a passage built underneath the tank.

✤✤✤✤

A MINE differs from a quarry in that the former is usually an excavation underground, where artificial light is used, while a quarry is open to the sky. Many mines consist of open excavations as well as those underground. In the Western United States are numerous ore deposits lying nearly horizontal, on the summits of hills. The excavations on these deposits, through open-like quarries, are usually referred to as mines, so that the material produced in a measure influences the name. Deposits producing metals and some earthy substances, such as magnesite, calcium borate, gem stones, etc., are called mines, regardless of the character of the deposit, so long as it is rock in place, while workings producing structural materials—granite, marble, sandstone, etc.—are called quarries. Deposits of clay, gravel, sand and similar substances, when opened by excavating, are called pits.

✤✤✤✤

MINERALS as constituents of rocks undergo many changes, due to oxidation and chemical alteration. Hornblende is altered from a dark green, compact crystal to a bunch of fibrous mineral, the outline of the original crystal being usually indicated by a border of black grains of magnetite. Augite alters to hornblende (uralite), but this may often be distinguished by means of the microscope. When augite has altered to hornblende, the latter takes the characteristic cleavage of hornblende, while the outline of the augite crystal remains unchanged. Often in the center of the crystal may be seen an unaltered core of the augite, with its characteristic cleavage lines. By shearing and pressure the hornblende is drawn into flat, disconnected filaments and gradually passes over by further alteration to chlorite, and chlorite to epidote. Greenstones undergoing alteration usually afford examples of these several phases of the alteration of augite and hornblende to other minerals.

✤✤✤✤

THE distribution of power in a quartz mill is a matter requiring as much attention as any of the other details of construction, or much power may be wasted by the employment of unnecessary shafting, belts, etc. All shafting, whether on blocks or hanging, should be kept in perfect alignment. Often the timbers placed in mill frames are unseasoned, and in time warp badly on drying. Shafting placed on such timbers will be thrown out of adjustment, and this necessitates watching the lines of shafting and occasionally lining them up with a transit. The transit is far better for this purpose than a chalk line. Rock breakers and concentrating machinery should not only have shafting separate from the other machinery of the plant, but each should be driven by a separate wheel or motor. Where a large engine runs the machinery of the mill, the breaker may be run from a pulley on the line shaft, but it is better to have a separate engine for the concentrators in any case, as on the steadiness of the operation much depends.

✤✤✤✤

WHEN water issues from the mouth of a mining tunnel and finds its way down a hillside, no one lower down on the hillside can acquire any permanent right to have this water continue coming down to him, if the mine owner chooses to stop it later. But if the water coming down from the mouth of the tunnel reaches a natural stream, it becomes part of the natural stream by accession, and may then be appropriated by others together with the water of the stream from which it can no longer be distinguished. The mine owner cannot thereafter take it out of the stream against prior appropriators of the stream, nor can he stop it before it reaches the stream to the injury of such appropriators. This is the best rule upon the point. Water coming from a mine tunnel cannot be appropriated by others, until it reaches a natural stream, but then it becomes a part of the stream and belongs to the appropriators of the stream. It is presumed that the correspondent from Phillipsburg, Mont., referred to water from a mine tunnel, and the above answer is made accordingly. The matter will be found discussed in "Water Rights in the Western States," Sec. 131.

✤✤✤✤

THE life of the electric furnace depends mainly on the durability of the lining used, the best of which principally consists of silicon carbides, such as carborundum, siloxicon and crystallized magnesite, themselves products of the electric furnace. For ordinary furnace kilns, carborundum is ground fine, and mixed in the proportion of three parts by weight of carborundum to one part by weight of silicate of soda (water-glass). After thoroughly brushing the freshly set firebrick to get rid of the dust (the mixture does not stick readily to a surface which has been already fired), the carborundum is painted on to the depth of half a millimetre. It is left for twenty-four hours to dry; afterwards the fire started up gradually, when a layer of carborundum becomes cemented over the whole surface of the firebrick lining, and if properly done it adheres soundly. Where basic slags or basic materials have to be taken into consideration, fireclay is employed as a binder instead of the waterglass, the proportion being usually six parts by weight of carborundum to one part by weight of fireclay. Although to a certain extent self-binding when heated to a high temperature, in commercial work it is advisable to add some form of bond to siloxicon.

✤✤✤✤

AFTER many years running of a 25-stamp mill, there is naturally a considerable accumulation of magnetings, that is, iron scraps and dust, due to the wearing of shoes and dies in the mortars, which are separated by magnet from amalgam and pyrites during each cleanup. The gold adhering to the larger particles of iron is easily recovered by heating, pounding and amalgamation; but that associated with the finer particles and dust can not be as easily extracted. The presence of a high percentage of metallic iron beds renders any attempt at grinding out of the question. It may be mixed with a little less than six times its weight of pyrite concentrates and the whole roasted in a reverberatory furnace. The sulphur thus liberated from the pyrites, combined with the metallic iron, forming a sulphide of that metal, and this, in its turn, as roasting proceeded, is reduced to Fe_2O_3, which is amenable to grinding, and the gold is consequently liberated. A small quantity of bichromate of potash may be added when the pulp is charged to the pan; and, after grinding for six hours, the muller raised and mercury introduced. For two hours, although the mercury remains bright but somewhat sluggish, no amalgamation will take place. On the addition of a little dilute sulphuric acid, however, the gold will be immediately taken up, the actual extraction approximating 95% of the assay contents.

✤✤✤✤

MILL AMALGAM contaminated with babbitt metal, lead, etc., may be freed to a great extent of these impurities by placing the foul amalgam in a pot containing sufficient quicksilver to readily float the contaminated mixture. Stir this well and allow to settle for several hours, or, better, a couple of days. The lead alloy will float on top of the mercury and the gold will settle to the bottom of the pot. By skimming off the dross and straining the quick, the gold may be recovered. If the process be repeated with the lead alloy it may be rendered quite free of mercury and gold. This lead may then be fused with a suitable charge in a crucible, when a lead button containing gold and silver will result, the tin, antimony, copper and other metals going into the slag. The lead button may then be cupelled to get rid of any base metal, the gold and silver only remaining. When the amalgam contains a quantity of nails and other metal scraps to which the amalgam clings, the mass should be treated some hours in a cleanup barrel, or, lacking this useful auxiliary to the mill, the mass may be ground or stirred in an iron mortar with an excess of quicksilver. This will soften the amalgam adhering to the metal, and the greater portion will become detached from the nails, etc., and drop to the bottom, while the nails will float on the surface of the mercury, from which they may be removed by the hands or a perforated strainer. This scrap should then be placed in a box and sprinkled with salt and allowed for several months to rust. In time this can be placed in the cleanup barrel or pan and ground with quicksilver for a day, when the gold will be recovered in the quicksilver.

Electric Smelting.

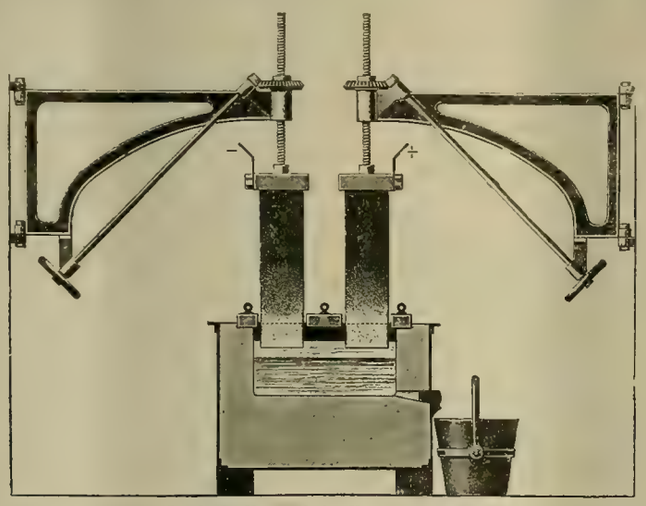
The smelting of iron ores by electricity will doubtless be successfully and economically accomplished in the near future, but the process is practically still in the experimental stage, although plants are being built for the purpose—one in Germany, one at Syracuse, N. Y., and one at the Sault Ste. Marie, Canada. As by the electric process it is thought iron sands and fines can be smelted without first briqueting the material, should the experiments now in progress prove commercially satisfactory, the electric method will become an important factor in the iron industry.

Dr. Heroult is possibly the best living authority on the smelting of iron ores and the manufacture of steel by the electric method. He has invented the process which is named after him. The works at Syracuse, N. Y., are being erected by the Holcomb Steel Co., who have obtained a license from Heroult to use his invention. The cost of the works will be $1,000,000 and the output will be from 80 to 100 tons daily. The company propose to manufacture tool steel and also high-class billets. The Holcomb Co. will be the first concern on the American continent to use electricity in connection with the making of steel. It will be produced by the ordinary method and the electricity will be applied to a purifying or refining process. Dr. Heroult has undertaken to superintend experiments in the making of pig iron and steel at the plant now in course of construction at Sault Ste. Marie, and for which the Canadian Parliament voted $15,000. Associated with him will be Dr. Haanel, superintendent of mines.

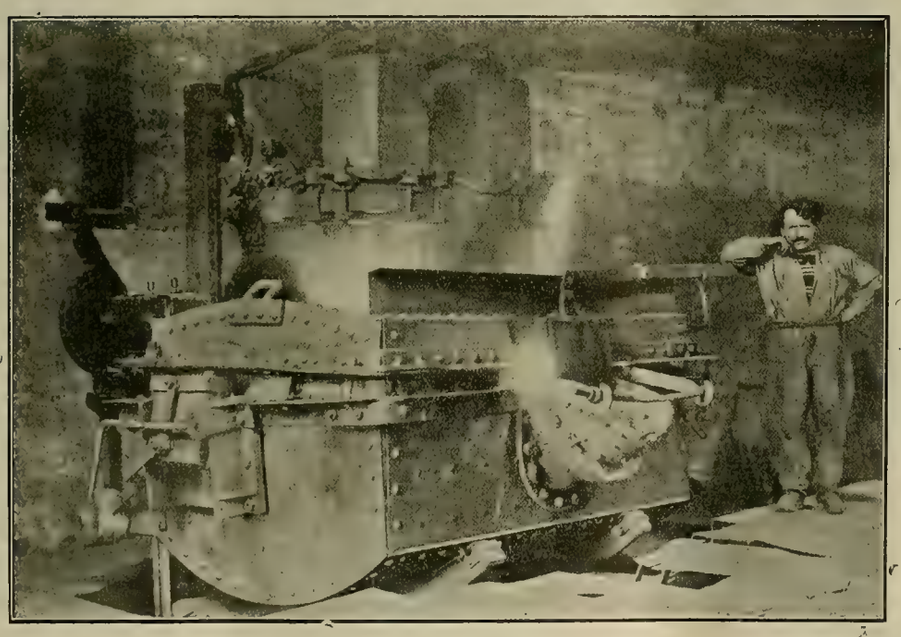
In the Heroult process the metal to be smelted is only brought indirectly into the electric circuit, and at the same time is introduced a layer of slag, or of an electrolyte, to act as a heating resistance between the electrodes and the metal. In this way all direct contact between the metal and the carbon electrodes is avoided. W. G. McMillan's translation of Dr. W. Borchers' treatise, "Electric Smelting and Refining, thus briefly describes the Heroult process:

The accompanying figure shows the arrangement of the electrodes in a diagrammatic sketch of the furnace, and the accompanying engraving illustrates the furnace in actual operation.

A bath of melted metal having been prepared either in the electric furnace itself or in some other suitable vessel, the material is treated electrically in a receptacle lined with a non-conducting refractory material free from carbon. In this vessel it is covered with a layer of slag or of other substance which only acts as a conductor at high temperatures. The electrodes are immersed in this slag to such a slight depth, and at such a distance apart, that the current is forced to flow from one electrode through the slag immediately beneath it to the metal below, and thence through the same layer of slag to the other electrode. This is arranged by regulating the proportion of the resistance between the electrodes and the sum of the resistances between the metal bath and the electrodes, respectively. Care must be taken that neither electrode touches the fluid metal. It is neither injurious nor necessary that arcs should be formed between the electrodes and the melted material in which they are immersed. It is, however, essential that the distance between the electrodes and the metal bath should be so regulated that the layers of slag in these spaces should, throughout the process, be hotter, and therefore a better conductor than the slag which lies between the two electrodes. Only in this way can the current be made to take the path indicated above.



Sectional View of the Heroult Furnace.



The Heroult Electric Furnace in Operation.

It is perhaps hardly necessary to say that the only way to act on the metal smelted in the above manner is by means of reagents introduced onto or into the metal, whether the object be to eliminate undesirable constituents or to add such as are desirable. The author has to thank Dr. P. Heroult for the following particulars of the composition of various samples of tool steel smelted in this furnace:

	Per Cent.
Sulphur	0.016 to 0.022
Phosphorus	0.006 to 0.011
Silicon	0.020 to 0.023
Manganese	0.092 to 0.138
Carbon	0.840 to 1.080

The percentage of carbon was designedly raised to the figures quoted; that it can be kept below this level is shown by the following composition of mild steel: S 0.008%, P 0.003%, Si 0.007%, Mn 0.000% and C 0.008%. The pig iron used for this charge contained: S 0.05%, P 0.129%, Mn 0.89% and C 0.31%.

The Heroult process can also be carried out on a comparatively small scale; and a current of 50 electrical horse power proved sufficient for the purpose of small demonstrations in the Aachen Metallurgical College.

With a 300 H. P. furnace, and starting with cold metal, Heroult has succeeded in producing 44 pounds of steel per electrical horse power in twenty-four hours. It is evident this figure would be considerably exceeded if the furnaces were charged, partly or wholly, with molten pig.

The success of this new process must be attributed to the fact that the electrodes are kept out of contact with the metal to be smelted. A simpler method than the one adopted is hardly conceivable, so long as a dynamo current has to be employed; but since that time a noteworthy method has been discovered, in which the use of electrodes is rendered superfluous, namely, the Kjellin method of generating the heating current within the metal itself by induction. The inventor of this process has favored the author with the following particulars:

"The furnace consists of a circular trough, with brickwork sides and bottom and covered top. In the center of the circle is a square core of thin, soft iron plates, enclosed in a bobbin of insulated copper wire. The core projects above the furnace chamber and forms a rectangle which occupies, in relation to the furnace, the same position as one link in a chain does to another. The bobbin is connected to the poles of an alternating current generator.

The passage of the alternating current through the bobbin excites the iron core and induces an alternating current in the metal contained in the annular bath. Since the bath is situated in a single plane around the core, the strength of current is equivalent to that produced in the generator, multiplied by the number of coils in the bobbin. The tension, of course, varies inversely with the strength of the current.

In this way use may be made of a generator of high tension alternating current to produce in the furnace a low tension current of increased strength, and that too without the use of wasteful electrodes and large copper conductors.

Cleaning and Agglomeration of Ore Dust.

A concentrating and smelting plant at Niagara Falls makes use of the Ruthenburg processes, says the Iron Trade Review. The ore concentrated is a fine dust containing sand, which must be got rid of before it is a valuable product. The tailings are also valuable from the copper content. The first step in the process is to remove the sand. This is done by means of a magnetic separator, which consists of a revolving electromagnet driven on a horizontal axis by means of an electric motor. Over this is placed a metal apron which, on one side, leads to a bin of the concentrates, and on the other to a shallow trough into which the dust is fed. The dust is stirred and pushed along this trough by means of a conveyor. When the magnet is revolved, the magnetic particles of ore are attracted by it, and, as each pole approaches them, rise, stand on end, and then fall flat in the other direction, rising again as the next pole approaches. In this way, by a series of somersaults, they march up the metallic apron in a direction opposite to the motion of the magnet, pass over the top, and fall into the concentrate bin. This concentrator is said to be very effective in removing siliceous matter and phosphorous impurities. After concentration, the ore, being in a powdered condition, requires special treatment before it is suitable for the smelter. This is accomplished by means of the Ruthenburg electric smelter, which has been described recently. In brief, it consists of an electromagnet having two cylindrical parallel electromagnets, the poles of which are cylindrical and arranged side by side. These poles also serve as the electrodes for passing heavy currents through the magnetic ore as it is passed through them. The particles of dust form bridges across the poles, through which the current flows, partially melting them, when they become non-magnetic and fall into a receiver placed below, in the form of beads.

Copper sulphide is said to be soluble in yellow sodium sulphide, says a writer in a German chemical journal, the solubility increasing according to polysulphides present. In the assay of copper in tin ores, by fusion of the oxides with equal parts of caustic soda and sulphur, and the extraction of the fused mass with water, large quantities of copper are dissolved in the solution according to Prost and Van der Casteele; this amount varies from 3% to 64% of the total copper present. Rossing claims that the copper will remain entirely insoluble in the fused mass if a current of hydrogen be allowed to permeate through the mass while being extracted with cold water. The author claims it easier to add sodium sulphite from time to time to the boiling solution of the polysulphides until the liquid becomes colorless, sodium thiosulphate and monosulphide being formed. It is claimed this method gives accurate results in the separation of copper from lead and antimony ores.

The Practical Operation of Machine Drills.*

Written by E. M. WESTON.

To say that an 8-inch deep vertical hole, bored with a Star bit of 3-inch diameter in homogeneous rock, represented truly the work to be done underground would be a mistake, because most holes bored in mines are nearly flat or inclined 45° on either side of the horizontal. The difference in conditions in boring a nearly flat wet hole 7 feet long in "sticky" ground on an "upper" inclined only a few degrees from the horizontal, and a short vertical hole, is enormous. In one case the drill has little or nothing to retard its rotation or to cause sticking and test the machine's power of recoil; in the other the drill is working in a long tube filled with grit and water, often, when too little water is applied, becoming a stiff mass. In the case of a dry hole also the tube is half filled with stiff sand, causing great friction and retarding rotation and recoil. The shallow hole is bored with a star bit having 6 inches of cutting edge, while a large proportion of a deep hole may be advanced by a chisel bit with only 2 inches of cutting face. Again, in shaft sinking the recoiling power of the machine is severely tested to lift 8 or 9 feet of heavy steel from a deep hole.

All types of machines will sometimes rifle badly in one hole, while boring the next truly cylindrical, and I believe "rifling" is almost always due to faulty alignment of the drill in the hole, causing friction on one side or other of the cutting bit or the steel itself. Quite a large number of holes are bored thus, owing to various causes, and the best machine will bore a hole while "laboring" to a great extent. Sometimes this is due to inattention of the boys in charge, and often the mere loosening of gig bolt or clamp will at once increase rate of boring. At other times it is impossible, owing to lack of room, to move the machine to properly follow the hole.

No deduction drawn from the tests before referred to appear so contrary to practical experience as the alleged advisability of using air at 60 pounds pressure for underground boring in ground of the average hardness found in this district. In actual work nearly 40% more work can be done in a given time with the pressure at 80 pounds than at 60 pounds. I have often gone below and had difficulty in boring 3½-inch holes when the pressure was low; while in the same ground I could bore five holes when it rose to about 75 pounds. In West Australia I have seen 100 pounds pressure kept on the receiver when working in hard quartz; and as far as I can compare the difference in ground, the number of feet bored per shift compared favorably with that shown by the same machine here. I am of course aware that in some cases this pressure would be excessive owing to blunting and breaking drills and the trouble in securing bar and connections. It appears strange that more advantage has not been taken of the facilities for forming large and cheap air reservoirs in drives underground that would be of value also in freeing the compressed air from injurious oil and other impurities. The necessity of preventing leakage in the underground pipe circulation has always been insisted upon. I should like only to point out that a mistaken desire for economy may force the miners or pipe repairer to use really worn out piping and hose for connections. This leads to frequent stoppage to repair breaks, and to more or less constant loss by leakage. Hose and pipes showing signs of deterioration should be at once condemned for air service and taken out of the mine or used for lagging to ensure their not being again used. I also think plug taps should not be used below. My experience is that they are always either too tight to turn or leaking badly. The wheels of wheel valves are too liable to get lost or damaged and it would be an advantage to get a special type of these with a handle like a plug valve ½-inch square that can be opened and shut by a spanner. I shall not soon forget the experience of trying to turn one of the ordinary ones (whose wheel had been lost), by means of a spanner while clinging to the foot wall of a stope having an angle of about 10° from the vertical. I remember being struck by the maze of pipes and right angle bends in the air service of a Broken Hill mine, where the square set method of timbering caused difficulty in supplying the many floors between levels with air, and wondering what pressure a gauge set before each machine would show under the circumstances. Conditions here are not so bad, but elbows are often seen put in where bends should have been insisted upon. The need, however, of a periodic test with a pressure gauge at each working face in a mine seems apparent from the following incident.

During one month the air pressure in our stope was good, during the next we could make no progress, and not being able to find a cause we put it down to something wrong with the compressor. Finally it was discovered that a stone had lodged in an old stop valve in the pipe line along a level some distance from our working face. In mines there is always a possibility of something of the sort happening, and I think in some mines surprising falls of pressure in some places might be detected by means of a gauge test at regular intervals. Some pipe men and their Kaffir assistants have a bad habit in making joints. When it is necessary to join up two pipes by means of a coupling having right and left handed threads a washer of rubber packing is inserted to stop leakage. I have seen this put in a 2-inch or 1½-inch pipe with a hole barely 1 inch diameter and cut in the center. This must greatly increase pipe friction to the passage of air.

In many quarters the advantage of using the longest possible holes in large stopes has been recognized. Mines may, I think, still be found where the same steel is served out for stoping as for development in drives, where a hole about 6 feet long is generally used. It is the starting, and the first foot or two of hole, that occupy the time in boring. It might be worth while to inquire what is the most economical length of hole to be used in stoping over 42 inches high. We must remember that in big stopes in average ground it is seldom possible to bore more than four, or at times five, holes to advantage from one bar. Indeed many miners decline to bore more than four holes in a shift. It is a loss of time to take down machine arm and bar and rig again. The shift is from 9½ to 10½ hours long, and holes must usually

Some Important Minerals.

There is a constant inquiry as to the properties, value and production of a number of minerals produced in the United States. The following tabulated statement will give this information in condensed form. Here is given the composition, value, color and production of the most important minerals produced in the United States in 1904:

ELEMENT.	Metal Value.	Principal Ores.	Approximate Analysis.	Per Ct.	Color Powdered Mineral.	Production 1904 Quantity.	Value.
ALUMINUM	$ .34 lb.	Bauxite	Alumina	74	White Gray	4142 tons	$ 2,477,000
			Water	26			
ANTIMONY	.08 lb.	Stibnite	Antimony	72	Gray to Black	3057 tons	505,524
			Sulphur	28			
ARSENIC		Orpiment	Arsenic	61	Lemon Yellow	Oxide 36 tons	2,185
			Sulphur	39			
		Arsenopyrite	Arsenic	46	Black		
			Sulphur	19			
			Iron	34			
BORON	.10 lb. Powdered	Colemanite	Boron	25	Colorless or White	Crude 45,647 lbs.	698,810
			Calcium	19			
			Water and Ox				
BROMINE		Sodium Bromide	Sodium	22	White	897,100 lbs	269,130
			Bromine	78			
BISMUTH	2.10 lb.	Tetradymite	Bismuth	52	Gray		
			Tellurium	48			
		Bismutite	Bismuth, Ox	88	Greenish Yellow		
			Carbonic Acid	07			
CADMIUM	1.00 lb.	Greenockite	Cadmium	79	Orange Yellow		
			Sulphur	21			
CHROMIUM	.80 lb	Chromite	Iron		Dark Brown	123 tons	1,845
			Chromium	52			
			Oxygen				
COPPER	.15 lb.	Chalcocite Covellite Bornite Chalcopyrite Cuprite Tenorite Malachite Azurite	(Copper glance) (Indigo) (Peacock) (Pyrite) (Ruby) (Black) (Green) (Blue)		Copper contents from trace to 88%.	812,537,267 lbs.	105,629,845
FLUORINE		Fluor Spar	Calcium	51	Pink Yellow	36,452 tons	234,755
			Fluorine	49			
		Cryolite	Sodium	33	Green White		
			Aluminum	13			
			Fluorine	55			
GOLD	20.67 ounce.	Native	Various Alloys		Yellow	4,090,176 oz	84,551,300
		Sylvanite	Gold	25	Steel Gray		
			Silver	15			
			Tellurium	56			
		Calaverite	Gold	45	Brass Yellow		
			Tellurium	55			
			Silver				
IRON	19 00 ton	Magnetite	Iron	70	Black	Pig 16,497,033 tons	233 025,000
			Oxygen	30			
		Hematite	Iron	72	Indian Red		
			Oxygen	28			
LEAD	.04 lb	Galena	Lead	86	Grayish Black	Metal 397,000 tons	26,402,000
			Sulphur	13			
		Cerussite	Lead Oxide	83	White		
			Carbonic Acid	16			
MANGANESE	2 75 lb.	Pyrolusite	Manganese	63	Black	Ore 3,146 tons	29,466
			Oxygen	37			
MERCURY	75-lb flask 4 0 00	Cinnabar	Mercury	86	Red Vermilion	34,570 flasks	1,503,795
			Sulphur	14			
MOLYBDENUM	2 75 lb.	Molybdenite	Molybdenum	60	Grayish Black		
			Sulphur	40			
NICKEL	.45 lb.	Niccolite	Nickel	44	Brownish Black	24,000 lbs.	11,400
			Arsenic, etc	56			
		Gersdorfite	Nickel	35	Black		
			Arsenic	45			
			Sulphur	20			
COBALT	Nickel and Cobalt are generally found together.						
SILVER	.60 ounce	Argentite	Silver	87	Blackish Gray	53,603,000 oz.	Coining value 69,303,319
			Sulphur	13			
		Pyrargyrite	Silver	60	Dark Red to Black		
			Antimony	23			
			Sulphur	17			
		Cerargyrite	Silver	75	Pearl Gray		
			Chlorine				
		Argentiferous Galena	Silver		Grayish Black		
			Lead				
			Sulphur				
TIN	.30 lb.	Cassiterite	Tin	78	Brown to Black		
			Oxygen	22			
		Stannite	Tin	27	Black		
			Iron	13			
			Sulphur	29			
			Copper	29			
TUNGSTEN	1.25 lb.	Wolframite	Iron Oxide	19	Black		
			Manganous Ox	05			
			Tungsten Ox	76			
		Scheelite	Calcium Oxide	19	White Brown Green		
			Tungsten Oxide	80			
URANIUM	3.50 lb.	Uraninite	Uranium	81	Brownish Black	Uranium & Vanadium 45 tons	10,600
			Oxygen	13			
ZINC	.06 lb.	Sphalerite	Zinc	67	Brown		
			Sulphur	33			
		Zincite	Zinc	80		186,702 tons	18,670,200
			Oxygen	19			
PLATINUM	20.50					200 oz.	2,600

be fired every shift. If, then, the miner is provided with steel that allows him to bore a hole no longer than 6 feet, it may often happen that he has finished his four or five holes, say 1½ hour before it is time to blast, when half an hour would be the time required to pull down machines and load up. Hence there is an hour's time wasted, which might have been profitably employed lengthening each hole. We would say, then, that the most economical hole is of such a length that four such holes can be bored on one bench, the machines removed, and the holes loaded and fired during one shift. This length may be anything from 5 feet to 10 feet, depending on the air pressure available, hardness of ground and facilities for working. For work in narrow stopes with small machines many consider that holes of 5 feet are as long as can be advantageously used. Holes 6 feet to 7 feet long can, however, be successfully used in such cases. It is possible to finish the hole with a chisel of ⅞-inch diameter, steel 8 feet long. This can be used even with a 2¾-inch machine in ordinary ground with air at 70 pounds pressure. I think it advantageous to use steel of different sizes for different lengths of chisels, as it is easy even in hard ground to get three chisels to follow one another if they are made of 1½ inch, 1 inch and ⅞ inch octagon steel, respectively. It is, of course, possible to make such a series from 1 inch steel, but in actual work the other arrangement guards against any mistake being made in sharpening, and allows a large shoulder margin on the cutting bit of the last chisel. Such details may appear trivial, but I know of one case here or elsewhere where such a method would have effected a great saving. A useful set of steel for 2¼, 2½ or 2¾-inch machines where the ground does not allow a longer hole being used is as follows: Starter, 2 feet long, 2½ inches face, star bit; chisel, 3½ feet long, 1⅜ inch bit, of 1⅛ inch steel; chisel, 5 feet long, 1⅜ inch bit, of 1 inch steel; chisel, 6 feet, 1⅛ inch bit, of ⅞ inch steel. Measurements are "more or less." The relative merits and defects of star and chisel bits applied in rock drilling deserves discussion. Compared with chisels, star bits have the advantage that in hard ground the wear on the cutting edge is halved for the same distance driven, and that the four shoulders opposed to wear allow a longer distance to be driven on a smaller difference of gauge between following drills. In ground full of heads and fissures in stoping or shaft sinking they will put down a hole where a chisel would certainly stick. They are, however, relatively heavier and oppose more resistance to turning, and in some grounds do not bore so quickly as a chisel bit. To what extent their use is advisable must depend on the circumstances of each particular case.

An objection to using ⅞ inch steel often urged is that it is impossible to get 1½ inch gelatine to the bottom of the hole, and that the last portion of the hole is thus rendered useless; while to do advantageous work the explosive should be concentrated in the bottom of the hole. Devices have indeed been proposed for enlarging the bottom of hole. If the direction of a stope hole is attended to this would be needless, and the smaller quantity of explosive in the end rendered effective in many cases.

Some notes on experience gained while working in large and small stopes on the Central Rand may illustrate this and other points. Firstly, the question as to the number of feet of working space advisable to allow to one machine deserves discussion.

We were usually working three machines on a face of 160 feet long. This I consider too crowded up for the best work. Each machine should be given 70 to 80 feet of space in a small stope, and 100 feet in a big stope where long holes are used and where there are many pillars to cut round. When we were able to work three machines on two faces east and west of a winze, we considered we could break from 3 to 6 fathoms more in a month than when we had to keep to one face. These figures refer to stoping when the whole round of four to six holes bored are not all loaded and blasted at the end of the shift. This, of course, is never done now where good results are expected; as the only proper system to use is that one miner loads and fires the front holes he has bored and the back holes left by his partner on his "bench," and he leaves his back holes in turn to be blasted by his partner. In this system the failure, if any, of the front holes to explode or "come" does not involve wasting the charge in the back ones. The reason a machine requires lots of face room is that it often happens that a "round" of holes may not have come well, leaving an awkward bench to bore, or one too narrow to make it worth while to put four or five holes in; while the time may not allow of boring three holes there and setting up again and boring elsewhere. When there is lots of room, however, another bench may be brought down to enlarge or deepen the poor one, and no time lost in setting up for a poor shift's work. If one could ensure that each time a machine was set up it had a face before it on which it was possible to bore a full "round" of holes to the best advantage and break a maximum area of ground, the efficiency of rock drilling would be so increased as to make it cheaper than hand stoping in stoping any width. To attain this ideal is perhaps impossible, owing to various causes; but it can be approached by giving machines lots of room. It would also be a great advantage in machine stoping if the miners were given the services of a few hammer boys whenever they required them. For instance, it often happens that there is a bench as shown in plan in Fig. 1 The machine A can bore a

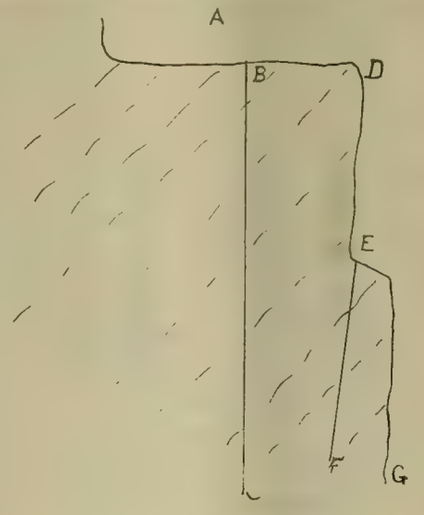

Fig. 1.

long hole; but the shape of the face B D E G makes it quite useless to put in a long hole, as the "toe" of rock E F G would prevent the bottom portion "coming." If, however, a hand hole or holes E F were put in and fired first, the hole B C would come out perfectly, and a bench 3 or 4 feet deeper could be taken out. It is obvious that it would not pay to set up a machine to bore E F alone.

In stoping, the direction of the hole in relation to the face is of vital importance. It is only by using the utmost care in alignment that long holes can be effectively used, and as many miners either do not know enough or won't take the trouble to do this, they prefer short holes. A very slight error in the direction of a hole will be the cause of its not breaking. Even in stopes worked by good miners it may happen that a considerable percentage of holes do not break well, either owing to unforeseen heads in the rock or to the tendency there is when on contract to put the last inch of ground on a hole and to make the hole "look in." This latter tendency is very noticeable in hand stoping where right handed boys have to work on an east face of a stope, and an examination of that side will always show a greater percentage of useless holes than a west one. For this reason, whenever it is practicable, boys should be kept working on west faces and machines on east faces.

Where the burden on a hole is small in comparison to the height of face, the direction of a hole is not of so much importance, but as the length of hole and the burden increase in proportion to height of face, the importance of a true direction increases. Looking at Fig. 2 and comparing the plan of the holes A,

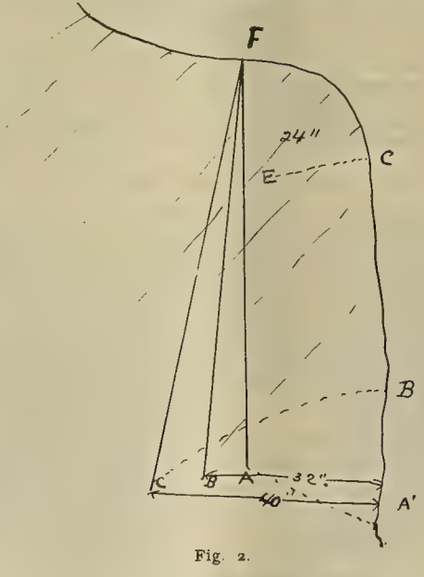

Fig. 2.

B and C, say 6 feet long, bored in a face 40 inches high, A when bored exactly parallel to the face A′ B′ C′ D will "come clean," bringing out the ground to A′ B will "come;" but will leave a foot of stump and break the ground to B′. C will do no good at all, the force of the explosion merely tending to form a volcano and break the ground near the mouth to C′. It is a question whether this would occur were the explosive concentrated at C, B and A; but the charge fills up between 2 and 3 feet of the hole. With high explosives the detonation and liberation of the gases is so sudden that the effects are localized, and so far as my experience goes, practically every cartridge has to be responsible for the shattering of the rock in front of it. If, then, an explosive cartridge at A, B or C is given more burden than another nearer the mouth of hole, and fails to move the rock in front of it on the first shock, its gases merely aid those higher up to break out, or they escape where the rock is already fractured. Machine holes in narrow stopes sometimes tend to "bull ring," i. e., break out at the bottom and leave the portion of rock round the mouth of hole, as E C′ D F. Where we expected this to happen—as in the case where, owing to difficulty in pitching the hole, it was impossible to give a 6 foot hole more than 15 inches or 18 inches of burden on a 38-inch face—we spread the charge as much as possible along the hole and so did not mind using ⅝-inch steel and boring with small bits. We used to place a few cartridges of ⅞-inch gelatine in the bottom of the hole, then 6 inches or 9 inches of sand packing in a paper cartridge, then insert a 1¼-inch cartridge and packing alternately until the hole was full to within 18 inches or so of collar. To do this takes time and trouble, and so again many miners prefer a short hole where the charge can be placed right at the bottom without trouble. Many miners fail to arrange their stoping holes in a rational way in relation to each other. The general plan is to put in the four, with two on top and two exactly below the others, and to load them with the same charge. I have seen a skillful miner put in two holes in a narrow stope, with about 24 inches "burden" on each, one being exactly below the other, and he placed five or six large cartridges in each. What happens in such a case is that the hole exploding first tears nearly all the burden off the other one, and one charge is mostly wasted. Holes should, when possible, be placed in zigzag order. In stoping a wide reef of 5 feet or over this is not always possible; as to get a sufficient burden on the back holes the machine has to be moved from the end of the arm on one side of the bar to the end of the arm on the other side. In that case about half the charge in the holes exploding last of the pair will be sufficient.

(TO BE CONTINUED.)

THE PROSPECTOR.

The mineral and rock specimens from Portland canal, Bear river, Alaska, are: No. 1, a felsitic dike rock, throughout which are scattered veinlets of iron and zinc sulphides. No. 2, diabase. No. 3, quartz containing much iron sulphide (pyrite), and should be assayed for gold and silver. No. 4 consists largely of barite (heavy spar), with sulphides of iron and zinc. A small amount of calcite is present. No. 5 is quartz containing a high percentage of granular iron sulphide and a small amount of copper sulphide. Arsenic is also present in this ore. No. 6 is composed largely of zinc sulphide in a gangue of spar. No. 7 is tennantite, a compound of antimony, copper, zinc and sulphur, with chalcopyrite. No. 8 is principally bornite (copper sulphide), with chalcopyrite, the latter also a copper sulphide, but of lower grade than the former. No. 9 is an amorphous sulphide of iron and zinc. No. 10 is a soluble sulphate of aluminum and magnesia, occurring as an efflorescence as the result of the action of sulphuric acid (resulting from oxidizing sulphides) upon the alumina and magnesian minerals in the rocks.

The mineral samples from Surprise valley, Modoc county, Cal., are much decomposed and in part iron-stained quartz porphyry, and may contain gold.

Of the two samples from Mineral Park, Ariz., the smaller one (No. 1) is flint. No. 2 is evidently from a dike and consists chiefly of quartz and feldspar. It contains some fine iron sulphide, a trace of copper sulphide and a little zinc sulphide. On one side is a scale of molybdenite.

The sample of material from Pearce, Ariz., is not mineral. It is pine gum with some remnants of bark, in which the tannin is still a prominent constituent. That which appears to be a deposit is evidently a fallen pine tree, the woody portion of which has long since decayed, leaving the resinous gum and fragments of the bark.

The samples from Lowrey, Tehama county, Cal., are: No. 1, altered greenstone containing pyrite and chalcopyrite. No. 2 is bornite, with a little quartz.

The rock from Elk City, Idaho, is apparently a much altered intrusive rock, consisting principally of quartz and feldspar. It contains a large amount of finely disseminated iron sulphide. It is not a typical rock of any class.

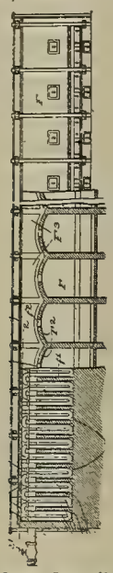
The minerals from Ibapah, Utah, are: The transparent crystals, topaz; the two larger crystals are silicate of aluminum, but are evidently pseudomorph after topaz, and are most unusual. The small tabular black crystals are illmenite (titanic iron). The light green mineral is jadite, a metasilicate of sodium and aluminum.

Mining and Metallurgical Patents.

PATENTS ISSUED OCTOBER 17, 1905.

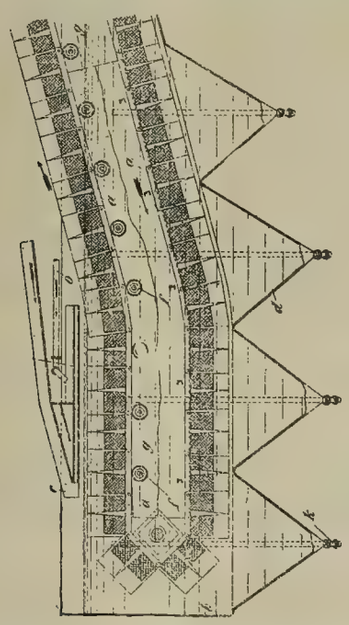
Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

REHEATER FOR FURNACE GASES.—No. 801,318; H. Howard, Brookline, Mass.



In apparatus of class described, row of roasting furnaces, reheating chamber contiguous thereto, heated by conduction of heat from burning ore, two inclosed and continuous conduits extending longitudinally above reheating chamber, for passage of purified, cooled gases, and plurality of reheating units connected in parallel with conduits and extended into reheating chamber, whereby cooled and purified gases pass from one to other conduit through units, to be reheated thereby.

METHOD OF AND APPARATUS FOR TREATING COAL, ORES AND OTHER MINERALS FOR DRAINING THEM OF WATER.—No. 801,204; F. Baum, Herne, Germany.

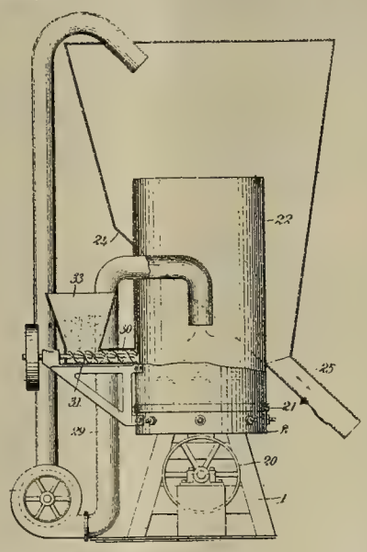


Method of treating washed coal and like for draining water therefrom, which consists in charging washed coal into draining buckets of transporting belt by causing it to descend through quiescent body of water in which buckets are immersed at one point of travel whereby the coal is deposited loosely in the buckets so as to facilitate subsequent drainage, washing water accompanying coal being at same time clarified in body of water by settlement of sludge therefrom, and deposited sludge being conveyed from body of water into buckets after these have received charge of coal while clarified water is conveyed back to washing apparatus.

PROCESS OF EXTRACTING TIN FROM TIN SLAG.—No. 801,290; C. A. L. W. Witter, Hamburg, Germany.

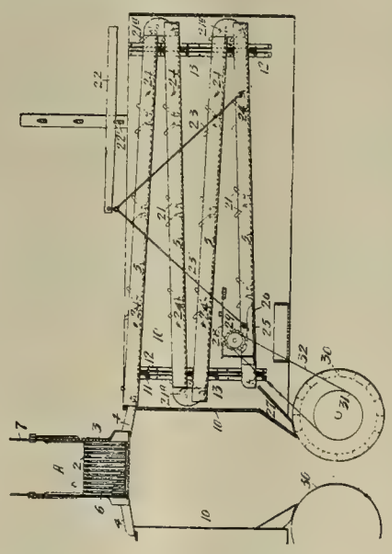
Process of treating tin slags containing iron, which consists in smelting them in presence of plumbiferous material and sulphur.

PULVERIZING MILL.—No. 801,572; J. H. Davis, Glens Falls, N. Y.



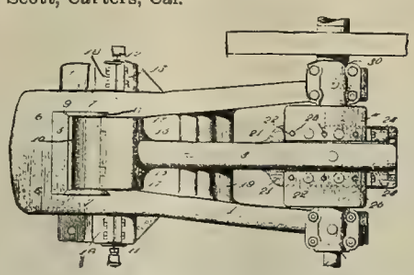
In pulverizing mill, outer support, annular die mounted in support, rotatable support also mounted in outer support, means operated by centrifugal force, due to rotation of rotatable support co-operating with die, for pulverizing material passed through mill, stationary casing extending above and surrounding pulverizing means, casing being open at top, means for directing blast of air downward toward center of pulverizing means, second stationary casing surrounding upper part of first casing, second casing being closed at top and having inclined bottom with chute attached for leading pulverized material out of mill, and suction pipe connected with top of second casing for removing dust in casing and directing it into blast for revolving member.

GOLD-SAVING APPARATUS. — No. 801,968; J. A. Clark, Yankee Hill, Cal.



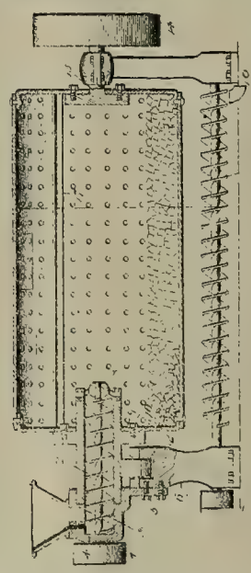
In gold-saving apparatus combination with sluice box, and grizzly in bottom thereof and comprising plurality of spaced bars extending in direction of current flow, and hinged closure for grizzly closure normally pendent beneath grizzly and including bars extending in direction of current flow and adapted, when closure is moved upwardly about hinged connection, to close interspaces between bars of grizzly whereby flow of current is diverted, means for raising and lowering closure and means for holding closure in closed position.

ROCK CRUSHER AND PULVERIZER.—No. 801,921; A. Scott, Carters, Cal.



Crusher comprising stationary crushing member, rocking crusher head, integral lever projecting outwardly from crusher head, crusher head being pivoted at point adjacent to stationary crushing member, gyrating bearing box mounted outside lever and below same, said lever being formed with vertical web and horizontal flanges projecting therefrom at lower edge forming broad bearing having movable engagement with gyrating bearing box, and cam member for operating gyrating bearing box.

MACHINE FOR GRINDING.—No. 801,854; W. and F. Dorey, Gananoque, Canada.

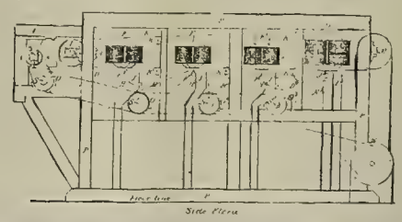


In grinding machine, combination with revoluble vessel having tubular piece secured to one end thereof and extending well within vessel, tubular piece mounted upon roller bearing, detachable bracket secured to support having tubular portion of same bore as tubular piece and carrying means, for feeding material to vessel, which extend through tubular piece.

APPARATUS FOR MINING.—No. 802,349; R. Baggaley, Pittsburg, Pa.

Apparatus for mining comprising passage other than mine shaft extending from surface of ground, tube therein for passage of filling material, and gated receiving hopper beneath tube.

MAGNETIC SEPARATOR.—No. 801,947; J. P. Wetherill, South Bethlehem, Pa., and H. A. J. Wilkens, New York, N. Y.



Magnetic separator for materials of low magnetic susceptibility, comprising series of magnets having highly concentrated magnetic fields, series of feed belts for several magnets respectively, feed belts discharging one upon other, receiver for heads in proximity to concentrated field of each magnet, and cleaner belt running past magnets in same general direction as feed belts.

In Nova Scotia.—III.*

Written for the MINING AND SCIENTIFIC PRESS by T. A. RICKARD.

The five fundamental occupations of man are agriculture, fishing, mining, forestry and the chase. Those who live far from tide-water may wonder occasionally why so much fuss, even to the point of diplomatic rupture, is made over the fishing rights off Newfoundland, Nova Scotia and the Great Lakes. A ton of gold ore outweighs a quintal of codfish, but the difference in value is not always one way. The fisheries of Nova Scotia (with a total population of half a million) make an annual output that is sold for $8,000,000; while the lumber, chiefly exported as "deal" to England, is valued at $20,000,000 per annum. These industries push the mining for gold into a subordinate place.

An Outcrop near Axis of an Anticline, Dip is to the North, Cleavage is South to the Left. In Nova Scotia.

The scenery of a country is largely determined by the underlying geologic structure; the soil, the drainage, the height of land, the sculpturing of frost and snow, the softening touch of atmospheric erosion are all traceable to the character and distribution of the prevailing rocks. In the region where gold mining flourishes in Nova Scotia, the prevailing formation consists of highly altered slate and sandstone of great geologic antiquity. These rocks are assigned to the Cambrian period, although, in the absence of the safe evidence of fossils, it is not certain that they are not pre-Cambrian, that is, Algonkian. The area they cover is estimated at 8500 square miles, representing the seaward half of the Province, their strike being roughly in agreement with the longer axis of the peninsula. Of this 8500 square miles, about 40% is occupied by masses of granite, which has intruded through the Cambrian sediments and underlies them. The distribution of these bosses of granite is shown on the map accompanying this series of articles, where it is apparent that the main body of granite is in the northwestern part of the mining territory.

In the eastern regions the houses stand in the valley, under the protecting shadow of the hills. In the west they are usually on the hill top; one might argue that in this case the owners were more fond of scenery or that the winds of that part of Nova Scotia were less severe; but the difference is due to geologic conditions. In the west glacial drift still crowns the ridges, the bedrock has not been bared, there is more soil. Much of the configuration is due to the position of glacial moraines; the lakes are frequently made by bars of drift, and marshes have been developed by the same cause. The granite especially is dotted with small lakes due to cup-like erosion. The main watershed runs northeast and southwest, and in running to the Atlantic the streams have but little grade, the height of land being only 500 feet, therefore they form linked patches of water, often held back by the debris left by the ice in its passage southward.

Between the Intercolonial Railway and Caribou there is an overlapping tongue of Carboniferous limestone; this marks the course of the Musquodoboit valley. The limestone has been eroded to rounded ridges with smooth slopes, making a neat landscape, diversified by hillocks surmounted with clumps of spruce and fir. In crossing from Country harbor to Antigonish the road traverses the Carboniferous and Silurian formations. The rocks of the latter are maroon colored sandstones, yielding a red soil and a richer vegetation.

In the gold-mining region one finds a succession of low ridges, a billowy land, without anything mountainous, wooded throughout and dotted with lakes connected by small streams which, as they approach the shore, expand into long estuaries. The Cambrian rocks are tremendously contorted, forming sharp anticlinal and synclinal folds. The compression they have undergone has developed a decided cleavage in the slate and has metamorphosed the sandstone into a hard quartzite. Many of the ridges are anticlinal crests. Bold escarpments frequently exhibit precipitous faces coincident with the cleavage, the bedding of the apex being flat. Where the cleavage is highly developed and vertical, it is well to look for the top of the saddle, for the planes of cleavage usually radiate toward the anticlinal axis. The quartz lodes are also found following the bedding planes for a couple of thousand feet on each side of the anticlinal axes. The valleys often follow lines of fault, thus, the estuary of Isaac's Harbor follows a fault (estimated by E. R. Faribault to have a throw of 1200 feet) for a distance northwestward of 4 miles and then passes up Branch brook toward the inlet of Country Harbor, until finally it cuts into the Carboniferous rocks, which it also dislocates.

No description of the region can proceed far without reference to the evidence of glacial erosion. Nova Scotia proper has no mountains. The highest land is about 600 feet above the sea. No rock mass has been strong enough to survive its lordly summit and snow-crested range; there are no proud peaks to throw their long shadows over dark ravine and sunlit plain, all such sculpturing of the earth's surface has been obliterated as by a ruthless hand; there remains only the basal wreck, not without beauty, clothed with forest, glad with lakes that give back the azure of the sky, but nevertheless disciplined and tamed from the larger contours of an earlier geologic period. The marks of the ice age are everywhere to be seen, the rocks are striated and glacial drift is scattered far and wide. The transport of rock is most marked in the case of the granite, boulders of it being found 20 miles from their nearest possible source, as at Bridgewater. The striæ run nearly due north and mark the general direction of movement southward; but local variations due to the topography are not infrequent. In considering the comparative freshness of this writing on the rock, of the grooves cut by the stone pulled forward under the advancing mass of ice, one is impressed with the extreme slowness of geologic action. These marks were made fully 10,000 years ago, and yet the effects of atmospheric erosion, of snow and sun, of wind and rain, have not sufficed to rub them out, although they never were deeper than an inch. No wonder the geologist asks for a blank check on time. These inch deep marks have survived 10,000 years, and yet the very rocks on which they are graven were at one time, on indisputable evidence, overlaid by several

Wine Harbor, Nova Scotia.

*See illustration on front page.

miles of sediment, all of which have been eroded and removed to the depths of the sea.

Incidentally, it is interesting to note that glacial action has robbed Nova Scotia of her alluvial gold deposits. The erosion of the Cambrian series must have yielded large accumulations of gold-bearing gravel, for these rocks are full of small seams of quartz containing gold. At the time of the first discovery of the veins, it was indeed supposed that important alluvial deposits would be found; when these did not become visible, it was supposed that they lay buried in the marshes and lakes. Attempts were made to drain some of these, but without profitable result. The patches of glacial debris, containing fragments of gold quartz, gave rise to false hopes until it was recognized that the region had suffered extreme denudation. The surface has been scoured by the ice, and the loose material which once lay upon it has been swept into the Atlantic ocean, where it will form the gold-bearing agglomerate of a geologic to-morrow.

Placer Mining in Alaska.*

NUMBER XII.—CONCLUDED.

On the Snowflake claim, a bench claim, worked by drifting, situated between Anvil and Dexter creeks, much of the gold sluiced from the winter dump was porous, occurring in lumps one thirty-second to one-fourth inch in diameter, resembling dentist's gold.

A peculiar riffle shown in Fig. 24 was devised, consisting of sawn blocks nailed to riffle strips.

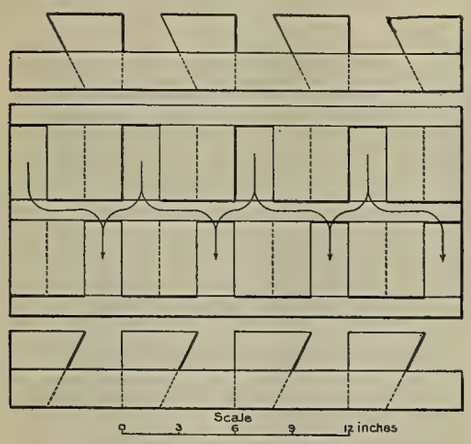

Fig. 24.—Special Block Riffle.

This riffle used on 14-inch boxes, on 8-inch grade, with 50 miner's inches of water, was said to be the only one of many tried which would catch this gold.

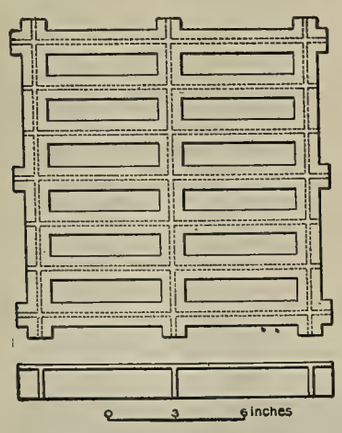

Fig. 25.—Iron Grate Riffle.

Fig. 25 shows an excellent iron riffle used in the smaller sluices of Seward Peninsula for saving gold of average fineness. The castings are light, can be easily handled, and can be set in the sluices so that the long dimension of the slots lies either transversely or longitudinally. The longitudinal arrangement has been found to be the better.

The use of quicksilvered copper plates is not likely to give increased saving to Alaska placer operations. Blankets, mats, or other fabrics are not generally used on account of their expense. H. W. Young has designed for the Waiwhero Sluicing Co., of New Zealand, a form of apparatus for the saving of fine gold which is used in New Zealand beach deposits where the gold is accompanied by an excessive amount of black sand. A few of Mr. Young's remarks are here quoted:

"The modern fine gold washing plant, as used on the West Coast, consists of three main essential parts. The first is the hopper box with stone shoot, which receives the water and gravels from the tailrace connecting with the sluicing face, and separates the stones and shingle from the water and sands. The second comprises the 'sand box' or 'boil box,' with its discharge ducts and other accessories, intermediate between the hopper and the tables. The third comprises the washing tables and their accessories. The three essential parts deal with the stuff from the face, and reduce it to concentrated gold and heavy sand ready for amalgamation."

The introduction of a sand box or agitation box, in which the material is kept in agitation by being made to pass over and under a system of baffle boards before passing to the tables, as described by Mr. Young, is of obvious advantage in connection with the plant described. The principle will undoubtedly be of use in some of the washing plants of Alaska, as it provides a moderate stirring action without the use of mechanical power. The quantity of water economical for a plant such as the one described, with material screened to seven-sixteenths inch size on the tables with a grade of 12 inches to 12 feet, is in the proportion of 40 miner's inches to each 10 feet of width of table. As at Oroville, the value of separate ducts from the feeding or sand box to each table has been proved.

The clearing of the gold from the accompanying minerals of high specific gravity is often difficult. In the creek workings on Bonanza creek, Klondike, for example, of the total weight of gravel handled, 1% of black sand, mostly magnetite, is caught with the gold in the cleanup. In American creek, Alaska, the cleanups are impeded by the presence of large quantities of barite pebbles. In the Fairbanks district red garnets and rutile, in some cases in quantity up to ⅓ of 1% of the total material washed, are caught with the gold. In the Birch creek district there is enough rutile in the auriferous sand to cause trouble in the cleanup. In Seward Peninsula the magnetite is in comparatively small amount. Garnets occur in the creek diggings up to 5 pounds to the cubic yard of gravel. In the beach and so-called "tundra" gold sands of the coastal plain from 3% up to as high as 61% of garnets occur.

The use of quicksilver in the northern operations of America is limited. Even allowing for the extra expense and time consumed in the use and recovery of quicksilver, it is surprising that this important agency for saving fine gold is not more generally employed. It has been shown that the proportion of fine gold in the interior fields is large. The neglect to use quicksilver in attempting to save such gold can be considered only as a penny-wise pound-foolish policy. It is needless to say that in all of the appliances above suggested for the saving of fine gold the use of quicksilver is imperative. Carelessness in the use of quicksilver, however, may result in increasing rather than diminishing the loss of fine gold. According to Bowie, float quicksilver containing microscopic gold particles has been taken from the surface of the water 20 miles from the place where the amalgam entered the stream. A single flask of quicksilver is ample for the needs of the average creek operation of the Klondike or interior Alaska, and even with wasteful handling would last a season.

Whether quicksilver is used or not, it will be found advantageous to get the gold and amalgam as clean as possible on the floor of the sluices or tables before removing the valuable product. The comparatively small amount of heavy concentrates accompanying the creek gold of Seward Peninsula makes this possible in the frequent cleanups of the tailrace. Skillful manipulation will accomplish the same result in the interior except where excessive quantities of magnetite occur. In one case on Bonanza creek, Klondike, the fine concentrates which could not be removed with the magnetite after drying were skillfully separated by dry-panning.

Black sand or other concentrates have occasionally been found rich enough to pay for sacking and shipping to smelters after cleaning. Exaggerated reports of high assays in gold obtained from black sand frequently find credence. Nevertheless, whenever this concentrate accumulates in the sluices or tables in any considerable amount, it should be sampled and assayed to ascertain the amount of finely divided gold which still remains in it.

CLEANING, RETORTING AND MELTING.—If amalgam is to be treated, it should be well stirred, either in buckets or large porcelain mortars, and the base material—sand, scraps of iron, etc.—which comes to the surface should be skimmed off.

"This residue (which holds considerable amalgam) is concentrated by washing in pans or rockers, and the concentrations ground in iron (or porcelain) mortars and treated with more quicksilver. Any base material which floats on the surface of the bath is melted by itself to a base bullion. The remainder is added to the fine amalgam. The amalgam is strained from the quicksilver through drilling, and the dry amalgam is retorted in iron retorts."

In cleaning the placer gold, when no quicksilver is used, a magnet inside a cotton sack passed through the dust will remove all the magnetite. Minerals of high specific gravity not attractable by the magnet are not easily removed by mechanical means. Rutile, garnets, and ilmenite are examples of these occurring in Alaska. In small operations the gold dust is roughly cleaned from these minerals by blowing and dry-panning. Where the amount of gold is considerable, a melting plant is advisable. In retorting amalgam, small hand retorts will in general be found adequate.

"Before the amalgam is put in the retort the interior is coated with a thin wash of clay, which prevents the amalgam from adhering to the iron.

"The amalgam should be carefully introduced and evenly spread. The iron pipe which connects the back end of the retort with the condenser must be clear of all obstructions, and under no circumstances should the amalgam be spread so that the pipe can possibly become choked, as in that case an explosion would probably ensue.

"To avoid any danger arising from this source after the cover has been put on, lined with either clay or a mixture of clay and wood ashes, and securely clamped, the fire is lighted and the heat gradually raised, a dark-red heat being all that is necessary to thoroughly volatilize the quicksilver. Toward the end of the operation the heat is raised to a cherry-red color, at which it is kept until distillation ceases. The retort is allowed gradually to cool, and when cold is opened."

A stream of cold water should be always flowing through the jacket which incloses the condensing pipe, so that by no possibility can mercurial vapor pass into the receiving vessel in which the lower end of the pipe terminates. The discharge end of the pipe should be kept under water during the retorting operation.

When gold accumulates in sufficient quantities to make the shipment of the dust inconvenient, the metal may be melted on the ground and molded into bricks. Both for convenience of shipment and facility in guarding against losses, this practice is to be recommended. A brief description of the essential features of this work follows.

In melting, a gasoline 2-jet furnace may be used. Gasoline under a pressure of 30 pounds enters a heating coil attached to the burner. The heating coil is so arranged and fed that liquid gasoline burning on the outside of the main feed vaporizes the gasoline which is used within the furnace. With the 30 pounds pressure used a very hot flame is the result. The gasoline supply should be stored without the building and brought in through pipes, so as to reduce the danger of explosion. An air barrel connected with the supply line and supplied with a small hand pump serves to keep the gasoline pressure as high as may be necessary. The furnace is made of sheet iron and lined with fire brick. A cover of asbestos and iron serves to retain heat. This should be so constructed as to allow the bolting on of new iron plates, as they burn off with the great heat generated. The operator should be supplied with asbestos gloves.

Crucibles are of various sizes. A No. 30 crucible, costing between $2 and $2.50, will hold from 900 to 1000 ounces of impure gold or bullion with the necessary fluxing charge. They are composed of fine clay and graphite, and to prevent breaking certain precautions should be observed. A new crucible should stand near the furnace, at least during two melts, and when first used should be heated gently. This precaution is not necessary when a crucible has once been used. After a crucible has been used five or six times it can not be depended on and it would be economy to discard it, as breaking during a melt is a source of great inconvenience and loss of time.

It is necessary to have an iron table near the furnace, upon which can be placed gold pans, shovels, tongs, etc.

Before the gold is placed in the crucible it should be accurately weighed and cleaned with a magnet, as above described.

In melting 900 to 1000 ounces, three-fourths of a pound of borax should first be melted in the crucible as a flux. After the dust is poured in, one-fourth pound of soda with one-half pound of borax should be placed on top. The soda unites with the silica of the sand, but in perfectly clean gold is not needed. The borax unites with the iron occurring with the gold. When the dust is mixed with considerable iron pyrite it is well to add a small quantity of scrap iron. This, in uniting with the sulphur, forms iron sulphide, which comes off in the slag. If this precaution be not taken, a hard matte, very difficult to remove, forms upon the brick.

During the melt it is necessary several times to skim the slag from the gold. A special instrument is used for this purpose, essentially a long rod bearing at its lower end an enlargement to which the slag will stick. After gathering a small quantity upon the skimmer it is brought out, and by rolling on the iron table is made into a smooth, disk-shaped mass upon the end of the rod. This operation is continued until the slag collected upon the skimmer becomes unwieldy, when it is cooled by plunging it in water and broken off. When the gold is reached it may be readily detected by its greater weight. A second flux of borax alone is then added, and when this has melted the product is ready for pouring.

Though the mold should not be heated too much, it should always be raised to such a temperature that oil will burn on contact with it.

On removing the bullion brick from the mold it is placed in a pickle of three or four parts of water to one of nitric acid, which serves to clean the gold of surficial deposit. By using a hammer and a steel slag brush the brick is made ready for shipment.

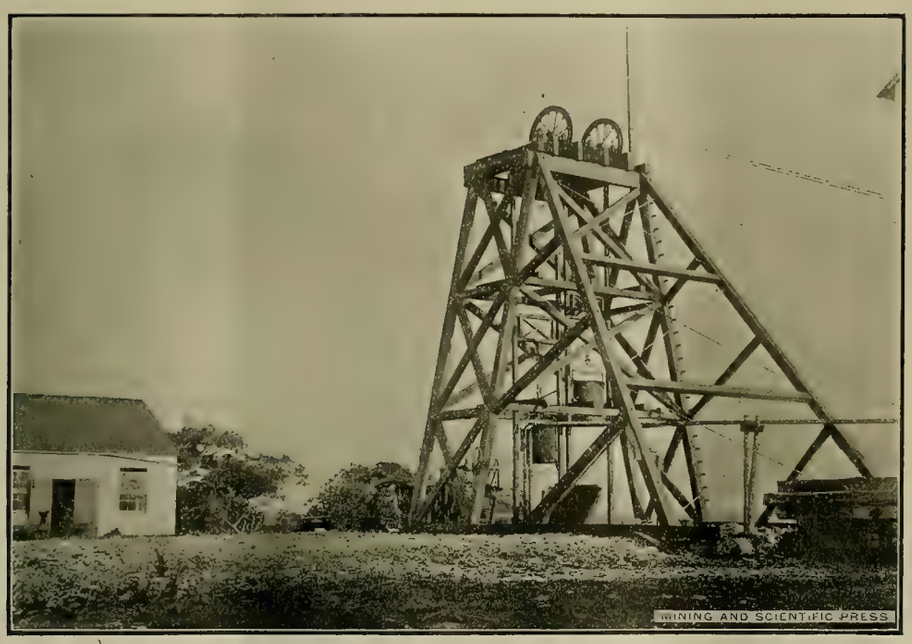
Four Typical Rhodesian Gold Mines.*

Written for the MINING AND SCIENTIFIC PRESS by THEO. F. VAN WAGENEN.

THE TEBEKWE.—The Tebekwe is one of the two mines of Rhodesia (the other being the Globe & Phœnix) that have been dividend payers. The vein is apparently a true fissure between walls of schist, stands nearly upright, has a width of 5 to 12 feet, and the croppings—or what is left of them—are traceable on the surface for ½ mile or more. Along these croppings the mysterious "ancients" of the region had worked out nearly everything that was rich down to depths ranging from 50 to 150 feet, leaving deep trenches bordered on their lower sides by long dumps of cobbings, containing thousands of tons of low-grade quartz, the most of which has since been milled with profit by the modern owners of the ground. The vein filling at this mine is the usual hard, glassy and bluish tinted quartz of the region, that looks very cold and dead to an American. But in the Tebekwe it has yielded from $7 to $12 per ton, and in several places the stopes have been over 10 feet in width of such material. Explorations have been pushed to the depth of over 1000 feet on the mine, and so far with very satisfactory results, though the lowest level does not happen to show at the present time as well, for either quality or quantity, as some of those above it. The payable ore shoot is from 500 to ,600 feet long. Very little pyrite is to be found, even in the lowest workings, and very little visible gold in any part of the mine. The equipment consists of a well appointed 40-stamp mill and cyanide plant, which handles about 200 tons daily. The working force, when the mine is operating at full capacity, consists roughly of 100 white men and 1000 black laborers. The location is in the Selukwe hills, a bunch of elevations that rise perhaps 1200 to 1500 feet above the general level of the Rhodesian upland, which, at this latitude (about 18° south), stands about 4500 feet above the sea. A branch of the Rhodesian railway system approaches within a mile or two of the mine.

Bonsor Mill, Selukwe, Rhodesia, S. A.



Headgear of the Veracity Mine, Rhodesia, S. A.

Plant of the Wanderer Mine, Selukwe, Rhodesia, S. A.

THE WANDERER.—This is a quarrying proposition. It is located also in the Selukwe hills—which are in the eastern part of Rhodesia—and consists of a run of opaque white quartz, from 40 to 80 feet wide, that crops out for 600 or 700 feet on the slopes of one of the ridges. The material is moderately soft, shows little or no pyrite, and carries frpm $3 to $4 per ton in recoverable gold values. The process of treatment is by dry crushing, followed by direct cyanidization. About 400 tons are handled daily, at costs ranging from $2.50 to $3 per ton. Considered by itself, it is a magnificent gold proposition, that might be made as profitable and permanent as the Homestake; but the capitalization (nearly $2,500,000) is many times what it actually cost to equip the mine, or what it should have cost, and the general Rhodesian scale in the way of fuel, supplies, labor and supervision costs is so severe a handicap that, up to date, little or no profits have been realized. Ultimately, no doubt, the property will be reorganized, and the capitalization cut down to proper dimensions. When this is done, and when the general commercial conditions in Rhodesia are brought into line with those of other gold mining communities, the Wanderer will take a good position among the notable gold mines of the world.

THE BONSOR.—The Bonsor had an unusually long line of ancient workings at its surface, fully 1800 feet of them, and gave every promise of becoming a highly payable property. The vein (or reef, as it is called in South Africa, following the Australian nomenclature) stands nearly upright between schist and diorite walls, and carried from 5 to 20 feet of hard, glassy, blue-white quartz, that assayed from $5 to $7 per ton from the bottom of the ancient diggings down to about 400 feet. At this distance from the surface, however, it became very low grade and unpayable, except in spots, and up to date the company owning it has not had the means to push below this low-grade zone. This is an experience that has been met in gold-bearing quartz veins almost everywhere, and in every case the miner or the mining company has been compelled to work out their own salvation as best they could. In many regions the barren zone has been shown, sooner or later, to be underlaid by a second payable one, not so good, perhaps, as the surface bonanza area, but still highly profitable, because generally more extensive. In Rhodesia the ore bodies, in the vast majority of cases, are lenses of hard quartz lying in the bedding planes of Archæan schists, or between schist and diorite, and, while their extent laterally is rarely more than 1000 feet, and often much less, they have, in a number of instances, been pursued downward for that distance and farther, without any indication (so far as the quartz is concerned) of coming to an end. But, as in the case of the Bonsor, the gold values have often decreased notably, and at times almost disappeared, at depths ranging from 350 feet and downward, and where that has occurred there is no instance yet on record in the country where it has been possible to prove a return of values below, because working capitals have become exhausted, and the various processes of reconstruction have not yet come about. So the problem of what is going to happen in Rhodesia in depth upon its numerous and magnificent quartz ledges is still an unsolved one. The Bonsor is now under lease, and if the royalties that are slowly accruing are devoted to deep exploration the mine may yet be carried into the winning class. It is also one of the Selukwe hill properties, is conveniently situated for economical operation, but, like all the other Rhodesian gold mines, is handicapped with a capitalization many times too large.

THE VERACITY.—This is a good example of the Rhodesian variety of the "poor man's" mine. It is a comparatively narrow, but very rich, quartz ledge, with a short ore shoot. The pay will average 2 to 5 feet in thickness, and will assay $12 to $25 per ton. It was started as a company proposition, but could not be made to pay under those conditions. It is now under lease. It lies in a perfectly flat region that was originally densely covered with stunted trees and low, thorny brush. No American miner would look for a gold vein in such a place, yet the African "ancient" found the rich decomposed surface croppings, went down on them till stopped by water, and then disappeared. The jagged earth scar left was sufficient to draw the attention of the Rhodesian

*See illustration on front page.

company claim pegger, and in due time the little thing was capitalized and floated off the stocks with all the style and circumstances attending the launching of a battleship, when its proper measure was about that of a neat little fishing schooner. But if it, and the thousands like it in the country, had fallen into individual hands, and could have been worked with freedom, and the energy and resourcefulness that freedom brings out, the gold production of Rhodesia would long ere this have startled the world with its magnitude.

History of Pyritic Smelting.*

NUMBER III.—CONCLUDED.

By ROBERT C. STICHT.

Of Mount Lyell, and the introduction of the pyrite process there, it is not necessary to speak, except perhaps to say that the process was there yet to be put to the severest test it still had to meet. By the initiated the pyrites of the Mount Lyell mine could not but be regarded as a veritable metallurgical feast, but to the outside world pyrite smelting had still to prove its adaptability to copper ores pure and simple. Some anxiety had arisen in this regard in the minds of prominent authorities, but previous experience, aided by a few simple chemical facts, had inspired the writer with considerably greater confidence in the fidelity of copper to sulphur under nearly all circumstances, and, for his part, he could not call up any apprehensiveness that "the powerful oxidizing atmosphere of the pyrite furnace" would ever be quite powerful enough to shatter this strong bond of affinity. It was gratifying to observe that this question was practically settled by the very first slag that ran out of the first Mount Lyell furnace, though not a little amusing mystification was engendered by the extreme emphasis of the endorsement given by the furnace. It went even further than the wildest expectation could have gone, for the slag analysis revealed no copper at all. However, this ideal state of slag did not continue long, and a few shifts soon reinstated the ordinary imperfections of all mundane affairs, metallurgical ones included, and so it has remained since. Still, the powerful oxidizing effect of the blast has up to date not asserted itself, for it requires greater pressure and longer application of the blast than is ever likely to be exerted on a copper ore in a blast furnace operated up to 50% matte only. The process in this respect is far more reliable than the smelting of roasted copper ores.

Mount Lyell started with hot blast and pressures not exceeding eighteen ounces, in June, 1896, after a stock of only 150 tons of coke had been slowly accumulated, which, with all machinery and two furnaces and stoves, had to be painfully carted a distance of 26 miles over a barbarous mountain road. Fortunately for the continuity of the running, since no irrational hope was entertained of accomplishing the absolutely cokeless state of pyrite smelting within a few weeks, the railway into the reduction works valley was completed on July 18th, and the first train delivered an augmentation of the coke stock. In course of time the original two-furnace plant grew into six, in No. 1 plant, and later on No. 2 plant was added, with five more furnaces. The experience of Mount Lyell has demonstrated the perfect suitability of the process to high and low-grade copper ores, on a large scale, and the establishment still remains the largest pyrite plant in the world, with a total complement of eleven furnaces, the second five of larger size than the first six, and both sets originally supplied with hot blast. Matte concentration was resorted to at once, for though a converter grade of matte might have been produced in one smelting, this would have been less profitable than the two-fold smelting. The only drawback for several years was that, owing to the excessively basic character of the Mount Lyell pyrites, and the then apparently absolute lack of profitable dry ores in the locality, it was necessary to use barren silica. In due course, however, matters improved in this respect, through the opening up of the siliceous mines in the district, whose product was secured by purchase. Some attempts were made in the early years to run with cold blast, but under the conditions then obtaining they yielded no result.

The example of Mount Lyell started the Lake George United Co., which began pyrite operations at Captain's Flat, N. S. W., with five furnaces, in 1897, at first using cold blast, but subsequently hot blast. Notwithstanding remarkably economical work, operations could not remain continuous, largely owing to the unsuitable nature of the main ore.

Since 1896 it may be said that pyrite smelting has been on the regular plane of a truly recognized smelting method, adaptable to copper. A rather vast literature, for so short a life, has accumulated, much of it inconclusive, and of a contradictory character in respect of the salient features of the process — such, for instance, as the necessity of hot blast. Much that has been written about the latter, especially, is to cross-purpose, and the voluminous dis-

*Abstract of Proceedings Australasian Inst Mining Engineers.

quisition wants sifting and bringing to a common ground for comparison.

In 1895 appeared the seventh edition of E. D. Peter's work on "Modern Copper Smelting," in which the pyrite method is first treated comprehensively from an independent standpoint. This work also contains an essay by the writer. This was originally written for a group of business men familiar with smelting operations, and not as a purely scientific expose, so that it is not of as much service to the metallurgist as it might have been made.

The present day status of pyritic smelting owes much to Franklin R. Carpenter, not because of the perseverance with which he has remained faithful to the general process under the most difficult ore conditions, but also on account of the liberal and lucid manner in which his investigations and opinions have been laid before the profession. He has elevated this form of the general method, and incidentally the condition of pyrite smelting itself, as well as that of partial pyrite smelting, to a chemical perfection along certain lines which, but for him, it would not so readily have reached. He is largely eclectic, his sources being predominantly the work of the older Germans. But so are we all at the present day, and it is fortunate that there is an opportunity for learning from the past. The metallurgist who does not now look back to see what has been attempted and accomplished before may not hope to make much of an advance in so difficult a study, and can not obtain a proper comprehensive grasp of its manifold aspects. Dr. Carpenter's pyritic work at Deadwood, S. D., and in Colorado, has been and is a creditable triumph of modern metallurgy. It is the old Roharbeit still, but etherealized, if one may use this expression about so material a thing as smelting, into a distinctively new and far-reaching process. His treatment of excessively dry siliceous ores carrying up to 76% silica with the use of a scarcely basic pyritous concentrate as a vehicle, and the addition of dolomite, running 1000 tons of charge daily into only 10 tons of matte, has never been equalled. His conviction that there is much needless wet concentration and wet process treatment—i. e., amalgamation, chlorination, leaching, etc.—of siliceous pyritic and cupriferous ores, practically free from zinc and lead, together with much superfluous roasting to facilitate subsequent reduction smelting, is shared by most metallurgists holding broad views of the pyritic art, and it may safely be predicted that we shall in due time see the largest mining localities of the world, which now use mechanical concentration and the roast reduction process, follow this important suggestion.

At Mount Lyell the latter part of 1902 saw the gradual abandonment of the use of hot blast, with all the attendant economic and metallurgical advantages, such as a higher concentration, etc., and with no palpable increase in the cost of mechanical power or other drawback to offset this result. The departure was first made in the matte concentration operation and then extended to the ore smelting in No. 1 plant. In the early part of 1903 hot blast was finally wholly discarded at Mount Lyell in both plants. Increased experience has caused the number of furnaces in blast to be gradually lowered from six or eight in both plants to four in No. 2 plant only, to which the original blowing capacity of both plants is now being applied. The total tonnage capacity has remained the same, but a single smelting only is now performed to produce a converter grade of matte, which implies a concentration of about 18 or 20 into 1.

In 1902 the companies working the great pyrrhotite deposits of Ducktown, Tenn., finally also investigated the subject of pyrite smelting, and, independently discovering its great advantages, rapidly worked themselves fully into it. W. H. Freeland has published the very interesting experimental data relating to the first successful trials there, which were collected with exceptional care. More recently the ore of the Great Cobar mine also began to be treated by the pyrite process, for which pyrrhotite is an ideal substance.

The years 1901–3 brought an almost complete return to Mr. Hollway's experimental smelting of pyritic ore in lumps in a tiltable converter vessel. It is the process of E. Knudsen, carried out at Sulitjelma, Norway. The difference, however, lies in the fact that the vessel lining is basic, though this was spoken of even at Hollway's meeting, and the vessel is also, of course, of a special design. The pyritic ore itself is only slightly basic in composition. It is not easy to comprehend the advantage accruing from the converter, for the same ore would have an enormous tonnage at a very much lower pressure in the ordinary pyrite furnace. The capacity of the converter appears to be about forty tons a day and the power per ton 4 H. P. As an ordinary pyrite smelter need use only roughly from ½ H. P. to 1 H. P. per ton of ore with the same or a higher rate of concentration, it is difficult to see why blast furnace operations at Sulitjelma were abandoned in favor of a converter process.

Finally, the most important recent contribution to the discussion of the subject, dealing with it in that scientific manner which is theoretically the most absorbing and practically the most helpful, is a valuable review by Prof. A. Lodin, also in 1904.

The application of the pyritic principle to the metallurgy of copper, silver and gold, or, more properly, of that of rapid oxidation, has guided Barthold Kohler's old Roharbeit, in the hands of latter-day metallurgical artists, to consummations which even a quarter of a century ago were scarcely dreamed of. But while the modern devotee of the art may rejoice that so decided an advance has been made, he will not be able to suppress a feeling of regret that it should have required the unconscious wastes incurred during more than three centuries to bring us to such a point at last. He will also simultaneously apprehend that much more yet remains to be done. The encyclopedic Karsten (who died just two years before the first Bessemer experiments) in 1831 remarked that, "however greatly the state of metallurgy in a further 300 years might surpass that of the present, an outlook to which the rapid progress being made in the discovery of natural laws gave encouragement, it was not likely that the disparity between then and now would be as great as that between now and 300 years ago." Our modern disposition, it may be said, is not to the same effect, however modestly the thought was meant. The progress already made teaches us to look forward to scientific revelations in the future of which the applications will make the methods of today appear like those of the veritable dark ages, and will relegate the sixteenth, nineteenth and twentieth centuries into one common obscurity of mere semi-science.

Divining Rod as a Water Finder.

All miners are more or less familiar with the divining rod or gold finder, as it is used by the various "professors" who attempt to lead others to believe that they can locate with a fair degree of accuracy valuable mineral deposits. Some of these forked devices are elaborate and expensive, gotten up in fine style, with linen or silk-wound handles, various wires and insulating devices for mysterious purposes, but the operators of the divining rod have never yet been known to grow rich in the pursuit of their profession from the value of ore bodies located by them in this manner. There are, however, numerous fairly well authenticated stories of the finding of water by means of the divining rod. The Engineering News prints the following as an interesting instance:

Successful use of a divining rod is reported by G. Franzius of the German harbor construction bureau, associate director of the construction of the Kiel concrete drydocks, in the Zentralblatt der Bauverwaltung of Sept. 13, 1905. The occasion for a trial of divining rod performance presented itself a few months ago when it became necessary to sink additional wells on the grounds of the Imperial Navy Yard at Kiel for water supply. In this territory water is found overlying an impervious hardpan whose surface is very irregular. The conditions are such that at one point a borehole may give ample water, while a dozen feet away no water is struck, and at still other points artesian flows of low head may be obtained. In order to avoid, if possible, the expense of many trial boreholes, Mr. Franzius obtained the assistance of one Mr. von Bulow-Bothkamp, who had made a large local reputation as a water and gold finder. The appliance used by him is a piece of iron wire, about ⅛ inch or less in thickness, bent to the form of a loop, with long cross ends. This "rod" is held by grasping in the two hands its opposite ends, which thus serve as axis, and allowing the loop portion to project horizontally forward from the body. When passing over or near an underground flow of water (apparently Mr. v. B.-B. is able to indicate only flowing underground water), the loop of the "rod" flies up sharply, striking the operator's breast. Armed with this instrument, the expert first discovered a large underground flow, undiscernible from the surface, but well known to the engineer in location and direction, because it had been tapped in drydock work. The expert at once found its course and direction. Next, at a driven well which had been closed off with a plug some time before, the expert obtained no reaction, in spite of the positive statement of the engineer's assistant that this pipe had given an artesian flow. As proof of the expert's error, the plug was taken out of the pipe, when, lo! no water came. It was thought possible that a well driven some 60 or 70 feet away may have laid dry the flow supplying the first well. The next test, made at the second well—an artesian borehole—was for depth of supply flow. The expert guessed 43 feet, which was correct. He next discovered a large flow, suitable for an additional well, and, as the first discovered location was inconvenient, he followed its course some 100 yards to a point where he said water would be struck at 50 feet depth. Subsequently an excellent well was put down here, with a natural head of several feet above the ground surface. By this time the expert was visibly exhausted, so that work was stopped. At the discovery of the spring last noted he asked Mr. Franzius and others of the party to touch the "rod" which he held. The former and some of the others claim to have felt distinctly something like an electric shock, while others were insensitive. Mr. Franzius later was able himself to obtain reactions with gold and water, using a bent fresh walnut twig, and also found some among his acquaintances who could, in varying degrees of strength, detect the effects in question. Judging by his signed article above referred to, from which the preceding is taken, Mr. Franzius appears convinced that there is something in the matter.

MINING SUMMARY.

Specially Compiled and Reported for the MINING AND SCIENTIFIC PRESS.

ALASKA.

The Anvil Hydraulic & Drainage Co., developing placer ground on Bourbon, East Bourbon, Holyoke, Saturday, Lake and Wonder creeks, near Nome, is draining the tundra by means of a 24-inch steel-banded circular pipe. Dredgers are to be put in and the ground worked from tide water toward Anvil mountain. E. E. Powell organized the company.

ARIZONA.

Cochise County.

(Special Correspondence).—At the Cole shaft of the Lake Superior & Pittsburg Co. of Bisbee excavations are being made for the foundation of the new gallows-frame. A sump has been finished at the bottom of the shaft, and when the new hoist is put in, it is understood the shaft will be sunk 400 feet from the 1100-foot level. This will make it the deepest shaft in the district. Shaft No. 3 is being put in order. A new road is being built from Don Luis to the hoist. The Cole shaft has been straightened, retimbered and enlarged from two to four compartments of full working size, 8x24 feet outside of timbers.——A new hoist has been put on the Denn mine, near Warren. At a depth of 575 feet the formation is still conglomerate.

Work has commenced on the Randolph mine, near Tombstone.

Bisbee, Oct. 30.

On the 700 level of the Shattuck-Arizona of Bisbee two faces in different workings are in ore 200 feet apart and from 75 to 100 tons are being placed on the dumps daily.——At Bisbee the Calumet & Arizona Co., the Calumet & Pittsburg Co., the Lake Superior & Pittsburg Co. and the Junction Co. are all preparing to put in new hoists.——A. Brackman has sunk a 100-foot shaft on claims 12 miles from Douglas.

Graham County.

J. F. Weber, manager of the Federal M. Co., reports that it has been reorganized under the name of the Gila Valley Copper Co. This company absorbs the Federal, San Juan and Great Eastern group of mines near Safford, in the Lone Star district. F. H. Wilson was elected president. A 50-ton concentrator is to be put in.

The tunnel of the Chase Creek Copper Co., near Clifton, is in 1040 feet.

Mohave County.

It is reported that W. H. Cushing of Topeka, Kan., intends putting a mill on the De La Fontaine mine, in the Stockton Hill district, near Kingman. The vein carries values in silver, lead and zinc.——Machine drills are to be put in at the Pinkham and Midnight mines, near Kingman. The Pinkham shaft is to be sunk deeper. R. G. Eckis is superintendent.——E. M. Carson is to develop the Bethel mine in Todd Basin, near Kingman, by driving the Green Linnet tunnel to cut the Bethel vein at a depth of 300 feet.

Yavapai County.

(Special Correspondence).—The Esmeralda M. Co. has bought a new hoist which is to be set up on the Penfield mines, near Cherry creek, recently bought from E. R. Hutsenpiller. Operations will be commenced on one of the claims, which has a shaft down 80 feet.——Sulphide ore, 4 feet in width, has been struck in the Shelton mine, near Walker, operated by the Metals M. Co. The company is running a crosscut tunnel from the Helwick tunnel to tap the vein on the Eureka mine.——E. Greenwood and E. Campbell have bonded from M. D. C. Putnam the Express mine, near Poland.

Prescott, Oct. 30.

(Special Correspondence).—The Octave mine at Octave has resumed active operations.——At the Rincon mines, near Congress, ore is taken from the 1100-foot shaft to run the mill. Two new Wilfley concentrators have been added to the plant in order to more economically handle the rich ores coming from the mine at this time, when the management expects to increase the production to nearly the mill's full capacity. The Rincon M. Co. has spent $150,000 on the mine and has now sixty-five men employed. The company owns its own freight teams and hauls its own freight, bullion and distillate, which latter is bought by the carload and stored in tanks built on the railroad at Congress Junction.

Congress, Oct. 30.

The 10-stamp Silver Flake mill at Groom creek is being moved to the Arizona Gold Mines property on Cherry creek. R. H. Burmister of Prescott is manager.——At Middleton the De Soto M. Co. has seventy men at work.——A two-compartment working shaft is being sunk by the Tiger Gold Co., near Crown King.——J. J. Shaw continues to remove the ores from the fire district in the United Verde mine at Jerome. The part of the mine where this work is now being done is known as the Hampton stope and is known to contain a body of ore. There are now employed under ground in the United Verde mine 540 men. Superintendent Taylor has the United Verde smelter working to almost its full capacity.

A rich vein of gold and copper ore is said to have been discovered near Black mountain, in the Bill Williams Fork range, 14 miles northwest of Wendon, on the Arizona & California railroad. It was found by T. J. Carrigan and J. E. Rogers, of the Clara G. & C. Co. The district may be reached from Wickenburg.

Yuma County.

(Special Correspondence).—The number of employes on the California-Arizona and Hecla properties has been increased and several freight teams have been purchased preparatory to starting ore shipments between the mines and Tacna, the shipping point on the Southern Pacific Railway. Arrangements have been made for building a line from Welton, the postoffice station on the Southern Pacific Railway, to the mines. On the Temper claim one tunnel is in 160 feet; a winze has been sunk from this tunnel 96 feet; another tunnel is being driven 100 feet below.

Welton, Oct. 30.

CALIFORNIA.

Calaveras County.

The Lightner hoisting works and 40-stamp mill were destroyed by fire Oct. 30. The loss will reach $150,000, with an insurance of $50,000. The fire started in the candle room, where the men change their clothing on going to work. It is supposed that the flame from a candle was communicated to a miner's coat. One thousand cords of wood was also destroyed. The sixteen men in the mine escaped through a 600-foot shaft into the Angels mine. The Lightner mine is owned principally in Stockton. —— W. T. Mitchell and F. Sciaroni were convicted at San Andreas recently of having attempted to wreck the Angels mine at Angels Camp during last May. Sciaroni was the foreman, and, learning that he was to be discharged, with Mitchell and Charles Holmes put in blasts at different levels of the mine to cave the shaft in. Holmes turned State's evidence, thus avoiding prosecution.

Nevada County.

The South Yuba M. & S. Co. has bought the Virginia & Gold Hill and the Martha quartz mines, near French Corral. Al Ellinger of Grass Valley is president of the company. O. Woehler is the general manager. Development work will be started.

Placer County.

It is reported that rich wash gravel has been struck at the Dardanelles mine at Forest Hill, being operated by A. G. Read. F. Randall is foreman.

Sierra County.

(Special Correspondence).—The Forest City M. Co. report pay gravel.——Wm. Brady, superintendent of the Irwin gravel mine, is putting in power drills, to be run by gasoline.——Spaulding & Peckwith will start the West Point mine when the rains come on.——The Golden Scepter have rich gravel opened up in their channel at Bunker Hill.——There is a report of a copper strike near Basset's station.——The Keystone will soon be ready to start its 10-stamp mill near Sierra City, as the work of repairing the damage caused by the recent flood is nearly completed.——The electric plant being put in at the Telegraph mine, near Downieville, is nearly completed. This will furnish power with which to sink on the vein. J. W. Finney is the superintendent.—— Sinking still continues to show up a strong vein of fair values at the Oaklick, in Jim Crow canyon, near Sierra City.——It is stated that 2530 pounds of ore taken from the Lightner mine at Alleghany last month gave a bullion return of $35,325.42 and 263 pounds of concentrates which assay $110,000 per ton. The 263 pounds of concentrates will give returns of about $15,000. This property is owned by H. L. Johnson of Alleghany.——Lumber is being taken to the Sovereign mine, near Downieville, to repair the buildings for winter.

Downieville, Oct. 31.

Henry Goering of Sierraville has sold the Last Chance gravel mine above Mohawk Valley in Sierra and Plumas counties, not far from Clyde. He has been placed in charge of the mine for the present. A new tunnel 800 feet long will be run to cross the channel and arrangements will be made for working all winter.

Trinity County.

A rich strike is reported in the Bonanza King mine, 4 miles east of Carrville. The mine was bonded to Treadwell of San Francisco by Vollmer, Eldridge & Filmer.

The dredger at Trinity Center, owned by Payne Bros. & Keenan, has closed work for the season. This is the only dredger operating in this county and this was the third season it had been in use. G. W. Payne of Santa Rosa, the superintendent, says this season's run has been satisfactory. The boat has a capacity of 500 yards a day.

A rich strike has been made at the Mountain Bloomer mine at Denny by J. A. Byers.

Tuolumne County.

Shaft sinking has been started at the Reed mine, near Big Oak Flat.—— It is reported that a 5-stamp mill is to be put up at the Mary mine, near Arrastraville.——Lack of water has caused suspension of work at the Jumper mine at Stent. —— At the Black Oak at Soulsbyville advantage is being taken of the idle season to make needed repairs and to retimber wherever necessary. —— At the Sunnyside mine, near Tuolumne, a crosscut tunnel will be started. A compressor is to be put in and machine drills will be used in the tunnel.

COLORADO.

(Special Correspondence).—The question of making the Bureau of Mines a repository for maps and other information of different mining sections is being considered among mining men of this State. It is proposed to ask the next Legislature to appropriate money to this department for maintaining men in the field in gathering information and making maps that will be of value to the mining industry. A question arises similar to the drainage question now being agitated in the Cripple Creek district. The Bureau of Mines sends a representative to the section involved and makes a map of the district, and estimates the cost of driving a tunnel necessary to drain the section. By a certain number of property owners petitioning the parties in charge to drive the tunnel the work is commenced and finished, and each property holder benefited by the tunnel will be assessed according to the benefits received from the tunnel. In this manner it is believed by the parties who have the matter in hand that much quibbling and delays will be avoided in getting the necessary relief. In Leadville the Yak tunnel is draining a large area of valuable mineral land without recompense from the owners of the land benefited. The same applies to the Cowenhoven tunnel at Aspen, Newhouse tunnel at Idaho Springs, the Nelson tunnel at Creede and the El Paso at Cripple Creek. If the State had charge of this work the expense would be divided among the parties benefited instead of allowing individuals of one company to do all the work and stand all of the expense involved in the enterprise. In this manner each mining district would be benefited to the extent that a map would be made of their locality and additions and corrections made from time to time. These maps would be kept on file and copies could be obtained from the Bureau of Mines office.——Governor McDonald has declined to call an extra session of the Legislature to provide bonds for the handling of the war debt incurred during the big strike in Cripple Creek and Telluride; also to pass a law regulating banking institutions of the State.——Most of the placer mines of the State have closed down for the winter. The recent snows made it impossible, as well as the shortage of water and freezing nights, caused the shut down for the year. —— The machinery at the new United States Mint in this city has been tested and is now ready for coining. Regular work will not be commenced before the first of the year.

Denver, Oct. 30.

Clear Creek County.

(Special Correspondence).—The St. Paul M. & M. Co., Mont. Tong manager, is driving a tunnel under Green Lake mountain to tap the Colorado Central vein. The tunnel will cut the vein 1000 feet deeper than the old workings of the Colorado Central Co. The tunnel is in 150 feet, being driven with an electric air drill. It is being debated whether they will do all the work through this one tunnel or divide the work with the old workings of the St. Paul Co. Nearly 2000 feet of work has already been done in different places on the property, and this tunnel will be 2000 feet in length when completed.—— The East Argentine T., M., M., P. & T. Co. is driving the Sidney tunnel. This tunnel is now about 900 feet in Pendleton mountain and still driving. The same company are also driving the H tunnel, which is in 300 feet. Power drills are used in both tunnels. The power plant of the company consists of a 9½-foot Pelton wheel and 8-drill compressor. They have 200 feet water fall, giving them about 100 pounds pressure. At the upper end of the flume they have a boiler and intend to turn steam into the pipes, to keep from freezing during the winter months, and they believe in this manner they will be enabled to operate throughout the year. This is an experiment. H. J. Crist is president and M. Sidney manager.——The Domino M. Co., owning a property across the gulch from the Sidney tunnel, has given an option for two years to E. Quigley of Idaho Springs, who intends to start a new tunnel. Power will be obtained from the East Argentine Co. to operate their drills.——The Waldorf M. Co. has completed a 50-ton mill at the Wilcox tunnel and will soon be in a position to turn out concentrates. The power for operating the mill is obtained from the Georgetown Electric Light Co. This company also furnishes the different properties of the Waldorf Co. with power for operating and light purposes. The wires are strung through Silver Plume to the Stevens mill and then brought over the hill to the Kittie Ousley and Tobin mines, and thence to the Wilcox. The Wilcox is running seven drills in the mine and two more will be added. At present they are not driving the tunnel, but drifting on the Commonwealth and Paymaster veins, in which they are opening up some good ore. The tunnel will be continued on to connect with the Stevens mine, on the opposite side of the mountain. Peter Hector is mine foreman.——The Tobin, on the eastern slope of McClelland mountain and one of the Waldorf Co.'s properties, is doing development work preparing for spring shipments. One tunnel is in 2000 feet and one 1600 feet. They are not aiming to take out large amounts of ore at present, as they do not expect to be able to ship before spring, when the railroad will be operating from the mine. Machine drills are used. Eighteen men are employed in the mine. John Nash is foreman.——The Kitty Ousley, belonging to the same company, is taking out some good ore. Foreman J. E. Wing states that he has opened up a vein 18 inches to 2 feet wide of sulphide ore and is looking better with each shot. A concentrating mill will be built in the spring to handle the ore from the mine. These properties, as well as the Wilcox tunnel, are above timber line. Chas. Tingle is superintendent and E. J. Wilcox of Denver manager.——In this same district the Santiago mine is keeping three wagons busy hauling ore to the mill at Georgetown, where it is being milled for shipment to the smelters. Wm. Rogers is manager.——D. Kennedy has started his mine, which has been idle for several months past. The mine is being cleaned out ready to take out ore.——S. Anderson, manager of the Independence M. Co., is operating on the Griffith mine, near town. The company intends building a mill for handling the ore at the mine, as well as treating the old dump, which carries considerable lead and zinc.——Another year should see heavy shipments of ore from the East Argentine district. The amount of work done in that district the past year has been satisfactory to all.—— The Vidler tunnel, which is intended to pierce the range and come out in Summit county, is operating a few men at present. R. C. Vidler, manager of the property, is still in London, but is expected home within the next sixty days. It is reported he has raised the necessary capital to finish the project. This tunnel when finished will be used as a railroad tunnel, and it is the intention of the management to build a railroad from the portal of the tunnel in Summit county to connect with the Colorado & Southern at Keystone, a few miles from Dillon. This will make a much shorter route from Denver to Leadville than by the present route which goes through South Park via Como and Breckenridge. On the eastern slope of the range it will connect with the new road now being built by the Waldorf Co., and the grade of which is now within a few hundred feet of the eastern portal.

Georgetown, Oct. 28.

(Special Correspondence).—The Dives-Pelican mill, which has been closed for some time on account of some repairs being made to the chutes in the mine, will be started about Nov. 1.——The railroad being built from Silver Plume to the East Argentine district has been graded and the laying of steel has commenced. The management of the railroad hope to have trains running

to the mines of East Argentine in the next thirty days. The road connects with the Colorado & Southern at Silver Plume. In order to get to the top of the mountain a switchback had to be built, and the grade is extremely hard. Some difficulty will undoubtedly be encountered with the snow during the winter months.

Silver Plume, Oct. 30.

The Commodore tunnel driving into Red Elephant mountain, near Empire, has reached the big veins and the company is upraising and drifting to prospect and develop them.

The Flexible tunnel has been driven over 200 feet into Saxon mountain, near Georgetown, under the direction of D. B. Roberts.——The Magnet mine, on Saxon mountain, is being developed under the management of W. B. Jacoby.——Drifting from the 265-foot level of the American Sisters mine, on Columbia mountain, near Georgetown, is opening up good ore.——The upraise from the Bonanza tunnel of the Democrat Mountain M. Co., for the purpose of securing air, has been completed after five months' work.——The shaft on the Edgar property can be sunk without difficulty.

Eagle County.

J. H. Lemmon has struck rich ore while sinking a shaft on the North Star on New York mountain, near Fulford.——The lessees on the Lucy, near Fulford, are breaking high-grade ore and sacking it for shipment. J. Bowman has let a contract for development on the Cattlet & May, near Fulford, to W. E. Frost.

Gilpin County.

The Pewabic Co. of Russell gulch is putting machinery on the Iron mine which will enable it to sink to a depth of 1500 feet.——The Ute mine at Nevada, near the California, has been started up by Central City men under the direction of Manager Pearce.——The force at the Freedom mine has been increased.——The Imperial Gold M. & M. Co., operating the Mackey mine at Apex, has commenced work on a new lode, the Amazon, which was recently purchased by the company.——S. T. Elliott will sink the Grand Central shaft, near Central City, from the 400 to the 600-foot level, and drifting will be commenced in the 350-foot level west. Retimbering of the shaft is to be done from the 200 to the 300 level.

Copper-iron ore has been found at a depth of 100 feet in the Rochester shaft of the Apex G. M. & M. Co., at Apex, by Manager C. E. Barrick.

The Carr claims, on Bob Tail hill, the aerial tramway and the Randolph 50-stamp mill, owned by King Leopold of Belgium and a number of wealthy Englishmen, have been sold to an Eastern syndicate for $50,000 cash. The deal was put through by G. P. Goodyear of Denver. The Randolph mill is in North Clear creek, below Black Hawk. The group has one shaft 800 feet deep.

Gunnison County.

The Maple Leaf Con. G. M. Co. is developing the Maple Leaf group, near Gunnison. The main shaft is down 250 feet and has opened milling and shipping ore. A mill is to be put on the property at once. —— The Cortland mine, above Ohio City, in McIntyre gulch, has been leased out in blocks and the leasers are taking out ore.

It is reported that the Gold Link T. & M. Co. has resumed operations on its big tunnel above the Raymond, near Gunnison.

Hinsdale County.

It is reported that high-grade ore has been opened in the Monte Queen mine, on Crooke mountain, near Lake City.

Lake County.

The Ruby mine, near Twin Lakes, recently shipped a carload of first-class ore to the Leadville smelter that netted $300 per ton. All of the low grade ore from the property is being stacked on the dump waiting the completion of the mill. The property will work all winter. From the different properties on Carbonate hill, Leadville, the tonnage during the month has been increased and they are sending out 400 tons daily. The upper and lower shafts of the Waterloo are shipping seventy-five tons daily and the Porter, Ladder and Crescent No. 2 are outputting 150 tons daily. The company working one shaft on the Evening Star is shipping fifty tons and a number of small lessees are shipping from ten to twenty tons daily. Prospecting with the diamond drill on the Ollie Reed No. 2 shaft, South Evans, Leadville, has ceased, as the results were not satisfactory. The company is working in No. 1 shaft. New prospect drifts will be started from the different levels in this shaft and the ground developed.

J. A. Storm has resumed work on the Bedford group on Mt. Ewing, near Twin Lakes. —— Work will commence very soon on the Ten Broeck, near Twin Lakes. —— The Mt. Storm tunnel at Red mountain is near the vein from which the rich ore was obtained on the surface.

Pitkin County.

Aspen ore is a low-grade silver-lead, but it is cheaply mined and gets the benefit of very low smelting charge because of its lime and the small per cent of silica. Some of the properties contain zinc, but it, too, is low grade. This product is marketed in Pueblo and at Iola, Kan. Most of the district's output is from leased ground. The recent fire in the Percy–La Salle, one of the most extensively developed properties, threw many miners out of employment temporarily; but it is stated that the damage will be fully repaired before the close of December, when the former activity will be resumed. The Smuggler and Percy–La Salle have been the largest shippers, but the Aspen, Compromise, Spar, A. J. Refent, Homestead and some others of lesser note have been steady producers. The ruling wage scale is $2.50 per diem.

San Juan County.

The Rattling Jack and Elk claims, on Breece hill, Silverton, have been leased to G. F. Barry, who will sink both shafts deeper. The present depth is 300 feet. The Rattling Jack shaft will be sunk to a depth of 750 feet.

The Silver Ledge mine and mill and the Esmeralda mine, near Silverton, have been closed down for the winter.

San Miguel County.

Manager W. C. Beam of the Japan-Flora M. Co. has closed down the property near Telluride.——The Pandora Gold M. & D. Co. has been formed with W. E. Westland of Denver, president; Charles Rittmaster, vice president; J. A. Manifold, secretary; S. L. Fulkerson, manager and treasurer, all of Telluride, except the first named. This company recently secured from the Smuggler-Union M. Co. a long-term lease on 2300 contiguous feet within Smuggler-Union territory, on the Pandora vein, between the point where this vein is intersected by the Pennsylvania tunnel and the lines of the Valley View group of mines. Just below the Valley View, which is much higher than the Pennsylvania tunnel, Messrs. Hallet & Webb held a lease on a considerable stretch of the Pandora vein, whose interests the new company purchased, giving it a clear passage. The purchase lease is known as the upper lease, and between it and the Pennsylvania tunnel the ground is known as the lower lease. The lease from the Smuggler-Union Co. carries with it the privilege of operating the Pandora vein through the Pennsylvania tunnel. The Pandora crossing the Pennsylvania at an angle of 45°, it is the intention of the management of the new company to crosscut from the Pennsylvania tunnel to the Pandora, drift on the latter until vertically under the upper lease and then raise to the surface. The upper lease is now being operated as extensively as the ground opened up will permit, the output being packed by mule trains to the Smuggler-Union mills at Pandora for treatment, and the values realized are more than sufficient to pay operating expenses. The Smuggler–Union M. Co. has a tramway in operation from the mouth of the Pennsylvania tunnel to its two large mills at Pandora; therefore, after the level has been projected on the Pandora vein and connection made by a raise with the workings of the upper lease, the ore can be dropped down, delivered at the surface of the upper terminal of the tramway and transported to the mills, effecting a saving of $2.50 per ton over the present method of packing the product on mules to the reduction plants.

Summit County.

It is reported that rich gold ore has been found in the Excelsior mine, near Frisco.——The new power plant of the Southwestern Brokerage Co. has been started up. It will furnish power for the air drills to be used in the driving of the main tunnels of the North American Mines Co. and the Mary Verna M. Co.——The concentration mill of the Old Union M. & M. Co., near Breckenridge, is running full time. The property is being worked through the main 1600-foot tunnel. A crosscut driven 97 feet north from the 1000-foot point in the tunnel recently cut a 2-foot streak of good concentration ore. A. E. Keables is manager and G. C. Smith superintendent.

Teller County.

The Hummer mine, of Cripple Creek, has been leased for two years to the Hummer Leasing Co., and active mining operations are to be under the direction of Chas. Ridpath. A 10x12 hoist is to be put in over the shaft, which is 230 feet deep.——Hoisting has been started from the 13th level of the Ruby mine, of Cripple Creek.

Work has begun in the Hoosier mine on Tenderfoot hill, Cripple Creek, under the direction of B. Shell, lessee. He will prospect to the bottom levels. On the 500-foot level a vein of good appearance has been followed by drift and winze for a short distance. Like conditions have been exposed on the bottom level to a depth of 635 feet.——The Trilby and Ben Harrison claims of the Moose Co., on Bull hill, Cripple Creek, have been sold to C. J. Billerbeck and T. Murray. ——P. McDonald has started work on a lease on a section of the Mabel M. mine on Beacon hill, Cripple Creek.

IDAHO.

Custer County.

The White Knob copper properties at Mackey have been leased and work will be continued under the management of F. M. Leland. The White Knob smelter is being dismantled, preparatory to shipping to the Balaklala mines in Shasta county, Cal.

Elmore County.

F. C. Innes, general manager of the Benton mine, at Atlanta, says in the experimental mill the saving on the plates runs from 55% to 58% of free gold, with from 22% to 24% of the values obtained in the concentrates, and from the slimes and sands remaining they are securing 80% by cyanide, giving a total extraction approximating 95% of the crude value of the ore. Mr. Innes will spend the winter in San Francisco, Cal., and while there will have a full equipment of machinery made for the property. This will consist of a hoisting plant, air compressor and machine drills and an electric plant.

Idaho County.

F. S. Myers of Richmond, Va., one of the principal owners of the Silver King mine at Warren, has shut down the mill because of lack of water. Steam is to be substituted for water power and the ore treatment changed.

At Florence four companies have been working this year in preparation for next year's run. The Gold Lake Co. has been active on Gold creek and has ditches in readiness for the spring run. The Mammoth, consisting of 600 acres, has been operated by a Cleveland, Ohio, company. The Last Chance has put in one giant. Development work has also been done on Miller creek.

Shoshone County.

The Success mill is shipping about 1000 tons of ore and concentrates a month. The zinc ore and concentrates average over 50% zinc, with low silver values, while the lead ore and concentrates will average 60% lead and about 45 ounces silver to the ton. The mill as rearranged has a capacity of 100 tons a day. Its equipment consists of a Blake rock crusher, 1 set of Blake and 2 sets of Humphrey rolls, 6 impact screens, 4 sets of jigs and 5 Wilfley tables. So far it is the only producer of 50% zinc ore or concentrates in the Cœur d'Alenes. The lead concentrates are marketed without any trouble, but the zinc concentrates and hand sorted ore are being shipped to the smelter at Iola, Kans., the freight rate being $10 per ton. The smelter agrees to purchase them, provided they average 50% zinc or more, for $33 per ton. After the freight rate is deducted this leaves the Success Co. $23 per ton for its zinc concentrates and ore. All the other lead mines of the district, most of which contain a percentage of zinc in their ore, get rid of as much of the zinc as they can in milling, with the result that the creeks are full of rich zinc tailings.

The annual report of the Federal Mining & Smelting Co., operating in the Cœur d'Alenes, covering the year ended August 31, shows a gross tonnage of ore mined amounting to 664,830 tons. The concentrates and shipping ore amounted to 85,205 tons. The total mineral production shows an output of 2,689,867 ounces of silver and 88,274,055 pounds of lead. The financial statement is as follows: Value of silver shipments $1,502,652; value of lead shipments, $3,066,779; net profit for the year, $1,242,697; dividends paid in the same time, $1,098,895; cash in banks August 31, 1905, $558,607. The general manager reports that the various mines belonging to the company are in excellent condition, and that the ore reserves were increased by 600,000 tons during the year. The control of the Federal Co. recently passed into the hands of the American Smelters' Securities Co.

MONTANA.

Fergus County.

The Barnes-King Co., at Kendall, will soon be operating its new electric diamond drill on ground adjoining its main property, and through its operations the company expects to add a considerable area to its producing ground. Much new machinery is now being put in at the mine.

Granite County.

C. Bergstrand, of Gold creek, has purchased the Wahlgren & Swanson properties, near Royal. The group comprises the Tussle, Hope, Hope Extension and Durvey quartz mining claims and the Little Creek placer mining claim. The principal development work on the group consists of a shaft which has been sunk 110 feet.——The Butte and Anaconda smelters are bidding for siliceous ores in Granite county. The minimum percentage of silica they require is 70, which they will work for $3 per ton. For every unit higher than 70 and up to 90, they allow 15 cents, giving the shipper all the metallic values in the ores. This premium will give a stimulus to mining in Granite county.——The Royal Gold mill at Royal has started to crush ore. The low grade or milling stuff is being put through the mill, while the high grade ore is being shipped to the smelter at Helena.

Madison County.

The Toledo mines and mill, near Sheridan, which were formerly owned and operated by the Bismark-Nugget Gulch Co., are to be worked by the Toledo M. & P. Co. The incorporators are L. D. McCall, W. A. Stanton and C. W. Foster of Chicago; H. M. Blossom of St. Louis, H. M. Langdon of Cincinnati, G. J. Renner of Youngstown, Ohio, and J. J. Shubert of Kankakee, Ill.

Silver Bow County.

(Special Correspondence.)—By the amalgamation of a number of independent mines, which have been shipping about 100 tons of ore daily, the East Butte Co. will increase the output to at least 500 tons a day. Work has been started on the Mary MacLane, and sinking is in progress on the Yankee Boy. The Wheeler, Oneida, Hancock, Simons and Lassen are also working. A new engine and hoisting plant has been put on the Dutton capable of working to a depth of 800 feet.——The Pittsburg & Montana Co. has purchased the Carlisle mine, located ½ mile east of its smelter. The Carlisle is supposed to be on an extension of the Pittsburg and East Butte veins.——The destruction of the coking plant of the Utah Fuel Co. by fire for a time threatened to inconvenience the Washoe smelter of the Amalgamated Co., as it has been getting one-third of its supply of coke from the Utah Co. However, it also has three or four other sources of supply, and these have promised to increase the shipments to Anaconda, so that the loss from the Utah source will be offset by increases from other sources, and the Washoe smelter will continue to run as heavily as usual.——Judge Hunt of the United States Court has refused to vacate an injunction in a suit of E. Rollins Morse against the Montana Ore Purchasing Co., one of the first suits brought in the noted litigation between the Amalgamated and Heinze interests. The injunction prevents the Heinze people from working in the Michael Devitt ground, owned by the Butte & Boston Co. Heinze has for years claimed that the vein from the Rarus mine dips into the Michael Devitt and that he has a right to follow it. He has twice convinced jurors of his contention, but the courts themselves have not been satisfied and the case is awaiting its third trial. In the meanwhile the injunction stands.——North Butte keeps up its record of ore shipments. The new shaft and equipment will soon be completed.

Butte, Oct. 30.

Siliceous copper-silver ore is being reduced to blister copper without concentration, heap roasting or any other process except that of running it through the blast furnace and converter, at the property of the Pittsburg & Montana Copper Co. at Butte. There are only two furnaces in operation in the plant, one of which is a blast and the other a converter, capacity of the latter being 15 or 16 tons of ore. The ore in its raw, moist state goes into the blast furnace and comes out matte, and then a mixture of matte and raw ore goes into the converter and comes out blister copper. At a public test given the plant recently the pour from the converter was begun shortly before 12 o'clock and lasted nearly an hour, during which time between 5 and 6 tons of blister copper in slabs, weighing 200 pounds each, were added to the stock.

NEVADA.

Humboldt County.

A test furnace, put in at Lovelocks by C. A. Gage recently, produced a 60-pound bar of antimony. The

claim from which the ore was taken has been developed by a tunnel 1200 feet and a shaft 250 feet. J. M. Jones of New York and C. A. Gage are the owners.

The inability of the Salt Lake smelters to handle the ore output from Nevada will compel several of the larger mines at Tonopah and Goldfield to build mills in order to treat their own ore. The announcement has been made that the Western Ore Purchasing Co. of Reno, representing the American Smelting & Refining Co., can hereafter ship but 150 tons a day from the southern district until an additional smelter can be built in Utah. This allotment is apportioned to the various mining companies, and the first to announce, in consequence, that it will build a mill of its own is the Montana-Tonopah. President Knox says that at the start a 50-stamp mill will be put up, and that it will be built in units, so that it may be enlarged.

Esmeralda County.

The Mohawk-Alpine Co. at Silver Peak is operating its two stamp mills. Most of the ore being worked is obtained from the Mohawk-Alpine mine, but the ore from the Mary mine yields equally as good returns on the plates. Development work is under way at the Mary mine, which was recently purchased by the company from John Chiatovich. The company is operating a cyanide plant in connection with each mill.

Lincoln County.

The mill of the Newport-Nevada Co. at Deer Lodge is said to be handling thirty tons daily of ore that runs $15 in gold per ton. —— E. D. Trenam, manager of the Deer Lodge G. M. Co., adjoining the Newport-Nevada properties, reports good progress on the tunnel, which will tap the ore bodies at a depth of 325 feet. Deer Lodge is 24 miles by stage from Uvada, Utah.

A 10-stamp mill has been bought for the Cyrus Noble mine at Searchlight. Good ore is said to have been struck in a winze from the 200-foot level.——The Ascot M. & M. Co. will resume sinking on the Ascot shaft, near Searchlight, from the 365-foot level.——A 300-foot vertical shaft is to be sunk on the Big Six group at Searchlight by James Wilson.

Nye County.

A new gasoline hoist has been put in at the Humboldt Tonopah mine by Superintendent Frank Haley.—— Water has been struck at the 200-foot level of the Tonopah Home shaft being sunk by J. W. Skelton.

Owing to the scarcity of water and the high rates charged for it by the water companies, the Tonopah Railroad offers to transport crude California oil free to both Tonopah and Goldfield for use in oiling the streets of both towns.

NEW MEXICO.

Grant County.

Henry Woods and H. H. Whitehill, owners of the St. Helena mine, Central City, are preparing to put in a boiler and pump to unwater the shaft preparatory to again starting work on the property. The ore will be shipped to the Silver City smelter.——The Phelps Dodge Co. is working 26 men in the Hanover copper mine at Hanover under the direction of Robert Musgrave. ——The Hermosa Copper Co. at Hanover is developing the Tourmaline and the Humboldt mines. A 90 H. P. boiler and a new hoist have been put on the latter. The old shaft is down about 140 feet and has been enlarged to two compartments to a depth of 90 feet.——At Santa Rita the Santa Rita Copper Co. has completed a new shaft, known as No. 8, to a depth of 214 feet. It is a 2-compartment shaft, 4x4½ and 4½x5 feet.

Taos County.

The New Mexico Chemical Amalgamating Co. intends putting up a mill near Red River. M. L. Harney is president, with principal place of business at Springer.

OREGON.

Baker County.

M. A. DeHuff of Spokane, a stockholder in the Daines M. & M. Co., which owns the Belcher mine, near Greenhorn, says that the company proposes to operate the mine all winter. A 1200-foot tunnel will be run from the Belcher property under the Golden Gate ledge.

Douglas County.

Manager W. B. Stewart, of the Continental mine at Myrtle Creek, has started the new 50-ton concentrating mill.

The Magnolia 10-stamp mill, near Granite, is to be started on ore from the Snow Bird mine under the direction of L. Durkee. —— Work at the Black Jack mine at Alamo is under the direction of T. J. Sheedy.

Grant County.

Superintendent N. F. Heath of the Standard mine, near Comer, has driven 300 feet in No. 1 tunnel during the last two months. A 171-foot raise has been completed and another raise has been made to a height of 90 feet. The first raise connects with No. 3 level. The intermediate level between Nos. 1 and 3 has been driven 170 feet on the vein, and will be carried ahead until it is above the face of No. 1. This level is 86 feet above No. 1. On November 30 bids are to close for the new concentrating plant. The excavation and timbers have been finished. The new mill will be put at the portal of the intermediate level, 86 feet above No. 1, as the latter does not give sufficient dump. The lower level will be continued as a drain at that depth, and ore mined there will be hoisted to the mill level when operations commence. A crew of forty-two men is employed at the Standard.

Jackson County.

The New York & Western Mines Co., which recently bought the Opp mine, near Jacksonville, has begun work under the direction of Foster & Gunnell of Grants Pass. Next summer a plant capable of treating 200 tons of ore daily is expected to be placed on the Opp. A carload of ore has been shipped from the Opp to Denver for treatment and analysis, that the best method of reduction might be ascertained. A building is being put up at the mine for a 10-drill compressor which will be driven electrically. A double-track tunnel is being driven on the mill level to tap the Opp veins at depth, and all ore for the mill will come through this.

The Layton hydraulic placer mines, near Applegate, have been sold by J. Layton to G. P. Mimms. Six giants are to be added to the battery, and the capacity increased.

Josephine County.

The affairs of the Lucky Queen M. Co. of Grants Pass are being readjusted. Work will be resumed under the management of C. D. Crane. A 10-stamp mill was put in last year.

SOUTH DAKOTA.

Lawrence County.

Although it was announced that the Golden Reward Co. had decided to put up a large cyanide plant at Bald mountain to handle its ores more economically, it has since been decided to abandon this plan and to increase the capacity of the mill at Deadwood.——The 200-ton cyanide plant of the Eleventh Hour Co. is nearly completed.

Pennington County.

(Special Correspondence).—James Cochran has uncovered a new shoot of ore lying east and north of the main open cut. The full extent of the new find has not yet been determined, but preparations are being made to get into this new ground by means of a drift from the floor of the cut, running in a northeasterly direction. Stoping of this ore body will be commenced as soon as preliminary arrangements for economically handling the ore have been completed.——At the Golden West mine as depth is attained the character of the ore is gradually changing, and the installation of a cyanide plant is being considered, as a portion of the gold is said to be difficult to amalgamate. Amalgamation is practiced in a Chile mill.

Rochford, Oct. 28.

TEXAS.

James T. Callbreath, secretary of the American Mining Congress, has completed the preliminary programme for the international meeting to be held at El Paso, November 14 to 18. It follows: Invocation; addresses of welcome; response by President Richards; responses by States; J. H. Richards, annual address; R. S. Morrison, author of "Morrison's Mining Rights," "Mining Laws;" V. C. Alderson, Golden, Colo., "Co-operation Between State Mining Schools and State Mining Bureaus;" C. M. Shartel, member of Congress, Neosho, Mo., "The Zinc Industry of the Kansas-Missouri Fields;" W. J. Thomas, chemist of Bingham (Utah) smelter, "Damages Arising From Smelter Fumes;" C. J. Norwood, director of Kentucky State Geological Survey, Lexington, Ky. (subject not assigned); W. M. Porter, Chicago, "Eastern Exhibition of Minerals and Mining Machinery by American Mining Congress;" F. E. Wire, Libertyville, Ill., "Attitude of Eastern Capital to Western Enterprises During Development Stage, and How to Attract It;" W. B. Phillips, president Texas State Mining Association, Terlingua, Tex., "Quicksilver Deposits of Brewster County, Texas;" F. A. Jones, Albuquerque, N. M., "Mineral Resources of New Mexico;" L. E. White, State Commissioner of Mines, Denver, Colo., "Mine Drainage Districts;" M. A. Smith, Tucson, Ariz., "A Department of Mines and Mining;" R. E. Benedict, Thatcher, Ariz., of United States Forestry Department, "Forestry as It Affects the Mining Industry;" C. D. Wolcott, director of United States Geological Survey, "The Advantages of Greater Co-operation Between the United States Geological Survey and State Mining Bureaus;" L. E. Aubury, State Mineralogist of California, and author of "California Law to Prevent Mining Frauds," "The Prevention of Mining Frauds by State Legislation;" J. W. Malcolmson, M. E., El Paso, Tex., "The Relation of Mining and Smelting Between Mexico and the United States;" W. P. Blake, Tucson, Ariz., "Ores, Worthless Twenty-five Years Ago, Which Have Been Made Valuable by Improved Mining Methods;" R. Gilman Brown, San Francisco, "The Examination of Mines Preliminary to Purchase of To-day as Compared With Twenty-five Years Ago;" unassigned, "Mine Management Now as Compared With That of Twenty-five Years Ago;" "The Proper Education of a Mining Engineer."

UTAH.

Beaver County.

Steam shovels are to be used at the Cactus mine of the Newhouse M. & S. corporation at Newhouse. At the same time a large force of men will be put to work cutting into the mountain and increasing the flow of the Wah Wah springs, from which the mill and the town of Newhouse derive their water. There has recently been uncovered a surface deposit of ore 300 feet long by 180 feet wide, which it is estimated will yield 4000 tons of ore for every foot of depth attained in it. Mr. Newhouse calculates that the steam shovels can be profitably employed to a depth of 100 feet in this deposit.

Carbon County.

In a fire at Sunnyside on October 26, two crushers, ½ mile of trestle work running up to the mouth of both mines, the main hoist of No. 1 mine, three coal crushing plants, the tipples, railroad and mine cars and several small buildings of the Utah Fuel Co. were destroyed. This has caused some inconvenience to Utah and other smelters dependent on this plant for coke. The plant is to be rebuilt at once by General Manager H. G. Williams.

Salt Lake County.

Manager D. C. Jackling of the Utah Copper Co. reports that grading for the company's big concentrating plant is being pushed at a site 4 miles from the American S. & R. Co.'s smelter. The grading will be finished by the middle of November. The main concentrator plant will cover five acres of ground and will have a capacity of 5000 tons of ore a day. The first unit of this plant will be put into commission as soon as completed and will handle 3000 tons of ore per day. The construction of the second unit of the plant will commence as soon as the first is in commission.

Announcement is made by the Bingham Con. C. & G. M. Co. that its new additional equipment for its smelter will be ready to be placed in commission early in November. The new reverberatory is finished and the roasting plant is under way. With these additions to the present plant completed and placed in operation the company will be capable of handling 1000 tons of ore daily. The capacity of the plant is now taxed to the utmost.

The Bingham Group M. Co. intend repairing the 3000-foot Last Chance tunnel preparatory to working the Greeley-Sacred claims in the West Mountain mining district, near Bingham. R. L. Booth of Bingham is interested.

Summit County.

The Ontario drain tunnel at Park City is open for 13,000 feet and workmen are driving a drift around what is thought to be the last cave. The first drift started was sent in for 30 feet and then the pressure from the tunnel side—the ground being bad—was so great that the timbers were broken as fast as they could be put in. Consequently this drift was abandoned, a bulkhead put in, and work on a new drift running off at a greater angle from the tunnel was commenced. This drift is in 50 feet and, though the ground is at present soft and treacherous, it is thought that it will soon change and that solid ground will be reached. A diamond drill is at the tunnel in readiness to be set up as soon as the ground will permit of its being done in safety. A bore will then be sent through to the tunnel, and unless all expectations are wrong the pent-up water will be tapped. If this is the case, water will be drained off and the trouble which has caused the Ontario Co. so much expense will be over.

Tooele County.

The new slimes plant at the Ophir Hill mine at Ophir is reported to be satisfactory by Manager E. W. Clark. ——The Overland shaft at Sunshine is down 280 feet.

Uinta County.

The Uinta Reservation was thrown open to mineral location on October 27 and many claims were located near Vernal, including gilsonite, asphaltum, coal, lead, copper and silver properties. The deposits of gilsonite and asphaltum are rich.

WASHINGTON.

Ferry County.

The First Thought M. Co. is making regular shipments of gold ore from their mine near Orient. P. Walsh is superintendent.——H. K. Jessup of Spokane is shipping zinc ore from the Young America mine at Bossburg.

FOREIGN.

AUSTRALIA.

Queensland.

The report of the general manager of the Mt. Morgan mines states that during the year ended May 31, 1905, the ore treated from the open cut amounted to 134,435 tons, which is 13% more than for the previous year, and the gold recovered from it amounted to 56,604 ounces, being 20% more than was obtained during the previous year. The amount of sulphide ore treated from underground was 109,296 tons, 8% less than for the previous year, and this yielded 62,034 ounces of gold, an increase of 5% as compared with last year. The quantity of copper precipitate won from this ore amounted to 237 tons 15 cwt., carrying 75.5% of copper. The total of both kinds of ore treated was 243,731 tons, which is greater than for any previous year by 6000 tons. In addition to the above, 3182 tons of auriferous copper ore were treated in the early part of the year, from which 263 tons of copper matte, carrying approximately 1409 ounces of gold and 115 tons of copper, were produced. The open cut is now in a satisfactory condition for extracting ore, the large mass of barren rock which overlaid and endangered the workings having been removed. It will be necessary to make provision for carrying the open cut down to the 450-foot level, 200 feet below the bench now being worked on. For this purpose it is necessary to excavate the waste for a considerable distance from the ore body to prevent it endangering the workings when the ore is being mined at the level mentioned. It is much less costly to do this in the immediate future while the steam shovels and trains are in position and have ample room to work. Prospecting at the lower levels by means of diamond drills was discontinued in April, the establishment of reserves of ore being amply in advance of the undertakings for extracting and treating it. The main working shaft is now down to the 650-foot main level, and the remaining 300 feet to be sunk will be finished in time to supply ore to the copper reduction works. Two of the main oreways are finished, and the other two are sufficiently advanced to enable their completion in ample time. The consumption of explosives now aggregate nine tons per month, and will shortly reach about eleven tons. The superintendent of the reduction works states that the total quantity of ore and tailings operated on during the year was 278,123 tons. Of this quantity, 109,296 tons was sulphide ore, and was dealt with at the mundic works. On the west works 134,435 tons of oxidized ore was treated. These two quantities represent 39.3% and 48.3% respectively of the total amount of material handled. At the lower works 34,392 tons of old tailings were retreated with payable results. The aggregate amount of ore and tailings put through for the year shows an increase of 11,724 tons compared with the previous year, which is equal to 4.4%. Notwithstanding the increasing sulphur contents of the ore, particularly on the west works, the average cost of treatment per ton is practically the same as last year — viz., 11.3s per ton. The installation of a battery of gas producers on the west works is now complete, and it is materially due to this factor, taking into consideration the nature of the ore at present being treated on this plan, that the cost of treatment is being kept at a normal figure. The sluicing scheme has been completed on the mundic works, and the results from same have fully come up to expectations, the cost of emptying these vats having been reduced from 8d to 1d per ton. The same system is now finished on the west works, and will effect a proportionate saving there. Machinery for filling the

mundic vats has been installed on the first section of these works and is working satisfactorily, reducing the cost of filling from 5d to 2d per ton. Similar machinery has been put on No. 2 section. The canals for the precipitation of copper have been added to, and from time to time are being augmented in order to cope with the gradually increasing supply of liquors. During the year 237 tons 15 cwt. of copper precipitate was recovered, carrying 75.5% of copper, this being an increase compared with the previous year of 18.5% in quantity and 1% in quality. The total quantity of ore treated for the twelve months was 243,731 tons, and the fine gold obtained 122,281.22 ounces. In addition to the ore treated, 34,400 tons of tailings were retreated at the lower reduction works, and 1305.49 ounces of fine gold obtained, the average value being 2.10 dwt. The average grade of all ores treated during the year was 9.71 dwt., or 41.24s per ton, which is an advance in value of 3.31s per ton on the ore treated during the previous year. The ore treated at the mundic works shows an increase in value of 1.4 dwt. per ton, and that treated at the west works an increase of 0.5 dwt. per ton. The total amount of fine gold produced during the year was 122,281.22 ounces. The amount of bullion in which the above yield was contained was 137,694.90 ounces, of an average value of £3 15s 9.33d per ounce.

Victoria.

There are now fourteen State batteries at work in Victoria, and it is proposed to invite tenders for five more, with the option of taking two or more. Five-head batteries are to be substituted for the three-head machines. Several applications have been received for batteries, and the residents of the localities have agreed to comply with the conditions of the Mines Department to form trusts for their management. A nominal rental of 1s a year is charged to create the legal position between landlord and tenant.

Western Australia.

The regulations under the Western Australia Mining Act, 1904, came into operation throughout the State on Sept. 1. Prospecting areas of forty-eight acres for gold and minerals other than coal or oil are granted to holders of miners' rights outside the limits of a gold field, and eighteen acres within the limits of such field. Bona fide work in prospecting must be carried out after ten clear days from the date of registration. The area for coal or oil is 3000 acres and must be worked after the expiration of thirty clear days by not less than three men for every 1000 acres. Exemption from labor conditions is only granted in special cases. Records and plans are to be furnished in certain eventualities and the discovery of gold or mineral is to be reported to the Warden. The extent of the reward claims is to be determined according to the distance of discovery from the nearest mine. The labor conditions need not be complied with on any reward claim granted in conjunction with any ordinary claim which adjoins, if the labor conditions in respect to the latter are complied with; but a reward claim held alone is to be worked by at least one man. Reward leases are also granted, the labor conditions of an ordinary mining lease to be applied thereto; but the rent may be remitted for a certain period, according to the distance from the reward lease to the nearest mine. Regulations are made respecting alluvial and lode claims, water rights and mining on reserved and exempted lands. The maximum area which may be marked off and applied for as a mining lease is as follows: For coal, sec. 52, 320 acres; coal, sec. 56, 640 acres; gold, sec. 52 and sec. 56, 48 acres; gold in all other cases, 24 acres; metallic minerals, sec. 52 and sec. 56, 48 acres; metallic minerals in all other cases, 24 acres; non-metallic minerals in all cases, 48 acres; precious stones, 24 acres. Coal or oil leases are to be worked by not less than one man for every sixty acres for the first twelve months, not less than two men for the second twelve months, and three men for every succeeding year. Gold leases, under section 52 or subsection (1) of section 43, are to be worked by not less than one man for every twelve acres; every other gold lease by one man for every six acres; but in no case shall any lease be worked by less than two men. Provision is made for the amalgamation of leases, mining on private land, the purchase and sale of gold, marking off of mining tenements, boundary marks and forfeiture and all exemptions from the labor covenants of a lease are to be registered and an annual return presented. A mining tenement on which labor conditions are prescribed shall be considered "efficiently worked" when the requisite number of men are engaged bona fide in working thereon for eight hours on every working day except Saturday, when four hours shall be sufficient. The men so employed must be either the holder or holders, men working on wages or men working under a duly registered tribute, which authorizes their employment as fulfilling or partly fulfilling the labor conditions. Regulations are also set out in regard to transfers, liens, mortgages, and caveats, partnerships, tribute agreements, surveys and proceedings in the Warden's Court.

BRITISH COLUMBIA.

Boundary District.

The Daly Reduction Co. at Hedley has applied for 5000 inches of water from the Similkameen river, the water to be returned to the river at Twenty Mile, after having been used for power. The company's 40-stamp mill is running continuously on ore from the Nickel Plate mill.

Treasurer G. W. Wooster of the Granby Con. gives the following summary of the year's business of the company, ending June 30, 1905: Produced 14,237,622 pounds fine copper, sold at an average price of 14.36 cents; 212,180 ounces fine silver, sold at an average price of 58.30 cents; 42,884 ounces fine gold, sold at $20. These prices are net after all expenses have been deducted. The total realized equals $2,749,145.02. Working expenses at mines and smelter, freight, refining, selling, general expenses, $1,797,964.35; foreign ores purchased, $238,531.41; net profit for year ending June 30, 1905, $712,649.20; surplus from previous year (corrected), $842,226.01; net surplus June 30, 1905, $1,554,875.27; expended in new construction, equipment at mines, smelter and converter plants, etc., $343,974.28; for additional mining properties, $142,603.33. All development, renewals and repairs have been charged to working expenses. Mine development, 5200 lineal feet; diamond drill development, 3148 lineal feet; Granby ore smelted, 550,738 dry tons; foreign ore smelted, 39,382 dry tons.

Boundary mines for the week ending October 28 sent ore out as follows: Granby mines to Granby smelter, 17,655 tons; Mother Lode to B. C. Copper smelter, 4032 tons; Oro Denoro to Granby smelter, 50 tons; to B. C. Copper smelter, 50 tons. Total output for week, 21,787 tons; total for year to date, 731,277 tons. Following is the treatment record of the Boundary smelters for the week: Granby smelter, 16,944 tons; B. C. Copper smelter, 4047 tons. Total for the week, 20,991 tons; total for the year to date, 750,093 tons.

East Kootenay District.

James Cronin, manager, states that the mine at Moyie will be working a full crew by November 15th, and that the concentrator will be running by December 1st. The smelters at Nelson and Trail are in need of ore, as before the recent fire and shutdown half their supply came from the St. Eugene. The blacksmith shop is completed, and the temporary hoist is in place. Work in the shaft has been resumed. It is to be sunk an additional 160 feet.

Rossland District.

The Le Roi mine for the year to date has shipped 97,576 tons of raw ore to the smelter and milled 3240 tons of second-class ore. The shoot on the 900-foot level of the Le Roi, a portion of the Black Bear ore shoot, which was 108 feet wide on the 800-foot level, is being stoped. On the 900-foot level it is nearly as wide as on the level above. The tonnage shipped for the week ended October 28 was: Le Roi, 1650; Le Roi, milled, 21; Center Star, 1630; War Eagle, 1050; Le Roi No. 2, 60; Jumbo, 100. Total for the week, 5630 tons, and for the year, 270,964 tons.

Slocan District.

In Ainsworth camp it is reported that P. Burns and associates have bonded the Highlander property.—— The reduction works at Pilot Bay have been leased to the Fernau syndicate, which has been making repairs for some time. The concentrating section is ready for operation, and will be employed in reducing zinc ores from the Blue Bell mine.——At Kaslo the Sapper mine is in operation and has about 1500 tons of zinc ore accumulated. This produce carries an unusually high percentage of zinc, and is expected to run 50%. George Alexander is expected to ship ore this winter from the Ruth mine, near Slocan.——At Sandon the Payne and Star properties are being operated.——The Fernau zinc enrichment plant at Rosebery has been blown in.——The Monitor mine at Three Forks is shipping to Rosebery.

West Kootenay District.

Near Camborne the Eva mine is working forty men in gold ore.——The Beatrice, at the head of Mohawk creek, near Camborne, is reported to be making a good showing in development work. —— The Silver Dollar, on Mohawk creek, is putting in machinery. —— The Mammoth, on Goat mountain, near Camborne, has had supplies packed in and will work all winter. Its principal ore is silver.——Near Ymir, the Molly Gibson mine has completed its concentrator and is prepared to ship at least a car of ore daily. The company will wait until snow falls to afford sleighing from the mine to the lake front.

JAPAN.

The law passed by the Japanese Parliament recently, which empowered and invited the Land Bank to make advances to the proprietors of mines at moderate rates of interest, not exceeding 8% per annum, is proving effective. According to the Belgian Moniteur des Interets Materials, advantage has already been taken of the new legislation. When fully applied, it is estimated that this will increase the annual output of gold and silver by about 5,000,000 yen. It was really the outbreak of the war with Russia which moved the Government to turn its serious attention to the matter, and during 1904 the annual output was increased 50%. The advances of the Land Bank are made upon the advice of a committee, which inquires into the organization of each mine, the quality of its output, etc. The capital advanced is to be returned in yearly payments within a period of ten years, the Bank of Japan, acting upon the advice of the Imperial Mint, buying up the gold and silver produced. The mines of Formosa are also increasing their production every year, while in Corea the Osaka Mint is already actively buying up Corean gold dust. When modern methods shall have been introduced for the exploitation of the gold fields, this country also may take an important position as a gold producer. For the twelve months ending February, 1905, the output of the gold mines in Japan amounted to 9,000,000 yen. The gold fields in Formosa yielded 3,000,000 yen, making the total yield from Japanese territory 12,000,000 yen—about $6,000,000.

MEXICO.

Chihuahua.

The San Patricio mines in Parral district are again to start work. Sinking will be resumed on two of the shafts and continued to the 650-foot level, when crosscutting and drifting will be commenced. J. N. A. Conner has completed an experimental test plant at Parral to determine the proper cyanide treatment of the ores of the Veta Colorado M. Co. preliminary to the building a 500-ton reduction plant.

Durango.

Superintendent F. C. Morehouse, of the Mexico Consolidated M. Co., reports from Guanacevi that at the 300-foot level of the Otero shaft on the Soto property an ore body has been disclosed on the north carrying high values. Previously the ground there had been barren. The management plans to have the mill in operation during the first part of November.

Guanajuato.

The Guanajuato Amalgamated Gold M. Co. is working the Jesus Maria and Villarino mines, purchased from the Castenada estate. A. Adams of New York is at the head of the company.——The Mineral Development Co. is preparing to sink a deep shaft on the Nueva Luz properties at Guanajuato.——The Guanajuato R. & M. Co. will have its mill completed by the first of the year. Milling ores are being found in the Cata mine.——The Guanajuato Consolidated M. & M. Co. is successful in cyaniding its ores. It will put up a mill at the Carmen mine.

Jalisco.

An air compressor and drills, hoist, pumps and an electric light equipment are being put in at the Carrizo copper mine, west of Autlan. K. E. Keller is manager and E. E. Nicholson superintendent. —— C. Romero, owner of the Tamara y Anexas mines, has leased the San Antonio reduction works on the bank of the Santiago river, near Hostotipaquillo. He will improve and enlarge the reduction works, and will treat the milling ores of the Tamara y Anexas mines there. The San Antonio plant has been operated in the past by the San Antonio M. & M. Co. The San Antonio plant consists of a 20-stamp mill, a concentrating table and a patio for amalgamation. Only five stamps are now in shape for operation. The mill will be repaired so as to secure the service of the entire twenty stamps, two concentrating tables will be added and cyanide tanks will be put in.

Sonora.

(Special Correspondence).—The Sonora Bonanza M. Co. is working its mines, 4 miles west of Imuris. The ores contain copper, gold, silver and wulfenite. Concentrating machines and a cyanide plant are to be put in. W. M. Barker is general manager.

Cananea, Oct. 28.

The Yeso mines, near San Jose de Gracia, 25 miles east from Hermosillo, are being worked by the Angus M. & M. Co.——It is reported that owing to the impossibility to get wood cut and hauled into camp, on account of the depredations of Yaquis in the vicinity, the Copete M. Co. has had to suspend operations. An effort to substitute coal was made, but the beating to death with clubs by Yaquis of four teamsters, on the road between Carbo station and Copete, has made it impossible to get coal transported from the Sonora railway to the camp.——The Verde Grande M. Co., 40 miles northwest of Hermosillo, have contracted for a new smelting furnace, burning charcoal. J. D. Fresh is general manager.

Zacatecas.

The San Rafael gold mine, near Zacatecas, is being pumped out. This mine is now owned by A. E. Stilwell of Kansas City, Mo.

Personal.

C. B. KINGSTON is now in the Transvaal, S. A.

J. R. CRUM of New York is in Guerrero, Mexico.

J. A. SHINN of Leadville, Colo., is in Pittsburg, Pa.

M. TONG is manager St. Paul mine, Georgetown, Colo.

E. C. JOHNSON is manager Gertie M. Co. at Hill City, S. D.

H. L. JONES is now manager Antler mine, Hill City, S. D.

WM. M. BREWER of Vancouver, B. C., is visiting California.

W. F. GRACE has returned to England from northern Australia.

BERTRAM HUNT has returned to California from Central America.

S. F. GODDARD is in charge of mines in the Val d'Aosta, Italy.

PHILIP L. FOSTER sailed from New York for London on the 25th ult.

JAMES H. ROBERTSON has left El Oro, Mexico, to proceed to Peru.

HENNEN JENNINGS has returned from London to Washington, D. C.

F. T. KELLEY, manager I X L mine, near Sumpter, Or., is East on business.

W. S. MORSE is to resign charge of the Mexican business of the Guggenheims.

J. W. ASTLEY has retired as superintendent of the Le Roi mine at Rossland, B. C.

W. C. POTTER changes his residence from Mexico City to Aguascalientes, Mexico.

THE address of H. W. Turner will be hereafter care of Ladd Metals Co., Portland, Or.

J. H. MULLIGAN has resigned as mine superintendent Cataract Copper Co., Basin, Mont.

FRANK GRAHAM is superintendent Dives-Pelican-Seven Thirty mill, Silver Plume, Colo.

M. P. MCCARTNEY has resigned as assayer Bamberger-DeLamar Co. at DeLamar, Nev.

E. C. KING has resigned as assistant superintendent Arizona Smelting Co. at Humboldt, Ariz.

J. H. VANDERCOOK has charge Sinaloa-Durango M. & M. Co., near San Ignacio, Sinaloa, Mexico.

H. G. A. BRUNNIER, manager Conlon mine, Grass Valley, Cal., has returned from a visit to Idaho.

C. F. MAUNDER has been appointed superintendent Chicago-Goldfield M. Co., at Diamondfield, Nev.

F. W. BRADLEY has succeeded J. S. Wyatt as general manager Eureka & Excelsior mine at Bourne, Or.

G. W. SCHNIDER, Inspector State Bureau of Mines, Denver, Colo., has returned there from Portland, Or.

WALTER FITCH has resigned as general superintendent of United States M. Co. of Salt Lake City, Utah.

G. A. GUESS has taken the position of chief chemist Cananea Con. Copper Co. at Cananea, Sonora, Mexico.

P. H. MAHONEY, manager Potosi mine, Good Springs, Utah, has returned there from San Francisco, Cal.

JAS. GEARON, superintendent Hunter mine at Wallace, Idaho, has returned to the mine from a visit to Chicago.

JOHN M. SHERRERD, general sales agent Taylor Iron & Steel Co., High Bridge, N. J., is on a business visit to California.

E. L. ADKINS of Bellingham, Wash., has been appointed manager Marvel M. Co., operating mines at Yale, B. C.

GRANT SNYDER, superintendent Balaklala mine at Kennet, Shasta county, Cal., has returned from Salt City, Utah.

HENRY PRALL of the Empire Zinc Co. of Denver, Colo., has been examining zinc properties around Vancouver, B. C.

A. V. OLIVER has resigned as manager Tucabe M. Co., near Magdalena, Sonora, Mex., and has been succeeded by A. W. Morris.

W. A. DESBOROUGH, formerly with the Risdon Iron Works, will hereafter represent the Fulton Iron Works of San Francisco in the Southwest.

E E. NICHOLSON, formerly foreman Granby mine, British Columbia, has been appointed superintendent Carizzo copper mine, near Autlan, Jalisco, Mex.

R. B. LAMB has been elected superintendent and general manager Daly Reduction Co., operating the tramway and mill treating ore from the Nickel Plate mine at Hedley, B. C.

W. M. BARKER has resigned as superintendent Green Con. C. Co., Cananea, Mexico, to devote his time to the Sonora Bonanza M. Co., Imuris, Sonora, Mexico, of which he is president and general manager.

W. C. MILLER, general manager Federal M. & S. Co., which has taken over the Morning mine at Mullan, Idaho, announces that H. W. Morse will be retained as manager and J. Corson as mine superintendent.

J. E. MCALISTER has been appointed manager Mother Lode mine at Deadwood, Boundary district, B. C., to take the place of Frederick Keffer, who has been made engineer of the mining department of the B. C. Copper Co., with headquarters in New York.

Books Received.

Water Supply and Irrigation Paper No. 141 is entitled "Observations on the Ground Waters of Rio Grande Valley," by C. S. Slichter. This report contains results of recent investigations in connection with the underground-water problems of Rio Grande valley.

The United States Geological Survey has published Water Supply and Irrigation Paper No. 145, entitled "Contributions to the Hydrology of Eastern United States, 1905," M. L. Fuller, geologist in charge. This paper is the third of a series of progress reports on the hydrology of the eastern part of the country. It contains papers on the following subjects: Hydrologic Work in Eastern United States; Drainage of Ponds into Drilled Wells; Two Unusual Types of Artesian Flow; Construction of So-called Fountain and Geyser Springs; A Convenient Gauge for Determining Low Artesian Heads; A Ground Water Problem in Southeastern Michigan; Water Supplies at Waterloo, Iowa; Water Supplies From Glacial Gravels near Augusta, Me.; Water Supply from the Delta Type of Sand Plain; Waters of a Gravel-filled Valley near Tully, N. Y.; Notes on Certain Hot Springs of the Southern United States; Notes on Certain Large Springs of the Ozark Region; Water resources of the following areas: Catatonk area, N. Y.; Pawpaw and Hancock quadrangles, W. Va. – Md. – Pa.; Nicholas quadrangle, W. Va.; Mineral Point quadrangle, Wis.; Joplin district, Mo.–Kan.; Winslow quadrangle, Ark.; Contact region between the Paleozoic and Mississippi embayment deposits in northern Arkansas; Portsmouth–York region, Me.–N. H.

"Technical Methods of Ore Analysis," by Albert H. Low, will prove valuable to every conscientious assayer. The book describes analytical methods that are likely to be needed in giving a complete report on the total composition of any ore that may be submitted. The author presents practical methods for the determination of twenty-nine of the more common metallic elements in all of their usual combinations, alphabetically arranged. Some of the methods given have been devised by the author, some are compilations of the work of others and some are modifications of existing methods. The directions for manipulation are complete but not verbose. Each has been subjected to the crucible of actual trial and repeatedly refined by laboratory experience. In contrast to many existing manuals the methods are applicable to the common ores of this continent and omit details necessary for some foreign compounds. The book is essentially a manual of practical methods that have proven good in the varied experience of a man well known for accurate and original work. The author states: "It has been my aim to make the descriptions so minute and complete that if the operator will follow them exactly he can scarcely fail to obtain satisfactory results. But herein lies the difficulty. There seems to be a tendency among technical chemists not to follow directions exactly. In carrying out a method the alert operator sees a short cut and takes it, or a "better way" occurs to him and he introduces it in the place of the one given him. There would be no ultimate harm in this (since all methods fall short of perfection) if the operator would only take the time to investigate and determine the real value of his ideas. In some cases he might discover that his supposed improvement was spoiling a good method, and he would come to agree with the author of the method, who had himself probably gone over the same ground. I have seen methods of my own thus modified, and ideas hastily adopted whose incorrectness I had previously demonstrated by careful investigations." The chapter on combining determinations contains several time-saving hints. Approved methods are also given for testing boiler waters, coal and coke and crude petroleum, apparently with the intention of determining their commercial value, rather than presenting a complete analysis. The chapter on apparatus gives some novel devices for the laboratory, but that on electrolysis is deficient, as it describes several antiquated methods and omits reference to recent electro-chemical progress. The book could be shortened by omitting an elementary explanation of the use of logarithms. These indispensable adjuncts to rapid work are among the fundamentals of the chemist's education, and could be omitted in a manual of this character. Heretofore the working chemist has often depended upon manuals prepared for students' use. These are necessarily limited in their application, and usually several volumes are required to furnish a working library. This book will find a welcome place on the working shelf of the assayer, who is compelled to leave many of his books in his trunk. It is published by John Wiley & Sons, and will be sent postpaid by the MINING & SCIENTIFIC PRESS for $3.

Commercial Paragraphs.

THE Main Belting Co. have appointed Messrs. Frost & Hall of 312 Cooper Bldg., Denver, Colo., as special selling agents for the "Leviathan" belting in that territory.

THE Chicago Pneumatic Tool Co.'s statement shows profits for the quarter ending Sept. 30, 1905, of $241,791.45. After deducting quarterly dividend No. 11 of $61,137.83, there is a surplus carried forward of $483,813.50.

THE gold dredgers owned by the Clear Creek Dredging Co. and the National Dredging Co., now operating about 12 miles from Denver, Colo., are Bucyrus dredgers. All the machinery was built in South Milwaukee, Wis.

THE Yampa Smelting Co. have contracted with the Allis-Chalmers Co. for six McDougall furnaces for the Salt Lake City plant. Each furnace will have six superimposed hearths, each with its sets of rabble arms and rakes. Furnaces measure 18 feet, outside diameter. The Nevada Con. Copper Co. of Nevada has contracted with the Allis-Chalmers Co. for similar furnaces.

L. S. PIERCE, 1653 Welton St., Denver, Colo., patentee and manufacturer of the Pierce amalgamator, was awarded a gold medal by the Portland, Or., Exposition by the jury of awards. He reports recent shipment of a 25-ton machine for South Africa, through the Leyner Engineering Works of Denver, Colo., and one to the Syssert Iron & Mining Works, Station Mramorskja, Government of Perm, Russia.

THE North Carolina granite corporation of Mt. Airy, N. C., is installing a Sullivan Corliss two-stage air compressor for driving the Sullivan drills and other compressed air appliances used at its quarries. This compressor has a capacity of 2000 cubic feet of free air per minute at seventy-eight revolutions. The air cylinders are connected to a Sullivan Corliss cross-compound, condensing steam end, especially designed and proportioned for this purpose. The air inlet valves are of the Corliss type, operated by independent eccentrics, and the discharge valves on both cylinders are of the automatic poppet type, moving in a direction parallel with the piston rod, with removable seats located in the cylinder heads. A similar machine is installed at the works of the Southern States Portland Cement Co. at Rockmart, Ga., and is stated to have given efficient service during the two years it has been in operation.

W. H. WHITESIDE, president Allis-Chalmers Co., says that there is no truth in the rumors of contemplated absorption of the company by the General Electric Co. "In the electrical business the Allis-Chalmers Co. has about $3,000,000 invested. This is in the Bullock plant at Cincinnati. It represents $3,000,000 out of a total capital of $36,000,000 of the Allis-Chalmers Co. Our business as a whole differs from that of the General Electric. We are engaged largely in the manufacture of steam engines, mining machinery, flour milling machinery, saw milling machinery, crushing machinery, sugar machinery, etc. To acquire the electrical business of the company, in which alone the General Electric would be interested, would involve the purchase of the controlling interest in the entire Allis-Chalmers Co." The Allis-Chalmers Co. is stated to have purchased outright the Bullock property, which it formerly leased. There will also be expended at Milwaukee over $3,000,000 in improving the plants there.

Trade Treatises.

Cranes—ladle, overhead traveling, gantry and locomotive—are superbly illustrated and explained in a handsome booklet from The Wellman-Seaver-Morgan Co. of Cleveland, Ohio. As one of a series descriptive of iron and steel works equipment, this will prove interesting to metallurgical engineers.

Catalog A of assay, analytical and pulp balances and weights of precision, manufactured by Wm. Ainsworth & Sons, Denver, Colo., is a good example of modern high-class catalogue work. Good pictures, terse text and neat arrangement give a favorable representation of the instruments catalogued. Details of balance construction are well illustrated.

The large catalogue of the Morse Bros.' Machinery & Supply Co., Eighteenth and Lawrence streets, Denver, Colo., contains 226 pages descriptive of mining, milling and smelting machinery supplies. It is conveniently indexed for ready reference, gives freight rates to all principal points, and is embellished with hundreds of illustrations portraying the machinery described and offered for sale. A copy will be sent anywhere on application.

A useful catalogue of books on steam and the steam engine is received from Henry Carey Baird & Co., industrial publishers, booksellers and importers, 810 Walnut street, Philadelphia, Pa. The catalogue is conveniently arranged, alphabetically by authors' names, its augmented usefulness by such arrangement being manifest. There is also a brief description of each book on the subject which this old established house publishes. Besides, there is a similarly complete catalogue of their books on mechanics, machinery, machinists' work, dynamical engineering, mechanical drawing, transmission of power, gas, gasoline and heat engines, refrigerating machinery, fuel, boiler making and management, pattern making, heat and thermo-dynamics, the heating of buildings by steam and hot air, mechanism, tool making and designing, screw cutting and boiler incrustation, which will be sent free to any address anywhere upon request.

Latest Market Reports.

SAN FRANCISCO, November 3, 1905.

METALS

SILVER. — Per oz., Troy: London, 28 1/16d (standard ounce, 925 fine); New York, bar silver, 62¾c, refined (1000 fine); San Francisco, 62¾c; Mexican dollars, 51c, San Francisco; 48c, New York.

COPPER.—New York: Standard, $16.35½; Lake, $16.35½@16.67½; Electrolytic, $16.62½; Casting, $16.00@16.37½. San Francisco: $16.75. Mill copper plates, $17.50; bars, 18@24c. London: £71 10s spot per ton.

Copper is at practically the same price as last week, but is in somewhat less demand, large consumers having apparently stocked up for the present. A slightly lower price may now be anticipated. The monthly statement of James Lewis & Son of Liverpool shows the total visible supply of copper in October, 1905, to be distributed as follows: Total stock on hand, 8304 tons; afloat from Chile 4000 tons; from Australia, 4000 tons; total visible supply 16,304 tons, which is over 1000 tons less than the amount reported on the first of August and first of September respectively, but is nearly 2400 tons more than was on hand October 3, 1904. This circular contains the following information concerning copper: The scarcity of refined copper which has been experienced for some time past has now extended to Standard copper, the available quantity of which has been reduced to the extent of 1847 tons during the past month, considerable shipments of Chile bars having been made to the United States and also to the Continent, in addition to good deliveries for conversion into electrolytic copper by English depositors. As large quantities will shortly be required for the manufacture of sulphate, a further serious curtailment of the public stock may be looked for. The effect of this materially reduced supply is apparent in the premium of £1 to £1 5s per ton paid for Standard for prompt and early delivery, as compared with the price obtainable for delivery in three months time, and it is further enhanced by the policy of many consumers in buying only for their immediate requirements —a policy that will probably lead to a further increase in the premium they will have to pay for immediate delivery, and be an element of strength to the market for some time to come.

LEAD.—New York, $5.40; St. Louis, $4.50; San Francisco, $5.00, carload lots; 5½c 1000 to 4000 lbs.; pipe 7½c, sheet 8, bar 6¾c. London: £14 18s 9d ℔ long ton.

SPELTER.—New York, $6.25: St. Louis, $6.00; London, £28 5s ℔ ton; San Francisco, ton lots, 7c; 100-lb lots, 7¾c.

TIN.—New York, pig, $32.80@33.25; San Francisco, ton lots, 34c; 500 lbs., 35c; 200 lbs., 36c; less, 37½c; bar tin, ℔ lb., 40c. London, £149.

PLATINUM.—San Francisco, crude, $18.50 ℔ oz.; New York, ingot, $20.50 ℔ Troy oz. Platinum ware, 75@$1.00 ℔ gram.

QUICKSILVER.—New York, $40.00@$40.50, large lots; London, £7 5s 0d; San Francisco, local, $38.00@39.00 ℔ flask of 75 lbs.

BABBITT METAL.—San Francisco, No. 1, 10½c; No. 2, 8c; No. 3, 7½c; extra, 17½c; genuine, 32½c; Eclipse, 35c.

SOLDER.—Half-and-half, 100-lb. lots, 22.00c; San Francisco, Plumbers', 100-lb. lots, 19.15c.

ZINC.—Metallic, chemically pure, ℔ lb., 50c; dust, ℔ lb., 10c; sulphate, ℔ lb, .04c.

NICKEL.—New York, 55@60c ℔ lb.; ton lots, 40@47c.

ALUMINUM.—No. 1, 99%, small lots, 37c ℔ lb.; 100 lbs.. 35c; 1000 lbs. 34c; ton lots and over, 33c, Pittsburg. No, 2, 90%, small lots, 34c; ton lots and over, 31c, Pittsburg.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, $16.85; gray forge, $16.35; San Francisco, bar, 3½c ℔ lb., 3¾c in small quantities.

STEEL.—Bessemer billets, Pittsburg, $26.00@$27.00; open hearth billets, $27.00@$28.00; San Francisco, bar, 7c to 13c ℔ lb.

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 7¾c; less than 500 lbs., per lb., 8c; in 25-lb. tin pails, ½c ℔ lb. above keg price; in 1 and 5-lb. tin cans, 100 lbs. per case, ½c per lb. above keg price. Dry Lead.—In bbls., 1 ton and over, 7½c; do. in kegs, 8c.

LIME.—Santa Cruz, $1.35 country, $1.25 city ℔ bbl.

CEMENT.—Imported, $3.00@4.00 ℔ bbl.; California, carload lots, $1.80 f. o. b. at works; small lots, $2.10 ℔

bbl. in sacks, 4 sacks to bbl., 5c for each sack returned.

LUMBER.—(Retail): Pine, ordinary sizes, $24.00@25.00; extra sizes higher; redwood, $28.00@30.00; lath, 4 feet, $4.50@5.00; pickets, $21.00; shingles, $2.50 for No. 1, and $2.25 for No. 2; shakes, $13.50 for split and $15.00 for sawed; rustic, $28.00@35.00.

NAILS.—This week the basic prices are: Wire, $2.77; Cut, $3.25. Meanwhile the nominal quotations per keg (list prices) are: No. 20d to 60d, Wire, $3.35; Cut, $3.55; 10d to 16d, Wire, $3.45; Cut, $3.35; 8d, Wire, $3.50; Cut, $3.50; 6d and 7d, Wire, $3.60; Cut, $3.60; 4d and 5d, Wire, $3.70; Cut, $3.70; 3d, Wire, $3.85; Cut, $3.85; 2d, Wire, $4.10; Cut, $4.10. Special rates for carload lots.

GENERAL SUPPLIES.

ANTIMONY.—New York, Cookson's, 13½c; Hallett's, 14½c; San Francisco, 1000-lb. lots, 14c; 300@500-lbs. 12c; 100-lb. lots, 13c.

BISMUTH.—Subnitrate, ℔ lb., $2.10.

BONE ASH.—Extra No. 1, 5@6c ℔ lb; No. 1, 4@5c.

BORAX.—Concentrated, 7@8c ℔ lb; powdered, 9@10c; fused, 25@30c; crystal, 7c.

CANDLES.—Spear Brand, 16 oz. adamantine, 40s., 11c ℔ set; 14 oz. adamantine, 40s., 10c; 12 oz. adamantine, 40s, 9c; 10 oz. adamantine, 40s, 8c; 16 oz. stearic, 40s, 12½c ℔ set; 14 oz. stearic, 40s, 11½; 12 oz. stearic, 40s, 10½c; 10 oz. stearic, 40s, 9½c. 100-case lots and over, ½c less. Not less than 50-case lots, ¼c less. Boxes of 20s, price ½c advance.

CAPS.—3x, $5.50@6 per 1000; 4x, $6.50@7; 5x, $8@8.50; Lion, $9@9.50, in lots not less than 1000.

CHEMICALS.—Cyanide of potassium, 98%–99%, jobbing, 23@24c ℔ lb.; carloads, 23@23½c; in tins, 30c; soda ash, $2.00 ℔ 100 lbs.; hyposulphite of soda, 3@3½c ℔ lb.; caustic soda, in drums, 3@3½c ℔ lb.; Cal. s. soda, bbls., $1.10@1.20 ℔ 100 lbs.; sks., 90c@$1.00; chlorate of potash, 12@13c; nitrate of potash, 6¾@7c; caustic potash, 10c in 40-lb. tins; roll sulphur, 2½@2¾c; powdered sulphur, 2½@2½c; flour sulphur, French, 2¾@—c; alum, $2.00@2.25; California refined, 1¾@2c; sulphide of iron, 8c ℔ lb.; copper sulphate, 5¼@5¾c; chloride of lime, spot, $2.50@2.75; sulphuric acid, in carboys, 66% B, 1¾@2c ℔ lb.; nitric acid, carboys, 8c ℔ lb.

CHROMIUM.—90% and over, ℔ lb., 80c.

COAL.—San Francisco, coast, yard prices: Wellington, $8.00; Seattle, $6.50; Coos Bay, $5.50; Southfield, $8.00. Cargo lot, Eastern and foreign: Wallsend, $7.50; Brymbo, $7.50; Pennsylvania, hd., $14.00; Scotch, $8.00; Cumberland, $13.00; Cannel, $8.50; Welsh Anthracite, $13.00; Rock Springs, $8.50, long ton; Colorado Anthracite, $14.00. Coke, $11.50 per ton in bulk, $13.00 in sacks; Sunnyside, $8.50, long ton.

FIRE BRICK.—Domestic, carloads ℔ 1000, f. o. b., factory square, $25.00; soap and split, $22.50; arch and wedge, $27.50; skewback, $30.00; circle, $32.00.

FIRE CLAY.—Domestic, ℔ ton 2000 lbs. in 125-lb. bags double, and dry ground, f. o. b., factory, $8.50.

FUSE.—Triple tape, $4.00 per 1000 feet; double tape, $3.55; single tape, $3.10; Hemp, $2.85; Cement No. 2, $3.10; Cement No. 1, $2.75, in lots of 3000 and up.

OILS.—Linseed, boiled, bbl., 54c; cs., 59c; raw, bbl., 52c; cs., 57c; Lucol oil, boiled, bbl., 48c; cs., 53c; raw-bbl., 46c; cs., 51c. Kerosene—Pearl, per gal., 17½c; Astral, 17½c; Star, 17½c; Extra Star, 20½c; Eocene, 19½c; Elaine, 26c; Water White, in bulk, 11c; Mineral Seal, iron bbls., 18c; wooden bbls., 20½c; cs., 24c; Mineral Sperm, cs., 26½c; Deodorized Stove Gasoline, bulk, 14½c, do., cs., 21c; 86° Gasoline, bulk, 25c; do., cs., 31c; 83° Naphtha or Benzine, deodorized, in bulk, per gal., 12½c; do., in cs., 19c; Lard Oil, E. W. S., bbl., 75c; cs., 80c; Neats-foot Oil, pure, bbl., 63c; cs., 78c; Sperm, crude, 63@68c; Natural White, 68c; Bleached, do., 68@73c; Whale Oil, cs., 52@67c.

LITHARGE.—Pure, in 25-lb. bags, 9½@10½c ℔ lb.

MAGNESIUM.—Pure, N. Y., $1.60.

MANGANESE.—Black oxide, ℔ lb., 2¾@4c.

MERCURY.—Bichloride, ℔ lb., 77c.

MOLYBDENUM.—Best, $2.75 ℔ lb.

PHOSPHORUS.—American, ℔ lb., 70c.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitroglycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1**, 50%, carload lots, 11½c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2, 35%, carload lots, 9½c; less than one ton, 11½c. No. 2**, 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2.00 per keg.

RED LEAD.—500 lbs. and over at one purchase, ℔ lb. 7½c; less than 500 lbs., 7¾c.

SILVER.—Chloride, ℔ oz., 90c@$1.00; nitrate, 54c

SODIUM.—Metal, ℔ lb., $1.

TUNGSTEN.—Best, ℔ lb., $1.20.

URANIUM.—Oxide, ℔ lb., $3.40.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS United States and Foreign Patent Agency the following are worthy of special mention:

MACHINE FOR SPLITTING CLOTH.—No. 802,545. Oct. 24, 1905. John F. Ames, Portland, Or. This invention relates to means for splitting cloth of standard width into strips of any desired width, and pertains especially to the splitting of the cloth while rolled in contradistinction to splitting lengths of cloths and then rolling or reeling the severed strips The main object is to save time, labor and expense and to provide a simply constructed and operated machine which will handle rolls of cloth or other fabric, paper or the like, of any texture or size and which is capable of adjustment to adapt it to cut a roll into any desired number of narrower rolls.

FIREPROOF PARTITIONS.—No. 802,556. Oct. 24, 1905. C. M Depew and H. E. McCoy, San Francisco, Cal. This invention relates to an improved fireproof building construction, and particularly pertains to a partition structure. Its object is to provide a simple, cheap, light and stable rigid fireproof structure of this character. It consists in the combination with a jamb-timber having an angular tongue on one edge, of partition panels having grooves on the edges adjacent to said timber, angle-iron uprights fitting the tongue of the timber and the grooves of the panels, means for anchoring the opposite ends of the panels, top and bottom supports for the series of panels, and finishing strips secured to the timber, and other details of construction.

SURFACING AND POLISHING MACHINE.—No. 802,604. Oct. 24, 1905. A. T. Spence, J. H. Prugh and S. B. Zimmer, Oakland, Cal. This invention relates to an apparatus which is designed for producing even surfaces and cleaning or polishing any surface to which such an apparatus may be applicable. It consists in a surfacing and polishing machine of a frame supported with relation to the surface to be acted on, independently movable abrading rollers, springs by which the rollers are normally maintained in contact with the surface, and a lever with intermediate connections and a stop with which the lever is engaged to raise the rollers from the surface, and other details of construction combined and adapted to produce the desired result.

SURFACING AND POLISHING MACHINE.—No. 802,605. Oct. 24, 1905. A. T. Spence, J. H. Prugh and S. B. Zimmer, Oakland, Cal. This invention relates to an apparatus which is especially designed for producing even surfaces and cleaning or polishing any surface to which such an apparatus may be applicable. It comprises in a surfacing machine, a longitudinally slotted drum and a flexible covering material, the contiguous edges of which enter the slot, jaws between which said edges are held, an eccentric mounted upon the drum shaft, said jaws pivoted together in pairs and one jaw of each pair being extended beyond its pivotal center to form a lever arm which clasps the eccentric, and a radially movable rod upon which the jaws are fulcrumed, and other details of construction.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market street, San Francisco, has official reports of the following United States patents issued to Pacific Coast inventors:

FOR THE WEEK ENDING OCTOBER 17, 1905.

802,252.—FIRE ESCAPE—C. W. Anderson, Seattle, Wash.
801,849.—METER AND MOTOR—A. H. Carpenter, Stockton, Cal.
801,968.—GOLD SAVING APPARATUS—J. A. Clark, Yankee Hill, Cal.
802,272.—LETTER FORMER—G. W. Dettner, San Francisco.
802,183.—DAM—G. W. Durbrow, Indio, Cal.
802,274.—STIRRUP—J. Engleheart, Waconda, Wash.
801,859.—PRESERVING WOOD—W. E. Everette, Tacoma, Wash.
802,033.—ALARM—C. Freeman, Los Angeles, Cal.
802,036.—CULTIVATOR—F. W. French, Oakland, Cal.
802,282.—SPEED CONTROLLER—F. A. Gerting, Portland, Or.
802,207.—DOUGHNUT MACHINE—Gray & Van Fleet, Riverside, Cal.
802,362.—BEARING—Green, Lyons & Garey, Los Angeles, Cal.
802,144.—WINDMILL—B. R. Harrington, Phœnix, Ariz.
802,213.—PIPE BAND FASTENING—A. W Hight, Ballard, Wash.
802,289.—PURSE HOLDER—R. K. Hohmana, San Diego, Cal.
802,215.—TUBE CUTTER—E. Johnson, Seattle, Wash.
801,990.—WATER GATE—Kellar & Thomason, Covina, Cal.
802,332.—VEHICLE WHEEL—J. M. Lenford, Hood River, Or.
802,106.—TOILET SEAT—J. V. Matteson, Fruitvale, Cal.
802,306.—SWIMMING APPLIANCE—E. J. McKittrick, Walla Walla, Wash.
801,893.—DOOR—A. C. Mortenson, Santa Barbara, Cal.
802,228.—CURRENT MOTOR—A. A. Morton, Walla Walla, Wash
802,304.—SASH FASTENER—S. F. and D E. Myers, Los Angeles, Cal.
802,108.—LINOTYPE MACHINE—C. J O'Brien, Redding, Cal.
801,902.—INCANDESCENT LAMP—S. Olafson, Seattle, Wash.
802,111.—ANNUNCIATOR—A. L. Peterson, Clipper Mills, Cal.
802,235.—CHANGE MACHINE—T. I. Pottier, San Francisco.
801,921.—ROCK CRUSHER—A. Scott, Carters, Cal.
802,123.—GUN MOUNT—M. C. Taylor, San Francisco.
801,944.—SHOW CASE—F. Weber, Los Angeles, Cal.
802,063.—TRANSOM OPENER—G. C. Weil, San Francisco.
802,343.—LOCK HOOK—E. Wiet, Sacramento, Cal.
801,953.—MUSIC LEAF TURNER—H. L. Wilson, Port Townsend, Wash

OTTUMWA IRON WORKS,

HOISTING ENGINES.
MINING MACHINERY.

California Agents: Harron, Rickard & McCone.
Washington Agents:
Bradley Engineering & Machinery Co., Spokane, Wash
Utah Agents: Salt Lake Hdw. Co., Salt Lake City, Utah.

Over 2200 Engines in Use.

Common Sense

teaches us that **RUBBER** against an article creates friction. In fact, we wear rubber soles—use rubber on steps, etc., to prevent slipping—to create friction.

Why do you use **ENGINE PACKING** with rubber on top—on the bottom—and in between—where it is rubbing against the rod all the time—creating excessive friction—loss in power—fuel—money?

No such mistake in

"EUREKA" PACKING.

The rubber is where it should be—embedded in flax—which takes the wear—the lubricants prevent friction.

Isn't it up to you to try **GENUINE "EUREKA,"** particularly as the price is one-half less?

CALIFORNIA and Pacific coast manufacturers, who were long handicapped by prohibitive prices of fuel, are given much encouragement by the present ability to secure fuel oil at a comparatively low figure. Several establishments in San Francisco are now contracting for oil delivered at their respective plants for from 42 cents to 48 cents per barrel. Electric power and cheap fuel are greatly aiding in developing Pacific coast resources.

THE burning of the coke-making plant recently at the Sunnyside coal mines in Utah threatens to embarrass the smelters of that State somewhat in their metallurgical operations, as unless a supply of coke can be obtained elsewhere some of the furnaces must soon blow out, and wait until such time as they can secure a continuous and sufficient supply. This incident shows how closely different branches of the mining and metallurgical industry are interdependent upon each other. Should the coke shortage last long, it will materially affect the copper output of Utah.

THE staff of highly paid engineers, managers, and the large clerical force essential to the operation of an extensive mining proposition, would completely swamp a small enterprise. In the conduct of the affairs of the large concern this official paraphernalia are essential — though not infrequently overdone, but the small mine can usually dispense with them. In the history of some large mines which have been successfully run with elaborate official staff, the time usually arrives when the proposition can no longer be operated profitably under such conditions, but if the mine, or various portions of it, is given over to leasers, large profits are again forthcoming, simply because it is stripped of the greater part of the expensive engineering and office staff. All work is done in a practical manner by experienced men, and no extraordinary expenses are permitted.

Be Up to Date.

The methods employed by some mill and mine managers and superintendents in certain districts in Colorado are rather crude. From their conversation one would think they were living in some other age than the twentieth century. In one mill, particularly, an arrastra was observed in operation which was used in "pan amalgamation," as the operator explained. This machine was of the ordinary type and was between 4 and 5 feet across the top and somewhat smaller at the bottom—pan-shaped and probably 2½ or 3 feet deep, with an opening on one side at the bottom. This contained a stone weighing 250 to 300 pounds, which was being dragged around in the pan, which also contained quicksilver. Through the arrastra pulp from the stamps and plates was passing. This process completed the "amalgamation," and the operator explained that he was able to make a better saving with this method than by any other.

The efficiency of the arrastra as a gold-saving device has long since been recognized by those who have had experience in its use. In Mexico, Arizona and California the arrastra is well known and was a favorite device of the Mexicans and early miners in the Southwest; but in Colorado this simple, primitive machine is seldom seen. The thought naturally occurred that there are modern methods and appliances available in good milling which make the arrastra an unnecessary attachment in the stamp mill. This machine was operated by steam power—somewhat of a luxury for an arrastra, which is usually operated by the aid of a mule or horse.

As a rule, the operators of Colorado are progressive and up to date and always willing to adopt new and improved methods for handling ore, and especially in the treatment of the ore, and knowing exactly what each ton is worth as it goes to the mill or smelter. The superintendent of a property in that State said that he had been connected with the mine for the past eight years and that he had not spent over $25 in that time on assays. When asked how he could tell the value of his ore, or how much he should receive for it when shipped to the mill or smelter, he said: "Oh, that's easy enough; you see, when a man has been on a mine for a few months or a year he can tell close enough as to what the ore is running without having it assayed." This mine has been paying dividends under such management for some time past. What would the mine be worth to stockholders if they employed an up-to-date manager and improved methods? Inquiry usually develops the fact that such managers are not keeping posted on the methods of the day by reading progressive mining journals. They usually say: "Well, I am getting a daily paper and one or two others, and then, you see, I am kept pretty busy here most of the time—I don't really have much time for reading." An operator in Colorado discharged one of his men who had been with him for a year on the grounds that he had never seen the young man reading a mining paper of any kind, and that a man in his employ must keep abreast of the times or suffer the consequences of being sent down the hill. This summary method of dealing may have its advantages, but it would seem to be the better plan for the management to provide a reading room and suitable literature for the men and encourage them in the habit of reading up-to-date journals and books on those subjects closely identified with their work.

An Unappreciated Resource.

In Eastern States there are numerous instances where natural gas is employed in heating and lighting cities, and in some cases it is employed as fuel in metallurgical operations. In view of these facts it seems strange that the natural gas available in several of the Western States is not employed in the same manner. In portions of Utah, Montana, Colorado, Oregon, California, Washington, Nevada and elsewhere natural gas has been proven to exist in large amount, but it is utilized to a very small extent. In a few places it is employed for heating purposes, but it is not employed nearly as much as its importance and value suggest it should be. It is surely due to lack of knowledge of the value of this resource in the Western States that it is not more commonly used. In the East natural gas is employed extensively in heating and lighting, in the manufacture of glass, in the generation of steam, for puddling iron, in roasting ores, heating furnaces, in the manufacture of steel and also as a source of power in the gas engine, in drilling and pumping oil and gas wells, and in other utilities. In the oil regions of the West it is not an uncommon thing for a bore to strike a flow of gas instead of oil. In such event the well is generally either capped or fired and allowed to burn for months, wasting thousands of dollars' worth of a natural product that might be utilized at a profit as great as if it were oil and not gas that had been struck in the well. In some of the Eastern States more than 5,000,000 people derive the benefit of the use of natural gas as fuel. Large compressors are run by natural gas, which is exploded directly within the cylinders, the compressors pumping the gas from wells having weak pressures, and forcing the gas through pipe lines to the points of use.

The Diamond Drill in Prospecting.

At various periods in the past has been pointed out herein the advantage of a diamond drill prospecting company, which, under contract, would undertake to bore holes for the purpose of prospecting undeveloped ground. Such companies have since been organized and are in successful operation. One company formed for this purpose is operating under contract in the War Eagle and Center Star mines, at Rossland, B. C., in the Sullivan mines at Marysville, Mont., in the Nickel Plate mines, for the Daly Reduction Co., at Hedley, B. C., in the British Columbia copper mines at Princeton, B. C., in the J. R. Cook mines, in the North Moccasin mine, and in the Bullard mine at Kendall, Mont., and until recently in the Pittsburg & Montana, at Helena, Mont. Many mining companies and the individual owners of mines would like to have prospecting done as cheaply as possible, but do not look with favor upon the expense incidental to the purchase of a diamond drill outfit, partly because of lack of knowledge of the machine, of its utility, and of the manner of running it. The idea of a company organized to do prospecting by this means in a district is one at once appealing to those who appreciate its advantages. The work above referred to was mostly for the purpose of locating veins believed to exist, but the whereabouts of which was not definitely known. The holes bored were generally about 300 or 400 feet in length, boring proceeding at the rate of 15 to 40 feet daily, according to the ground. The cost of the black diamonds used in diamond drilling operations is at the present time from $60 to $65 per carat, depending on quality, some being superior to others. The work of setting these in the boring bit can only safely be intrusted to an experienced man, for a novice would, in all probability, lose the diamonds in the hole. Diamond drilling is a science in itself, but in experienced hands is a comparatively inexpensive and satisfactory method of prospecting ground. Holes may be bored to any depth up to 5000 feet, though deep holes require powerful and expensive machinery of this type, and are more expensive per foot drilled. The diamond drill is yearly coming into more extended use in the mines of the West, as the advantages of this means of prospecting becomes more familiar to mine owners and managers. Some excellent results have been obtained by the use of the diamond drill in Leadville district, Colo., in Utah in various places, and also in California.

MANY mines possess the elements of success, but are handicapped by a lack of sufficient means to equip and operate the property on a scale commensurate with its magnitude, or by the parsimony or ignorance of the owners or management. The mines which run on a margin of profit so small as to render the outcome always a matter of doubt usually produce the best superintendents, for their energies are constantly directed toward a legitimate reduction of expense while increasing the output. Although this is a fact commonly recognized among mining men, the popular saying is that "Good mines make good miners." This is an admission that the rich mine will pay under extravagant or inexperienced management, but where the profits are large there is usually little disposition to complain at the character of the management.

Annual Assessment.

The inception of a miner's title to his mining location is his discovery. This is a fact well established by the laws and the courts. To preserve and perpetuate this title the law requires the performance of certain acts on the part of the locator—the annual assessment work. The performance of this work, or the making of improvements on his claim to the extent of one hundred dollars annually, permits the miner to hold possession of his claim to the exclusion of all others. These are the two factors of perpetual ownership—discovery and the performance of the amount of work (or improvements made) to the extent of one hundred dollars annually. As the end of the year is approaching, many holders of unpatented mining claims naturally are making preparations to comply with the laws, and thus hold their claims for another period. In view of this fact a few pointers on annual assessment generally will be welcomed by many.

The miners of the West early called this performance of a stipulated amount of development work, or improvements, "assessment work," and the performance of it the "representation" of the claim.

The early Federal mining laws—those of 1866—made no provision for annual labor on mines, leaving its regulation to the several States or mining districts, but as the requirements of these were so widely different the Federal Statutes of May 10, 1872, made the necessary provision for this, to apply to all claims previously located or which might be thereafter located.

This law provided that the year within which the work should be accomplished should begin with the date of location of the claim; but this law appearing somewhat confusing where there were groups of locations owned by the same parties, the several claims of which were located on different dates, the law was amended January 22, 1880, and provided that the period within which the work to be done annually on all unpatented claims located since May 10, 1872, should commence on the first day of January next succeeding the date of location of such claim. This made the date of expiration of annual assessment on unpatented claims uniform throughout the United States. The law also provided that no assessment work need be performed within the year in which the claim was located.

As, under the provisions of this liberal law, a claim could be located on the first day of January, and no assessment work required within the year of location, nor during the following year up to the last month of the year, or just sufficient time within which the $100 worth of work or improvement might be made, several of the mining States of the West passed laws (as well as some counties and districts) which require the performance of a stated amount of work within a short period of the date of location, as a part of the act of location. This is undoubtedly wise legislation, as it has a tendency to lessen the likelihood of wholesale location of mining ground by the few first-comers in a new district, and aids materially in the development of the mineral resources of the country. Some of the States have also adopted laws relative to annual assessment work—not as a part of the act of location. Arizona, Nevada, North and South Dakota and Washington have statutes which formally adopt the Federal laws, and which, while not emphasizing the Federal statutes or adding to their requirements in any manner, practically shut out any district laws or rules which would have a tendency to increase the amount of labor required by the United States laws. In New Mexico the Legislature has fixed the value of a day's work at $4 for eight hours. The Wyoming statute provides that the assessment work on placer claims shall consist of $100 worth of manual labor, permanent improvements on the claim in the way of buildings, or roads or ditches made for the benefit or working of such claim, to show that the work or improvements are in good faith.

Colorado has a State law requiring that on placer claims of 160 acres, or more, there must be at least one hundred dollars worth of work, done annually before the first of August of each year. On smaller claims the amount shall be in proportion, but not less than twelve dollars worth of work shall be done on any claim. Where two claims adjoin, the work may all be done on one claim for the benefit of both. This law was held by the courts to be contrary to the Federal statutes and void. Colorado, therefore, has no valid legislation on the subject. In regard to lode claims, the Colorado law is silent, consequently the Federal laws alone control.

California and Utah have no legislation requiring the performance of any work as a part of the act of location, the Federal laws only being operative in this respect in those States.

In Colorado, the State laws require the filing of a location certificate within three months from the date of discovery. Before the expiration of this time, and within sixty days from the date of discovery, the discoverer must sink a discovery shaft on the lode to a depth of at least ten feet, from the lowest part of the rim of the shaft, or deeper if necessary, to show a "well defined crevice." Any open cut, crosscut, or tunnel which shall cut a vein at a depth of at least 10 feet below the surface, or a tunnel run along the vein for a distance of 10 feet, is considered equivalent to a 10-foot shaft.

In Arizona, within ninety days from the date of discovery, and posting the notice thereon, a discovery shaft shall be sunk on the vein to a depth of at least 10 feet, from the lowest portion of the rim of said shaft, or deeper if necessary, until there shall be exposed therein "mineral in place." An open cut, adit or tunnel may be substituted for the shaft, as a part of the act of location, which shall be equal to a shaft 10 feet deep, 4 feet wide and 6 feet long, and which shall cut a mineral bearing lode at a depth of 10 feet from the surface.

In Idaho the locator must complete his location by marking his boundaries within ten days from the date of discovery. Within sixty days from the date of location the locator must sink a shaft upon the lode to a depth of at least 10 feet from the lowest part of the rim of such shaft (which means that where the shaft is located upon a hillside the lower and not the upper side shall be the place of measurement), and not less than 16 square feet in area. As in the States above mentioned, a cut or tunnel of proper size, on the vein, may be substituted for a shaft.

In Montana the first requisite after discovery is the posting of a notice, and within sixty days of the date of discovery the locator must sink a 10-foot shaft, or run a cut or drift, exposing a "well-defined crevice" or "valuable deposit." The Montana law resembles that of Colorado in its general features.

In Nevada, also, the posting of a notice is required, and the locator must within ninety days from the date of location sink a shaft to the depth of at least 10 feet (or its equivalent), showing a "lode deposit" of mineral in place. This legislation has been held to be valid.

In New Mexico, from the time of taking possession, and prior to recording the notice of location (three months after posting), the locator must sink a discovery shaft upon the claim to the depth of at least 10 feet from the lowest part of the rim of said shaft at surface, or must drive a tunnel, open cut or adit upon such claim, exposing mineral in place at least 10 feet below the surface.

In North Dakota the locator must within sixty days from the date of discovery file a location certificate with the county recorder, but before filing such certificate must sink a shaft sufficient to show a well-defined mineral vein or lode.

The law of Oregon requires that the locator post a notice of discovery, and before the expiration of sixty days from the date of posting same, and before recording the notice of location, must sink a shaft to the depth of at least 10 feet. Here also an open cut, crosscut or adit, exposing the vein at a depth of 10 feet from the surface, may be substituted for a shaft. The law of that State distinctly provides that the work required by this State statute shall not be considered as part of the work required by the United States statutes. An affidavit showing compliance with the foregoing provisions is required to be made and attached to the notice of location and recorded therewith.

South Dakota requires a 10-foot shaft or cut with 10-foot face exposing mineral in place. As in North Dakota, the locator must record a location certificate within sixty days from the date of discovery, but before filing such notice must sink a discovery shaft on the claim 10 feet deep.

In Washington the locator is given ninety days within which to record a notice of location, but before filing the same he must have sunk a discovery shaft to a depth of at least 10 feet. Other superficial work equivalent in extent to a shaft which shall expose mineral in place at least 10 feet from the surface may be substituted for the shaft. These provisions do not apply to locations west of the summit of the Cascade mountains.

In Wyoming the locator has sixty days within which to sink a 10-foot shaft or make a corresponding open cut.

These State laws were passed with the object of compelling the would-be locator to actually demonstrate that he has discovered a mineral vein in place, and to further compel him to demonstrate his good faith by performing a stated amount of development within the period fixed by the respective States.

The language of the State statutes having a bearing on this subject is in many instances unfortunate, in that they anticipate a geological condition which may not exist. All miners know that a valuable mineral deposit may exist which has no distinct well-defined walls. Yet some of the laws demand a "well-defined crevice," "well-defined mineral vein or lode," etc. It is evident, of course, that the intent of the law is that "mineral in place"—that is, not loose detached pieces of ore commonly known as float, shall be discovered.

There is no question as to the wisdom of this State and district legislation, which has a tendency to promote the development of the mineral resources of the country. In all cases after the first two years succeeding the date of location, except in the few States which have laws on annual assessment, the claim holder usually defers his assessment work until he is compelled to resume it to save his location from being taken by another.

The class of work or improvements permissible as assessment work is that work or development which will have a tendency to improve the property, or that class of improvements, in the way of buildings, machinery, ditches or roads, or other substantial investment which may have a direct benefit on the development and operation of the mine or mines.

In case of a group of claims the work (or improvements) may all be placed on one of the claims if for the manifest benefit of all, or the expenditure may be made entirely without the limits of the group for the benefit of all of them. If a portion of the group is patented, the expenditure may be made on a patented claim for the benefit of all the claims in the group which are unpatented, it being only necessary that the equivalent of $100 be expended for each unpatented claim of the group.

THE time usually arrives in the history of most rich mines when the fact can no longer be disguised or disregarded, however unpalatable it may be, that the rich ores are giving place to those of lower grade and of more complex composition, with a correspondingly increased expense in treatment and a lessened return per ton of ore treated. There are scores of examples of this condition, and the unwelcome change in ore composition and value must be offset by corresponding changes in mining methods, ore handling below ground and on the surface, and the adoption of metallurgical processes which will secure a higher extraction at reduced cost. In other words, the change from rich to low-grade—or from free milling to base—ore must be met by the wise application of methods and processes which will result in a corresponding reduction in costs. This, modern science usually makes possible, but to take advantage of the new order of things the management of mines must sweep aside prejudice, time-honored precedent, tradition and practice, for that which is superior.

ONE of the features of modern copper mining in the Lake Superior region is the vigorous exploration of copper-bearing beds which have been known for years, but which were recognized in former times as containing too small an amount of metal to afford a profit under the conditions existing and the methods of operating at that time. The cheapening of production by the introduction of improved methods and machinery now bring some of these low-grade deposits within the range of possible profit.

CONCENTRATES.

THE presence of lead or iron in gold renders the alloy brittle and unfit for use where strength or ductility are essential.

COLD rolled steel makes excellent "U" bolts for machine drill use. They will outlast other metal generally used for this purpose.

IN Kings county, California a mine telephone is in successful operation a distance of 50 miles, the conductor being the wires of a barb-wire fence.

A VEIN may occur at contact of a dike with older rock, or it may occur wholly within the dike itself, due to fissuring of the dike subsequent to its injection.

ANY mineral at all soluble in water will leave a clearly perceptible residue on a platinum dish when the solution is evaporated. Gypsum is slightly soluble in water.

IT never pays to handle rock or ore in a wheelbarrow where a track and car can be utilized. The difference in cost will in a short time pay for the installation of track and car.

MADAGASCAR has gold mines, but the development of the mining industry in that island is as yet in its infancy. The gold output of Madagascar in 1904 was about $1,500,000.

GOLD which has been collected in metallic iron in metallurgical operations may be recovered by roasting the iron with pyrite and a small amount of rich copper ore on the hearth of a reverberatory furnace.

COMPRESSED air was used for agitating the silver-bearing solution in the hypo-sulphite of soda lixiviation of silver ores, when sodium sulphide was added to the solution for the purpose of precipitation of the silver.

A SUBSTANTIAL tramway trestle may be made of 2x8-inch lumber if the pieces be properly disposed. There is a tendency to employ timber of unnecessarily large dimensions in structures of this character.

IF the bolt holes in the base of a mortar are not of the same size as he anchor bolts, the mortar is very likely to shift about on its foundation and in time get a rocking motion as the stamps fall and finally require resetting.

BERYLS are usually various shades of green, shading to light blue and whitish blue, but are also occasionally found of rose red color. Crystals of the latter sort are found in the gem mines at Mesa Grande, San Diego county, Cal.

THE grade of ditch lines, roads and tramways may be established with sufficient accuracy by the use of the triangle and plumb-bob. The accuracy of the work depends entirely upon the care employed in the use of this simple instrument.

IT is stated that the Britannia copper mine on Howe Sound, B. C., is equipped with 400 rock drills of various types, and there are said to be more rock drills operated in the lead-zinc region of southwest Missouri than in the entire State of Colorado.

IT is ordinarily unsatisfactory to build heavy structures of any kind on a mine dump unless it has been made many years and has firmly settled. A new dump shrinks in volume by the slow settling of the mass, which continues for years in some cases.

HONEY-COMBED and heavily mineralized veins undoubtedly offer a better inducement to exploration than veins of pure white quartz. Very few large veins of white quartz outcropping on the surface contain payable values. There are exceptions, but they are rare.

A GOOD suspension bridge may be made from disused mine hoisting cables. Such a bridge may be built over almost any stream where sufficient tension can be brought upon the ropes, to give them a proper catenary curve. Such bridges have been constructed and used for the passage of mine cars, and also to carry air and water pipes.

THE expense of treating ores in a stamp mill is determined by the capacity of the plant per crushing unit, the number of men employed and the wages paid, and, to some extent, the arrangement of machinery and distribution and cost of power. Mills having the same crushing capacity are not always operated at the same expense per ton of ore treated.

IT is difficult to suggest a name for a new location that will not conflict with others already in existence. Miners seem to have exhausted their ingenuity in that direction, and duplication of names of mines is of very common occurrence, particularly among the more noted mines, such as Anaconda, Silver King, Homestake, Independence, Tonopah, etc. A prospector in Riverside county named his claim Hexahedron, a name which has probably not as yet been duplicated, but should the claim of this strange name come into prominence there would doubtless soon be numerous Hexahedrons.

QUICKSILVER occurs usually as the sulphide (cinnabar), also as metacinnabarite, another sulphide, and as native mercury. A few other mineralogical occurrences are of merely scientific interest. The large deposits of the world occur under almost identical geological conditions—at or near the contact of sandstone and serpentine.

A VALUABLE paper on tellurium ores can be found in Vol. XXVI, p. 485, Trans. A. I. M. E., written by Frank Clems Smith. It is entitled the "Occurrence and Behavior of Tellurium in Gold Ores," more particularly with reference to the Potsdam Ores of the Black Hills, South Dakota. A discussion of this paper will be found in the same volume beginning at p. 1103.

IT is not likely that the X-ray will prove of material or practical value in the determination of the values in ore. It is no doubt true that the metal may be seen in a small piece of rock by use of X-ray apparatus, but ordinarily gold and other minerals of value occur disseminated in extremely small particles, and where they do not may be seen without the aid of this extraordinary paraphernalia.

THE composition of the ore charge at Mount Lyell, Tasmania, is stated to be about as follows: Fe, 40.30%; SiO_2, 4.42%; $BaSO_4$, 1.48%; Cu, 2.36%; Al_2O_3, 2.04%; S, 46.01%; Ag, 2 ounces per ton; Au, 0.0725 ounce per ton. This general average is maintained as nearly as possible by mining the necessary amounts from various portions of the ore body, which differs in composition from place to place. The height of the ore column in the furnace is kept at 9 feet 6 inches.

A FARRED LETTER in a chemical formula indicates that two atoms of that element are represented by the symbol, while each of the dots over the symbol represents one atom of oxygen. The small numerals to the right of any symbol multiply not only the number of atoms of the element represented by the symbol, but also the atoms of oxygen indicated by the dots above it. This is a survival of the old dual system, by which the cathions were represented as oxides and the anions as hydroxides. It is now obsolete.

PYRITE containing 40% iron and 43% sulphur is worth at the present time at tide water in Spain about $2.50 per ton. A large amount of pyrite is shipped annually from the Spanish mines. A similar grade of pyrite at San Francisco, Cal., is worth about $4 to $4.50 per ton. On the Pacific coast a higher grade of pyrite —50% sulphur—is desired by the manufacturing chemical companies. At the port of New York pyrite sells for about 10 cents per unit of sulphur contained. At this rate a 50% ore would be worth $5 per ton of ore.

DIFFERENTIAL results in the re-assay of pulp samples, which have been submitted for check assays, probably represent the different quantities of gold and silver in the several lots taken from the pulverized general sample, and not to defective assays. Gold ores in which the gold is evenly disseminated in very fine particles give more uniform results than where the values are in coarse gold. The screening out of metallics, and the addition of these values to those obtained in the assay of that portion passing the screen, must necessarily lead to differing results.

CHUTES constructed of pipes or of wood, if of greater than 6 or 8 feet length, should have a slope angle of at least 35°, or only dry rock will run in them. A long chute provided with a gate at the lower end, and which is filled with a mixture of fine and coarse ore, if at all damp will not run readily at even 35° when the gate is opened, it being frequently necessary to enter the chute and move the ore along. Such chutes should have a slope of about 45°, but should be kept full, or the impact of the falling ore when dumped from a car will soon wear the structure out, even if lined with iron.

THE hydro-metallurgy of copper is not a simple proposition, for its success depends to a great extent upon definite chemical knowledge and experience. Some ores are naturally suited to leaching, but others have to be prepared by roasting and by other preliminary treatment. The roasting must be done with greatest care by experienced men, or it may easily be overdone. It is the process often adopted for ores too low grade in copper to be treated at a profit by any other method. Twenty or more years are required for sulphide ores to oxidize sufficiently by natural processes, so that the copper may be recovered by leaching.

IN the use of machine drills it is very essential that sufficient lubricating oil be used inside the machine, but the tendency is to use too much. Any excess of oil will be blown out within a few minutes after drilling begins. The machine should be examined by the machinist frequently to see that the machine is kept properly packed, and the management should not permit the miners to take a machine apart underground in the working place, for even if the drill runner be competent to make the necessary adjustments or changes, which generally he is not, the drift or stope is not a machine shop, and not the proper place to perform such work. Usually more harm than good is done in this way. If the machine fails to work well it should be sent to the shop, whether it be on the surface or underground.

THE mineral contained in rock—pyrite, galena, blende, chalcopyrite—usually will break free from the gangue if the ore be crushed sufficiently fine, for the reason that the surface between the ore particle and the gangue mineral is a natural surface or plane of fracture. If ores are not crushed sufficiently fine, the mineral will not separate readily from the gangue, and a portion of the values must thus pass into the tailings as this grain of ore; part sulphide and part gangue will not, in all probability, be saved on the concentrator. It at once becomes a choice of crushing finer and making a higher saving while lowering the crushing capacity of the mill.

NATURAL lubricating oil—petroleum—is a composition of gases and liquids. When the oil reaches the surface of the earth the gases pass off into the air leaving behind the liquids, the composition of which is variable proportions of carbon and hydrogen. It is usually a dark green by reflected light, and red by transmitted light. The various grades of petroleum are known under the general term "hydro-carbons." The principal combinations in the crude state are methane, CH_4; ethane C_2H_6; prophane, C_3H_8; butane C_4H_{10}; pentane, C_5H_{12}; hexane, C_6H_{14}; heptane, C_7H_{16}; octane, C_8H_{18}. These compounds appear to bear a simple relation to each other throughout the series.

WHEN a dike of intrusive rock accompanies a vein, the geological conditions must show whether the vein or dike is the older. In case the vein is cut by the dike, it may be that the dike has little if any influence on the ore deposition, as in its intrusion it has simply followed a line of pre-existing weakness, the plane of the vein. If, on the other hand, the dike is found to be a portion of the vein, having been altered by the infiltration of waters from below, then there is the liability for the dike to occupy the entire fissure, and the values to practically disappear, as, in all probability, only those portions of the dike which have been subjected to pressure and crushing will be found infiltrated with mineral to a payable extent.

IT usually pays to spread concentrates out on a drying floor, frequently raking them in order that the moisture may disappear by evaporation before shipment to smelters. This is particularly advisable where the transportation charges are high. Many mines ship concentrates carrying from 10% to 20% moisture, which is little less than this amount when received at the smelters, as the opportunity for drying when sacked is greatly reduced. Some shippers claim it is economy to ship damp concentrates, but this is a policy rarely justified. A ton of damp sulphides containing 12% moisture will cause a greater loss than those shipped dry and which lose something by dusting. This latter factor can be reduced by the use of canvas sacks.

A UNITED STATES deputy mineral surveyor is appointed by the Surveyor-General of the respective districts. A deputy may hold a commission in more than one State, but can make no surveys in a district in which he holds no commission. He must give a bond in the sum of $10,000. They are officers of the Land Department and as such are under obligations to perform their duties in accordance with official instructions. At one time the Land Department held that they were not prohibited from making mineral entries within the district for which they are appointed, but by subsequent rulings it was determined that they came within the inhibition of Section 452 of the Revised Statutes and were prohibited from entering or becoming interested in any of the public lands of the United States. There has been some controversy and uncertainty about the legality of this departmental ruling, but a recent Supreme Court decision has determined that a deputy mineral surveyor can locate no public land of any description, nor hold an interest in the same.

GOLD POCKETS are usually discovered by systematic search and not by coming upon them by chance. The pocket hunter pans the alluvial on the hillside where he thinks a pocket may be found, and finding gold pursues his investigation systematically, usually digging shallow pits at stated intervals. If the gold found comes from a single point on the hillside above, the occurrence of gold as indicated in the test pits, will indicate a fan-shaped distribution of the gold from the vicinity of the pocket down the hillside, the gold gradually spreading out as the distance from the pocket increases. The pocket may be shallow or lie deep beneath several feet of soil and rock. When the latter occurs it makes the labor of the pocket hunter more difficult and its results less certain. Those who follow pocket hunting as a business usually become very expert at it and can "read the signs" as they are uncovered in digging with almost unerring certainty. When the pocket hunter becomes thus expert he is able to save himself much labor and can more quickly reach a safe conclusion as to probabilities after on y a few holes have been dug.

Gold Mining in Egypt.*

The gold district of Egypt, as far as known at present, is situated between the river Nile and the Red sea for 100 miles or more on either side of the 24th parallel north latitude. Assouan is one of the chief cities in this part of Egypt and in recent years has come into prominence through the construction of a dam across the Nile near the city for the purposes of irrigation. The quarries of red granite of Assouan are noted, the stone having been used extensively locally and also by the Romans.

In this region are many evidences of former occupation of the country by miners. Numerous ancient workings have been found and in some of them rich ore still remains.

The writings of the ancient Greeks, and also the inscriptions on the rock faces and the walls of temples and other buildings, indicate that the mines were not worked steadily, many interruptions occurring on account of wars.

The gulches and valleys of the region contain alluvial gold, and some of these have been extensively worked by the ancient miners. One of the most important of these is the Wadi Allaghi, which runs in a northwesterly direction from the vicinity of Mount Elba, near the Red sea, to the Nile, as indicated on the accompanying sketch map of the region. Other gold districts are those of Um Rus, Oneib and Ciega. There are also ancient copper mines in this mineral region.

The ancient Greek geographer thus describes the methods of mining in those days:

"They put fire to the reefs, and the thus loosened stones were taken away and crushed. The chief quartz powder by water, on specially constructed tables. The lighter parts are washed away, while the heavy gold dust remains in the rills. By taking up the gold with soft sponges it gets a final cleaning, and is then molten in small clay retorts, with a mixture of lead, salt, a little tin and bran. After glowing for five days and nights, the material is one compact gold mass, in quantity only a little less than the quartz powder has been."

One of the accompanying illustrations shows a number of these ancient mills of stone. Mining was evidently carried on successfully in this primitive fashion for many centuries, and apparently mostly before the Christian era. There have been numerous concessions granted to mining corporations to reopen and operate these ancient mines, among them being the Egypt & Sudan Mining Syndicate, the Egyptian Gold & Gem Syndicate, for emeralds are reported in the ancient workings found on this company's concession between Hamesh and the Red sea. Others are the Egyptian Sudan Minerals Co., Deraheib & African Syndicate, and the Nile Valley Co., Ltd. The latter is one of the most important and has the most extensive ancient workings on its concessions. This property is under the management of John M. Beckwith, E. M., who several years ago was general manager for the Silver King Mining Co., Ltd., at Calico., San Bernardino county, Cal. The deserts of Egypt present few novel features or conditions to Mr. Beckwith, who became thoroughly familiar with similar conditions in southern California. In a private letter recently written he says some of the veins are rich, and that in a few days he took out about $50,000 in specimen rock. These mines are at Um Garaiart, about 60 miles from the river Nile and 100 miles from Assouan. At Ceiga No. 1 are the deepest mines. The vein is 4 feet wide and was evidently rich also.

There is much that is speculative in the history of these mines of Egypt, though of great interest. The accompanying illustrations, and also those on the front page, give a good idea of the topography and sterile aspect of the Egyptian desert. The inscriptions on the rocks are still well preserved, as they

work had an expert miner to perform, who brought the laborer to places where he had traced the gold, and divided the work among them according to the capacity of the single man. The strongest, and still in the prime of manhood, were used to break the stones and to work in the shafts. Without anything else but their own strength, they were breaking the stones with heavy iron hammers and following the gold-carrying vein. A light was fastened to their foreheads, and, under the eyes of their gruesome foreman, they had to work from morning to night. The stone material was carried by children out of the shafts, and only the oldest men, useless for any other work, had to bring it to places where others were kept busy crushing. This was done by strong young men of about 30 years of age, using heavy iron pestles and stone mortars, the latter being hewn in the solid rock. In mills, placed in long rows, one close to the other, the crushed quartz is ground by women. Only expert laborers were treating the must continue to be for many centuries more—if not defaced—in that dry atmosphere. The accompanying map and the following description of the mines of the region are from the London Mining Journal:

In the works of Um Eleacha two working periods are distinguishable. As sure, we only know that already before the times of the oldest Egyptian kings, or at their times, a mining population has been working in the districts between the Nile and the Red sea, but most probably unknown to anyone in Egypt.

The old Phœnicians already were trading in these districts, and later the Egyptians got enormous amounts of gold from here. To make an exact calculation of the gold produced is impossible; one can only imagine it when reading the accounts of the treasures of the Egyptian kings, and from the highly advanced skill with which the jewelries found in ancient tombs are worked.

It seems that with the diminishing power of the Egyptians the mines have been more and more neglected, and later we can only find that in the begin-

*See Illustrations on Front Page.

ning of the ninth century after Christ they again were exploited by El Omari, a descendant of the Khalefa. The first mine, most likely, was at Um Garaiart, about 60 miles from the Nile, at a place where water was plentiful. These mines were worked with varying success, and in them we have the Nile valley mines of to-day.

Owing to quarrels with the different tribes, El Omari had to retreat to a mine farther south and farther off the Nile, near the Gebel Aswad. Here water was very scarce. After he had slain the Nubians and secured a way for water from the Nile, El Omari worked here for several years. A third mine was at Ceiga, three days from the Nile. Here the gold-bearing reef has been taken out to a great depth—how deep it is impossible to say, as in some places the hanging wall has fallen in, and the workings are silted up to about 100 feet from the surface. In other parts the workings are about 300 feet deep. The reef here is about 4 feet wide, and the ancients have removed all the gold-bearing stone, leaving the white buck reef standing.

With much blood is marked the history of these mines, for which 60,000 camels were carrying provisions from Assouan. The gain from these works must have been enormous, but nowhere has been found anything definite about the value of it.

About the northern mining districts of Hamamat and Sighdit (Sikait?) reports have been published by Mitchell, but for exactness they cannot be compared to those of Floyer. Mitchell only describes the discovered ruins of ancient settlements and the traces of mining works around the Hamamat district.

Brugsch Pasha is proving from ancient documents that the first working period has been about 2500 B. C. The Pharaohs of the second dynasty were already working them, and to judge from hieroglyphic inscriptions found by Mitchell in the ruins at Hamamat, the second period was begun under the Ptoleman King Euergetes, about 200 B. C.

Farther south, in the western and southern wadies of the Gebel Elba, several large and small mines have been discovered. Linant de Bellesfond was probably the first to examine them. He reports of them as follows: "In the upper part of Wadi Murat, about 21° 10′ latitude north, are traces of old mines and quartz reefs, which have been worked from the open. The reef runs from southeast to northwest, and the quartz seems not at all rich in gold. These mines are of a much later date than those at Gebel Raft." Here we have the Om Nabardi mine of the present day.

In the Wadi Habsah (20° 20′ N.) are numerous traces of old settlements—broken quartz and ruins of huts where the latter seems to have been crushed. It seems as if these mines have been worked without any rule, and the reefs are mostly worked only at the surface.

Of a much later time are the mines of Ceiga, before mentioned. Here a big quartz reef in mica and talc-slate is divided into numerous small reefs and veins, leading in every direction. The most of these veins have been exploited at a small hill. To judge by the ruins of old dwellings, a large number of workmen must have been employed here. From 400 to 500 single huts are scattered about in the valleys, and in many of them are still found small handmills for grinding the quartz. It seems that the work here has been suspended after exhaustion of the quartz, as far as they could reach it.

Deraheib is situated at the south of the Wadi Allaghi, which latter is leading northwest to the Nile, as far as Dakkah, between the first and second cataracts. Here are the ruins of quite a large town. Big parts of two castles on the opposite hills are still standing in very good order. Two periods can be distinguished here by the construction of the buildings, as well as by the methods employed in mining.

Map of Southeastern Egypt, Showing Locality of Gold Mines.

The old mines distinguish themselves from the others by their vastness and the carefulness with which they have been worked. The quartz reef has split into many branches and veins, and every one of them has been followed by the miners. These mines were worked by the Copts in 1300 A. D.; the name Deraheib is from Der (a convent) and aheib (beautiful). At some places two main shafts have been sunk, and farther down both have been connected by long drives. There are vast places entirely hollowed out, and the ways in many of the big workings are barred with hills of broken down walls and debris. One of the shafts is closed up at the end by a solid stone wall. These mines were first worked in the times when Egypt was governed by the Pharaohs. In almost every shaft the walls have been tried much later with chisels, probably to examine the quality of the quartz.

The later works of the Arabs are all in the open, as the Arabs detested to work underground. To judge by the numerous ruins of huts and great buildings, a large number of workmen must have lived here. Most probably there was formerly plenty of water through rainfalls, as wells have not been found.

Though neither documents nor inscriptions have been found here, doubtless these are the mines of which Diodorus, the ancient Greek writer, speaks, and which were said to be Allaki, probably the Allagi of to-day. Diodorus describes the gold production of the ancient Egyptians in the year 50 B. C. as follows: "On the borders of Egypt and the neighboring countries, some districts are full of mines, which produce plenty of gold. The soil is black, but has many veins white as marble and glittering from the precious metal. A large population is working here, as the kings of Egypt are sending to the mines not only all the criminals of the country, but also their whole families, and even their descendants and relations, to multiply the revenue of the mines. With chains forged to their feet, these people are working day and night. They are watched by soldiers, who do not understand their language. Nobody cares for them, and whether they are well, or sick, or weak, they are driven to work until death releases them."

An inscription in the palace of Thebes, Karnak, states the revenues from the gold mines of the Egyptian Kings to have been 22,000,000 minas. This sum has been calculated as equal to £6,000,000.

After Diodorus nothing is mentioned about these mines by any other author until the Arab Macrusi, who lived about 1385 A. D., or 1430 years after Diodoc. He tells that under the reign of King Achmed of Egypt, an Arab went to Nubia, and was working there, under an everlasting war, in the old mines.

It seems strange that in the long space of time between the two periods of Diodorus and Macrusi no mines have been worked, and that the mines should have been desolated for so long. The places known as gold carrying, and which have been worked in olden times, are:

Um Gariat Ceiga Gebel Abdulla Machemunaye Um Gabril Tamille Gebel Essewed Gebel Tellatabd Um Taiur	Between 22° and 23° latitude north.
Oneib Wadi Hegatte Wadi Affave Wadi Daguena Wadi Nasarrie Deraheib	In the district of the Melekal Arab.

At all these mines, which were exploited in the old times on a considerable scale, but later on a smaller scale, the sometimes very variable gold production had to be got through a most wearisome kind of mining, and the revenues of the different works could only be considered as a profit in representing the labor of prisoners and slaves.

Two days south of Deraheib is Oneib. Here are the largest workings in Egypt or the Sudan. The reef here occurs in a range of four slate hills, and the gold-bearing stone has been all removed down to the Wadi level. These hills are literally cut in two. There are three reefs here, but only the first one appears to have been worked for any length of time. A half a day's journey northwest from Oneib are the old workings of El Harr. Here there are ruins of many old buildings and the remains of crushing mills. The works here are not to be compared to those at Oneib, but it is probable that all the stone was brought from Oneib to here to be treated with water. There is a large quantity of tailings here. El Harr is situated at the junction of two wadies, or dry water courses, and it is probable that there was a good supply of water here, both from rainfalls and wells. Wells may have been sunk by the ancient miners, but are now silted up to the surface.

Taking into consideration the machinery of to-day, and the fact that the ancients had no pumps or appliances for dealing with water, and must therefore have been stopped on reaching water, Egypt appears to have a bright future as a gold producing country.

Venezuelan Gold Fields.

TO THE EDITOR:—Gold in abundance occurs in all parts of the Venezuelan Guiana. Through liberal laws a stampede to the region could be easily induced. The placers are especially rich, the climate fair and the inhabitants favorably disposed toward English speaking people.

Most of the auriferous Guiana region is embraced in the Territory of Yuruary, recently created. Yuruary is as large as France. It has a population of 15,000.

In such a great extent of land, subject to many atmospheric changes, there is no uniform class of temperature. Both topography and geological conditions cause divergences of climate. On Muria hill, for instance, the thermometer always shows a temperature between 15° and 20° lower than that of the plains below. A similar variation of temperature is observed in all localities where there are groups of hills placed in the midst of savannahs. In August, September and October the thermometer often registers 110° F., but at all other times the Territory enjoys a fresh and agreeable climate, which contributes to good health.

The principal orographic feature is the Paracaima range, and the most notable landmark is Mount

Roraima. There is a zone about 2000 square miles in extent in which there are many natural prairies, interspersed with lomas and traversed by some elevated table lands, resembling small sierras, where the gold is found. The upheavals most noted for auriferous deposits are Muria hill, Botanama, Miripia, Tomasote, Carapa, Platanal, and Caroni. The region is at present given up almost exclusively to the raising of cattle. There are numerous springs.

The rest of Yuruary is entirely unknown. It is a forested country, unexplored—an immense wilderness, whose area has never been calculated because of a lack of data and detail. Only the edge of this region is known, since it surrounds the partially settled pastoral district on all sides. It offers itself only to the imagination as a defiant sea of vegetation.

There are few inhabitants in the Venezuelan Guiana except the aborigines. In the entire Territory there are but two Americans. South of the Cuyuni river live Caribs; to the south of these Arecunas and Guaicas, who people a picturesque plain called Camarata; still farther southward, on the road to Mount Roraima, where the jungle becomes so thick that a man can hardly "cuss a cat" through it, live the Marabitanos, who occupy a beautiful prairie known as La Gran Sabana. The Marabitanos are white Indians, who cultivate beards. They are now at war with the Arecunas and Guaicas, who are beardless, olive-complexioned aborigines. The Caribs are of a light mulatto color. They fight very little, but eat all strangers who stray singly among them.

All these tribes are composed of robust, well-built Indians, inclined to agricultural and pastoral pursuits. They gather rubber in the forests and transport it by the Cuyuni river to Georgetown, in British Guiana, for sale. They recognize the Government of Venezuela, but have no dealings with Venezuelans. Most of them are Christians and have Spanish names, though few of them speak Spanish. They all speak English—in a way.

There are forty-five different kinds of useful woods found in the forests of the Yuruary region.

In 1889 the population of Yuruary was 13,000. In 1891, after the inception of exploration work under President Crespo, it was 18,000, or an increase of 40% in two years. In 1898, just before General Castro came into power, it was 28,000. The fall to 15,000 has occurred almost wholly during the last two years. Within two years more, under the unscientific Government now existing, it will fall below 10,000. In three years sixty towns have disappeared.

Decadence of the gold mining industry is due to the nationalization of mining property by Castro. Titles to mines cannot be secured and gold cannot be extracted without a penalty.

As showing the great importance of the Venezuelan Guiana field, it may be stated that during three years of the progressive Government of Crespo the production of gold increased 70%.

Americans will do well to watch for a change in the Venezuelan Government, to pour into the Guiana region at the earliest opportunity. The gold is ready for appropriation. JOHN DWYER.

Caracas, Oct. 15.

THE PROSPECTOR.

The samples from Silverbell, Ariz., have been examined with the following results: No. 1 is practically all silica and has the appearance of being a silicified intrusive (dike) rock; there is also a small amount of carbonate of lime in it; this rock bears a remarkable resemblance to the gold ores of the Gold Roads district of Mohave county, Ariz., and this department suggests that the rock be tested for gold and silver—on general principles. No. 2 is a slightly porphyritic feldspathic rock. No. 3 is diorite-porphyrite, containing considerable iron sulphide. No. 4 is also porphyrite, though of lighter color; both rocks are intrusive. No. 5 is quartz porphyry—numerous blebs of quartz, with crystals of feldspar in a fine-grained groundmass. Nos. 6 and 7 come under what is known as keratophyre, a fine-grained rock composed chiefly of feldspar; both rocks contain a considerable amount of magnetite in small grains. No. 8 is syenite in which the hornblende is very much decayed; it contains a little biotite mica and very little quartz; sulphides of iron and copper also occur. No. 9 is a feldspathic rock, somewhat altered and colored greenish by finely disseminated microscopic particles of chlorite; it also contains pyrite in disseminated grains.

The light greenish-gray rock from Bearmouth, Mont., is felsite, a feldspathic rock; it contains pyrite and may occur in or with gold ores; rocks of this description should be assayed to determine the values, if any, in gold and silver; the appearance of pyrite in this rock, together with the fact that it contains more silica (quartz) than it normally should, suggests the advisability of doing some prospecting on or near it; the green mineral is silicate of iron and magnesia.

The metallic mineral from Prescott, Ariz., is antimony sulphide; as it only occurs as an incrustation on the rock, it is of little value for the antimony it may contain.

The Salts of Potassium.

One of the pamphlets recently issued by the United States Geological Survey is entitled "Potassium Salts," and is the advance sheets of the Mineral Resources for 1904. Although the production of potassium salts would be of great value to the United States, there has been comparatively little effort made to find them. W. M. Courtis, writer of the bulletin in question, says in this regard:

No systematic work has been done in this country for the purpose of developing beds of potassium salts, with the exception of the work done by a small Michigan company organized in 1899 for that purpose. Within recent years both individuals and small companies have attempted to exploit certain districts or properties for potassium salts, but so far as is known they have accomplished nothing of practical value. The actual work of the Michigan company referred to was limited to one hole 500 feet deep put down at Cody, Wyo. A contract was made for drilling 2500 feet, but after boring 500 feet the men threw up the contract.

Very little money has been expended in the attempt to discover potassium salts in the United States in comparison with the value of the discovery to the country and in comparison with the sums of money expended on the German mines by way of exploration. The United States Potash Co. did not expend over $30,000 in its four years of surface exploration and preparatory work, and private individuals have reported a total outlay for exploration of about $40,000. In the German field, where the extent of the deposit is pretty well defined, immense sums of money have been expended in exploration. The Hohenzollern Co. at Alfeld-on-the-Leine spent some £300,000 in fruitless exploration work. At Bentheberg, near Hanover, a shaft was sunk 3250 feet and potassium salts of fine quality were found; but the shaft failed, owing to the influx of water into the mines. The Deutsche Solvay Werke at Micheln, in the Kalbe district, has a capital of $2,380,000 to be used for the development of potassium salts.

There are seven districts in the United States, including a Mexican locality extending into the United States, which seem to offer the most favorable conditions for boring, and in which a hole put down 1000 to 2000 feet would decide for that district whether it contained a bed of potassium salts or not. These seven fields are in the neighborhood of:

1. Cody, Bighorn basin, Wyo.
2. Magnesian lakes, near Laramie, Wyo.
3. Byron springs, Contra Costa county, Cal.
4. Death Valley, Cal.
5. Sierra de los Cucapas basin, Lower California, extending into San Diego county, Cal.
6. Boundbrook, N. J.
7. Mount Tom, Mass.

Although no deposits of potassium salts similar to those found in the Stassfurt district of Germany have been discovered in the United States, various indications of possible potassium deposits have been found in saline springs, in oil wells and bore holes, and in desert deposits.

Along the line of a fault on the rim of the Big Horn basin, Wyo., the waters are rich in potassium salts, running from 5% to 11% of the total residue. The latter amount is claimed for the Great Spring of Thermopolis, at the eastern end of the Big Horn basin.

POTASSIUM SALTS IN OIL WELLS AND BORE HOLES.—Many of the saline waters struck in wells and bore holes in the Western oil fields have been tested for their potassium contents. In many cases the quantity was so slight that no record of the analysis was kept. A few examples of the richer analyses are given in the following table:

POTASSIUM SALTS IN SALINE WATERS FROM CALIFORNIA OIL FIELDS.

Sample.	County.	Percentage of Potassium Salts in Residue.
1. Oil City bore hole	Fresno	6 51
2. From sulphur bank	Lake	Slightly over 2.
3. Williams Bros.' oil well	Napa	Slightly over 1
4. From Miners' oil well	Colusa	Slightly under 1.
5. Coalinga	Fresno	0.62
6 Berryessa oil well	Napa	0 7

No analyses of oil-well water have shown a higher percentage of potassium salts than those here given.

POTASSIUM SALTS IN DESERT DEPOSITS.—From time to time large deposits of potassium salts are reported as found in the arid regions of the West, but on examination these deposits usually prove to be mixtures of sulphate of lime, sulphate of soda and carbonates, with but a small percentage of potassium salts. Prospectors have analyses made, and the chemist reports perhaps 20% of sodium and potassium salts. The prospectors immediately imagine this percentage to be largely potassium salts, while as a matter of fact it is chiefly soda and contains probably 1% or less of potassium salts. A good example of such deposit is that of Cariso creek, San Diego desert, Cal. Another is a deposit in Uinta county, Utah (south of Rock Springs, Wyo.)

The composition of the deposits of salts about the sinks of the desert country may be seen from the following analysis, which may be taken as a general type of all such deposits:

ANALYSIS OF SALTS FROM CARSON SINK, CHURCHILL COUNTY, NEV.

	Percentage.
Insoluble in acid, gypsum and clay	77.264% } 88 554
Water and organic matter	11.290% }
Sodium sulphate	1 396
Sodium chloride	.677
Potassium sulphate	.214
Ferrous sulphate	.690
Magnesium sulphate	.097
Calcium sulphate	.367
Soda, as silicate or other combinations	4.290
Traces and undetermined (total salts 11 446)	3.715
Total	100 000

A full description of the various soda lakes throughout the country is to be found in Bulletin No. 60 of the United States Geological Survey.

An analysis from a deposit in the district in the neighborhood of the volcanoes of Lower California, lying west of the Sierra de los Cucapas, and probably extending into the San Diego desert of California, gives the following results:

ANALYSIS OF SALTS FROM SIERRA DE LOS CUCAPAS BASIN, LOWER CALIFORNIA.

	Percentage.
Water	43.65
Ammonium sulphate	39 03
Potassium sulphate	15.20
Undetermined	2.12
Total	100.00

Forestry on Mining Lands.

One of the forest tracts which are now being managed under working plans prepared by the United States Forest Service is situated in southwestern West Virginia. About 24,000 acres in the heart of the soft-coal region, and consisting of mixed hardwoods, form the basis of the plan. The owners, who are chiefly interested in mining, asked the assistance of the Forest Service, which was given in accordance with its co-operative plan. They saw that the introduction of forestry would enable them to convert the idle forest land into profit, and so increase the income from their holdings. Since the local logging methods are so careless, and since grazing and fire have wrought so much damage in the region, it is rarely that second crops can be secured after once the virgin timber has been removed.

In applying for the help of the Forest Service the owners had two main objects in view. They wished to handle their lands so as to obtain continued supplies of timber sufficient for the present and future needs of the town and the mines, and, in addition to this, to have a surplus of valuable timber such as yellow poplar or white oak, to be cut and marketed from time to time.

The study of the tract on which the plan is based revealed conditions common in the region, and the recommendations which were made by the Forest Service, and which are being carried out by the owners, apply in a general way to a number of similar forest problems.

Fires, everywhere the chief menace to forests, have been especially destructive in this locality. Spring and fall are the dangerous seasons, April, May, October and November being the months when most fires break out.

Repeated fires, even when they are individually unimportant, do much more havoc than is realized by the uninitiated. Burning leaves which should protect the ground leave the soil exposed, to be eroded by the rains and dried and hardened by the sun and winds. Impoverishment of the soil necessarily follows, and, with it, deterioration in the character and growth of the timber. On spots which are repeatedly burned over it is impossible to obtain reproduction from seeds, since the seeds are burned before they can germinate, or if the seeds escape, the seedlings are killed by the next fire. The roots of seedlings and saplings, persisting after fires, reproduce themselves by sprouts, so that little by little the entire stand is changed to sprout growth.

Grazing has been carried on ever since the early settlement of the region. Cattle, horses, mules, sheep and hogs were all found on the tract, cattle in the greatest number. Cattle and sheep have been the most injurious. The bad effects of overgrazing are chiefly injury to the soil, to the seedlings, and to young trees small enough to be reached by the cattle. According to its composition, the soil is either packed hard or pulverized by the feet of the grazing animals. The seedlings and young saplings can never develop healthful growth so long as their leaves and tender shoots are again and again browsed. Occasionally, where logging has just been done, grazing helps to expose the soil, and so many encourage the germination of seed, but as soon as seedlings appear grazing on lumbered areas becomes exceedingly harmful.

Perpetuation of the forest depends first and foremost upon its ability to reproduce itself. In order that it may do so, the trees which die and those which are cut must be replaced by young ones. And since young trees are exposed to many dangers, many more young trees must start to grow than are needed in the mature forest which is to replace the older one.

Apart from the ridges and slopes of this tract, which has been so repeatedly burned over that seedling reproduction has become impossible, it was found

that if fire could be stopped reproduction would be abundant in the forest.

The recommendations based upon the study of the tract deal with the solution of the following problems:

1. Protection of the forest from fires.
2. Restriction of grazing to clearings and land not recently lumbered.
3. Obtaining satisfactory seedling reproduction of the more valuable timber trees.
4. Removal from the forest of inferior species at a profit, or, in other words, the utilization of low-grade timber.
5. Modification of present logging practices, for the purpose of reducing waste in felled trees and of leaving the forest in improved condition.

Concrete Mixtures.

A writer in the Cement Age gives the following advice on the mixing of cement mortars and concrete:

One part Portland cement, 2 parts sand, 4 parts broken stone give the strongest concrete made.

One part Portland cement, 2½ parts sand, 5 parts broken stone give an exceedingly strong concrete, suitable for foundations for sidewalks, engine foundations, etc.

One part Portland cement, 3 parts sand, 6 parts broken stone offer an exceedingly strong concrete, suitable for carrying a "skyscraper."

One part Portland cement, 4 parts sand, 8 parts broken stone furnish a sufficiently strong concrete for ordinary purposes.

One part Portland cement, 5 parts sand, 10 parts broken stone make a cheap concrete—stronger than concretes from common cements.

THE measurement of a horse's power of work, first ascertained by Watt, the inventor of the steam engine, says Popular Mechanics, was founded upon the basis that the average brewery horse was capable of doing work equal to that required to raise 330 pounds of weight 100 feet in one minute, or 33,000 pounds 1 foot in one minute. This estimate, however, was for one minute; it would not be possible for a horse to perform this amount of work continuously for eight consecutive hours. One horse could exhaust twelve men in a single day; for where a strong man could perhaps pull half of 330 pounds to a height of 100 feet in two minutes, he probably could not repeat the operation more than a few times. A man's power is about one-tenth of a horse's power—that is, where a horse could pull 330 pounds to a height of 100 feet, one minute, and then slack up and repeat the operation, for eight hours, thus pulling four hours, and slacking up four hours, it would require ten strong men to perform the same amount in that length of time. When man put horses to work the gain in labor for the world was thus tenfold. Multiply this by steam power, water power, air power, and, above all, electric power, and one has a problem in mechanical progression.

In Nova Scotia.—IV.

CONCLUDED.

Written for the MINING AND SCIENTIFIC PRESS by T. A. RICKARD.

The finding of fragments of quartz containing gold ("float," as we call it in the West) in the glacial drift has given the clue to the discovery of several lodes. As a rule, such pieces have not traveled far; moreover, the direction of their source is indicated by the glacial striæ. A good example of the application of geological knowledge to prospecting is afforded by the finding of the Rose vein at Montague, as told by Mr. George W. Stuart.* Angular pieces of rose-colored quartz, rich in gold, had been found in drift, down to a depth of 15 feet. Most of them were at grass-roots, although some were encountered near bedrock. Search was made for the vein that had shed them, but such work was confined to the vicinity of the largest mass of drift. Mr. Stuart had noticed a large boulder of quartzite, twenty tons in weight, traversed by a narrow serpentine seam of slate. This peculiarity gave the clue, for eventually 2500 feet north of the boulder he actually found the spot whence it had come, this being determined by the shape of the recess made by its removal and by the identity of the peculiarly corrugated seam of slate. Up to that time, from 1862 to 1877, the search for the Rose vein had been restricted to a distance, northward, of 200 or 300 feet from the "float," but now it became evident that search must be made further afield. The boulder just described had traveled 2500 feet along a line, as determined by glacial striæ, 2° east of south. Shortly afterward a large rose-colored boulder of quartz, weighing 500 pounds, with a wedge of quartzite attached to it, was discovered and it was carefully examined before being broken up for the gold it contained. A year later, on December 7, 1878, the "Rose lead," as the miners had already christened the vein, was found. Forty feet east of the point of discovery, Mr. Stuart detected the very place from which the last mentioned boulder had been detached; the remainder of the wedge of quartzite and the shape of the recess in the quartz coincided exactly. The quartz had been borne 1200 feet along the line of glacial movement. Whether some of these conclusions were not reached after the data were known, I must leave to the reader; the main facts and the sound reasoning based upon them present an excellent example of skillful prospecting.

Of course, the striæ are not always uniformly in one direction; they vary with the topography and they diverge in different localities. Moreover, the distance which the drift has traveled ranges from a few feet to several miles. The Rose vein was not found for so long because the prospectors had a decided notion that they should not look for it far. In the sequel, it was proved that pieces of the quartz had been carried a mile away; just as in the case of the Dufferin lode, the "float" was found near the shore, a distance of 2½ miles. In prospecting under such conditions the first thing is to find quartz drift that has not been water-worn. At Seal Harbor, within the last year, a promising gold lode has been found by the aid of glacial evidence. Angular boulders of quartz, weighing up to half a ton, had been uncovered at grass-roots; these carried gold in small stringers traversing quartzite. One boulder yielded $300. At intervals, in a line northward, trenching was started; this followed a course north 3° west, as marked by the striæ on bedrock. No lode was found. The drift continued to be of equal thickness northward; this indicated that no approach was being made to the source of it. Another set of trenches was started farther to the west, until the work had extended 600 feet west of the drift outcrop; at this distance the drift lay on bedrock, proving the direction of search, north 18° west, to be correct. A little more trenching led to the uncovering of the lode itself, a large width of quartzite interlaced with small stringers of quartz, as shown in the accompanying photograph.

It is also to glacial erosion that Nova Scotia owes those stretches of flat upland, half moor and half swamp, that are called "barrens;" they are dreary tracts that elsewhere, in the interior of Canada, extend northward until they merge into the frozen moss of the Arctic tundra. The "barrens" are clothed with heaths, such as sheep laurel (kalmia angusfoliata) and rhodora (a rhododendron). There is also the bay-berry and, in early summer, the trailing arbutus, the flower covered by its own leaves. But more plentiful than any of these is the blue-berry and, where fires have raged, the raspberry Near

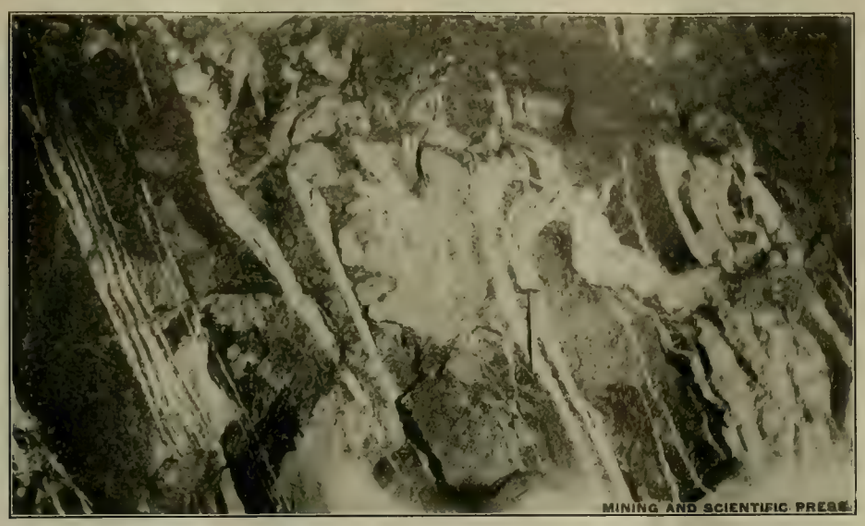
Ready to Take a Tribute Pitch.

The Caribou Lode, at the 950-Foot Level, Nova Scotia.

the settlements the primeval forest has all been cut down and a generous second growth has come up. The "bush" is thick and is often rendered impassable by wind-falls. Many a time have I wondered how these were brought about within the heart of a forest, where the wind would seem to have full play only over the tops of the trees. Wind-falls are the work of cyclonic storms, especially at the time of the autumn equinox. Mr. D'Arcy Weatherbe, deputy inspector of mines, told me how he had been present when trees of 3 feet diameter were twisted around and thrown down by the wind. He and his companion, engaged in hunting moose, found the forest full of driven spray and subsequently discovered that this came a distance of over 200 yards from a shallow lake, the surface of which was uptorn by the wind and whirled among the trees. The lake was covered



Beaver Hat Lode, at Seal Harbor, Nova Scotia.

with small waterspouts, spread all over its angry surface by reason of the cyclonic action of the storm.

By reason of glacial denudation and the intense disintegration of the rock surface which must have preceded it, the gold-mining country of Nova Scotia is not picturesque, although it has a quiet beauty, due largely to the contrast of water and forest. In crossing high ground the view is one wilderness of dark woodland; the somber tints of spruce and fir are lightened by patches of maple, birch and beach; here and there, like jewels in an Ethiop's ear, are lakes mirroring a perfect sky. But life is absent; it is a lovely desolation. An occasional grouse crosses

A Fishing Settlement in Nova Scotia.

the road; a shy rabbit, even a porcupine; but human habitations are wide apart, and the track of a moose will suggest that this is a primeval wilderness untamed by man. In the valleys there are clusters of whitewashed houses with shingled roofs, devoid of color; the village churches, for there are several, have white steeples; the cultivated land is meager; there is no exuberance of life or color, save in autumn. The road comes often within sight of the sea or edges the shore of an estuary; the headlands thrust their dark woods far out into the gray waters; rocky islands mark dangerous navigation, and cold fogs, obliterating earth and sky, suggest the further risks encountered by the hardy fisher-folk, whose cottages line the wayside. The lobster pots lie scattered on the beach, and the iron kettle in which they are boiled is seen near the fish sheds. The long wooden stands or "flakes" on which the cod is dried and salted is in evidence, through both the sense of sight and smell. The "dories," the almost unsinkable little boats in which the fishermen ply their trade, lie close to the beach; the dark shallows reflect the forest-clad shore and the white cottages; farther out in the harbor the wind and sun make rippled silver, and on the horizon a wreath of smoke marks a coasting steamer. There is a hint of quiet thrift and simplicity of life. Nature also is restrained—severe as a Puritan, a restful reticence, without exuberance of color or reckless sculpturing of line. It is a strong contrast to the scenes of that golden country over which Bret Harte has thrown the halo of a romance that will not die.

A Rapid Method for the Determination of Copper in Chilled Slag.

Written for the MINING AND SCIENTIFIC PRESS by H. A. TOBELMANN.

Take two grams of the finely ground sample, brush into a No. 1 Griffin beaker, add 15 c.c. boiling distilled water, then, giving the beaker a rotary motion with one hand, add 15 c.c. hot concentrated HCl with the other. Continue rotary motion until dissolved to prevent caking.

When slag is all dissolved, or nearly all dissolved, immediately fill beaker with boiling water and pass a current of hydrogen sulphide (H_2S) gas into the solution. Continue this until all the copper has been precipitated as copper sulphide (CuS), which will be in two or three minutes (as in nearly all blast furnace or converter slags the metals are in a reduced form), then remove beaker from source of heat and allow the precipitate to settle. When settled, filter with suction on an asbestos film, on a platinum cone. Wash precipitate three times with boiling water, then invert funnel over the original beaker, allowing the platinum cone with its asbestos film to drop into it. Rinse funnel with 5 c.c. concentrated nitric acid (HNO_3). Cover beaker with watch glass and set on hot plate. In a few minutes the CuS will be dissolved and the asbestos turned white. Now rinse off the watch glass and sides of beaker with water. Carefully add 15 c.c. concentrated ammonia (HN_4OH), filter into flask, wash, cool, then titrate with a known solution of potassium cyanide (KCN).

NOTES.—By careful work the copper in the slag can be determined in less than ten minutes. In case the slag is not chilled, I generally add a little hydrofluoric acid (HF), which materially helps the solution, the action on the glass being much less severe than one would expect.

Should small particles remain undissolved it will not matter, as all the copper would be removed by the HNO_3 acid treatment to which the CuS, plus residue (insoluble), is subjected.

The asbestos film is made by pouring over a platinum cone in a funnel an emulsion of short fiber asbestos in water, and then turning on the suction. This will form a thin film of asbestos on the cone which is capable of holding the finest precipitates. Those objecting to KCN titration can use the iodide method. If the iodide method is used the platinum must be removed from the solution and washed. When the asbestos has turned white add a crystal of chlorate of potash ($KClO_3$). The solution is now boiled until fumes cease coming off, then diluted to 20 c.c., 15 c.c. NH_4OH added, and the solution again boiled for one minute, then removed from source of heat, then 8 c.c. of acetic acid ($C_2H_4O_2$) added, and then cooled. Add a few grains of potassium iodide (KI), and, when dissolved, the solution is titrated in usual manner with a solution of sodium hyposulphide ($Na_2S_2O_3$).

Both methods are accurate and give uniform results. The KCN method is the simpler and quicker. While chemist and assayer for the Old Dominion C. M. & S. Co. at Globe, Ariz., I often found it necessary to turn out exceedingly quick results, and found this method satisfactory, giving accurate results.

Ore Valuation of a Rand Mine.*

Written by E. J. WAY.

In a paper on "The Determination of the Present Value of a Mine on the Rand," read before the Institution of Mining and Metallurgy by F. Hellmann, it was pointed out that "the accuracy with which the problem can be solved depends upon the reliability of the various factors entering into the calculation." The most important factor in the calculation would appear to be the recovery value of the ore itself. This can only be ascertained with any degree of accuracy after a mine has to a large extent been opened up, so that average values can be arrived at. The writer has been at great pains to ascertain why the most carefully prepared assay plans have not properly accounted for the gold recovered. The recovery, generally speaking, should have been higher than the actual returns. In these days, when mines are opened from end to end, and to depths on the reef of from 1000 to 1500 feet, exposing 500,000 to 1,000,000 tons of ore, greater accuracy should be the rule in gauging the value thereof in the mine, and the consequent recovery value.

An assay plan is made, and it is assumed that it is as accurate as possible, and that the calculations to arrive at the values of stoping widths have been made out without error.

Stoping width has now to be considered in relation to ore mined. By stoping width is understood the width necessary to take out a given thickness of banket. If the values are calculated on a lode of 6 inches of banket, it is usual to allow a stope width of 3 feet for the purpose of getting out that 6 inches, and the value of the 6 inches is diluted accordingly. In a lode or reef 4 feet wide no allowance in calculation would be made, as that width is considered sufficient for all purposes. Therefore a 6-inch lode assaying four ounces is reckoned to have a value in the mine of 13.3 dwt. over 3 feet, the hanging and foot wall being considered valueless. In the same way a 4-foot lode assaying 12 dwt. is reckoned to have a value in the mine of 12 dwt. over 4 feet. Taking the latter case and presuming that the lode is interstratified with thin bands of sandstone which have been taken into account and included when the value was arrived at, there will be a margin of sorting of say 15% provided that the 4 feet are taken, and no more.

The usual calculation is made:

100 tons assaying 12 dwt. contain	1200 dwt.
15 tons waste rock assaying 1 dwt. contain	15 dwt.
85 tons sorted ore contain	1185 dwt.

One ton has a value after sorting of 13.9 dwt., and, on a basis of 90% extraction, a recovery value of 52.5s.

Waste rock after mining, when sorted after being in contact with banket, generally has an average value of about 1 dwt. fine gold per ton.

As a matter of fact, instead of a recovery of 52.5s, only about 42s on a basis of 15% sorting and 90% recovery would be saved in actual practice. This is one example of the many hundreds that have come under the notice of the writer, and the object of this paper is to account for the difference. It will be seen at once how important the question becomes when recovery values have to be considered in connection with propositions which on mine assays show a very small margin of profit. In the above case 15% is taken as the basis of sorting, because if the reef is taken out clean between its walls (as the basis of calculation presumes and lays down it must be), it is difficult to find even 15% of pickable waste rock.

Taking the above case with the 4-foot lode assaying only 7 dwt.

Again:

100 tons assaying 7 dwt. contain	700 dwt.
15 tons waste assaying 1 dwt. contain	15 dwt.
85 tons sorted rock contain	685 dwt.

Therefore one ton has a value of 8.06 dwt., and on a 90% recovery basis a value of 30s 6d, which is payable. It would, however, be found that this ore, if sent to the mill after 15% sorting, would only yield about 24s 3d, and it could hardly be worked at a

*Trans. Inst. Min. and Met.

profit. There is a discrepancy, if the latter figure be right (and actual work shows that it is), of 6s 3d, a sum quite large enough to seal the fate of, perhaps, a big corporation, but it might not be discovered until the mill itself found it out.

The reason for this discrepancy is that no allowance has been made for the waste of actual mining. In measuring the width of a stope it is usual to measure the actual face, the measurement being taken at right angles to the dip of the reef. The actual face between foot wall and hanging wall may in this way be 3 feet.

Now if a measurement be made 3 or 4 feet back from the face between foot wall and hanging, also at right angles to the dip of the reef, it will be found in the majority, if not in all cases, if the bed has remained continuous, and has not been cut out by a fault, and has not pinched, that such a measurement will be greater by about 12 inches than the measurement at the face. The dilution caused by these 12 inches which have not been allowed for will account for the difference in nearly all cases. In other words, actual blasting on a 3-foot lode or in attempting to carry a 3-foot stope, will generally carry away 6 inches more in the hanging wall and 6 inches more in the foot wall than the actual calculated width. It is found, therefore, that the assay plan stoping width in feet, which may be called X, becomes in practice X + 1. Going back to Example 1, the theoretical recovery without making this allowance was 52.5s, and in actual work was found to be only 42s. The assay plan gave 12 dwt. over 4 feet and 15% was sorted. Making the foot allowance the actual stope becomes 9.6 dwt.:

100 tons assaying 9.6 dwt. contain	960 dwt.
15 tons waste rock assaying 1.0 dwt. contain	15 dwt.
85 tons sorted ore contain	945 dwt.

One ton after sorting contains $\frac{945}{85} = 11.11$ dwt. per ton. A 90% recovery on 11.11 dwt. = 41.99s, or very close to the 42s obtained.

This may be taken as a typical example. The writer has worked many hundreds of such, and has ascertained from many mine managers, who have given him great help in the matter, that this method of making allowance brings their calculated values and actual results very close.

The Practical Operation of Machine Drills.*

NUMBER II.—CONCLUDED.

Written by E. M. WESTON.

In a small stope, however, with a face height of about 40 inches, the following arrangement shown in elevation (Fig. III) is advantageous. The width of

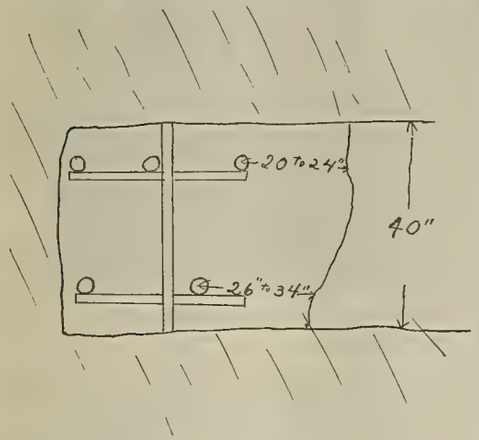


Fig. 3.—Machine Drills.

face of the bench is 5 feet and depth of holes 6 feet to 7 feet. These are bored in the order shown, and should be all parallel to each other and to the face of stope, except hole 4, which having little burden can be made to look in somewhat. In average ground this round should bring out a bench from 4½ feet to 5 feet by 6 feet to 7 feet, with a charge equivalent to an average of 3½ to 4 large cartridges per hole. In some mines where stoping with machines is done on wages, it is the custom to limit the number of cartridges issued per shift. This I think is a mistake, as any miner taking an interest in his work tries to get the best results, and if he is not given the explosive he thinks necessary, and in any mine the conditions vary enough to make a fixed rule bad, he is apt to be discouraged and lose interest. On the other hand, of course, careless miners would waste explosives. For these and other reasons contract work is always to be preferred. In one mine the allowance per hole for big machines was 2½ big cartridges, and in another with small machines six small cartridges. I have often used five or six large cartridges to advantage with small machines. It would be interesting if members would supply information as to the allowances made in mines they know of and the conditions there. The judging of what is a proper and just sufficient charge is perhaps the most difficult part of the art of rock drilling, as the holes vary so much and so many factors have to be taken into account. The question as to what is the maximum burden to be placed on a hole is one hard to determine, even when the rock is homogeneous. It is evidently some factor of the height of the face, and I should be glad if some mathematically endowed members would attack the question. My experience is that there is a given maximum burden one can put on a hole beyond which no charge however great will dislodge the rock. If there is no plane of weakness it is about two-thirds height of face; but may equal or exceed face height if there is a defined plane of weakness. There would be an advantage gained, I think, if rock drill miners when working in stopes were supplied with a rather weak gelignite, containing, say, 50% nitro-glycerine in addition to the usual blasting gelatine. As I have before shown, in all holes it is not advisable to concentrate the explosives near the bottom of the holes, and in cases where it was necessary or unavoidable, to bore weak holes, a lower strength of explosive could be economically employed. Unfortunately, it is not always possible to bore the hole of ideal strength. For hand stoping in some mines I believe the management suddenly served out gelignite to their stopers in the same quantity as the more expensive gelatine, and it was stated that no falling off in the quantity of rock broken was noticed. I think, however, that in hand stoping also a judicious use of different strengths of explosives for different holes would prove more advantageous. Or, does this experiment prove that blasting gelatine is too powerful for work in hand stopes? There is the interesting question, as to whether or not tamping is of any use in assisting the force of explosion. A little is always necessary where several holes are fired in series to prevent the shock jerking the primer and fuse out of hole. The theory of tamping appears to be that it interposes between the explosive and the cushion of the atmosphere, a body, that by its inertia, and the friction of its parts against the side of the hole, offers a resistance to the escape of the gases. This resistance in the case of high explosives can proportionately amount to very little, while their detonation is so sudden as to expend all its force on the sides of hole before seeking any escape along it. This is shown in "bull ringed" holes. Water is always considered an efficient tamping, but its inertia and friction amount to nothing in such a case. I am led to infer then that its only beneficial action is in excluding air that might otherwise act as a buffer between explosive and the side of hole. One, however, finds great differences of opinion on this question. The Government mining regulations lay down the rule that only sand or clay loosely filled in, or water, may be employed for tamping. Yet certain manufacturers of explosives, in printed instructions sold with their explosives, advise the use of sand very firmly rammed. As a matter of fact every one does break the law by using sand or grit firmly made into paper cartridges and rammed home with a good will. I think from experience that an inch or two of tamping is as effective as 18 inches. I must refer to the regulations forbidding under any circumstances boring in the stumps or sockets of old holes. Every one who has done any rock drilling knows that it is impossible to observe this, as very often the only possible place to start a hole is in the socket of an old one. The Government should recognize this and allow boring where, say, the stump hole is 3 inches in diameter, 9 inches or less deep, and where the bottom can be clearly seen, and all loose rock liable to contain hidden explosive carefully removed. The accidents occurring owing to cartridges being forced into a hole slightly too small for them leads me to mention an expedient so simple that I would apologize for bringing it forward were it not for the fact that few appear acquainted with it. It is true the Government regulations forbid forcing a cartridge into a hole; but a contractor will not see his day's work spoiled for lack of a little force, and an accident last year on the French Rand mine showed the results. If, when a cartridge sticks even in a damp hole, a little water is poured in and allowed to stand a few minutes, it will be found in nine cases out of ten that it has so soaked and softened the paper round the explosive that it will now move easily. If it has become doubled up and cannot be dislodged, the water by filling the hole below it acts as tamping and renders the explosive effective.

In considering what is the best size of machine to use in wide stopes it must be remembered that miners can generally be got to look after three 2½-inch or 2¾-inch machines; while they refuse to supervise more than two large machines. As far as my experience enables me to judge, three 2¾-inch machines provided with proper steel will break more than two 3⅜-inch machines; while the air consumption will be nearly the same in each case, and, provided reliable labor is to be obtainable, I believe them to be superior. In small stopes 2¾-inch machines do excellent work. Personally I should prefer a machine a shade smaller (about 2⅝ inches diameter), and I think one might be designed as powerful as the present 2¾-inch machines. With these the arm, bar and clamp are of the same size and diameter as with large machines, and this is rather awkward in practical work in small stopes. For effective stoping a good range of movement of the arm up and down the bar is necessary in order that the top and bottom holes may be parallel, or nearly so, in a vertical plane, and be bored, say, 30 inches apart. In this way the stope is kept at a proper and regular size, for if, owing to being bored at nearly the same elevation of machine, the holes diverge, they are always liable to break into the foot and hanging wall (see Fig. IV).

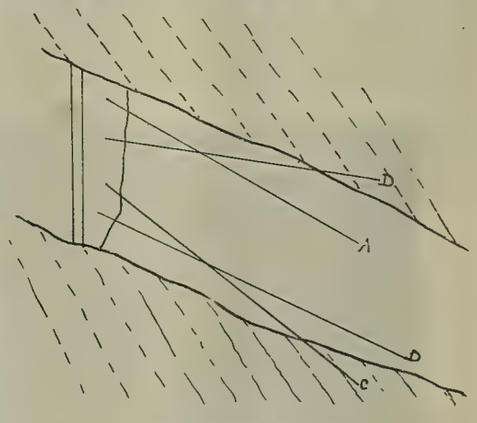

Fig. 4.—Machine Drills.

For the same reason several different sizes of bars should always be supplied to miners. With a bar for big machines only 24 inches or 30 inches long, the part of arm that embraces the bar is about a foot long, and this will allow little range of movement between the piece of bar and screw at the top. In fact only 5 inches or 6 inches in range is obtained. When large arms must be used a great advantage is gained by cutting off 3 inches top and bottom of the portion embracing the bar. With a good 3-inch or 3½-inch arm, bar and clamp a much greater vertical range is obtainable for the machine, and better work made possible, especially in awkward places. I know of one mine on the Rand where it is stated that machine stoping on a 38-inch width was for a period cheaper than hand labor. A feature I would introduce in small machines, and in big ones also, would be to place two "necks" and "seats" on the "cradle" of machine, one forward and the other about 6 inches back from it. This would add little to the weight and would often mean the saving of much time when the only drill available was just a little too long to "follow." This often occurs below. It would save time lost in hunting for a suitable drill or moving arm or clamp. Instead the machine would be lifted into its other seat and boring resumed. This device would also prove useful when owing to the shape of roof or foot wall it is necessary to "rig" bar either too close or too far from the face to be bored. I cannot lay too much stress on the importance of supplying machines with an adequate or rather excessive supply of drills. Of course where sharpening is done underground these remarks do not apply so much; but in many cases it is a struggle to obtain sufficient drills. The record book of the foreman blacksmith may indeed show that what is apparently an ample number has been issued; but a time always arrives when, owing to breakages, borrowing without permission by one's neighbor, one's jumper boy throwing drills down a winze to save trouble in carrying them to the shaft, a difficult hole, the starting of which has blunted numerous drills, or a hundred other causes, one is unable to do a proper shift's work. There should be a reserve of fifteen to twenty drills always available on the spot and the miner be given all or more drills than he asks for; while at the same time a sharp lookout be kept behind old pillars and in abandoned workings for neglected ones. When one hears battery managers complaining of amalgamating troubles one wonders if they are aware how much oil is used and spilt by machine men and their natives below. Half to three-quarters of a pint of oil seems the amount used per machine per shift, and where many are employed it means quite a quantity of oil coming in the rock to the battery. A miner working three small machines should always be allowed to have one spare one in the stope to save time in case of breakdowns, and a few big machines should be kept at or near the shaft at every level as spares. This simple matter is not attended to in all mines. Every miner working machines should have a locked box given him solely for keeping his tools and spare parts in (such as U bolts, side rods, clamp and arm bolts, etc.), of which a liberal supply should be given him.

When developing I always endeavored to make the distance between the "collars" of the cut holes about 18 inches apart, the idea being to get the explosive as much behind the center core of rock as possible. I have seen miners obtain good results in average ground by placing the holes within 12 inches of each other. Their theory seemed to be that in this manner the shattering force of the explosive was

*Abstract Jour. Chem. Met. & Min. Soc., S. A.

better applied in pulverizing the core, rather than in ejecting it. A contribution from some experienced miner on "cuts" and "cut holes" generally would be interesting.

The Highest Mines.

It is not a great many years since there was a theory among a large number of miners that, to have a profitable mine, it was necessary to seek high altitudes; that if a mine was found at or near sea level it would be of little value. Recent years have proven that there is absolutely nothing in such prejudice against the occurrence of mines of gold, copper or any other mineral at low altitude. The noted mines of the Treadwell group of Alaska are only a few feet above sea level. Many of the copper and gold mines on the chain of islands reaching from Vancouver to Seward Peninsula run down to the water's edge of either the Pacific ocean or some one of the numerous interior channels. In South America gold mines are known on the west coast which are at the level of the sea. Some of the noted mines of Australasia are but little above the sea.

In the United States, however, particularly in the Western portion, the mines are mostly above 1000 feet altitude, and from that upward to 13,000 feet, and even more, in the State of Colorado. In California, in the Sierra Nevada, there are many mines and ore deposits at altitudes varying from 8000 to over 11,000 feet. In Idaho some of the mines are over 7000 feet above the sea, and in Utah the most noted mines are from 8000 to 10,000 feet or more above this universal datum.

Mines operating at low levels in many instances have advantages over those situated in the mountains. This advantage is generally the more easy means of communication with the outside world.

Low altitude, however, does not always signify superior economic conditions. In San Diego county, Cal., some of the largest gold mines in that State are less than 500 feet above sea level; but they are surrounded by miles of desert sand and abrupt, precipitous mountains and are more unfortunately situated than some of those at high altitude.

The accompanying illustrations show the types of mountain scenery in the mining region of the West. One shows the rounded slopes, partly covered by snow. Although not a rugged country, transportation here is difficult, by reason of the numerous small gulches and ravines. A few stunted pines and tamaracks are the only trees seen in the landscape, though in the gulches a few aspens quiver with every passing breath of wind. Though not easy of access and distant from the railroad, still the prospector has penetrated here during the summer months and has found sufficient encouragement to establish a camp and open a mine, which will prove to be of greater or less value, as determined by development.

A Glacial Valley Amid High Ranges, Where Both Mining and Agriculture Thrive.

Near Timber Line in the Colorado Rockies.

The other engraving is that of a glacial valley surrounded by hills which rise 2000 feet or more above the valley. Here not only mining but also stock raising, and, to a limited extent, agriculture, are possible during summer. Here, too, the pines and the aspens grow side by side, and the miner has built his habitation of logs near his prospect.

Each of these illustrations is typical of the conditions as they exist in different portions of the high mountains of the Western United States. Neither represents the worst features—the extreme types of mountain scenery. These latter are merely a few precipitous rocks projected above the eternal snows of some high range—where a narrow trail, mostly cut in the ice, is the only means of communication with the world below, where the buildings are erected against the side of an overhanging precipice as a protection against snowslides and where the moisture in the rock is frozen solid to a depth of several hundred feet. These are some of the inconveniences of the highest mines, and yet some of these mines furnish a grade of ore which makes their operation largely profitable, and the prospector does not hesitate on account of the situation, if he can only find pay rock there.

Testing Ores and Tailings Preliminary to Cyaniding.

As there is a frequent demand for literature on the testing of ores and tailings with a view to ascertaining the amenability of the material to such treatment, the following partial bibliography on the subject has been prepared, being a number of original papers in which the methods are described in detail:

FELDMANN, W.—Notes on Gold Extraction, Johannesburg, 1904.

FURMAN, H. VAN F.—Laboratory Tests in Connection with the Cyanide Process, Trans. A. I. M. E., vol. XXVI, p. 721; "Manual of Practical Assaying," p. 401, ed. 1905; MINING AND SCIENTIFIC PRESS, Nov. 7 to 28, 1896, pp 379, 402, 421 and 441.

CLENNELL, J. C.—Notes on Experimental Metallurgy, Jour. Chem. & Met. Soc. S. A., Dec., 1898, vol. 1, p. 177; vol. 2, p. 492; MINING AND SCIENTIFIC PRESS, Feb. 18-25, 1899, vol. 78, p. 181 and 209.

JANIN, L., JR.—Practical Points for the Assay Laboratory, Pacific Coast Miner, Jan. 10, 1903, p. 30.

BROWNE, R. S.—Testing Ores for Cyanide Treatment, MINING AND SCIENTIFIC PRESS, Jan. 2 and 9, 1904, vol. 88, pp. 6 and 22.

JAMES, A.—Cyanide Practice, Proc. Inst. Min. & Met., 1895, vol. 3, p. 369.

To these should be added two papers on the testing of gold ores in general without special reference to the cyanide process, but which contain valuable references to it. These are:

CHARLETON, A. G.—Trans. Inst. Min. Eng. (Newcastle), 1893.

WARWICK, A. W.—Jour. Soc. Chem. Industry, Feb., 1898.

Short summaries of the more essential tests are contained in several of the monographs on the cyanide process:

PARK, J.—The Cyanide Process of Gold Extraction.

BOSQUI, F. L.—Practical Notes on the Cyanide Process.

JAMES, A.—Cyanide Practice.

GAZE, W. H.—Practical Cyanide Operations.

JULIAN, H. F., AND SMART, E.—Cyaniding Gold and Silver Ores.

MILLER, A. S.—The Cyanide Process, Moscow, Idaho, 1903.

BYRN, G. A.—The Laboratory in its Relation to the Cyanide Process, Melbourne, 1897.

Among the publications describing experiments made on particular ores and tailings may be mentioned the following:

MERRILL, C. W.—The MacArthur-Forrest Process, Experiments in the Metallurgical Laboratory, MINING AND SCIENTIFIC PRESS, April 23, 1892, vol. 64, p. 296.

JANIN, L., JR.—The Cyanide Process, Min. Industry, vol. 1, p. 239.

LODGE, R. W.—The Cyanide Process as Applied to Concentrates, Trans. A. I. M. E., 1895, vol. XXV, p. 90; Tech. Quarterly, vol. 8, p. 389.

CLAUDET, A. C.—Notes on the Experimental Treatment of a Gold Ore, Proc. Inst. Min. & Met., 1897, vol. 5, p. 327.

JOHNSTON, W. S.—Cyanide Experiments on Ores of the Slocan District, Can. Min. Review, Aug., 1898, vol. 17, p. 212.

CHATARD, T. M., AND WHITEHEAD, C.—Examination of Ores of the Republic Gold Mine, Washington, Trans. A. I. M. E., 1901, vol. XXX, p. 419. Eng. & Min. Jour., Apr. 28, 1900, vol. 69, p. 497.

BROCKUNIER, S. H.—Experiments with Bromo-Cyanogen, Trans. A. I. M. E., 1901, vol. XXXI, p. 793, MINING AND SCIENTIFIC PRESS, Apr. 26, 1902, vol. 84, p. 230.

JANIN, L., JR.—Cyaniding Tests at Chainman Mine, Nevada, Pac. Coast Miner, Jan. 24, 1903, p. 59.

ALLAN, J. F.—Notes Upon Preliminary Tests and Cyanide Treatment of Silver Ores in Mexico, Trans. A. I. M. E., 1904.

JAKMAN, A., AND BRERETON, E. L.—Laboratory Experiments on the Use of Ammonia and its Compounds in Cyaniding Cupriferous Ores and Tailings, Proc. Inst. Min. & Met., 1905.; Eng. & Min. Jour., April 27, 1905, vol. 79, p. 802.

An original paper by M. A. Knapp on "A Cheap Cyanide Plant" appeared in the MINING AND SCIENTIFIC PRESS of October 10, 1896, and was copied by the New Zealand Mining Standard in 1897, without acknowledgment. An abstract of it appeared in the Eng. & Min. Jour., Oct. 30, 1897, and again in the Mineral Industry for 1897 (vol. VI); the S. A. Min. Journal also copied it in 1897, and the Jour. Chem. & Met. Soc. of S. A. reprinted it in July, 1903, from the Mining Journal, all of them crediting the N. Z. Mining Standard with the article.

CHRYSOBERYL is beryllium aluminate. It occurs in varied shades of green, from light green to grass green and yellowish green, sometimes yellow, pale red or dark red. It has a hardness of 8.5 and is used as a jewel.

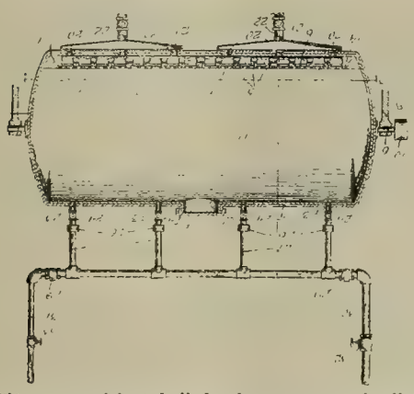
THE American Mining Congress meets this year at El Paso, Texas, from the 14th to the 18th inst., inclusive.

Mining and Metallurgical Patents.

PATENTS ISSUED OCTOBER 24, 1905.

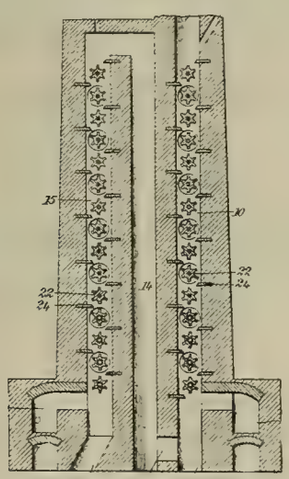
Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

METALLURGICAL FILTER.—No. 802,242; E. Stewart, Colorado City, Colo.



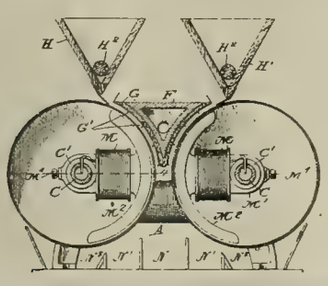
Filter comprising shell, having non-corrosive lining, ledges extending longitudinally within shell in spaced relation, filter plates secured upon ledges, supports between ledges at intervals longitudinally of plates, decanting pipes having heads, pipes connecting each of heads with interior of filter beneath filter plates, pipes leading into shell at opposite sides of filter plates from heads, and means for connecting fluid supply pipes with last named pipes.

DRYING AND ROASTING FURANCE.—No. 802,191; C. E. Ballow and E. Stein, Guanacevi, Mexico.



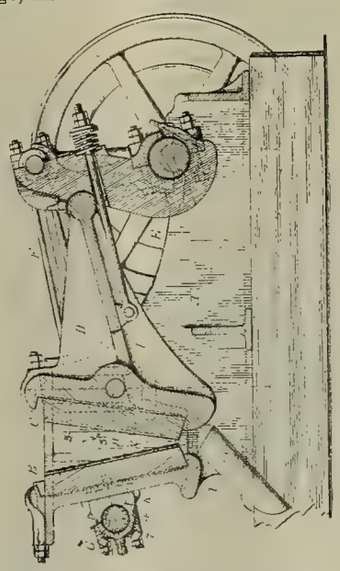
Furnace provided with drying stack having discharge into atmosphere at upper end, and ore discharge at lower end, roasting stack having ore discharge at lower end, downtake flue passing from top of roasting stack to base of drying stack, means for heating roasting stack, auxiliary heating means at base of drying stack, corrugated agitating rollers mounted in drying and roasting stacks, and shelves carried in stacks, and projecting between rollers, certain of rollers having tubular axles projecting through walls of stacks to permit circulation of cooling medium through axles.

MAGNETIC ORE SEPARATOR.—No. 802,170; R. R. Moffatt, Brooklyn, N. Y.



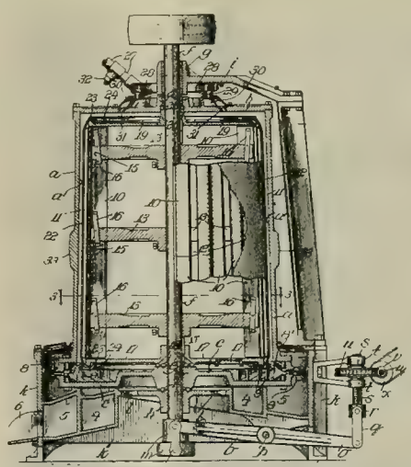
In magnetic ore separator, combination of framework, two stationary shafts, two rotating drums for separating material on shafts disposed so as to converge in curvilinear direction, and whose axes of rotation are in same horizontal plane, two standard blocks at each end of drums having transverse sockets, one of which supports ends of stationary shafts, two electro-magnets disposed at right angles to drums at either side of same and adjustably supported in other of two transverse sockets of standard blocks, whereby distance between two drums can be increased or decreased, magnetic bridge interposed between drums in field of force above plane of rotation for reducing magnetic resistance, and means for vertically adjusting magnetic bridge.

CRUSHING MACHINE.—No. 802,842; A. Cameron, Chicago, Ill.



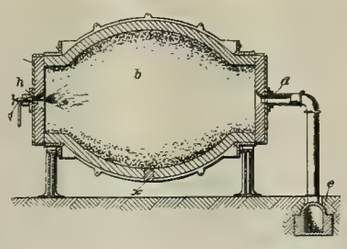
In crushing machine, crushing jaw supported for oscillatory motion about axis arranged between upper and lower portions and reciprocative laterally to plane of jaw-face and along line inclining downwardly and forwardly; pitman with which jaw has jointed connection; and swinging arms or links having jointed connection with pitman and tied to swing about axis forward of jaw.

CENTRIFUGAL ORE SEPARATOR.—No. 802,779; W. H. Peck, Chicago, Ill.



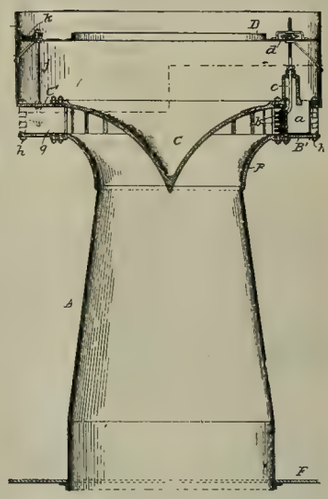
In centrifugal ore separator, combination of rotatable treatment vessel having separating surface therein, expansible and contractible deflector within vessel having sections provided with channels adapted to receive retaining devices and removable flexible covering around deflector, having retaining devices with one of parts embedded in covering and another of parts removably engaging channels.

PROCESS OF REDUCING METALLIC OXIDES.—No. 802,493; T. S. Blair Jr., Woodmere, N. Y.



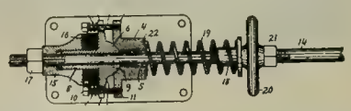
Process of reducing metallic oxides mixed with gangue, consisting in removing oxygen therefrom by subjecting same to contact with reducing gas at temperature sufficient to cause required chemical reactions, but with insufficient supply of free oxygen to consume reducing agents, changing reducing temperature to non-reducing one by supplying more air, raising temperature sufficiently to fuse gangue or extraneous matter and burn out metalloids, but not to extent required to fuse metal, separating fused gangue or extraneous matter from metal by melting gangue therefrom and balling metal while gangue is being melted away therefrom.

HYDRAULIC AIR COMPRESSOR.—No. 802,575; W. J. Linton, Woodstock, Canada.



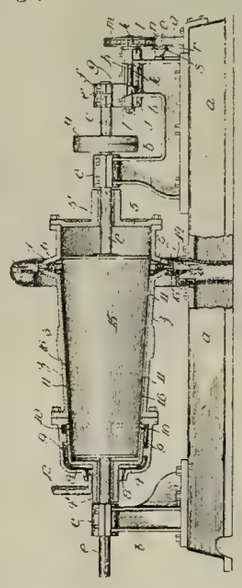
In hydraulic air compressor, headpiece forming mouth through which water is admitted to apparatus and a series of air inlet chambers arranged within mouth and dividing it into separate water passages, each of which chambers is connected with air outside and is open to water at inner end, and means for regulating size of water passages.

ACTUATING MECHANISM FOR ORE CONCENTRATORS.—No. 802,374; E. Deister, Fort Wayne, Ind.



In actuating mechanism for concentrating tables and similar devices, table suitably mounted to be vibrated; bracket fixed to table; block adjustably seated against bracket; bolts having loose connections with block and rigidly fixed in bracket; springs in connection with respective bolts and acting against block toward bracket; reciprocating driving rod having actuating connection between driving rod and block; and spring in connection with driving rod and acting against bracket.

CENTRIFUGAL ORE SEPARATOR.—No. 802,726; P. H. Adams, Chicago, Ill.



In centrifugal ore separator, combination of rotatable tapering treatment vessel having separating surface therein, and provided with discharge openings for material and water, rotatable longitudinally travelable deflector within vessel, and means for feeding material and water into vessel distance from its small end substantially as great as distance of longitudinal travel of deflector, deflector of sufficient length and adapted to at all times cover points of feed of material and water into vessel, and operate to effect separation on surface.

MINING SUMMARY.

Specially Compiled and Reported for the MINING AND SCIENTIFIC PRESS.

The petroleum production of 1904 was greater than that of any previous year. The total output of crude petroleum in the United States in 1904 was 117,063,421 barrels. The total value of all the petroleum marketed in the United States in 1904 was $101,170,466. The gain over the production of 1903 was 16,602,089 barrels in quantity and $6,476,416 in value. The quantity of oil produced has increased 2½ times in ten years. For the first time in the history of the petroleum industry the quantity of oil produced west of the Mississippi river was greater than that produced east of that river. New pools were discovered during 1904 in Texas, California, Kansas, Indian Territory and Oklahoma, and many extensions were made to the old fields. An immense section beginning in southeastern Kansas and extending southwestward into northern Indian Territory and Oklahoma, over 180 miles in length and 50 miles in width, was proved to be locally productive of petroleum and natural gas. All indications point to an increase in the production of petroleum in the United States for a series of years. Most of the petroleum produced in these western localities is, however, inferior in quality. It is not suitable for the manufacture of the most refined products, but its high heating value and its freedom from the more volatile constituents renders it comparatively safe to transport and consume and make it a most valuable fuel. The oil report of E. H. Oliphant of the U. S. Geological Survey contains an account of the oil production in the United States by fields, States and districts, with historical and statistical matter, comprising statements concerning imports, exports and prices of petroleum, as well as the tariff duties, descriptions of methods of transportation, analyses of United States petroleum and its derivatives, and a discussion of the caloric value of petroleum. The last hundred pages of the report are devoted to an account of the operations of the petroleum industry in 1904 in the other countries of the world.

ALASKA.

The development of placer mining in Alaska is having an effect on the total gold output of the country. The estimated production of the Territory last year was $9,000,000, and it may be $11,000,000 for this year. The open season of mining closed unusually early in the Nome districts, owing to freezing weather. A greatly increased production is reported from the Tanana valley. The returns from the custom houses indicate the increased production of the Alaska mines, and it is a significant fact that for the first eight months of the present year the shipments of Alaska gold exceeded those from the Yukon Territory to the United States. This is a new condition in gold mining in Alaska, for heretofore the Alaska output has always been considerably smaller than that of the Klondike and the tributary region in British territory. In the first eight months of this year the shipments of native gold from Alaska to the United States amounted to $5,887,672, as against $5,148,155 of foreign (Canadian) gold. The combined shipments of native gold and silver from Alaska in the same months amounted to $5,889,729, as against $3,524,703 in the first two-thirds of 1904. A small part of the shipments of native gold from Alaska was taken from the ground in 1904, but, on the other hand, the largest shipments of this year's product were made subsequent to August 31.

Passengers from Nome bring news of the freezing up of some of the big mining plants in the Solomon River district before the winter cleanup was made, leaving the gold of the entire season's workings in sluice boxes. Thomas Mulligan, who has been in the Solomon country for years, says the season was thirty days short of any previous year. The season opened July 15, and September 18 everything was frozen up solid. It was impossible to work hydraulic plants and winter drifting has commenced. On some of the creeks the freeze up occurred as early as September 14.

ARIZONA.

Coconino County.

(Special Correspondence).—It is reported that the Standard Iron Co. of New York is sinking a shaft 6 miles south of Diablo station, on the Santa Fe railroad, half way between Winslow and Flagstaff, to recover and smelt a meteor. This meteor is said to have torn a hole in the earth 600 feet deep and fragments of it are scattered over the surrounding country. The fragments have been analyzed and are found to contain iron and gold. The Standard Iron Company began working to locate the meteor about a year ago and a shaft from the bottom of the hole has been sunk.

Flagstaff, Nov. 7.

Gila County.

The Old Dominion C. M. & S. Co. during October produced 3,170,000 pounds of blister copper 99½ fine, which is a new high record, exceeding the output of May of this year—the previous record month—by 85,000 pounds. A reverberatory furnace of 250 tons capacity is to be put in to treat the flue dust and slag. The working shaft has been sunk to the fourteenth level and a crosscut started toward the main lode, 500 feet to the southeast.——The Tri-Bullion S. & D. Co., who own the Starlight mine in Kelly gulch, near San Carlos, are making regular shipments of their lead-copper ores to the El Paso smelter, and have made arrangements to ship their carbonate copper ores to the Old Dominion smelter at Globe. The company will extend their crosscut tunnel by contract. Superintendent Frank Weast may put in machinery for sinking on the vein to the sulphide ores at depth.

Maricopa County.

The Gila Gold Lode mines, in the White Tank mountains, west of Phœnix, are opening up considerable ore under the direction of S. W. Haines. Maddox & Towers are putting a mill on the Little Jessie mines, in the same district.

Yavapai County.

(Special Correspondence).—L. V. Wilkinson may develop a kaolin deposit near Wickenburg.——The Sunrise mine near Walker has been sold to an eastern company, who will start work December 1.

Prescott, Nov. 6.

E. W. McClave is developing the Easy Boss mine, near Stoddard.——The Planet Saturn mine, between Congress and Octave, is said to have passed into the possession of the Alvarado G. M. Co., of which F. L. Wright of Prescott is president and Paul Johns secretary and general manager.——M. L. Buckley, who owns the Victor mines on Lynx creek, 6 miles from Prescott, has developed them to a depth of 100 feet, and proposes to put in a gasoline hoist at once, and as soon as possible a 5-stamp mill.——The Black Dike group of claims on Cherry creek has been bonded to Julius A. Goerdeler of New York.——The cyanide plant at the Richinbar mine is now in operation, and it is proposed to add ten more stamps to the mill at Richinbar.

CALIFORNIA.

According to a recent bulletin of the United States Geological Survey, natural gas is produced from wells in San Joaquin, Sacramento, Santa Barbara, Ventura, Orange, Los Angeles and Tehama counties. Most of the domestic consumers using gas in California are supplied from wells in San Joaquin and Sacramento counties, the towns of Stockton and Sacramento being supplied. During 1904, however, 9 gas wells were drilled in Ventura county, the product of which is supplied to domestic consumers in Ventura and Oxnard. At Fairview, Orange county, is located a well, the product of which is used in a hotel and in cottages. At Tuscan Springs, Tehama county, are two wells, the product of which is used at the hotel and grounds for fuel and lighting. The wells in Santa Barbara are small gas producers. Gas from Los Angeles county wells is produced with the oil and partially utilized.

Amador County.

The 5-stamp mill at the Burlington mine, near Sutter Creek, will soon be started on ore that has been on the dump for some time past. A short test run has been made. G. H. Allen will act as millman for Superintendent Sibole.

Unless rain falls soon nearly every mine on the mother lode will have to close down, owing to the scarcity of water. In many cases the mines depend upon water power to operate the mill machinery, and even where electric power is used water is required in the mills. The storage reservoirs upon which depends the generation of electric current are getting low. Mines are being shut down at Jackson, Angels, Amador and other places along the lode, and hundreds of men are being thrown out of employment.

El Dorado County.

Work is to be resumed at the Scherrer mine at Georgetown.——It is reported that Frick & Ball will put in a mill at the Idaho mine, near Kelsey.——At the Sunrise mine, near Kelsey, Superintendent Ranney has had men opening up new ground. Grading has been done for the new mill. —— The Toombs property at White Rock has been bonded for $15,000 to C. E. Seymour of Georgetown.

Kern County.

The Greenback copper mine at Woody is to be worked after being idle for five years. Joseph Werringer, one of the owners, has leased the property.

Lassen County.

At Hayden Hill it is reported that the Golden Eagle mine has 100 men on the payroll. Ore from the Golden Eagle is treated by the cyanide plant that has a daily capacity of 120 tons.

Mono County.

The first shipment of ore from Masonic mountain, near Bodie, has been made from the Eastwood & Weitfle lease. Sorena is the name of the new camp in the Masonic Mountain district. Carson City is the shipping point for the district.

Nevada County.

At the Austin mine in Willow valley, near Grass Valley, the new double-compartment vertical shaft is down 25 feet. The machinery from the Posey mine has been moved to the Austin and is now all on the ground, waiting to be placed in position.

The big new concrete dam constructed by the Omega Co. in Scotchman's creek, 1 mile above Washington, has been completed and inspected and it is expected that a permit will be issued by the California Debris Commission to the Omega Co., allowing them to hydraulic this winter. The dam is built between two bluffs that extend into the creek. It is 50 feet high and 30 feet wide at the base and 15 feet wide at the top. It is a solid mass of rock and cement. In the center of the dam there is an outlet for the water, while a hard rock tunnel will also carry away the surplus water. There is a great basin back of the dam and tailings will be impounded for a mile or more up the creek. Over 250 tons of cement have been used, it being brought in from Emigrant Gap by freight teams. The work has been under charge of Superintendent W. M. Wilson and Foreman E. Brindle. As soon as the company receives a permit to hydraulic they will get their mine at Omega in readiness for the winter. The new dam is so located that at any time it can be raised and a total height of 80 feet can be secured.

At the Spanish Ridge mine, near Washington, Superintendent J. H. English has made arrangements for a new compressor. The Spanish Ridge secures free water from the head of Poorman's creek, but this season it failed on account of the dry spell, forcing the mill to shut down. Arrangements have been made to secure 400 inches of water from the McCarty ditch. The new sulphurets house is completed and will be used for holding sulphurets during the winter months, when not much hauling can be done.

At Graniteville the Birchville mine has been started after being shut down for thirty-five years. The old incline is being cleaned out and retimbered and a steam pump put in. Fred Medlin is in charge.

Placer County.

Superintendent R. Jones of the Cash Rock mine, near Forest Hill, has pulled out their machinery for the winter. They will open up again next spring.——A large force is working at the Baltimore, near Forest Hill.——There is prospect of the Gold Run Gravels, Ltd., being worked again. The company owns the gravel beds at Gold Run. J. D. Stewart of 214 Pine Street, San Francisco, has recently been appointed manager.

San Bernardino County.

The estate of H. L. Drew and J. B. Osborne have sold to the Guggenheims claims in the Ord mining district for $300,000. The property lies on the western slope of the Ord mountains, 144 miles from Daggett. The purchasers have had experts inspecting the property for several months. The claims affected are the Rio Vista, Plainsville, Bluff, Central, Coupon, Last Chance, Josephine, Modesto, Aztec, Sunflower, Brilliant, Keystone, Climax, Wild West, Cliff, Tehachapi, Atlantic, Conception, Sunset and Empress. The Guggenheims have a large force already employed, and machinery will be shipped from San Francisco.

San Diego County.

(Special Correspondence.)—Gold has been discovered near the Sweetwater dam.——Calcium carbonate has been discovered on the El Cajon grant, near Lakeside. A lime kiln may be built.——Calcium tungsate has been found on the road to Yuma from San Diego.——Mispickel has been found near Pine valley, and, from specimens received, seems to be very rich in the compound. ——The Stonewall mine at Cuyamaca has closed down indefinitely.

San Diego, Nov. 8.

Shasta County.

J. W. Neill, of Butte, Mont., representing an Eastern syndicate, has bonded the Uncle Sam mine and the Shasta copper claims, near Kennett. T. A. Varden is foreman at the mine. The mill on the Uncle Sam will be started when the rains come.

The mining industry of the French Gulch district is unusually prosperous this season. The Gladstone mine is employing more men than ever before and twenty stamps are kept dropping on ore. —— Stratton Bros. have struck high-grade ore in the Wheeler mine.

Sierra County.

The North American gravel mine near Gibsonville is being worked by 20 men under the direction of Elias Squier.

At the Oriental mine, near Alleghany, active development work has been resumed by Superintendent H. L. Johnson. The Alleghany M. Co. at Balsam Flat recently struck pay gravel in an upraise from their main tunnel.

J. H. Patterson is driving a tunnel to develop the Twenty-One and Rainbow Extension quartz claims near Alleghany.——The recently reconstructed 10-stamp mill at the Rainbow mine, near Alleghany, has been started regularly.

The Fillmore M. Co. is prospecting with Keystone drill in placer ground at the head of Port Wine ridge. E. O. Pieper of San Jose, Cal., is interested.

Trinity County.

Jas. Treadwell of the Bonanza King, near Trinity Center, was in San Francisco last Saturday with $20,000, representing a 2-weeks clean-up.

The quicksilver camp of Cinnabar is the scene of renewed activity after suspension of operations since a big flow of water was struck a few years ago in the Altoona. A company composed of Redding men has resumed operations in the Altoona. The quicksilver is shipped out by pack trains 17 miles to Castella, the nearest railroad point.

Tuolumne County.

About seventy men are employed at the Confidence mine at Confidence. —— A body of ore 8 feet wide has been uncovered on the 700-foot level in the Black Oak mine, near Soulsbyville.

COLORADO.

(Special Correspondence).—A large mineral exhibit is being arranged for by the Bureau of Mines to be placed in the State Capitol. This when completed may be the second largest in the country, according to statements given out by the parties interested in the work. The World's Fair of St Louis and the Exposition at Portland have enabled the Bureau to make a fine collection. It is believed many private individuals will contribute to the collection.——Many of the camps throughout the State report increased shipments for the month of October. A visit to the different machinery houses and machine manufacturers of the city demonstrates the fact that the mining industry is in excellent condition. A majority of the firms are doing a large business and the prospects for the future are bright.——E. Lyman White, State Mine Inspector, has asked for suggestions as to the best method for protecting mine tunnels in case of fire similar to the one at the Percy-LaSalle mine, near Aspen. Operators and mining engineers are invited to make suggestions.——A walkout has been reported from the San Juan district by the men, numbering forty in all, on account of the poor food being served by the boarding house, which is said to be under different management from the mine.

Denver, Nov. 6.

(Special Correspondence).—Efforts are being made by Secretary Callbreath of the American Mining Congress to have as large a delegation from this and other States to leave this city in a body arriving in El Paso, Texas where the Congress is to hold its next annual meeting, on the morning of Nov. 14th. A number of the delegates have signified their willingness and intention o

take advantage of this special arrangement. It is expected a large company of representative men will attend the convention from this city and State. Governor McDonald has already made public the names of the delegates appointed.

Denver, Nov. 6.

Boulder County.

It is reported that the Ottumwa Co.'s mill, near Sugar Loaf, is to be sold to the Virgilia G. M. Co., which has sold the Rugged Top mine.——The 50-ton mill being put up at the Corona mines by the Pollock M. & M. Co. is expected to be finished by December 1.

Chaffee County.

The St. Elmo Co. at St. Elmo have closed the mine and mill for the winter.

Clear Creek County.

(Special Correspondence).—Mining near Empire and Lawson shows increased activity.——Red Elephant mountain is being worked by the Red Elephant M. Co., in which A. C. Monson and G. E. Soderholm of Denver are interested, and by the Commodore Co. through their crosscut tunnel which has reached and cut some of the veins. Into this mountain, also, is being driven the Gold Valley tunnel, which is in 300 feet. In 150 feet more the Belvue Hudson vein will be cut. The Millington, Dictator, American Sisters and Joe Reynolds are all producing.——President Snavely of the Big 40 M. & M. Co. has started work on mines on the top of Columbia mountain, west of the Joe Reynolds.

Empire, Nov. 6.

Thomas Barnard, superintendent of the Clarence Stevens properties in Banner district, near Idaho Springs, has temporarily suspended work in the Fairfield tunnel and is now sinking the shaft upon the Nathan lode, at the head of Banner gulch. The shaft is 90 feet deep and has a good prospect of an ore body. The tunnel has been driven 700 feet on the Fairfield vein.——The Hansbrough claims, on Democrat mountain, are receiving active development.——H. M. Vincent of Denver, owner of the Vincent claims in East Argentine, is driving his crosscut tunnel.

The Montgomery-Ward tunnel, being driven by the Prudential M. Co. of Georgetown, is to be driven an additional 1000 feet.——The Pay Rock extension lode will be cut within the next 100 feet. It is now in 400 feet. Drifting is to be started in addition to the driving of the tunnel ahead. Manager W. C. Hood hopes to put up a power plant, at which time machine drills will be put in.

The Anglo-Saxon mill, erected for treatment of the ores of the Mrs. Wiggs and Anglo-Saxon tunnels, near Georgetown, has been finished. The tramway is carrying ores from the Saxon-Extension tunnel to the bins at the new mill. Manager J. K. Brown will work throughout the winter on the crosscut tunnel being driven by the Leavenworth Mountain M. Co., near Georgetown.——The Lafayette shaft on the Lamartine mine is to be sunk an additional 100 feet. This shaft is down 300 feet, and is 6000 feet west of the Lamartine shaft. A lateral will be run from the 400-foot level to connect east with the Lamartine shaft.——The Pelican mill, near Georgetown, has resumed work. The retimbering of the old stope in the Bismark workings has been completed. During the suspension of work at the mill, manager Frank Graham made a number of changes in the setting of the machinery.——A. Roberts is at work on the Sunburst Extension group, on Democrat mountain, near Georgetown. The crosscut tunnel is in over 200 feet.

Near Georgetown, the Mineral Chief is to be worked. A concentrating plant is to be put in, with a capacity of 100 tons daily. This property is owned by the Linn Consolidated M. Co., and Manager Hood is employing men in driving No. 2 and No. 4 levels ahead and in cleaning out and retimbering No. 6 level. Nos. 3 and 5 levels are both in over 1000 feet.

Gilpin County.

The Gold Rock mine is being unwatered and will be developed by J. J. Elliott of Russell Gulch.——New machinery has been put in and a shaft house built at the Ralls County mine, near Central City, by Manager Chas. Gage.——The working force at the Freedom mine, near Central City, has been increased by Manager Borcherdt. The main shaft, down over 800 feet, has been unwatered and the intention of the Eastern operators is to sink it down to the 1000-foot point during the winter. They intend to drive the tunnel in from Chase gulch to cut the Freedom shaft.——The Pozo mine, in Nevada gulch, near Central City, is being operated under a lease and bond from W. J. Lewis & Son of Central City, under the management of A. M. Rucker. The shaft is down 165 feet. The smelting ore is handled in Denver by the Lanyon Zinc Co., where the zinc is separated with magnetic and electric apparatus, the zinc product being afterwards shipped to zinc smelters at Iola, Kan., the lead and iron going to the Denver smelters for further treatment.

Gunnison County.

The Grand Prize claims, in the gold belt west of Pitkin, has been sold to T. M. Lyons, of Denver, and South Dakota capitalists for $25,000 The shaft is down 106 feet and has two levels into ore. The new owners contemplate extensive work——Near Maple Leaf and Sillsville, a 10-stamp mill is being put on Cooper mountain by Colorado Springs parties. This company has opened a lead of free gold quartz. A. L. Whitehorn and R. Jones are promoting it. It is expected the mill will be ready to operate within the next three or four weeks.

The Spring Valley G. M. & R. Co., which is operating the Midland mine, south of Gunnison, on a lease and bond, has started a tunnel to cut the vein 100 feet below the present workings.

Lake County.

In addition to the iron that is being shipped from the Tom Sargeant shaft, at Leadville, a good body of zinc has been opened at the lower level.——T. D. Kyle and associates, leasing on the Gold Basin, are shipping 30 tons daily of ore that will average $15 per ton. Work is also being carried on at the lower levels, and it is expected that the ore shoot above will be caught in the lower workings.——During the month of October Leadville produced 79,000 tons of ore of all grades, an increase of 1000 tons over September, and an increase of almost 4000 tons over August. Of the 79,000 tons produced, the Arkansas Valley smelter treated 20,000 tons. The remainder went to other smelters in the city.——The properties on Yankee Hill, between Fryer and Carbonate hills, Leadville, are shipping considerable ore, mostly iron.——The Hayden shaft, recently put into commission, has completed the dead work, and while prospecting in one of the drifts at the 375-foot level a good body of ore has been opened, and shipments from this part of the mine have started.

(Special Correspondence.—The Damascus M. Co., H. W. Hinckley, manager, shipped during the month of October 500 tons of ore from their property on the northeast slope of Iron Hill, near what is known as Adelaide Park. The ore was shipped to the smelter at Salida.

Leadville, Nov. 6.

The Result shaft of the Small Hopes Co., which has not been worked for years, has resumed operations. New machinery will be put in at once, and when the shaft and old drifts are repaired prospecting from the lower level will be started.——The Bullion shaft at the head of East Fourth street is shipping 200 tons per month of a fair grade of iron from the 125-foot level. Good progress is being made on the Bohn shaft, East Second street, and an average of 4 feet per day is being maintained. The shaft is in contact with no water to handle.——Sinking has been started on the Silver Nugget and will continue without interruption until the 700-foot mark is reached. This shaft is expected to develop the extension of the Little Jonny ore shoots, and also to catch the Garbutt vein. Larger pumps are being put in at Ollie Reed No. 1 shaft with a view of sinking the shaft deeper. When the pumps are in place hoisting ore from the different levels will be resumed. From the Little Jonny 7000 tons per month are being shipped by the lessees.

Ouray County.

York & Rathmell, who have been doing extensive development at the Union on Bear creek, near Ouray, have shipped their first car of ore.——Superintendent Frank Carrol of the San Pedro, near Ouray, has driven the development tunnel 1800 feet. Total length of the tunnel is to be 1 mile.

San Juan County.

Another carload of high-grade ore has been shipped from the Highland Mary mine, near Silverton, to the Durango smelter. Development work is being done on the property, and it is probable that this will be kept up all winter. The high-grade product will be shipped to the smelters, while the milling ore will be piled on the dump to await the starting up of the company's mill in the spring.

Theodore Ivens of the Eureka Exploration Co. has ordered machinery, roasters, tanks, etc., for an experimental plant for the Silver Wing mine, above the town of Eureka, for the treatment of copper ores. The new method is known as the Waterbury leaching process and consists in first crushing the ore and roasting it; second, in leaching it with sulphuric acid and then precipitating it upon steel plates, producing, it is claimed, a 90% copper product.

In Red Mountain district nearly every property will be worked all winter. All the large properties will continue active and many of the smaller properties that have been idle for the past fifteen years will be worked.

Arrangements have been made to continue work on the King mine on Sultan mountain, 2 miles south of Silverton, all winter. This property belongs to the Royal M. Co. During the winter operations will be confined to the Mazeppa and Turk veins and the upraise on the King vein proper.

Summit County.

(Special Correspondence). — The Old Union Co. of Breckenridge is producing thirty tons of concentrates per day. The Laurium is also shipping concentrates, as well as the Washington and Lucky mines. The Lucky mine is also shipping ore from workings. The Morning Star and the Carbonate, on Mount Baldy, the Gold Dust, on Nigger hill, and the Wellington, on Mineral hill, are also shipping high-grade ores. Mining on Mount Baldy is active. Besides the Morning Star leasers and the Beaver Creek M. & M. Co., working the Carbonate, both of which properties are shipping, are the Gold Belle, which is working twenty shifts on the main development tunnel; the Klondyke group, on which the owners are sinking a new shaft to strike the lime and porphyry contact, and the St. Johns group, being worked by the Summit County Mining Exchange.——The French Creek Tunnel Co. have driven their tunnel over 1600 feet and a drift is being run on one of the ledges passed through. Mark Evans is general manager. The other properties working in French gulch which are making good showings for themselves are the Wellington, which continues its shipments of lead and zinc ores; the Old Union, with its 100-ton mill, kept running night and day. The Rose of Breckenridge is being systematically prospected. The owners of the Mono group have decided to work throughout the winter. They have started raising from the lowest level to the middle level, by which they will provide circulation.

Breckenridge, Nov. 6.

On the Bannerot group, on Cowan mountain, 3 miles southwest of Cripple Creek, A. A. Bannerot of Pittsburg, Pa., has driven the Garfield tunnel 900 feet, and has cut several veins.——The mill of the Little Giant Co., in the same district, will soon be ready to crush ore from the Johnson group.——The Summit mill at Gillett, which during the summer has treated tailings at the old chlorination mill, has been closed down for the winter and no further work will be done until spring, when a cyanide plant of 100 tons capacity will be put in. The dump is under lease to George Kimball and associates of Idaho Springs.——Good ore has been found on the Requa Savage, on the south slope of Beacon hill, Cripple Creek, at a depth of 485 feet. This property is under lease to a company of which Ed. Chase and Robt. Austin of Denver are the principal owners. They gave out a contract for the sinking of the shaft to 315 feet. At that depth a contractor cut a 4-foot vein.

After a close-down of several months operations have been resumed on the Midget mine, on the west slope of Gold hill, Cripple Creek. The property is under lease to Charles Smith. The shaft of the Midget is down 850 feet.——A strike is reported on the Ellen McGregor claims of the Fair Chance M. Co. by Lessee Kellogg while working in a tunnel.——Operations have been resumed on the Hoosier mine, on Globe hill, Cripple Creek, by B. G. Shell. The shaft is to be sunk 100 feet from the 670-foot level.——Sinking has been started on the Finn lode on Ironclad hill.

C. J. Jackson & Co. have struck a 3-foot ore body in the Mary Nevin property, on Rosebud hill, Cripple Creek.——The shaft on the Montrose, on Ironclad hill, is 300 feet deep, but it is to be continued to the 400-foot level before doing any development.

The new machinery on the Burns lease of the Acacia, on Bull hill, Cripple Creek, has been started. The shaft on the Burns is down 400 feet and drifting for the Shurtloff vein has been started.——Lessees operating on the Christmas, on Bull hill, are sinking an additional 200 feet. The shaft is now down 800 feet. After the 1000-foot depth has been leased a crosscut will be run in an effort to tap the big ore bodies extending from the Golden Cycle.

Teller County.

The October output from the mines of the Cripple Creek district exceeded in tonnage and total value of that of any month during the past three years. The total tonnage treated is the highest in the entire history of the district. That the total value is not greater than ever before is because of the large tonnage of low grade ore treated by cyanide process in the district, this amounting to 16,000 tons, the lowest grade treated being $2.75 per ton at Gillett, and at this figure some profit being obtained. The balance of the total tonnage was handled by the mills at Colorado City, the Dorcas at Florence and the smelters. The October tonnage was 14,260 tons greater than for the preceding month with a total valuation of $110,487 in excess of the October production.

	Tons.	Av. Values.	Total
Smelters	12,000	$60.00	$78,3000
U. S. R. & R. Co	25,000	24.00	650,000
Portland	8,100	25.00	202,500
Dorcas	3,300	35.00	115,500
Anaconda	2,550	6.00	15,300
Wild Horse	2,300	6.00	13,300
Santa Rita	400	7.00	2,800
Sioux Falls	1 000	3.00	3,000
Los Angeles	500	5.00	2,500
Homestake	9,300	3 00	27,900
Summit	250	2 75	687
Economic	6,600	28.00	184,800
Totals	71,200		$1,956,287

IDAHO.

Boise County.

The United Idaho M. Co. has been formed to work placer and quartz claims near Placerville. W. P. Rowe, of Nampa, is superintendent.

Idaho County.

I. E. Warner, manager of the McKinley G. M. Co., says the mill near Lucile is completed and in operation. A cyanide plant will be put in.——It is reported that the owners of the North Star mine, near Pollock, intend to put in a mill next summer. Jas. Potter is manager.

Kootenai County.

The Conjecture M. Co. has started a long tunnel to develop its claims near Lakeview. H. D. Payne is superintendent.——The Panhandle Development Co. is opening up the Venezuela mine, near Lakeview. A. W. Thayer is manager.——The Keep Cool mine, near Lakeview, is being worked under the superintendence of W. W. Thibadeau.

Latah County.

The White Cross M. Co., owning property on Moscow mountain, 7 miles northeast of Moscow, is advertising for bids on a 100-foot extension of the lower tunnel. It is expected this will tap the main ledge 400 feet below the surface. Experiments are being made preparatory to putting in a cyanide plant.

Lemhi County.

The Gilmore M. Co., working on the headwaters of the Lemhi river, near Gilmore, hauls silver-lead ore 85 miles to Dubois, the nearest shipping point. In the same district the Silver Mountain mine is being operated by J. D. Wood and associates.

Shoshone County.

The Springville M. Co. has been formed to work claims between Mullan and Wallace, by C. Amonson, W. Graham, H. L. Bard, L. L. Leighty, John Frederick, O. Miller and D. M. Edmonds.

Washington County.

The Oregon Smelting & Refining Co. of Sumpter, Or., has purchased 4000 tons of Seven Devils copper ore, which will be hauled from Landore to Council and shipped to Sumpter. The ore belonged to the Ladd Metals Co., which recently closed down its smelting plant. The Oregon Smelting & Refining Co. has also taken a bond and lease on an iron sulphide copper mine 20 miles from Weiser, and will commence work on it. The ore will be hauled to Weiser and shipped to Sumpter. Tuzon & Stevens have their supplies for the winter at their Cuddy Mountain mines near Dale. R. Wilkie, who has a mine on Cuddy Mountain near Dale, has leased his property to the Ladd Metals Co. which will operate it and use the ore for fluxing purposes in the smelter at Landore.

MONTANA.

Fergus County.

The North Plum Creek Co. will start work with a diamond drill near Kendall. The Montana Hog, Grey Hound, Black Bird, Triumph, Troy, Mendota, Independence, Mayflower, Gold Ledge, Blue Bird and Magpie claims, and the Plum creek claims Nos. 1, 2, 3, and 4, have been transferred to the company. H. L. Arnold of Kendall is agent.

Madison County.

F. Thurston of Mammoth and A. Laden and S. Arthur of Butte have sold the Cliff mine, near Mammoth, to Ohio men, who will drive the tunnel 800 feet farther. —— At the Oro Cache, near Virginia City, J. Allbright has purchased the interest of Jack Devlin in the lease from the Granite Mountain Co., and the work is now carried on by Walker & Allbright, under the management of F. Walker.——Superintendent J. B. Salisbury, at the Shafter, near Virginia City, has been working the mill and cyadide plant on custom ore. The recent frost congealed the cyanide pulp to such an extent that a warm spell will be necessary to thaw out the returns.

Silver Bow County.

(Special Correspondence).—There is great activity in the East Butte district. The Amalgamated, United Copper, East Butte and Pittsburg & Montana companies are getting options on a lot of mining ground. The Pittsburg last week cut a big copper glance vein 11 feet wide, and the East Butte Co. is mining some of the richest ore in Butte from its mines. One shipment from the Oneida averaged 60% copper and 10 ounces of silver. The Pittsburg has acquired the Carlisle, but the Pacific is owned by the Butte Mines Exploration Co., which has not been working the mine for several years. Work has been started on the Mary MacLane, one of the East Butte Co.'s mines. It has a 4-foot vein of copper ore. Sinking on the Yankee Boy is down 320 feet. New machinery capable of working to a depth of 800 feet has been placed on the Dutton. Owing to a scarcity of cars on the Great Northern Railroad, the shipment of ore from the Boston & Montana mine at Butte to Great Falls fell off in October about 10,000 tons. The railroad company promises to furnish a sufficient number of cars by the middle of November. The new engine has been put in at the Mountain Con. mine of the Boston & Montana, but will not be put in operation at once. All mines of the Butte district, with the exception of a few that are shut down by injunction, are running up to their usual capacity and the district is yielding about 15,000 tons of ore a day. The Belmont mine, one of the new properties of the United Copper Co., is shipping 200 tons of ore daily, and the output is gradually increasing. The Pittsburg & Montana Co. has made the first shipment of copper, consisting of 100 tons, to New York. The metal so far turned out is better than 99% fine. The company is rushing its mining operations and is increasing its output of ore daily. The work of sinking a new shaft has begun. The North Butte Co.'s new hoisting engine, capable of working to a depth of 4000 feet, will arrive about the first of December. The new steel gallows frame being built will be 127 feet high. Work by leasers has been resumed on the Ophir mine in the southwestern part of Butte.

Butte, Nov. 6.

MISSOURI.

Secretary J. W. Marsteller of the Bureau of Mines of Missouri gives the value of the minerals produced in that State during 1904 as follows:

Ore.	Quantity.	Value
Zinc, pounds	476,786,000	$8,255,174
Lead, pounds	270,052,000	6,451,418
Coal, tons	4,368,129	7,003,078
Copper ores	.....	6,865
Nickel	.....	25,382
Cobalt	.....	89,706
Iron ores	.....	190,311
Barytes	.....	176,644
Kaolin and tripoli	.....	40,380
Total		$22,238,960
For 1903		20,352,976
Increase in 1904		$1,885,985

To the 1904 output should be added the value of the marble, granite, building stone, cement rock, lime rock and fireclay, amounting to $4,218,426, making a total of $26,451,097. The copper, nickel and cobalt ores were mined in Madison county. Iron ores were mined in thirteen counties, Crawford, St. Francois and Christian furnishing most. Barytes came from nine counties, Washington and St. Francois being the largest producers. Tripoli came from Newton county; kaolin from Miller and Morgan. The output of zinc and lead ores is given in the following table, in short tons:

County.	Zinc Ore. Tons.	Lead Ore. Tons.
Barry	312	.....
Benton	183	50
Camden	.....	31
Christian	275	95
Cole	.....	120
Crawford	.....	27
Dade	140	60
Franklin	.....	1,362
Greene	1,350	480
Hickory	12	17
Howell	4,115	.....
Jasper	202,513	27,891
Jefferson	1,475	461
Lawrence	13,579	1,101
Madison	.....	9,153
Miller	.....	30
Moniteau	213	187
Morgan	90	190
Newton	14,131	1,650
Oregon	30	.....
Ozark	60	.....
St. Francois	.....	89,354
Washington	15	2,634
Webster	.....	32
Wright	.....	51
Totals	238,393	135,026

Zinc ores show a product of 238,393 tons, which embraces 21,601 tons of the silicates and carbonates. This is an increase of 45,368,000 pounds over 1903. The value of the 1904 product is $8,255,174, and compared with 1903, shows an increase of $1,464,960, or 17.7%. The average price received for all grades of zinc for the year 1904 was $36.33 per ton. The silicates and carbonates averaged $17.50 per ton. The lead ore product amounts to 135,026 tons, of which 1276 tons represent the dry-bone mined. Of this total amount, the eastern district produced 103,682 tons, or 77.6%. The latter ore does not average as well per ton in price as in the Joplin or western district, as it averaged but $45.61 per ton. The 30,068 tons of lead proper averaged in the western district $56 per ton, while the 1276 tons of dry-bone averaged $30.85 per ton. The Joplin district leads all other sections of the State, as well as the nation. Its output for the year of zinc ore amounts to 467,790,000 pounds, while the remainder of the State produced 11,996,000 pounds of zinc ore. Jasper county produced during the year 91% of all the ore mined in the Joplin district, having to her credit for zinc and lead production during the year the sum of $8,869,607. St. Francois county, in the eastern district, like Jasper county in the west, continues its great lead in the production of lead ore. It furnished during the year 86.3% of all the lead ores produced in the eastern district—this, too, in the face of the closing down of three large plants on account of strikes for a considerable time. The product of the county for the year is valued at $4,038,094 in all.

NEVADA.

Elko County.

Manager G. L. Moats of the Ohio Lead M. & S. Co., operating the Latham and other properties at Sprucemont, south of Wells, will put in power drills to hasten work on the Juniper tunnel.

Humboldt County.

The Federal Mines Co., operating the placer mines in Spring valley, near Winnemucca, has bought a dredger and will rebuild its present pipe line over Indian Summit in order to begin work on a large scale.

Lander County.

There is a rush from Austin to Gold Park. A strike was made on the Peterson claim.

Lincoln County.

It is reported that the Searchlight M. & M. Co. will at once put in a 10-stamp mill, in addition to the 3-stamp battery which has been used for prospecting purposes. Sinking has again stopped on account of an increased flow of water, which taxes the capacity of the new pump.——F. Carlsen will develop the Oregon group, near Searchlight.

NEW MEXICO.

Otero County.

The Excelsior Co. will put in machinery on its property at Jarilla.——The Jarilla branch of the El Paso & Southwestern Railroad is to be extended through the gap near the Lucky at Jarilla to the Bi-Chance property, on the north side of the Lucky Flat. The shaft is to be equipped with a modern hoist.——The Southwest Co., operating at Jarilla, intends to carry on diamond drill operations to prove the ground on its properties.

Sierra County.

The Empire G. M. & M. Co. is preparing to transfer ore from the Bonanza mine, near Hillsboro, to the mill by rail. Track laying is in progress. Ten additional stamps for the mill are on the ground and they will be in operation before Dec. 1.

OREGON.

Baker County.

The shaft at the United Elkhorn mine, near Baker City, is down to the 400-foot level. Stoping is being done mainly on No. 3 level. Manager E. O. Field has seventy-five men at work.

Grant County.

The Buffalo Monitor mines, near Granite, are to be opened up by N. Berkeley.

Josephine County.

Manager A. C. Hoofer of the Mount Pitt Quartz & Placer M. Co., near Grants Pass, has purchased supplies and placed a crew on his company's mine. Development will be done all winter.

The Mines Development Co., of which S. W. Blasdell is superintendent and manager in charge, is building a flume to work its 400 acres of hydraulic placer ground on Grave creek, 5 miles west of Leland. The water is being taken out of McNair and Reuben creeks, and will furnish a flow of 2000 miner's inches during the winter season. A head will be secured for the giant of 275 feet.

The Grouse Mountain property of Mount Baldy district, 4 miles from Grants Pass, has been bought by L. P. Larsen of Spokane from A. L. Smith, Wm. Gant, E. A. Edger and I. J. Hunter, the former being retained to superintend operations. The Southern Pacific G. M. Co. has been formed to work the claims.——A number of miners have returned to Grants Pass from Lightning gulch and Canyon creek district, western Josephine county, their pack ponies laden with 400 pounds of rich telluride ore discovered on the Luce, Kauffman & Booth claim of Canyon creek. Canyon creek district is reached from Grants Pass by way of the stage road to Kerby. The district of the strike is 12 miles by trail from Kerby.

Lane County.

The initial shipment of mercury from the new furnace at the Black Butte has been made from Cottage Grove, being more than 3000 pounds of quicksilver. The new furnace has a capacity of 240 tons daily.

Wallowa County.

Manager E. R. Trippe has let a contract to sink a 200-foot shaft on the Tenderfoot mine, near Joseph.

PENNSYLVANIA.

The new child-labor law, which will force 12,000 boys out of employment at the anthracite mines, has gone into effect in Pennsylvania. It provides that no boys under 14 years shall be employed in the breakers or outside the mines and none under 16 in the mines. It is estimated that about 12,000 of the 24,000 breaker boys employed are between the ages of 10 and 14 and will be affected by the new law. These boys will be forced into the schools by the compulsory education law. In the mines there are some 3500 door boys and helpers, many of whom are under 16, but those who are displaced there may obtain work in the breakers. The breaker boys work nine hours a day and earn an average of 10 cents an hour. The dust in the breaker, their confinement to a bench where, bent over, they pick the slate from the coal as it slides down the chutes, stunts the boys, makes them liable to various diseases and generally impairs their health. It is the intention of the officers of the Mine Workers' Union to see that the law is enforced. It provides a fine of $10 a day for each boy under age employed by a coal company, and makes the companies responsible.

SOUTH DAKOTA.

Lawrence County.

Work has commenced on the Echo claim of the Echo Gold Mining Co. near Maitland. The company is sinking a single-compartment shaft and has now reached a depth of 30 feet. Superintendent A. J. Simmons of Deadwood will sink 100 feet and then development work and prospecting will start.——The Black Hills Mining Men's Association has elected a new set of officers, which will at once take charge of the affairs of the association. The officers are: W. J. Thornby, president; J. V. N. Dorr of Lead, first vice-president. Walter Mackay of Lead, second vice-president; Otto P. Th. Grantz, third vice-president; D. A. McPherson, Deadwood, treasurer, and Jesse Simmons, Deadwood, secretary.

UTAH.

According to the United States Geological Survey's report on lead production, Utah has increased its output by enlarged operations in the Tintic district, where the Centennial-Eureka, Gemini, Grand Central and Mammoth are the principal shippers. At Park City the Daly-Urst and the Silver King are the leading producers. The United States Smelting Co. has completed a new lead-smelting plant at Bingham Junction.

Beaver County.

The shaft of the Estrella mine of the Milwaukee Leasing Co., 6 miles from Milford, is to be sunk to a depth of 400 feet. S. A. Tarbet is superintendent.

H. S. and E. R. Woolley, of the Mines Development Co., will start work on the Catalba and Odd Fellows claims, near Milford.

Juab County.

The Grant claims, near Eureka, are being worked by J. A. O'Brien and H Gustaldi.——The Tip-Top mill at Hailey, Idaho, is to be moved to the Godiva mine at Eureka.

Salt Lake County.

Work on the Snyder group at Bingham has been resumed.

Summit County.

President N. Treweek and manager of the Wabash M. Co. of Park City reports that the company now controls 220 acres. In the development of the property they have found five different veins, of which three have shown ore. For fourteen months prior to July 1, 1905, energies were devoted to running a long line of crosscut work in a general south-southeast direction; this new line of work is over 3000 feet in length. Up to Sept. 1, 1905, there had been 5597 feet of shafts sunk and drifts run at a cost of $83,755.13. Since that time additional work aggregating 6059 feet has been done: Drifts, 5709 feet; main shaft sunk (total depth now 800 feet), 200 feet; double-compartment winze, 90 feet; double-compartment raise, 60 feet.

Cost of main shaft, 200 feet at $40	$8,000 00
Cost of winze shaft, 90 feet at $25	2,250 00
Cost of raise, 60 feet at $20	1,200 00
Cost of miscellaneous surface work	1,500 00
Total cost of extra expensive work	$12,950 00
Cost of drifts, 5709 feet, at $16 48	94,091 54
Total cost of work done, 6059 feet	$107,041 54

The report covers the period from Sept. 1, 1903, to Aug. 31, 1905. In the election the old board of directors was returned. It consists of N. Treweek, president and manager; John R. Barnes of Kaysville, vice-president; W. M. Ferry, secretary and treasurer.

FOREIGN.

CANADA.

BRITISH COLUMBIA.

Boundary District.

Ore shipments have been started from the Dominion Copper Co.'s Brooklyn mine in Phœnix, the ore going to the company's smelter at Boundary Falls. It is given out that the smelter itself will be blown in about Dec. 1. Superintendent W. C. Thomas is getting matters ready at the reduction works. A supply of coke has been obtained and Manager Drummond is gradually increasing the forces at the mine. Preparations are being made for the installation of an electrically operated air compressor at the Rawhide mine at Phœnix.

Cassiar District.

The Atlin mining division has been the chief factor in the placer gold production of the Province for some years. This district was discovered during the summer of 1898. On the south bench of Pine creek opposite the town of Discovery, hydraulicking is being done by the North Columbia Hydraulic Co., of which J. M. Ruffner is manager. The B. C. Mining Exchange states that he has succeeded in thoroughly disintegrating the cemented gravel, and has found a cheap and satisfactory method of piling tailings. He has concluded that blasts of 2000 or 3000 pounds of 75% powder are of most efficacy. Drifts are run and T's set, so that charges of powder can be placed at least every 25 feet over the whole area of ground to be blasted. He calculates that the powder has a breaking potential of 12½-foot radius. The biggest charges, about 200 pounds each, are at the back of the drifts. Time and labor are saved and the efficiency of the blast greatly increased by using water for tamping. To outward appearance, the blast is a failure. Only the top of the bank is observed to fall down. When piping begins, however, the effect of the dynamite becomes apparent. The gravel, which was as hard as cement, is found to be perfectly shattered, and the washing of it is

as easy as ground sluicing. The system of piping observed throughout is having two giants work together so that the gravel is driven into sluice boxes by two streams directed against it from opposite directions. Seven-inch nozzels are used. The pits are double-compartment, with two lines of sluice boxes. When one sluice is being cleaned, piping goes on in the other compartment. Three pits are worked. On one of them natural dumpage facilities are poor, so to dispose of tailings an elevator has been built. This elevator is 36 feet long, 10 feet wide, 8 feet high, and supported by trestles. Its lower end is two feet below bedrock, its upper end 12 feet above bedrock. In it steel bars ½ inch by 3 inches are set horizontally 3 inches apart. The floor is protected from wear and tear by being solidly blocked. Between the blocks and the bars there is a clearance of 1 foot. As the elevator can be readily moved, it is so stationed that its foot is near the giants. A constant stream of water and gravel being directed against it, the boulders too large to pass between the bars are rushed up the incline and topple over, while the fine material passes between the bars and thence to the sluice-boxes. When the tailing pile gets higher than the elevator a piper trims it off with his giant. Thus the boulders are driven back and stacked 20 feet high. The management tried placing the bars longitudinally, thinking that boulders would be forced up the elevator more easily. The bars were too light. A short run bent them badly, so their former position was reverted to. Next year the longitudinal may again be tried, but railway track will be used. The dredger on Upper Spruce creek has been completed and is working full capacity. The Northern Mines, Ltd., on Spruce creek, have successfully worked a steam shovel plant. Birch creek had a short water season,

East Kootenay District.

The Marysville smelter has determined to put in Heberlein roasters to equal the capacity of its plant. This is expected to work a saving of nearly $5 a ton on the ore treated. The second stack of the smelter will not be blown in until next summer.

Nelson District.

The Hendryx agitator and process of cyaniding ore which has been put in at the Reliance mine, near Nelson, has been declared by Superintendent D. Lay to be a success. The ore at the Reliance is a low grade, slimy proposition, which has to be crushed to from 60 to 100 mesh to give the best results. The process differs from others in that cyaniding the ore is done with a solution of $\frac{2}{10}$ of 1% to the ton in the battery. When the pulp reaches the agitator the cyanide is increased to ½ or ¾ of a pound to the ton of solution. The ore pulp is agitated from four to six hours, and the gold and silver are precipitated on the plates with an electric process. No attempt is made to separate the slimes from the sands. The mine is on Forty-Nine creek, and is connected with the mill by a 1750-foot aerial tram.

Rossland District.

The Le Roi is putting a skipway in the winze on the 1350-foot level as a preliminary to beginning the work of deepening the winze from the 1550 to the 1650-foot level, which will be explored. The development from the 1350-foot level down to the 1550-foot level has been satisfactory in disclosing the presence of ore bodies. A crosscut from the 1350-foot level of the Le Roi in another direction is intended to pierce the Josie ground of the Le Roi No. 2. The Josie workings are down 900 feet, and this crosscut will enable the Le Roi No. 2 to explore its ground at a point 450 feet below their present workings. The shipments for the week ending Nov. 4 were: Le Roi, 2220 tons; Center Star, 1590; War Eagle, 1320; Le Roi No. 2, 180; Le Roi No. 2 milled, 1200; Jumbo, 300; Crown Point, 80. Total for the week, 6890; and for the year 282,553 tons.

MEXICO.

Baja California.

(Special Correspondence).—Near Alamo it is said that the Russell M. Co. are putting up new machinery and discarding their old plant. —— The Pedrara Co. are working the Pedrara onyx mines in Lower California, extracting the onyx and hauling it 50 miles to a landing 7 miles below Canvas Point, from which it is shipped by steamer to San Diego, Cal.——A party is investigating the onyx mines owned by Wm. Denton about 30 miles north of San Luis Gonzago.——Tourmalines and a good quality of beryl have been discovered near Ensenada.

San Diego, Nov. 8.

Jalisco.

The Amparo M. Co. has put in machinery at the Canada mine, 2 miles northwest of the Santo Domingo property, and has commenced to reopen and unwater it. The Canada was worked by the former owners of the Santo Domingo, who extracted very rich ore. The Amparo M. Co. is now shipping from two to three cars of ore per day from the Santo Domingo mine to the Torreon smelter, and is milling thirty tons of low-grade ore daily.——C. Romero has commenced work on a tunnel to cut below the old workings of his Sorrillo mine, 1 mile south of Etzatlan.——The Magistral Mining Syndicate of Los Angeles, Cal., of which M. D. Graves is manager, has commenced development of the Magistral, Eden and Refugio mines, 1 mile south of the Santo Domingo.

Michoacan.

(Special Correspondence). — In the Ario district, New York and Salt Lake parties, headed by S. L. Butler, have started work on their Los Pozos properties, in the basin of the Arroya de los Naranjitos. The group consists of four claims of which the Pozos mine has been worked extensively on the surface by the antiguas.——The vein is on a slate and porphyry contact and is 11 feet wide. ——The Amplicaciones consists of 18 pertenencias northeast and southwest of the Pozos mine. —— The Veta Grande consists of 8 pertenencias. ——The Virginia concession of 12 pertenencias is being worked by the open cut method; 12,000 tons of concentrating ore lie in sight on the slate bed on the surface. A grinding mill with daily capacity of 15 tons will be put in. A concession of the water of the Arroya de los Naranjitos has been granted by the State of Michoacan.——The Carrizal M. Co., which has suspended operations, has made a 2-weeks run of their 5 stamps, realizing a bar worth $2400.——Juan Lopez is working a small force on the Cuachtemoc mine near Los Joyas. The vein averages 15 inches and carries 2 ounces values. —— The State of Guerrero has been claiming, recently, Michoacan territory, owing to the rich mineral discoveries in the latter State. Upon legal investigation it is found that the decreto number 3253 fixed permanently the Rio Balsas as the boundary line between the two States. This decree is dated May 15, 1849.

Carrizal, Nov. 6.

Personal.

W. F. BRAY of Placerville, Cal., is in San Francisco.

W. A. HENDRYX has left Nelson, B. C., for New York City.

L. L. WARDE of Mexico City, Mexico, is in San Francisco.

CHAS. READ has left Eureka, Nevada, for the Philippines.

T. E. SCHWARZ has returned from Ouray, Colo., to Denver, Colo.

CHAS. M. MCINTIRE is developing a mining property at Ely, Nevada.

SAMUEL MCINTYRE has returned from Nevada to Mammoth, Utah.

W. F. ENGLEBRIGHT has returned from San Francisco to Nevada City, Cal.

WILLIAM RUSSELL has returned to Denver, Colo., from Sheridan, Mont.

G. W. HEINTZ, traffic manager U. S. Smelting Co., of Utah, is in New York.

J. M. CALLOW has returned from Denver, Colo., to Salt Lake City, Utah.

ALGERNON DEL MAR is running the Edel mill at Enterprise, Butte Co., Cal.

SUPERINTENDENT W. A. PTOLEMY of Silverton, Colo., is in Los Angeles, Cal.

FRED W. BRADLEY of San Francisco, Cal., is in Colorado on professional business.

J. C. SCOBEY, consulting engineer Cinguieta C. Co., Sonora, Mex., is in Denver, Colo.

J. S. WALLACE, secretary Oriental M. Co. of Korea at San Francisco, Cal., is in Colorado.

J. B. ROSS, manager Ross M. & M. Co., has returned from Bisbee, Ariz., to Denver, Colo.

N. C. BONNEVIE, who has been in Chicago the past few weeks, has returned to Denver, Colo.

W. J. ROBINSON, of the British-American Dredging Co., Atlin, B. C., is in San Francisco, Cal.

T. A. RICKARD returns from Mexico to-day to his residence, 2335 Warring St., Berkeley, Cal.

JOHN H. MACKENZIE, of San Francisco, Cal., has left Rossland, B. C., for London via New York.

A. S. ROSE, manager Gilmore M. Co., near Gilmore, Idaho, will spend the winter in Pittsburg, Pa.

F. M. LELAND is reported making a success of the White Knob copper property, Mackay, Idaho.

JAS. MAHER has succeeded Samuel Treloar as superintendent Lexington mine, at Butte, Montana.

C. A. HOPKINS of Boston, president of the Quartet mine at Searchlight, Nev., is in San Francisco.

CHAS. HORNBACK is manager American Tungsten & Mining Co., working properties near Eldora, Colo.

CHAS. P. OLIVER is now mine superintendent Colorado Tungsten Corporation, Nederland, Colorado.

E. E. NICHOLSON has been appointed superintendent Carizzo copper mines, west of Autlan, Jalisco, Mex.

P. C. MCCARTHY, manager Hidden Treasure mine, Lake City, Colo., has returned there from Denver, Colo.

L. W. VIDLER, who has been examining mine property in New Mexico, has returned to Georgetown, Colo.

J. M. GOODWIN has returned to Silver City, Idaho, from a mine examination in Humboldt county, Nevada.

J. B. TOMLINSON, manager Swansea mine, Cananea, Sonora, Mexico, has returned to the mine from Denver.

JOHN YEATMAN, engineer with the United Iron Works, has returned to San Francisco, Cal., from Yuma, Ariz.

JNO. YATES, A. R. S. M., has been appointed professor of mining at the Transvaal, S. A., Technical Institute.

FRANK E. SHEPARD, president Denver Engineering Works, Denver, Colo., has returned there from a trip to Mexico.

O. A. STRANAHAN is now sales manager power department Allis-Chalmers Co., with headquarters at Milwaukee, Wis.

DR. F. R. CARPENTER has returned to Denver, Colo., from Nova Scotia, where he has been examining mining property.

JOHN J. DALY, president Daly-Judge mine at Park City, Utah, has returned from California to Salt Lake City, Utah.

C. F. SCHILLING of Kelvin, Ariz., has been appointed superintendent White M. Co., working near Wickenburg, Ariz.

ARTHUR WARREN has resigned the position recently held by him in the publicity department of the Allis-Chalmers Co.

C. A. VAN HORN, manager Fortune Dyke M. & M. Co., has returned to Sugar Loaf, Boulder Co., Colo., from Michigan.

S. A. KNAPP, of Tonopah, Nev., who has been examining mining property at Pine Grove, Nev., is in San Francisco, Cal.

E. A. ADHAMS of Milwaukee, Wis., president Milwaukee Leasing Co., has returned home from his mines near Milford, Utah.

W. E. DEFTY of Phœnix, Ariz., will be making examinations in Durango and Chihuahua, Mex., during the month of November.

H. L. JOHNSON, owner Tightner mine at Alleghany, Sierra county, Cal., has returned to the mine from a visit to San Francisco.

E. J. MOORE, the Colorado manager of this journal, will represent it at the American Mining Congress at El Paso, Tex., next week.

CHAS. HUTCHINSON of the Union Iron Works of San Francisco, Cal., has gone to El Paso, Tex., to attend the American Mining Congress.

V. C. HEIKES, of the U. S. Geological Survey, is preparing a bulletin on the mineral statistics and development of Mohave county, Arizona.

R. MCF. DOBLE, consulting engineer of San Francisco, Cal., has severed his connection with the Abner Doble Co. in order to resume his individual practice.

JOHN W. CLEAVER, manager Santa Rosa Mexican Mining Co's. smelter, San Javier, Sonora, Mexico, arrived there Nov. 4, after an absence of five years.

MARK B. KERR, having completed an investigation of mines on the Cuyamaca Grant, in San Diego county, Cal., has gone to New York City on mining business for the Cuyamaca Co.

H. V. CROLL, manager Salt Lake City office of The Wellman-Seaver-Morgan Company, has been at the general offices at Cleveland for a number of weeks, and will return to Salt Lake City today.

JAS. ANNAND, for the past year superintendent of mill for Ashanti Goldfields Corporation, Ltd., Abuassi via Sekondi Gold Coast Colony, West Africa, has resigned his position and is now at Hotchkiss, Colo.

W. C. RALSTON and traveling representative W. A. Desborough will be present at the coming session of the American Mining Congress, at El Paso, Tex., in the interests of the Fulton Iron Works, San Francisco, Cal.

PRESIDENT ROOSEVELT has appointed the following delegates to the Mining Congress at El Paso, Texas: S. F. Emmons, T. A. Rickard, J. W. Holman, W. R. Ingalls, A. F. Lucas, J. A. Holmes, F. W. White, L. A. Coate, F. C. Barrett and C. W. Hayes.

N. S. KEITH is installing a plant for the Pahaquarry Copper Co., Dunnifield P. O., to treat 200 tons per day of their cupriferous sandstones at their mines in Warren county, N. J., as noted in the article on treatment of low-grade copper ores in the issue of this journal of Sept. 9.

GOVERNOR PARDEE of California has appointed the following delegates to the eighth annual American Mining Congress, to be held at El Paso, Texas, November 14th to 18th: E. C. Voorhies of Sutter Creek, R. N. Bulla, Thomas Ewing, H. Z. Osborne and G. H. Hooper of Los Angeles, Frederick W. Corkhill of Berkeley, J. H. West of Needles, Prof. S. B. Christy of Berkeley, W. F. Detert of Jackson, David McClure of the Gwin mine, J. H. Neff of San Francisco, W. P. Hammon of Marysville, John Daggett of Siskiyou, Harold T. Power of Bullion and Frank A. Leach of Oakland.

Books Received.

In Bulletin No. 268 of the United States Geological Survey, R. M. Bagg describes "Miocene Foraminifera from the Monterey Shale of California with a few Species from the Tejon Formation."

Water Supply and Irrigation Paper No. 136, "Underground Waters of Salt River Valley, Arizona," by W. T. Lee, is a valuable contribution to the literature of the bearing of geology on water supply.

As extracts from "Mineral Resources of the United States," the United States Geological Survey has issued "The Production of Platinum and Allied Metals in 1904," by D. T. Day; "The Production of Zinc in 1904" and "The Production of Lead in 1904," by Chas. Kirchhoff.

Proceedings of the American Institute of Electrical Engineers, Vol. XXIV, No. 10, Oct., 1905, contains "Some Experiences with Lightning Protective Apparatus" by J. C. Smith, and "Notes on Lightning Arresters on Italian High Tension Transmission Lines" by Philip Torchio.

Water Supply and Irrigation Paper, No. 123, of the United States Geological Survey, describes the "Geology and Underground Water Conditions of the Jornada del Muerto, New Mexico," by C. R. Keyes. This is a valuable paper, showing the relation of geology to a possible water supply for an arid region.

As Bulletin No. 270, the United States Geological Survey has issued "The Configuration of the Rock Floor of Greater New York" by W. H. Hobbs. It presents results of studies of the depth and nature of bedrock beneath New York as shown by various wells and borings, bridge and tunnel sections, Government dredgings, etc.,

with the intention not only of studying the geological problems, but also to aid engineers in future work.

As an extract from "Mineral Resources of the United States for 1904," the United States Geological Survey has issued "Natural Gas," by F. H. Oliphant, which contains much information regarding the production, distribution and uses of natural gas in the several States. The production was valued at $38,496,760, of which Pennsylvania produced 47%, and West Virginia, Indiana and Ohio 46.3%. The United States produced 99% of the entire known world's production of natural gas.

As Professional Paper No. 41, the United States Geological Survey has published "Geology of the Central Copper River Region, Alaska," by W. C. Mendenhall. This paper presents the scientific results obtained in 1902 by two combined geologic and topographic parties in the upper Copper, the Nabesna, Chisana, south and west slopes of the Wrangell mountains, and the southern face of the Alaska range that is drained by the tributaries of the Copper. The author details the geography, historical geology, physiography, and economic geology of the region.

In the "Geology of the Tonopah Mining District, Nevada," Professional Paper No. 42 of the United States Geological Survey, J. E. Spurr presents the results of an exhaustive investigation into the occurrence of the Tonopah ores. The author describes the general geology, the mineral veins, subterranean water, physiography, and the descriptive geology of mines and prospects. He also discusses rock alternation connected with mineralization, origin of mineral veins, increase of temperature with depth, and comparison with similar ore deposits elsewhere. The paper contains much material pertinent to the theories of ore deposition. In his conclusions as to the genesis of Tonopah ores the author says: "The Tonopah district was, during most of the Tertiary time, a region of active volcanism, and probably after each eruption, solfataric action and fumarolic action, succeeded by hot springs, thoroughly altered the rocks in many parts of the district. At the surface, during those periods, the phenomena of fumarolic and solfataric action and of hot springs were similar to those today witnessed in volcanic regions, but the rocks now exposed were at that time below the surface. The veins fill conduits which were formed by the fractures due to the heavings of the surging volcanic forces below, and along which the gases, steam, and finally hot waters, growing gradually cooler, were forced, relieving the explosive energies of the subsiding volcanism. The water and other vapors, largely given off by the congealing lava below, carried with them, separated and concentrated from the magma, metals of such kind and of such quantities as are present in the veins, together with silica and other materials. The nature of the metallic minerals in the vein in this case is believed to depend largely upon the particular magma where the emanations pro eeded. In the chief Tonopah veins this was the earlier andesite. Other factors, such as relative depth, have evidently an important controlling influence." The paper will probably furnish much material for geologic discussion. It contains some practical information that may be valuable in the further development of the region. It will be interesting to see how the author's contentions are borne out with depth.

Commercial Paragraphs.

THE Salt Lake Hardware Co., Salt Lake City, Utah, is supplying a new power plant to the Sevier Con. G. M. M. & P. Co., Kimberly, Utah.

THE Dow Steam Pump Works of San Francisco, Cal., have bought ten acres of land with tidal frontage at Alameda, Cal., as a site for their new and enlarged works.

FROM Manager W. B. Dennis of the Blackbutte quicksilver mine, Blackbutte, Or., comes "one flask Hg." as a souvenir of the first run of the new Dennis furnace.

W. H. MOTTER & SON, Eighteenth and Lawrence streets, Denver, Colo., are installing one of their 25-ton roasters at Silverton, Colo. Same will be in operation about Nov. 20th. They also have orders for two 50-ton plants, one for New Mexico and the other one for Gunnison county, Colo.

ON the wall of the manager's office hangs the latest diploma accorded the MINING AND SCIENTIFIC PRESS, it having been conferred by the jury of awards of the Louisiana Purchase Exposition at St. Louis, Mo., in 1904, which accorded a gold medal to the MINING AND SCIENTIFIC PRESS. The diploma is 16x18 inches and finely printed. The gold medal weighs 3½ ounces and is a handsome affair. The Chicago Exposition in '93 and the Paris Exposition in 1900 sent similar diplomas for awawded excellence to the MINING AND SCIENTIFIC PRESS.

THE Wellman-Seaver-Morgan Company of Cleveland, Ohio, have been awarded by the United States Government the contract for crane service over two ship building berths, at the United States Navy Yard at Mare Island, Vallejo, Cal. This is one of the most important contracts in this line that has been placed for a long time, comprising an immense steel trestle and a powerful high-speed cantilever gantry crane, mounted on same, and traversing over the two berths. C. W. A. Koelkebeck, mechanical engineer, for the past four years with the Garrett-Cromwell Engineering Co., and for ten years previous with Julian Kennedy, has joined the engineering staff of the Wellman-Seaver-Morgan Co., where his attention will be given to blast furnace, steel plant and rolling mill construction.

THE Lindholm Manufacturing Co., 1643 Champa street, Denver, Colo., are receiving orders for their patent candlestick. A list of firms carrying same in stock throughout the country is as follows: Anaconda M. Co., Butte, Mont.; Cripple Creek Mine Supply Co., Cripple Creek, Colo.; Hibbard, Spencer & Bartlett Co., Chicago; Holly, Mason & Marks, Spokane, Wash.; A. N. Holter Co., Helena, Mont.; Krakuer, Zork & Moye, El Paso, Texas, and Chihuahua, Mexico; McGowan Bros., Spokane, Wash.; Missoula Mercantile Co., Missoula, Mont.; A. E. W. Miles Co., Livingston, Mont.; Morrell Hardware Co., Cripple Creek, Colo.; Pacific Hardware & Steel Co., San Francisco, Cal.; E. G. Pryor & Co., Victoria, B. C.; Pacific Coast Borax Co., Borax, Cal.; Scott S. & T. Co., Denver, Colo.; Salt Lake Hardware Co., Salt Lake City, Utah.

Trade Treatises.

Bulletin No. 358 of National Electric Co., Milwaukee, Wis., intimately shows the details of construction of their belt-driven A. C. generators and gives data relating to various types.

Brown & Sharpe Mfg. Co. of Providence, R. I., send their 1905 catalogue and price list of fine mechanical machinists' tools, including rules, scales, protractors, calipers and gauges.

Latest Market Reports.

SAN FRANCISCO, November 10, 1905.

METALS

SILVER. — Per oz., Troy: London, 29 1/8d (standard ounce, 925 fine); New York, bar silver, 63c, refined (1000 fine); San Francisco, 63c; Mexican dollars, 51c, San Francisco; 48½c, New York.

The price of silver quoted to-day is higher than in many months—63 cents. Within the past month the price of the metal has advanced from 61⅝ to 63 cents, a gratifying increase, though small.

COPPER.—New York: Standard, $16.35½; Lake, $16.35½ @16.67½; Electrolytic, $16.62½; Casting, $16.00@16.37½. San Francisco: $16.75. Mill copper plates, $17.50; bars, 18@24c. London: £71 10s spot per ton.

The copper market remains at a standstill. The conditions of supply and demand remain almost stationary, and the price shows no change.

LEAD.—New York, $5.40; St. Louis, $4.50; San Francisco, $5.00, carload lots; 5½c 1000 to 4000 lbs.; pipe 7½c, sheet 8, bar 6¾c. London: £14 18s 9d ℔ long ton.

SPELTER.—New York, $6.25; St. Louis, $6.00; London, £28 5s ℔ ton; San Francisco, ton lots, 7c; 100-lb lots, 7¾c.

TIN.—New York, pig, $32.80@33.25; San Francisco, ton lots, 34c; 500 lbs., 35c; 200 lbs., 36c; less, 37½c; bar tin, ℔ lb., 40c. London, £149.

PLATINUM.—San Francisco, crude, $18.50 ℔ oz.; New York, ingot, $20.50 ℔ Troy oz. Platinum ware, 75@$1.00 ℔ gram.

QUICKSILVER.—New York, $40.00@$40.50, large lots; London, £7 5s 0d; San Francisco, local, $38.00@39.00 ℔ flask of 75 lbs.

BABBITT METAL.—San Francisco, No. 1, 10½c; No. 2, 8c; No. 3, 7½c; extra, 17½c; genuine, 32½c; Eclipse, 35c.

SOLDER.—Half-and-half, 100-lb. lots, 22.00c; San Francisco, Plumbers', 100-lb. lots, 19.15c.

ZINC.—Metallic, chemically pure, ℔ lb., 50c; dust, ℔ lb., 10c; sulphate, ℔ lb, .04c.

NICKEL.—New York, 55@60c ℔ lb.; ton lots, 40@47c.

ALUMINUM.—No. 1, 99%, small lots, 37c ℔ lb.; 100 lbs.. 35c; 1000 lbs. 34c; ton lots and over, 33c, Pittsburg. No, 2, 90%, small lots, 34c; ton lots and over, 31c, Pittsburg.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, $16.85; gray forge, $16.35; San Francisco, bar, 3½c ℔ lb., 3¾c in small quantities.

STEEL.—Bessemer billets, Pittsburg, $26.00@$27.00; open hearth billets, $27.00@$28.00; San Francisco, bar, 7c to 13c ℔ lb.

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 7¼c; less than 500 lbs., per lb., 8c; in 25-lb. tin pails, ½c ℔ lb. above keg price; in 1 and 5-lb. tin cans, 100 lbs. per case, ½c per lb. above keg price. Dry Lead.—In bbls., 1 ton and over, 7½c; do. in kegs, 8c.

LIME.—Santa Cruz, $1.35 country, $1.25 city ℔ bbl.

CEMENT.—Imported, $3.00@4.00 ℔ bbl.; California, carload lots, $1.80 f. o. b. at works; small lots, $2.10 ℔ bbl. in sacks, 4 sacks to bbl., 5c for each sack returned.

LUMBER.—(Retail): Pine, ordinary sizes, $24.00@25.00; extra sizes higher; redwood, $28.00@30.00; lath, 4 feet, $4.50@5.00; pickets, $21.00;shingles, $2.50 for No. 1, and $2.25 for No. 2; shakes, $13.50 for split and $15.00 for sawed; rustic, $28.00@35.00.

NAILS.—This week the basic prices are: Wire, $2.77; Cut, $3.25. Meanwhile the nominal quotations per keg (list prices) are: No. 20d to 60d, Wire, $3.35; Cut, $3.55; 10d to 16d, Wire, $3.45; Cut, $3.35; 8d, Wire, $3.50; Cut, $3.50; 6d and 7d, Wire, $3.60; Cut, $3.60; 4d and 5d, Wire, $3.70; Cut, $3.70; 3d, Wire, $3.85; Cut, $3.85; 2d, Wire, $4.10; Cut, $4.10. Special rates for carload lots.

GENERAL SUPPLIES.

ANTIMONY.—New York, Cookson's, 13½c; Hallett's, 14½c; San Francisco, 1000-lb. lots, 14c; 300@500-lbs. 12c; 100-lb. lots, 13c.

BISMUTH.—Subnitrate, ℔ lb., $2.10.

BONE ASH.—Extra No. 1, 5@6c ℔ lb; No. 1, 4@5c.

BORAX.—Concentrated, 7@8c ℔ lb; powdered, 9@10c; fused, 25@30c; crystal, 7c.

CANDLES.—Spear Brand, 16 oz. adamantine, 40s., 11c ℔ set; 14 oz. adamantine, 40s., 10c; 12 oz. adamantine, 40s, 9c; 10 oz. adamantine, 40s, 8c; 16 oz. stearic, 40s, 12½c ℔ set; 14 oz. stearic, 40s, 11½; 12 oz. stearic, 40s, 10½c; 10 oz. stearic, 40s, 9½c. 100-case lots and over, ½c less. Not less than 50-case lots, ¼c less. Boxes of 20s, price ½c advance.

CAPS.—3x, $5.50@6 per 1000; 4x, $6.50@7; 5x, $8@8.50: Lion, $9@9.50, in lots not less than 1000.

CHEMICALS.—Cyanide of potassium, 98%–99%, jobbing, 23@24c ℔ lb.; carloads, 23@23½c; in tins, 30c; soda ash, $2.00 ℔ 100 lbs.; hyposulphite of soda, 3@3½c ℔ lb.; caustic soda, in drums, 3@3½c ℔ lb.; Cal. s. soda, bbls., $1.10@1.20 ℔ 100 lbs.; sks., 90c@$1.00; chlorate of potash, 12@13c; nitrate of potash, 6½@7c; caustic potash, 10c in 40-lb. tins; roll sulphur, 2½@2¾c; powdered sulphur, 2½@2½c; flour sulphur, French, 2¾@—c; alum, $2.00@2.25; California refined, 1¾@2c; sulphide of iron, 8c ℔ lb.; copper sulphate, 5½@5¾c; chloride of lime, spot, $2.50@2.75; sulphuric acid, in carboys, 66° B, 1¾@2c ℔ lb.; nitric acid, carboys, 8c ℔ lb.

CHROMIUM.—90% and over, ℔ lb., 80c.

COAL.—San Francisco, coast, yard prices: Wellington, $8.00; Seattle, $6.50; Coos Bay, $5.50; Southfield, $8.00. Cargo lot, Eastern and foreign: Wallsend, $7.50; Brymbo, $7.50; Pennsylvania, hd., $14.00; Scotch, $8.00; Cumberland, $13.00; Cannel, $8.50; Welsh Anthracite, $13.00; Rock Springs, $8.50, long ton; Colorado Anthracite, $14.00. Coke, $11.50 per ton in bulk, $13.00 in sacks; Sunnyside, $8.50, long ton.

FIRE BRICK.—Domestic, carloads ℔ 1000, f. o. b., factory square, $25.00; soap and split, $22.50; arch and wedge, $27.50; skewback, $30.00; circle, $32.00.

FIRE CLAY.—Domestic, ℔ ton 2000 lbs. in 125-lb. bags double, and dry ground, f. o. b., factory, $8.50.

FUSE.—Triple tape, $4.00 per 1000 feet; double tape, $3.55; single tape, $3.10; Hemp, $2.85; Cement No. 2, $3.10; Cement No. 1, $2.75, in lots of 3000 and up.

OILS.—Linseed, boiled, bbl., 54c; cs., 59c; raw, bbl., 52c; cs., 57c; Lucol oil, boiled, bbl., 48c; cs., 53c; raw-bbl., 46c; cs., 51c. Kerosene—Pearl, per gal., 17½c; Astral, 17½c; Star, 17½c; Extra Star, 20½c; Eocene, 19½c; Elaine, 26c; Water White, in bulk, 11c; Mineral Seal, iron bbls., 18c; wooden bbls., 20½c; cs., 24c; Mineral Sperm, cs., 26½c; Deodorized Stove Gasoline, bulk, 14½c, do., cs., 21c; 86° Gasoline, bulk, 25c; do., cs., 31c; 83° Naphtha or Benzine, deodorized, in bulk, per gal., 12½c; do., in cs., 19c; Lard Oil, E. W. S., bbl., 75c; cs., 80c; Neats-foot Oil, pure, bbl., 63c; cs., 78c; Sperm, crude, 63@68c; Natural White, 68c; Bleached, do., 68@73c; Whale Oil, cs., 52@67c.

LITHARGE.—Pure, in 25-lb. bags, 9½@10½c ℔ lb.

MAGNESIUM.—Pure, N. Y., $1.60.

MANGANESE.—Black oxide, ℔ lb., 2¾@4c.

MERCURY.—Bichloride, ℔ lb., 77c.

MOLYBDENUM.—Best, $2.75 ℔ lb.

PHOSPHORUS.—American, ℔ lb., 70c.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitroglycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1**, 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2, 35%, carload lots, 9½c; less than one ton, 11½c. No. 2**, 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2.00 per keg.

RED LEAD.—500 lbs. and over at one purchase, ℔ lb, 7½c; less than 500 lbs., 7¾c.

SILVER.—Chloride, ℔ oz., 90c@$1.00; nitrate, 54c

SODIUM.—Metal, ℔ lb., $1.

TUNGSTEN.—Best, ℔ lb., $1.20.

URANIUM.—Oxide, ℔ lb., $3.40.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market street, San Francisco, has official reports of the following United States patents issued to Pacific Coast inventors:

FOR THE WEEK ENDING OCTOBER 24, 1905.

802,545.—CLOTH SPLITTING MACHINE—J. F. Ames, Portland Or.
802,729.—MEAT TENDERER—J. D. Atkinson, Olympia, Wash.
802,905.—TIRE INFLATER.—G. A. Bobrick, Los Angeles, Cal.
802,912.—HOSE CARRIAGE—H. B. Cary, Los Angeles, Cal.
802,367.—CAN FILLING MACHINE—A. Cerruti, San Francisco, Cal.
802,443.—FLEXING MACHINE—A. Cerruti, San Francisco, Cal.
802,627.—FOUNTAIN BRUSH—Chrisler & Kays, Eugene, Or.
802,372.—DESK—F. A. Creed, Petaluma, Cal
802,556.—FIREPROOF PARTITION—Depew& McCall, San Francisco, Cal.
802,630.—GRUBBING MACHINE—A. I. Dunavan, Izee, Or.
802,375.—DRIVING BIT—G. T. Duncan, Seattle, Wash.
802,744.—HOLSTER—W. J. Foister, Myrtle Point, Or.
802,852.—BOAT—E. Fournier, North Yakima, Wash.
802,747.—CURRENT MOTOR—H. H. Granger, Davenport, Wash.
802,750.—SHAFT BEARING—J. H. Gray, San Francisco, Cal.
802,693.—BROODER—J. H. Huff, Fresno, Cal.
802,695.—BICYCLE—Ingham & Robinson, Roche Harbor, Wash.
802,816.—STRAP POLISHER—W. C. Lawrence, Portland, Or.
802,578.—VENDING MACHINE.—W. F. MacArtor, Los Angeles, Cal.
802,460.—FLOWER POT—A. Marshall, Los Angeles, Cal.
802,775.—PUMP—E. P. McMurtry, San Francisco, Cal.
802,466.—HARNESS SADDLE—T. I. Morrish, San Francisco, Cal.
802,654.—DIRECTORY—P. C. Murphy, Seattle, Wash.
802,876.—FIRE HEATER—O'Connor & Covey, Riverside, Cal.
802,706.—BALING PRESS—G. W. Pearson, Fresno, Cal.
802,413.—ELECTRICAL APPARATUS—J. F. Seeley, Los Angeles, Cal.
802,480.—VIBRATOR—J. F. Seeley, Los Angeles, Cal.
802,893.—CHECK BOOK—Slane & Corbaley, Spokane, Wash.
802,828.—ROTARY ENGINE—N. R. Smith, Seattle, Wash.
802,604.—FLOOR SURFACING MACHINE—Spence, Prugh & Zimmer, San Francisco, Cal.
802,605.—FLOOR SURFACING MACHINE—Spence, Prugh & Zimmer, San Francisco, Cal.
802,606.—FILE CABINET—M. R. Stapp, Aberdeen, Wash.
802,537.—SWIVEL—A. Uren, Seattle, Wash.
802,787.—QUARTZ MILL—R. A. Vaughn, Ballard, Wash
802,944.—ELECTRIC VALVE—I. G. Waterman, Santa Barbara. Cal.
802,945.—ELECTRIC VALVE—I. G. Waterman, Santa Barbara, Cal.
802,946.—ELECTRIC VALVE—I. G. Waterman, Santa Barbara, Cal.
802,947.—ELECTRIC VALVE—I. G. Waterman, Santa Barbara, Cal.
802,948.—ELECTRIC VALVE—I. G. Waterman, Santa Barbara, Cal.
802,949.—ELECTRIC VALVE—I. G. Waterman, Santa Barbara, Cal.
802,950.—ELECTRIC VALVE—I. G. Waterman, Santa Barbara, Cal.
802,951.—ELECTRIC VALVE—I. G. Waterman, Santa Barbara, Cal.
802,952.—ELECTRIC VALVE—I. G. Waterman, Santa Barbara, Cal.
802,953.—ELECTRIC VALVE—I. G. Waterman, Santa Barbara, Cal.
802,954.—ELECTRIC VALVE—I. G. Waterman, Santa Barbara, Cal.
802,955.—ELECTRIC VALVE—I. G. Waterman, Santa Barbara, Cal.
802,956.—ELECTRIC VALVE—I. G. Waterman, Santa Barbara, Cal.
802,957.—ELECTRIC VALVE—I. G. Waterman, Santa Barbara, Cal.
802,958.—ELECTRIC VALVE—I. G. Waterman, Santa Barbara, Cal.
802,959.—ELECTRIC VALVE—I. G. Waterman, Santa Barbara, Cal.
37,575.—DESIGN—G. L. Price, Seattle, Wash

Needed Amendments in Mining Law.

One of the most interesting of the papers read before the American Mining Congress at El Paso, Texas, the past week was that of R. S. Morrison on needed changes in the existing mining laws. The one feature which, above all others mentioned, seems the most timely and urgent is that suggesting the need of uniform legislation, which shall be adapted to every State and Territory in the Union. The Federal Statutes are good enough, perhaps, as far as they go, particularly since almost every character of contention which may arise under existing laws has already been considered, and the laws have been interpreted by the State and Federal judiciary up to the highest—the United States Supreme Court—until we now understand fairly well what may be anticipated in the courts on nearly every question that may arise, but the laws of the several States lack uniformity, and, as pointed out by Mr. Morrison, what may be legal compliance with the law in one State or Territory may not be sufficient in another. The Congress of the United States should repeal the Act giving to the States, Territories and mining districts the right to enact local mining legislation, and define more clearly the acts of discovery, location and possession, and enforce more strictly the requirements of the law, the main objects being to secure to bona fide locators their rights, and to bring about more promptly the development of the mineral resources of the country by requiring certain work to be done as a part of the act of location. This has been attempted by several of the mining States, the only fault being the lack of uniformity in these State laws. Something should be done to lessen the evil of wholesale location of the mineral lands of the public domain by those who claim large tracts without performing any other work than setting a discovery stake, or possibly completely staking or monumenting a claim.

Another phase of the Federal mining law is that relating to discovery. The law distinctly states that the initial act of the locator is his discovery. This law undoubtedly contemplated an ideal condition—the outcrop of a mineral vein, or deposit, which might be easily seen and recognized by the prospector. There are many places where valuable mineral deposits and veins lie buried beneath the surface, covered by gravel and soil, rock slides or later formations, either volcanic or sedimentary, and where considerable exploratory work is necessary before a discovery can be made. The bedded deposits of Leadville, Colo., form an excellent example of such occurrence. In the Black Hills of South Dakota the veins in the Algonkian schists at many places pass underneath hundreds of feet of the later Cambrian sedimentaries, or are buried by porphyry sheets. In California many quartz veins are hidden under valley alluvials or beneath the later Tertiary lavas, and basalt flows cover valuable ore deposits in Arizona. Many other instances of similar conditions might be mentioned, but it is clear that a bona fide discovery by the prospector is not always easily possible. He often needs time and money to prove his belief that valuable mineral exists beneath the unpromising superficial strata. He should be permitted to locate unclaimed public land, and to show his good faith by the performance of certain acts. such as making an excavation of stated dimensions within a given time after location, and thereafter the annual performance upon the claim of not less than $100 worth of work or the expenditure of an equal amount in improvements, the same as required by the law at present. There are many things to be considered when a change in existing statutes is contemplated, but as the laws now are there certainly is room for decided improvement in several directions.

The Concentrators of the Cananea Copper Co., Cananea, Mex. (See Page 342.)

THE statistical bulletin issued in October by Julius Matton of London, Eng., shows the lead production of the world to be increasing annually. According to this statement, the total production in 1902 was 903,000 English tons; in 1903 it was 912,600, which was further increased in 1904 to 981,100 tons. The five largest producers in the world in 1904 were the following: United States, 298,820 English tons; Spain, 183,014 tons; Germany, 133,498 tons; Australia, 117,105 tons; and Mexico, 100,000 tons. Of the production of the United States in 1904 of 318,679 tons, 108.854 tons was produced in Idaho, chiefly in the Cœur d'Alene district. Colorado and Utah came next, with 51,884 tons and 56,470 tons respectively. The lead fields of the Mississippi valley and including Virginia (small output) produced 92,275 tons. The Idaho, Colorado and Utah mines also produced considerable silver and gold.

Mine Extension and Equipment.

Whenever a mine undertakes the broadening of its scope of operations, or the management announces to the public that the property is about to be equipped with a smelter, or a mill, such announcement is usually the occasion of rejoicing in the camp where the proposed improvement is to be located, and this, with absolute disregard of the needs of the property in question for such smelter or mill. The local papers published in the numerous mining districts throughout the West frequently contain announcements of this character. There have been a number of such within the past two weeks. In most instances these proposed installations are legitimate and needed to accomodate the mines building them, but in a number of instances it is positively known to those who are well informed as to the condition of some of the mines where it is proposed to make these extensive improvements, that there is not enough ore available in them at present to keep a small smelter or mill employed a week. Why, then, a large mill or smelter, when neither are required, and will not be needed for a long time, if ever? Such installations work a vast injury to the district where they are made, the only advantage being in the temporary distribution of the money paid out for labor during the period of construction, but which is short lived. Soon the actual condition must become manifest, and not only will the mill or smelter be closed for lack of ore, but the probability is that work on the mine will also be suspended. As to the effect on the legitimate investments of capital in other properties of the vicinity, it cannot be said to be conducive, but rather the reverse. It is no new thing to find a promising district held back by the premature building of reduction works on undeveloped property. Legitimate mining should be encouraged in every possible way, but there is another kind of mining conducted largely for the purpose of using other people's money to maintain a few men in good positions with liberal salary attachments.

State Mining Bureaus and Mining Schools.

In his address before the American Mining Congress at El Paso, Texas, the past week, Victor C. Alderson, of the Colorado State School of Mines, at Golden, laid great stress upon the co-operation of State mining institutions for the common good. All who are interested in the mining industry and familiar with State mining bureaus and the State mining schools will agree that such harmony and co-operation are desirable, but a mining bureau such as contemplated by Mr. Alderson would be merely a repository for valuable specimens, maps and literature, representative of and referring to the mineral resources of the State, under the direction of a competent business man, aided by several practical miners. This idea is not at all in accordance with the requirements of a Mining Bureau, such as that created by the government for the Philippine Islands, to which Mr. Alderson refers in his address. To properly carry out the intention of Congress along the lines of this Statute would require men of the highest technical ability as well as men trained in practical mining. The first mining bureau in the United States was that organized by legislative act, in 1880, in California. Previous to this the State had for years maintained a geological survey, as had also general Eastern States, but the purpose of the California State Mining Bureau contemplated much more—in fact, the same scope of operations as those outlined in the bill creating the Mining Bureau for the Philippine Islands. The California State Mining Bureau has done a vast amount of excellent work in investigating the mineral resources of that State, and its reports, bulletins and general information is in demand throughout the world. Several States, as well as foreign countries, have patterned after the California State Mining Bureau as exemplifying the highest and most useful type of public institution of this kind. That institution does not make free analysis and assays for the public of the State, for the reason that there are a large number of assayers, chemists and analysts who follow their profession for a livelihood, and with whom the gratuitous work of the mining bureau would come in direct and disastrous competition.

If the State Mining Bureau is to be required to furnish technical information on mining practice, engineering and metallurgy as suggested by Mr. Alderson, then the State institution at once comes in competition with the graduated technical engineers who have their offices in the cities of the State and who depend largely upon the patronage of the people of the State in supplying just this class of information. If the State institutions, whether as mining bureaus or as schools, are to usurp the privileges of the technical engineers, there is little incentive for the young man to take up the engineering profession.

Ore Weights and Values.

Frequently it is announced in the periodical official reports of various mining companies that a given number of tons of ore have been milled, or smelted, or subjected to other metallurgical operation, with the result of a stated amount of gold, silver, copper, or other merchantable metallic product. This stated tonnage and resultant product establish an average valuation per ton on the ore treated. Occasionally, when a change in management occurs, the new manager is unable to come up to the standard set by his predecessor, on the same class and value of ore. Usually an investigation will result in the discovery of a discrepancy in the methods of arriving at the tonnage treated. In one instance a mine manager gave strict instructions that all buckets on the aerial tramway be loaded to their utmost capacity. He figured the tonnage treated on a basis of the number of buckets delivered at their normal capacity. This, as a matter of course, gave him a greater output than the theoretical tonnage would call for. His successor gave orders that the buckets be loaded somewhat under their normal capacity, as the tram was showing signs of wear. The result was that the output per calculated ton was considerably below that previously recorded by the former manager. This resulted in his removal for incompetency, owing to his inability to keep up the record of output. Too many mines have lax methods for arriving at the tonnage treated, the most common method being the estimate of weight by the number of cars sent to the reduction works. At a few mines, where the management is more exacting, the cars of ore are actually weighed at some convenient point between mine and mill, and a correct record thus secured. The practice is one deserving of more universal attention than it receives.

The Value of Cost Sheets.

Cost keeping in mines and metallurgical works is comparatively easy of accomplishment, if a proper system be devised to apply to the several departments. It is, perhaps, somewhat more difficult to compile the necessary data for operation in mines than in mills or smelters, owing to the well-known prejudice of the miners against any system of checks on their work, but by the aid of competent foremen and shift bosses, who faithfully report on the cards provided for the purpose the time and materials consumed in a given operation, the costs may be arrived at with a surprising degree of accuracy. It is essential that stores and materials of every description be placed under a storekeeper, and that nothing be given out or sent into the mine without a requisition and signed by the proper person, which card states definitely where the thing called for is to be used. This places a reliable check on everything, from a nipple or a small valve to heavy timbers and explosives. The storekeeping system, where perfected, will be found to make it possible to account for all stores, supplies and materials consumed. It may be divided into as many departments as are deemed necessary, but to make it effective and of practical value the system must not be enveloped in too much of the official authority known as "red tape." The requisitions must be recognized by the storekeeper if signed by any of the under officers, or those in authority, from the shift boss up, and even in case of necessity by one of the miners. The card will be a sufficient check against misappropriation if placed on a separate file, to be later endorsed by the foreman or superintendent. The hours of work performed at any particular place (a raise, stope, crosscut, winze or drift) in the mine must be determined by some one in charge. When the system has been properly organized and applied, it will at a moment's notice be possible to ascertain the cost of performing any particular operation, together with the kind, quantity and value of all material consumed.

THE last annual report of the Minister of Mines for New Zealand, for the year 1904, shows that there were in operation in that island 186 dredgers, and that the business of dredging for gold had been reduced to a commercial basis, the speculative features having largely disappeared. He says, however, that there is small likelihood of the number of dredging boats being materially increased, though those already at work will continue to find profitable employment for many years to come. The experiment of tree planting on flat areas over which the dredgers have worked has proved successful. The Minister, in summarizing the accidents of the year, says that 4757 men were employed in quartz mining. There were 6 fatal accidents in this branch of the industry, a rate of 1.26 per 1000. In hydraulic and alluvial mining, including dredging, 6141 men were employed, and the fatal accidents numbered 9, of which 4 occurred on dredgers. This was at the rate of 1.46 per 1000 employed. In coal mining—a branch of the industry ordinarily considered as extra hazardous—there were 3228 men employed, with only 4 fatalities, a rate of 1.35 per thousand—a lower rate than in any of the other branches of mining in New Zealand, probably due to the extraordinary precautions taken to avert disaster.

THE collapse of a vertical shaft of the Driefontein mine at Johannesburg, S. A., on the 13th inst., by which one white man and sixty-seven native laborers were killed, will probably require considerable explanation. It is one of the deep shafts on the Rand, timbered with what in the United States would be called material of small dimensions. The cause of collapse is not mentioned in the press dispatches.

CONCENTRATES.

TO FIND the pressure of water under a given head in pounds per square inch, multiply the head by 0.433.

THE American Institute of Mining Engineers meet in their ninetieth session on February 21, 1906, at Lehigh University, South Bethlehem, Pa.

FORMERLY a flask of quicksilver was 76½ pounds, net. In 1904 this was changed, and now the quicksilver mines of the world place only 75 pounds, net, in a flask.

ANDESITES throughout the world were erupted during Tertiary times. The lavas of recent times are almost wholly basic and are chiefly basaltic in character.

GOLD mines are now being worked in Africa in the following countries: Transvaal, Natal, Rhodesia, Congo Free State, Egypt, and at several places on the West Coast.

MINERAL VEINS and deposits that are known, but not located, are reserved from townsite patents. Such may be located and patented the same as veins in the unappropriated public lands.

VENTILATING FANS are sometimes employed to withdraw the very fine pulp and dust from dry crushing machines, the coarser ore falling into a receptacle from which it is carried away by spiral conveyors.

SERPENTINE is derived from a variety of minerals, but chiefly from actinolitc, biotite, bronzite, chondrydite, diopside, enstatite, hornblende, humite, hypersthene, muscovite, olivine, pyrope, sahlite, and spinel.

THE Anaconda mine at Butte, Mont., is producing the lowest average grade of any copper mine in Butte district—about 2½% copper—but the output of that mine is larger than that of any other about Butte, being nearly 8,000,000 pounds in October last.

WHAT is known to the trade as standard cast iron water pipe 20 inches diameter weighs 185 pounds per running foot. Doubling the inside diameter of a pipe increases its carrying capacity four times, with a somewhat smaller coefficient for friction.

WHERE copper glance is present in ore to be treated by acid leaching, and subsequently by the cyanide process, this mineral would probably cause a large consumption of KCN, for the reason that the glance is not readily soluble in weak solutions of sulphuric acid.

IN order to take the extralateral right on a lode claim it is not necessary that the outcrop, or apex, shall extend the full length of the claim, crossing both end lines, or either of them. If enough of the apex can be determined to ascertain the probable strike, this will be sufficient.

MINIUM is the native red oxide of lead. It is of brilliant red color with an orange-yellow streak. It is of uncommon occurrence. It was found occasionally with other lead ores in the oxidized zone in the Leadville, Colo., mines. It is also found in several European localities.

THOSE doing assessment work at the close of 1905 for this year may continue to work during January, completing the assessment for 1906. This would carry the work along for nearly two years, or to the close of 1907. Many who have to go a long distance to their claims adopt this method.

A MAN may be able to properly perform the operation of thoroughly sampling a mine in all its mechanical details, and still have little knowledge of geology, though the latter is desirable and gives a broader knowledge, and consequently better judgment, in deciding as to the possibilities of the vein or deposit.

THE force which causes a syphon to operate is the difference in head between the surface of the water in the reservoir and the discharge end of the pipe. The greater this head the more rapid will be the discharge or flow. An inverted syphon operates simply through the tendency of water to seek its own level.

WHERE patent has been applied for, and the money paid into the United States land office, the mere pendancy of patent proceedings does not excuse the performance of annual labor prior to the issuance of a certificate of purchase. Until the receipt has been received, therefore, the annual assessment work must be performed.

THE Federal mining law does not require any assessment work on claims during the year in which they are located. Thus a claim located on any day during 1905 requires no work for this year, but next year, 1906, $100 worth of work or improvements must be made. Any work done during 1905 under these circumstances cannot be credited to 1906, simply because the law required no work during 1905. No matter how large an amount of work or improvement is made on an unpatented claim during any one year no portion of it in excess of $100 can be credited to the following year's work.

WHEN powder, supposed to be what it is represented to be, fails to perform the work that may reasonably be expected of it by an experienced miner, it may be due to the fact that the powder is either inferior in composition or that from some cause it has deteriorated. In either case it would be wise to employ powder of a different brand.

THE Great Boulder Proprietary mine of Western Australia is capitalized at £175,000 and has paid £1,500,-550. The Lake View Consuls has also paid dividends in excess of its capitalization, being capitalized at £350,000 and having paid in dividends £1,317,500. The Oroya-Brownhill of Western Australia has also paid dividends in excess of its capitalization.

WATER may be caught up on the several levels of a shaft or mine and collected in tanks cut in the rock at a safe distance from the shaft, from which it may be removed by pumps or drawn off into skips and hoisted to the surface. When dumped at the surface, care should be taken that the water pouring from the skip does not flow or seep back into the shaft, thus increasing the expense of mine drainage.

THE precussion-figure is a star-shaped six-rayed figure produced in all of the micas when a plate is struck with a blunt-pointed instrument. Chlorite mica (clinochlore) is a dark-green, translucent mica, flexible and tough, but very slightly elastic. It also produces the precussion-figure or pressure-figure when indented with a blunt point. Occurs in talcose rocks, serpentine, etc., and is also sometimes associated with biotite and phlogopite.

ONLY rarely since 1857 has tin been so high as during the present year. In 1871 the highest price was £157 and the lowest £123. In 1872 the highest price was £160 and the lowest £130. In 1887 the highest price was £167 and the lowest £100 (a very wide range), and in 1888 the highest price was £170 and the lowest £75, a difference within that year of £95 per ton. The highest price thus far in 1905 is £153 and the lowest £130. The total visible supply at present is about 15,400 tons.

THE drilling of bore holes 8 to 10 inches diameter is a good way to prospect gravels, and the method is considered fairly reliable if the holes are sufficiently close to give a reasonable average, and the necessary and proper allowances are made for loss. The same means may be employed with success in ascertaining the depth of channels which are overlaid by volcanic or other material. In Calaveras county, Cal., holes have been sunk with well-drilling machinery to the depth of 600 feet.

THE Federal Statutes relative to mines contains the following: That where two or more veins cross each other priority of title shall govern, and such prior location shall be entitled to all the ore or mineral contained within the space of intersection; provided, however, that the subsequent location shall have the right of way through the said space of intersection for the purpose of convenient working of the said mine; and provided, also, that where two or more veins unite the oldest or prior location shall take the vein below the point of union, including all the space of intersection.

IN his study of the Comstock lode, Geo. F. Becker made the following classification of the rocks of the district: Granular diorite, porphyritic diorite, micaceous diorite porphyry, quartz-porphyry, earlier and later diabase, earlier hornblende-andesite, later hornblende andesite, and basalt. The diabase and augite-andesite shade into each other. The diorite is thought to be the result of alteration of diabase, the hornblende having been derived from the original augite. All of the more important rocks of the district pass by transition to other varieties, as in the case of the diabase and augite-andesite.

THE number of tons of ore that may be trammed in an eight-hour shift on a surface tramway depends on the distance the ore must be trammed, the size of cars used, the condition of the track, and, to no small extent, upon the man. At one mine known to "Concentrates" one car man trammed each shift eighty-five to ninety cars, containing 2200 pounds, a distance of 600 feet, of which 200 feet were in a tunnel. The ore was drawn from a chute provided with a gate operated by rack and pinion. This work was done under contract at 4 cents per car. The men on the opposite shift trammed from sixty-five to seventy-five cars, working nights.

IN case of quartz occurring "frozen" in schistose formation, the question of its origin and relative age is speculative, without definite knowledge of the existing geological conditions. If the quartz occurs in the schist as a series of lenses, the probability is that its occurrence is due to plication of the schist, which has been caused by stress, and that the quartz has been infiltrated later. If the quartz occurs in a zone of uniform width, lying parallel with the lamination of the schist—in fact, a quartzite—it would be reasonable to suppose that it was originally laid down as a bed of sand, and was therefore of an age contemporaneous with the schist. If the quartz occurs as a zone of indefinite and frequently changing width, passing over by gradual transition to the schist, it is presumable that the silica has been infiltrated since the schist was uplifted and its original rocks metamorphosed to the present crystalline condition. As the schist in question at Marysville, B. C., is stated to carry gold, silver and copper, it would be good mining and good business to follow the ore so long as it proved profitable, or, if unprofitable at the start, to prospect it by shaft or tunnel in search of better ore.

IT is often good practice to build a solid concrete wall around the collar of a shaft started in soft wet rock or soil where the bedrock is several feet below the surface. To do this properly, a pit should be sunk at least a foot larger on all sides than the proposed wall, which must rest on bedrock, and the interior dimensions should be sufficiently large to admit of placing the regular timber sets within the wall. The concrete should be permitted to set thoroughly before filling in the space between the outside of the wall and the bank of earth. If sand or tailings are available, this is good material to run into this open space, as it packs tightly and may be readily removed later, if necessary. If the ground is very soft and wet it may be necessary to drive a line of sheet piling entirely around the proposed shaft, before beginning the work of excavation. The first sets of timbers placed in the shaft may be hung by permanent iron bolts of good size to stringers resting on the concrete walls, which it would be well to provide with buttresses for additional strength and solidity at those points where the girders may rest. These sets will line up with those placed lower in the shaft, and which are wedged in the usual manner against the rock walls of the shaft. This arrangement gives solidity to the collar of the shaft and obviates a flow of surface water into the shaft through the soft material at the surface.

THE structural character of ore is usually influenced by the wall rocks in which it occurs, though this structural condition can in no case be considered an index of values, except possibly in individual mines, where close observation may make it possible to tell by its appearance payable ore from that which is too poor to pay. Quartz occurring between walls, both of slate, is likely to be banded—what is known by miners as ribbon rock. That having a massive rock on one wall and slate on the other is likely to be banded on the slate side, passing over to a massive structure on the side next to the massive rock. Quartz occurring wholly within a massive rock, like granite or diabase, usually is more or less crystallized and not infrequently exhibits a "comb structure." When the vein enters schistose rocks it may be stratified, something like the ribbon rock, or it may be brecciated, consisting of angular fragments of the rock walls much silicified and otherwise altered and carrying iron and other sulphides. Veins occurring in granite usually present characteristics peculiar to themselves and often somewhat different from those found in other veins. Mineralized zones often have very indefinite walls, the so-called wall being sometimes found to be merely an interior plane of movement within the mineralized zone. The chemical composition of veins often bears no apparent relation to the wall rocks. Thus a system of veins at one place occurring in rocks containing abundant lime-soda feldspars have no calcite, but do develop a large amount of heavy spar (sulphate of barium).

THE Cassel-Hinman process is a process covered by numerous patents for the use of bromine in connection with cyanide of potassium in the extraction of gold and silver from its ores. The method comprises crushing the ore, roasting when necessary, leaching in vats with a nascent bromine solvent, recovering the bromine and recovering the gold. Eissler states that "a clean siliceous ore, or a well-roasted sulphide, requires for a good extraction of gold per ton of ore about seven pounds of bromine. The bromine is prepared for shipment by adding bromine to a nearly saturated solution of a hydrate or carbonate of an alkali, or alkali earth metal. The solution is evaporated nearly to dryness and the resulting powder forms the salt employed. Per ton of ore treated, a quantity of this salt, containing 7 pounds of bromine and 3½ pounds of NaOH, is dissolved in about 100 gallons of water. This constitutes the leaching solution. After having charged the pulverized ore, if it is not sufficiently acid, a dilute solution of acid is leached into it, which is then followed by the leaching solution proper. If the acid is added at the beginning of the leaching, the solution after the leaching, which ought to be of such duration as to give from four to six hours' contact with the ore, will leave all the bromates decomposed, and if the acid be not added at the beginning of the leaching the bromates may not be entirely broken up, in which case sufficient acid must now be added to effect this. The bromine is now all free in the solution, with the exception of that which has combined as bromide with the bases of the ore, including gold." Chlorine is added to set free this bromine, and the solution, now being warmed to 150° F., has passed through it a current of air, which carries the bromine as vapor into a condensing tower, where it comes in contact with a subdivided stream of a solution of an alkali, and here the initial reaction of the production of bromide and hypobromite takes place, which constitutes the leaching solution for the next cycle of operations, the dry powder being only used at the beginning. This solution has the power of dissolving the gold without the addition of an acid.

The American Mining Congress.

On Tuesday, the 14th instant, the American Mining Congress assembled in its eighth annual session at El Paso, Tex. A number of valuable papers were read during the session of the convention, several of the most important of which have been reported for the MINING AND SCIENTIFIC PRESS by its special correspondent, but owing to the large volume of the several speeches and papers delivered at the meeting it has been found inexpedient to give more than an abstract of the most of those thus far received.

The paper by R. S. Morrison, author of "Morrison's Mining Rights," on needed amendments to the mining laws, was timely and interesting. This paper is published in full:

AMENDMENTS ADVISABLE TO THE FEDERAL MINING LAW.—Before 1866 Congress passed no law providing for the pre-emption of mining claims on the public domain or their sale or disposition. Everything was left to the mining districts or the local legislatures.

In 1866, by the act of that year, provision was made for the patenting of lode claims; in 1870, for the patenting of placers.

In 1872 both acts were combined and enlarged, and but slight amendments have been made since. The principal features of the mining act, as is doubtless familiar to all the members of this convention, are the annual labor required on every claim and the apex right of the lode claim. Its other sections are mostly details regulating the procession of title through the stages of discovery, location, advertisement and entry until the final issue of patent.

As to the matter of annual labor and the more debatable item of apex rights: Both have become so thoroughly understood, and have been crystallized into shape by so many decisions, that little or no change seems advisable—at least the subject would breed at once contention, and extreme positions would be taken.

A revision of the whole series of acts might be advisable, but would involve so many items of detail, the subject of work in the committee room of Congress, that mention of them in this address will not be made.

But the practical and immediate need which, in my judgment, would produce the desired object of uniformity of mining titles in the regions of the Rocky mountains is the repeal of the first clause of Section 5 of the act of 1872, Revised Statutes, Section 2324, which allows each State and Territory to regulate the details of location, or to the mining district the same right, where the State or Territory fails to pass any act on the subject. There are only three of the details or conditions of location enumerated in the act of Congress itself, which are:

1. There must be an actual discovery of mineral on which to base the location.

2. The location must be distinctly marked on the ground so that its boundaries can be readily traced, and

3. The record of the location must contain the names of the locators, the date of location and such a description, by reference to natural objects on permanent monuments, as will identify the claim.

These enumerations are preceded by the clause giving to the State, Territory or district the right to regulate all other details, and, as a matter of course, the result is that in every State and Territory the statutes on this subject disagree, and a title which would be good in one State would be void in another, for the want of compliance with some technical and perhaps useless detail of location provided for in the local statute.

In Montana and Nevada, for instance, it is required that the location certificate or record describe each corner, with the markings thereon. This requirement is perfectly useless, and yet it has been held mandatory, and titles prior in time and associated with every feature of good faith and integrity have been held void by the courts for want of conformity to such provision.

In Arizona, the two Dakotas and Washington it must be stated in the location certificate whether or not it is a relocation of abandoned property, which is an unnecessary hardship; for often the prospector cannot tell whether the old pits he finds on the ground are mere prospect holes, which were never staked, or form the work of a claim which has been recorded but abandoned.

The State of Washington requires the boundaries of the whole claim to be blazed, which seems a unique and wholly unnecessary condition to impose.

It is not right to impose unnecessary and trifling conditions the neglect of which, however inadvertent, may lead to litigation and perhaps to the loss of a valuable claim.

Some of the incidents of location are declared mandatory, others directory; and the result is that the essential details of location in no two States are alike, and what is a perfect location, in some of them, is difficult to determine even by a competent lawyer with all the facts before him.

This result is directly chargeable to the first clause of Section 2324, above referred to. That clause was a concession to mining districts and district rules, which in most of the States have been absolutely obliterated and passed to the condition of innocuous desuetude.

As a concession to the legislatures of the several States and Territories it is not much less productive of evil, for no two of them agree in all particulars and uniformity becomes impossible. The law should be such that a lawyer in Montana could pass on a mining title in Nevada, or vice versa, knowing that the conditions or facts which make a perfect claim were the same in all the States.

A single amendment to Section 2324, detailing the necessary incidents of a location, and not making them needlessly rigid, and repealing the grant of sub-legislation to the districts and the local legislatures, would remedy this most glaring defect in the present mining law.

A further section should limit the right of tunnels to 750 feet on each side of the bore of the tunnel, or at least compel them to elect definitely at the starting of the tunnel how many feet they will claim on each side of the bore.

Section 2338, which gives to the local legislatures the right to regulate easements, which includes drainage and rights of way, should, in my judgment, be repealed, and in its stead should be a section defining in terms the extent of such easements.

The "Known Lode Clause," in the placer section, 2333, should also be amended. A placer location of 160 acres, a half a mile square, can be staked on a hillside known to be seamed with rich veins, and under a recent decision of the National Supreme Court, in the Eli-Clipper case, all prospecting is prohibited within that area. This defeats the practical benefit of the reservation of the lodes existing within placer bounds. On the other hand, the patent to the placer, containing the loose exception of "all lodes known to exist," diminishes the value of the patent; for there is nothing of record or in the abstract to tell whether or not a known lode exists, or is claimed to exist.

The entire placer area should be open to the lode prospector until actual entry in the land office. Up to that time the discovery of a lode within a placer should be legalized, but if such lode location be made it should be compelled to adverse and assert its existence, or otherwise allow the placer applicant to take his patent uncloaded by a vague reservation which impairs its value to the holder with no compensatory good to any other party.

These are the amendments which I consider both important and advisable. Any radical change, such as adopting a block system, or making all claims square, with a large acreage and taking away the apex rights, I do not consider wise at this day, though it might have been a better plan if originally adopted. The act of May 10, 1872, has now been thoroughly analyzed and explained by hundreds of authoritative decisions, and an old statute so explained and understood is always better than a new statute on a new theory which is sure to suggest as many points of doubt and contention as the one it supplants.

It is not every charge that means improvement or reform. In 1840 the New York Code of Practice was adopted with the promise by its authors that it would do away with all the technicalities of the common law practice and reducing pleadings to rules of common sense and simplicity.

It has been since adopted, with more or less change, in most States of the Union.

And during the sixty-five years of its growth it has been found that its technicalities are more and greater than ever Chitty or Blackstone dreamed of. The simplicity of code pleading vanishes with the simplicity of the case. It is a loose and lazy practice appealing to the lawyer who loves ease and hates study. It has therefore come to stay because it coddles to the natural disposition to take what seems the easiest, not the best, way of doing things.

The promise of reform would, in my judgment, be no better kept in case of the passage of an entirely new mining act based on theories entirely different from those of the act of 1872.

The tendency of modern thought in the United States is toward nationalism and uniformity. In banking, divorce, insurance, railroad and commercial law the effort is everywhere toward uniformity and to an act of Congress where Congress has power to cover the subject. That Congress has this power in the matter of mining is not disputed. It arises from its being the original proprietor as a feudal lord of all the Louisiana purchase and the cessions from Mexico.

When the district rules were first adopted around the camp fire it was the only government practicable. There were then no railroads to bind the country together. The reason for their existence has passed and I see no legitimate or convincing argument whatever to prohibit Congress regulating the subject of mining titles in all their details until patent issues, when, of course, the State assumes the sovereignty of the subject matter.

The first persons to be protected are the prospectors. There is an army of them scattered everywhere — above timber line and in the desert — out of access to lawyers. They are men of intelligence and originality above the average of any one special class or trade, because from the nature of their occupation they are compelled to be thinkers as well as toilers.

They are best protected by knowing just what is essential to perfect their discoveries into marketable titles. This knowledge fixed in advance is better for them than the sentimental right of making their own laws, for if there be defects in the original title it keeps back the buyer, prevents development, and the real value of the mine is perhaps exploited by strangers who have not bought, but fought, his property from the man who under plain and fixed laws would have been protected in its enjoyment.

An interesting subject was introduced by F. E. Wire on the ways and means of attracting Eastern capital to Western mining enterprises. His paper was in part as follows:

ATTITUDE OF EASTERN CAPITAL TOWARD WESTERN ENTERPRISES DURING DEVELOPMENT STAGE, AND HOW TO ATTRACT IT.—The subject under consideration seems to be one of vital importance to all of us. Any practical knowledge and studied observation that will bring Eastern capital and the Western enterprise together in their development stage, help them to better understand each other, and appreciate each other more, is well worth our while.

To you pioneers in the mining industry, you who have blazed the trail and blazed the way, opening up and making possible a greater and richer Western civilization and development, by being interested in mining, during the cradle days of our Western mining region; and to you Eastern capitalists and investors who joined hands with your Western brothers, I offer a word of cheer and appreciation. It will be generations before the pioneer and the prospector's work is fully appreciated.

Truly you were the advance agents of civilization. You did much to cherish and foster the spirit of Western progress and development, imbuing in young men the desire to go West, and when they could not go they sent their money for you to use for your joint good. Western opportunity offers to Eastern capital the means by which they both may grow strong and useful to all mankind. By "Eastern capital," I mean all the sources from which Eastern money is raised to aid in developing Western enterprises, such as mines, railroads, irrigation propositions, and the like.

For convenience I will divide the people who contribute to these Western propositions into three general classes—first, the capitalist; second, the well-to-do investor, and third, the small investor. I have had experience with all three of these classes of investors, have studied them, and read much on the subject. My experience has been uniformly successful. My desire is that my experience and observation may help to pave the way for a better understanding between the prospectors, miners and promoters on the one hand, and the investor and general public on the other.

The capitalist is the hardest man to interest in a new mining or other proposition. He is liable to be critical regarding conditions generally. He is trained in investments, and is likely to be acquainted with speculation. He is usually a busy man, whose time is taken up fully by his regular business affairs and financial interests. Occasionally he has been a promoter himself, in one way or another, and understands the plans, policy and means usually used in promotion. This type of investor is experienced and clever, and can size up a prospect or any new proposition. Such a person will usually see possibilities of a proposition at a glance, as well as understand the undesirable features. He has many opportunities, but it is impossible for a moneyed man to have the time to consider the merits of all of the new propositions of the West. As a rule, rich men do not care to spread out their investments. They believe in concentration. Ordinarily, they associate themselves with their kind. To the capitalist is left the necessity of promoting and financiering the bigger schemes, such as railroads, big mines, smelters, ship building, irrigation, and the vast number of large undertakings.

The well-to-do investor is usually a progressive business man, a politician or salaried man, who has more funds than he needs in his business or vocation, consequently has surplus for miscellaneous investment. Generally he is clever and alert to opportunities and is ready to consider new Western propositions when handled by some friend or known reliable party. As a rule, there is very little of the plunger, and not much of the speculator, in this type. He is not as critical as his richer brother, is more easily approached, and likely to be more reasonable. He cannot afford to be as independent as a richer man. I believe the well-to-do investor furnishes the most money for the great bulk of ordinary mining propositions that are not in close, or semi-close, corporation. This class of men forms the brains and sinew of our best public mining and kindred Western propositions in the development stage.

The small investor, while in a class of his own, is worthy of our attention. He is likely to be a person whose opportunities along the investment line are limited. In consideration of his financial limitations, he must invest small amounts in any one thing. On account of the smallness of his investments, this type of investor is frequently not as careful as he should be. He is quite inclined to follow some prominent man's lead and invest because "Mr. So and So did." The real small investor does not as a common thing hold a large enough interest to make him the support to a proposition that a larger stockholder would be. Thus it frequently happens that a company composed of the smallest stockholders has some trouble in having as large a representation at the stockholders' meetings as they should have. The characteristic small stockholder is likely to buy without mature deliberation, and he often is the first one to grow impatient. The more conservative element of this class of small investors is a source of support and strength to any Western corporation. But the thoughtless, unstable variety is an element of weakness in any proposition. The right sort of a small investor is very desirable, and, sandwiched in with the other classes, conduces to the good of the proposition.

Now as to the attitude of Eastern capital toward Western enterprises during the development stages, I will admit at the outset, it is not what it should be. But this attitude is very positively and noticeably changing for the better. The campaign of education which mining journals are carrying on is working wonders in changing the attitude of money toward these Western enterprises. Their work, so well begun, but far from finished, strikes at the root of the evil.

Under the dawn of the new order of things, the public generally are looking upon mining prospects, undeveloped mines, and all Western enterprises in a far more favorable light.

The public is beginning to realize that promoters, next to the actual pioneers of these undeveloped propositions, are entitled to great credit. Clean, legitimate promoters are a very necessary factor or medium between the Western opportunity and Eastern capital.

The attitude of Eastern capital toward Western undeveloped propositions is not as yet what we wish. There is no disguising the fact that the East is suffering with too much fake promotion and wildcatting, notwithstanding the fakirs are much scarcer than heretofore.

While there are many and unmistakable signs of a more favorable attitude, we must take conditions as we find them, and not as we would like them, as to deceive ourselves in this matter is simply to weaken our efforts and strengthen the enemy.

It is gratifying to see public sentiment look favorably toward a mining district that is proven, and toward a promoter, officers, or a company that is acting on the level. There is a tendency toward letting every new proposition rest on its merits. The spirit of investigation is spreading among people with money. Investing in mining is no longer looked upon as a gamble, but as a legitimate business proposition. People do not invest "on the sly" as they used to, as it is no longer looked upon as a questionable act.

The proposition seeking the aid of capital should be

truly meritorious; it should be founded on principles and conditions that will win. If a prospect, it ought to be one where the chances of making a pay mine are excellent. There ought to be a minimum of outstanding stock, when going to the public, seeking its aid and co-operation. The proposition should be capitalized on a conservative basis. There should be no evidence of "graft," "waste" or "extravagance" on the part of those in charge of any corporation's affairs, up to the time they seek the investor's money. To ignore these common-sense fundamental essentials is to court disaster and failure.

It is useless to go before the intelligent investing public, and try to befog and mystify, on the pre-organization facts and conditions. Any equivocation on the part of officers or managers, on these vital points, are justly construed against them.

The several varieties of investors are perfectly willing that the prospector and promoter shall receive a fair and even liberal consideration of stock or moneys for their actual services rendered and property turned in, based on a conservative valuation. The public I have always found to be exceedingly reasonable along this line. The public has a right to know the whole truth on these matters. The old line promoter who used to get up to half of the capitalization of a mining, exploration, or other company, for a few indefinite and simple services and a few hundred dollars, has no place or chance now. There is very little hope for a proposition that is not shaped up on a fairly reasonable basis.

For clean, progressive promoters who are determined to start right and keep right, on any proposition they attempt to finance, and who will stay by the affair until it is in shape, there is a big field of opportunity, with reasonable assurances of success. After the right sort of a prospect has been chosen, care should be taken with the organization of the company so that when the public knows the truth about its history, it will not nauseate it.

Officers should be selected who are clean and able, and are so situated that they can and will give the company's affairs their careful attention. Too many officers give only the odds and ends of their time to their duties. A proposition looking for public subscription for their stock ought to have not less than seven directors, and nine is better.

The investor reasons that too small a board does not look well, and that cheap politics and trickery are more liable to be played. Having gotten our proposition ready to take subscriptions from the public, under ordinary conditions, I should proceed about as follows, to interest capital:

In the first place, a thorough report on the property should be obtained from some mining engineer of standing and reputation. This should be supplemented by conclusive evidence as to the title of the property. Never forget that it always pays to thoroughly satisfy the public as to the title of your property, whatever that title is, as well as to demonstrate its value and advantageous location.

Next, you should have some first class references, men whose word and opinion carry weight. Don't try to get along without references, and do not try to give "bluff references." There was a time when this sort of thing "worked" to some extent, but it does not now.

After having taken care of the matter of property, incorporation, organization, title and references, you are ready for your stationery and literature. It always pays to get a good quality of stationery. The prospectus and other printed matter should be cleverly gotten up and neatly printed on good quality paper. Be careful how you write your prospectus and the attitude you take wherever you appear in print. Always be plain spoken. Say what you mean, and always mean what you say. Avoid any and all forms of exaggeration. Don't cater too much to imagination. Advertise all you wish. Put your best foot forward. Publish mining statistics. Publish all the facts that will do you good. Publish letters and statements from reliable sources, regarding your proposition. Discuss mining and the opportunities of the West generally, once in a while. Don't urge people to buy stock. Don't promise dividends; if you do, nine times out of ten your cake is dough right then. Reason with people how it is necessary to sell stock cheap to get the development funds to explore and develop the property. Show them how this is nearly always done. Show how money is high and scarce in a new Western country. Have the right kind of officers and a strong directorate; that is the best talking capital you could have. You can use this fairly and honorably, to convince the investor of a square deal.

When you can convince capital that everything is on the level your victory is half won. A large per cent of investors will at once invest if satisfied on this point. Shun guaranteed dividend schemes of all kinds. Even guaranteed stock plans do more harm than good. Any company that pays dividends while selling its own treasury stock is committing business suicide, as on its face it is an inconsistency.

I have great faith in and have always found successful the policy of excursions to the front, where your property is located. This acquaints prospective stockholders with all the actual conditions, and they each act as a sort of missionary when they return.

I have always found arguments by photographs very convincing and satisfactory. One mistake a large number of new companies make is to get their stock too high at the start. This necessitates much more advertising, more agents, and higher commissions.

I favor putting the stock out at a rather low price at first, limiting the amount of stock to any one person.

This policy secures a goodly number of stockholders early, who will be of advantage later on, when the stock is higher. My observation and experience teaches me that it is hard to interest capitalists in a Western enterprise, in the development stage, unless you get them in while the stock is low. A good way is to take a few parties out with ample money, and if the proposition shows up all right you have a good chance to secure funds enough for all immediate needs.

I fully believe that any truly meritorious Western enterprise in the development stage can, if handled with discretion and ability, secure all the funds needed for development purposes from the capital of the East, where money is cheap and plenty.

The address of Arthur J. Haskin, United States Deputy Mineral Surveyor, and professor of mining at the Colorado School of Mines, was on "A Proposed Remedy for the Difficulties Arising From Inaccurate Records of Patent Survey." After reciting the difficulties in obtaining patents to mining claims in Colorado and elsewhere, which were valid without a lawsuit, owing to defective land surveys, the suggestion was made by the speaker that a remedy might be found in the appointment of a commission to be known as the United States Mineral Survey.

It would be well to act harmoniously with the Geological Survey, which belongs in the Interior Department. Besides surveying accurately in the field, tying in every existing patent monument, it should be the duty of the Mineral Survey to determine accurately the original position of each missing mining corner, and to require the re-establishment of all such corners by the owners. These engineers should also carefully plat such monuments of the public survey (the section and township subdivision corners) as are included in mining districts, and their work should be done with such thoroughness as to be invulnerable, and as such to be accepted as final authority by everybody. Their maps and records may be then referred to and relied upon, in place of the unreliable mass of documents now on file. My proposal contemplates the correction of all errors introduced into patents that have issued prior to the completion of maps of the respective localities, and to this end each claimant is to be furnished gratis (or at a slight nominal expense) an amended document of patent correctly describing the premises in each instance, and retaining all priority or other rights due to the original dates. In this way no claimant's rights will be endangered, he will be put to little or no expense, and he will be given a guarantee of unquestionable ownership and peaceable possession of the exact ground he sought to obtain. Undeniably, such a plan would require a large appropriation, but there is no way of estimating the benefits that would accrue to the nation's mining industry. The field or scope of the Mineral Survey may be enlarged easily to include the construction of maps giving a graphical description of the extent of mining operations. These would be a valuable adjunct to the compilation of statistics of production and labor involved in the mining business of our nation.

The Brooks law and the Mineral Survey would work admirably in conjunction. But neither alone can cope with the situation to a successful issue. The law, supplemented by the proposed Mineral Survey, will have the desired effect of settling all existing difficulties, and will further prevent troubles hereafter. All mineral claim boundaries will be authoritatively defined, and every claimant will be obliged to abide by such metes and bounds. Maps and records will thus be acquired that will be accurate. A not insignificant benefit following such a course will be the prevention of much fraudulent practice.

Another interesting paper was that by Victor C. Alderson, president of the Colorado School of Mines, on co-operation between State Mining Bureaus and State Schools of Mines. His address follows in part:

DEMAND FOR INDUSTRIAL EFFICIENCY.—The most pressing demand of the present age is for industrial efficiency. Between nations, the constant struggle in the industrial warfare is to train workmen who shall become influential factors in the industrial world. The great problem before the consulting engineer, before the designer of labor-saving devices, before the contractor, before the business man, before the mining engineer, and the metallurgist, is the securing of increased efficiency. In the mining industry the same conditions prevail. In each mining State there are two great influences of an institutional character whose hearty co-operation is necessary for the advancement of mining interests within the State—the State Bureau of Mines and the State School of Mines.

FUNCTION OF THE STATE BUREAU OF MINES.—The work of a State Bureau of Mines is well described in the law of Congress establishing a Mining Bureau for the Philippine Islands, as follows: "To make, facilitate, and encourage special studies of the mineral resources, mineral industries and geology of the Philippine Islands; to collect statistics concerning the occurrence of the economically important minerals and the methods pursued in making their valuable constituents available for commercial use; to make collections of typical geological and mineralogical specimens, especially those of economic and commercial importance, such collections to constitute the museum of the Mining Bureau; to provide a library of books, reports, drawings, etc., bearing upon the mineral industries, the science of mineralogy and geology, and the arts of mining and metallurgy, such library constituting the library of the Mining Bureau; to make a collection of models, drawings, and description of mechanical appliances used in mining and metallurgical processes; to preserve and maintain such collections and library as to make them available for reference and examination, and open to public inspection at reasonable hours; to maintain, in effect, a bureau of information concerning the mineral industries of the Philippine Islands; to make an annual report to the Secretary of the Interior, setting forth the important results of the work of the Bureau, such special reports as may be called for by proper authority, and such bulletins concerning the statistics and technology of the mining industries and of the geological and mineralogical and other office and field work of the Bureau as may be approved by the Chief of the Bureau and ordered published by the Secretary of the Interior."

FUNCTION OF THE STATE SCHOOL OF MINES.—The primary work of a School of Mines is to train young men for active and successful work in the mining profession. To do this it must have a competent faculty composed of experts; have large working collections and well-equipped laboratories. The students should make frequent visits to mines, mills and smelters to become familiar with the applications, on a commercial scale, of the principles taught in the lecture room. This work, however broad, thorough and valuable it may be for the embryotic mining engineer, does not advance the interests of the mining profession except as it graduates well-trained men, who may, later in life, do creditable work. The primary function of the school, therefore, is to develop as far as it can the future mining engineer.

EXAMPLES OF CO-OPERATION IN COLORADO.—It seldom happens that a School of Mines takes up seriously or continuously the work belonging to the Bureau of Mines, and it is also true that the Bureau of Mines seldom touches upon the educational aspects of the mining industry. In some isolated cases this is true, but the exception only proves the rule. In Colorado the State Commissioner of Mines, E. L. White, has shown unusual interest in the educational aspect of mining, and his efforts have been of great service to the Colorado School of Mines. The School of Mines has, on its part, rendered to the State Bureau of Mines every assistance that it could. Such co-operation, however, should not depend upon the personal relations existing between the Commissioner of Mines and the president of the School of Mines, but should be the result of legal enactment, so that the business and educational sides of the mining industry may work in thorough harmony. Recently a large number of coal analyses were needed in order to arrive at an estimate of the value of certain coal lands belonging to the State. These were referred to the State School of Mines, where the work was easily done, because the school had both the men and the facilities for so doing.

Not long ago attention was called to the fact that certain lands in the southern part of the State of Colorado contained extensive soda deposits. The question of the value of the deposits was referred to the School of Mines. One of its experts was sent to investigate, and, on the basis of his report, a lease of the land was made which proved very favorable to the State. Whenever a new mining camp is exploited by the daily newspapers it is fitting that the Bureau of Mines should immediately make a preliminary report for the guidance of prospectors and investors. Such investigations can easily be made by the School of Mines in conjunction with the Bureau of Mines, the former supplying the expert geologist, mineralogist, surveyor or mining engineer, while the latter supplies the practical mining men. The Bureau is also frequently called upon for information along the strictly technical lines of mining and should be in a position to inform the community upon such important subjects as proper ventilation and mine drainage, the best safety devices, the results of scientific tests on hoisting engines, air compressors, rock drills, and many other subjects dealing with the engineering lines of mining. It should also be in possession of the latest and best information concerning ore dressing, roasting of ores, cyaniding, and the general subject of the treatment of low-grade refractory ores. No Bureau of Mines in this country has either the force of experts or the scientific facilities for making original experiments in these lines. A State School of Mines fully equipped with laboratory facilities, with expert mining engineers, metallurgists, chemists and geologists on its staff can take up such subjects as the Bureau desires to have investigated, and treat them in a scientific manner.

BENEFICIAL RESULTS.—The future of the mining and metallurgical industry will depend upon the careful observance of a few well defined principles; prevention of waste in time of operation, in labor employed, and in capital invested; correct business principles; the application of the latest and best technical skill and knowledge; and an appreciation of the value of scientific research. The idea of the conservation of values should ever be uppermost in the mind of the mining engineer. We are now and for many years shall be living on the waste of the past. Values that could not then be recovered can now, thanks to increased scientific knowledge, be easily recovered.

Magnetic Separation.

The North Queensland Register says an ingenious method is employed at the Loudon mill, Irvinebank, to separate the iron from tin concentrates. The ore from the Vulcan mine contains magnetic iron, and the trouble always was to eliminate so undesirable a substance. The specific gravity of the tin and iron, however, so nearly approximates that separation was exceedingly difficult, and was never satisfactorily accomplished. James Tunnie, assayer at the Irvinebank Tin Mining Co., owners of the mill, proposed using electricity to overcome the difficulty. With Mr. Moffatt the scheme, which has acted so well, was evolved. Water containing the tin and iron was charged with electricity, which increased the magnetic influence of the iron, and this created cohesion between the iron particles. The ore was then run over vanners, and the united iron particles, irregularly joined, offered much greater resistance to the water, and were more affected by the vanning motion than the close lying tin. As a result separation was easy, the iron particles fairly dancing off the table along with the lighter stuff. The device gives much more effective treatment, and the reduction in the cost is also considerable.

WHEN you want to meter a load on a 220-volt circuit, and have nothing but a 110-volt meter in stock, says H. E. Ryder in Electricity, run the line through the field of the meter in the usual manner, and the other side of the line goes to the lamp. Then for the shunt tap bring a wire from the center line, or the 110-volt side, and you are all right by using a constant of (2).

Plant of the Cananea Con. Copper Co., Cananea, Sonora, Mexico.*

Written for the MINING AND SCIENTIFIC PRESS by O. P. FINDLEY.†

The Cananea Con. Copper Co., the property of the Greene Con. Copper Co., affords an example of successful accomplishment ranking among the largest producers of copper in the world, its present output averaging about 6,000,000 pounds per month. The ore is of complex character and has required patience and skill to work out a proper scheme for its economic treatment. By intelligent application of advanced practice the plant has been brought up to a high state of efficiency.

W. C. Greene, president of the company, has a staff of advisers who are experts, practically and technically, in their respective departments, and to his acumen and good judgment is primarily due the credit for the achievement of such results. A. S. Dwight, assistant to the president and general manager; J. H. Kirk, manager mining division; R. L. Lloyd, superintendent of the reduction division; D. Cole, superintendent of concentrators; V. R. Walling, superintendent of railways, and N. B. Roper, superintendent of construction, are thorough students of the science of mining as related to their respective departments, and ever ready to avail themselves of any new ideas or discoveries which promise to yield greater results, with less expenditure of energy and money.

The management has virtually solved the fundamental problems which confronted it; the question with which it has to deal at present is that of reducing waste to a point where it will be an infinitesimal quantity. The results which have been accomplished along this line are commendable, and the means by which they have been attained should prove interesting.

WATER SUPPLY.—The supply of water for the entire camp comes from the company's pumping station at Ojo de Agua, situated 9 miles from the smelter. The receiving tanks are located above the smelter and 1000 feet above the source, which is a well sunk to the bedrock, with a subterranean gallery which taps a living stream of water capable of furnishing 3,000,000 gallons per day. The water is practically free from organic matter and carries only a small percentage of scale-forming solids, thus making it desirable for boiler feeding. Two centrifugal pumps driven from the flywheel of the main pumping engine are used to lift the water. The main plant consists of two pumping engines, one being a cross-compound differential duplex engine, the other a duplex-compound steam pump. The feed water is ordinarily delivered to the boilers at a temperature of 180° F.

The total length of the pipe line is approximately 9 miles, the pipe being 10 inches in diameter. The water is delivered to a steel tank of 600,000 gallons capacity, located above the power house, and also a brick reservoir of 250,000 gallons capacity, which supplies the power house and the smelter. The concentrator and the mines are supplied from the tank mentioned. The pipe line is tapped 1½ mile from the tank to supply water for domestic use in the municipality of Cananea and the lower part of Ronquillo.

The main pipe line is composed of three sections of varying weight, the first section being of standard wrought iron, weighing 40 pounds per foot. The pipe in the middle section weighs 35 pounds per foot, and that of the upper section, where the pressure never exceeds 200 pounds per square inch, is 10-inch casing, weighing 22½ pounds per foot. The line was tested at the factory to a pressure of 1000, 750 and 600 pounds respectively per square inch. The pipe is buried throughout its entire length with the exception of three points where ravines are crossed. Owing to the warm temperature of this climate in the winter, no trouble has been experienced as a result of freezing.

POWER PLANT.—Power for operating the reduction works is generated at one central plant, consisting of the boiler house 45x216 feet in size, and the engine house 65x245 feet, each built of steel and corrugated iron. The boiler plant consists of five duplex boilers, rated at 300 H. P. each; four water tube boilers of 250 H. P. each, and two horizontal water tube boilers of 250 H. P. each.

The equipment for generating the air blast for the smelting furnaces consists of one 225 H. P. compound duplex blowing engine, steam cylinders 13 inches and 24 inches, air cylinders 57 inches with 42-inch stroke, and a capacity of 20,000 cubic feet of free air per minute; one 380 H. P. tandem-compound engine, steam cylinders 16 inches and 28 inches with 36-inch stroke. This engine is connected with a No. 10 blower, with a capacity of 30,000 cubic feet of free air per minute; one tandem-compound engine, steam cylinders 10 inches and 18 inches with a stroke of 24 inches, and 121 estimated H. P. This engine is direct connected to a No. 8 blower, and under a pressure of 2½ pounds per square inch will provide 12,500 cubic feet of free air per minute; one tandem-compound engine with cylinders 16 inches and 30-inch by 36-inch stroke, directly connected to a No. 10 blower of the Anaconda type. This set furnishes 30,000 cubic feet of free air per minute and will operate under a pressure of 2½ pounds per square inch.

Before the present power house was completed a part of the machinery was operated in an auxiliary building, from which most of the machinery has now been transferred; however, there still remains in this building the following equipment, which is operated in conjunction with the main plant, viz.:

One 14-inch by 36-inch engine belted to two blowers, and one 18-inch by 18-inch balance valve engine connected direct to a blower. These two engines will furnish a maximum of 40,000 cubic feet free air per minute. They are used only for regulating the blast, or, in cases of emergency, to relieve the engines in the main power house.

With the entire equipment of the plant there can be provided 132,000 cubic feet of free air per minute, with a blast pressure of 2½ pounds per square inch. The air blast for the converter plant is provided by three cross-compound duplex Corliss blowing engines, two having steam cylinders 20 inches by 36 inches, air cylinders 44 inches by 44 inches, with a common stroke of 42 inches, the third engine having steam cylinders 22 inches by 40 inches, air cylinders 46 inches by 46 inches, common stroke 48 inches, and will deliver 10,750 cubic feet of free air per minute at a pressure of 15 pounds, developing 650 H. P.

There are two blast pipes leading to the smelting furnaces, one being 44 inches in diameter and the other 42 inches, made of riveted steel. There is also a third blast pipe, which conveys the air to the converters. This pipe is of $\frac{3}{16}$-inch riveted steel, 30 inches in diameter. Both the smelter and converter blast pipes are equipped with relief valves. The blast furnace blowing engines are equipped with recording gauges, which give a continuous record of the air pressure furnished to the furnaces. The converter blast engines are similarly equipped. All engines in the main power house are operated condensing and are connected with independent surface condensers located in the basement.

At the west end of the power house is a cooling tower 12 feet by 24 feet and 49 feet high. The frame work is steel, covered with wood. The warm water from the circulating pumps is distributed uniformly at the top of this tower through perforated pipes,

†Condensed.

of 100 K.W. each and the fourth 200 K.W. From a main switch board 6 feet by 14 feet, the current generated by these dynamos is distributed to the various circuits at a voltage of 250.

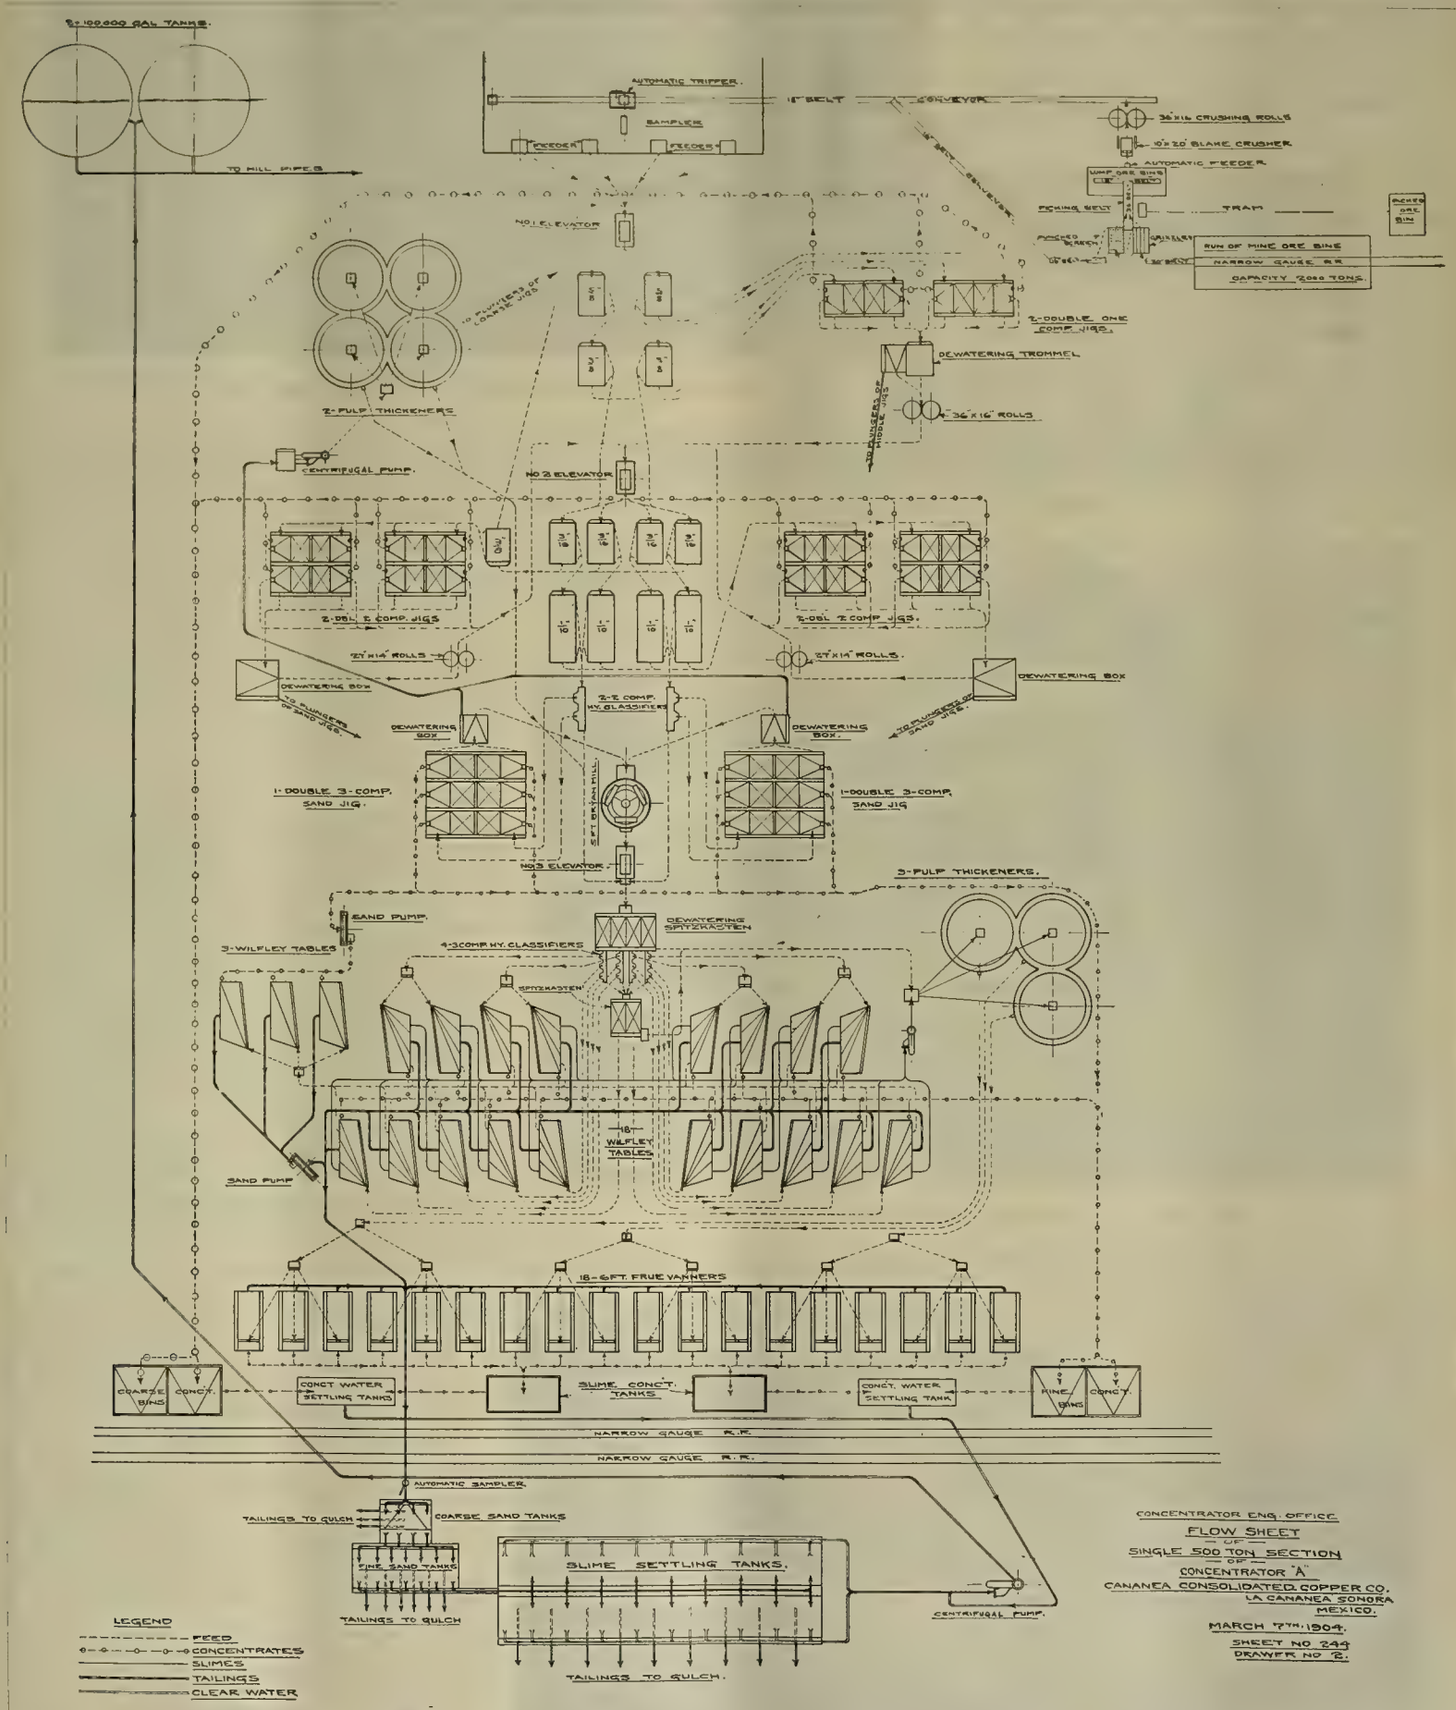
Each conductor leading from the three smaller dynamos has a 600 ampere circuit breaker; the 200 K.W. dynamo has a 1200 ampere circuit breaker. The 100 and 200 K.W. generators are also equipped, respectively, with 700 and 1200 ampere ammeters. Two 250-volt voltmeters are available for use upon any of the various circuits. Three ammeters of 200 amperes each are ready for use in connection with any additional circuits.

In addition to the present electrical plant the company is arranging to install two alternating current generators of 300 K.W. capacity, which will deliver three-phase alternating current at 2300 volts, to furnish power for the mines and more distant works tributary to Cananea which are too far from the power house to be reached by the present equipment of direct current machinery.

The coal used in the power plant is delivered to the boilers direct from standard-gauge cars, which are emptied through chutes on to the floor of the boiler room and immediately in front of each boiler. The ashes are loaded into tram cars, which convey them to receiving bins, thence transferred to narrow-gauge cars and transported to points on the line of the company's railway, where they are utilized for ballast and the filling in of bridges and trestles.

(TO BE CONTINUED.)

A TANK 60 feet long, 5 feet deep and 20 feet wide will hold approximately when full 45,000 gallons.



Notable Events in Connection with Gold and Silver.

Following are some of the more notable events, with the dates of their occurrence, as related to gold and silver:

Egyptian gold mines worked 2000 years B. C.; Mines of Ophir worked by Solomon 950 B. C.; Conquest of Peru, and opening of its silver mines, 1535 A. D.; discovery of silver mines at Guanajuato and elsewhere in Mexico, 1548 A. D.; discovery of gold in Brazil, 1577; discovery of placers of Minas-Geraes, Brazil, 1680; silver mines opened in Russia, 1704; discovery of gold in the Urals of eastern Russia, 1743; discovery of gold in California, 1848; Plattner's chlorination process introduced at Reichenstein, in Sile-

sia, 1848; discovery of placers in Australia, at Ballarat, 1851; hydraulic mining introduced in California, 1853; chlorination process introduced at Grass Valley, Cal., by Deetkin, 1858; gold discovered in Colorado, 1859; discovery of the Comstock Lode, Nevada, 1859; gold discovered in the Black Hills of South Dakota, 1875; lead-silver ores discovered at Leadville, Colo., 1877; discovery of the gold mines of the Rand, S. Milling in Gilpin County, Colo.

Written for the MINING AND SCIENTIFIC PRESS.

There are a number of rules pertaining to mining and milling still in vogue in Gilpin county which were adopted during the early days of mining in that section. Gilpin is the smallest county in the State, and has the distinction of being the first county in Colorado in which gold was discovered. In the early days of mining in that commonwealth, before scales came into general use, the ore was measured and sold by the cord. A cord consists of 128 cubic feet—the same measurement as a cord of wood—and contains from seven to twelve tons, varying according to the character of the ore. This rule applies to a majority of the mines in the district. With but few exceptions, neither mines nor mills are equipped with scales. Many of the mills do custom work, i. e., they treat the ore from the different mines of the surrounding camps. The mills of the district have all agreed upon a scale of prices to be charged for handling the ore. The prices were recently increased, owing to the fact that the mill men work but eight hours instead of twelve hours, as heretofore. The flat minimum rate for treating the ore is $10 per cord. A customer sometimes secures the use of a section of a mill, or 5 stamps, and is charged $8 50 for 24 hours. The mill work consists of automatically putting the ore through the battery, running the pulp over copper plates and then over the bumping tables. This has been the system, with but few changes in the type or kind of machinery, for many years. The customer receives from the mill the gold taken from the plates and the concentrates from the tables. The concentrates are shipped to the smelters at Denver or Pueblo, Colo. Sometimes the concentrates are disposed of to the samplers. The amount saved on the plates varies from 10% to 30% of the values. In many of the plants a large percentage of the amalgamation is done inside of the batteries. Most of the stamps weigh 550 pounds and drop from 28 to 30 times per minute. A blanket sluice is also used in some of the mills before the material passes to the tables.

Central City, Colo., from the Dump of the Ontario-Colorado Mine.

Surface Plant of the Ontario-Colorado Mining Co., Central City, Colo.

45-Stamp Mill of the Gregory-Buell Mining Co , Gilpin County, Colo.

In the Gregory–Buell mill, illustrated herewith, they do custom work as well as treat ore from their own mine. The stamps—45 in all—are of the heavy rapid-drop type. After the ore passes under the stamps in this mill, and over the plates, it goes to bumping tables and other concentrating devices.

The Boston mill, which is operated by the Gregory-Boston M. Co., contains eighty 1000-pound stamps, which drop 95 times per minute, using 24 mesh screen, and crushing, per stamp, an average of 3½ to 4 tons in 24 hours. After leaving the stamps the ore passes over 4½x16 foot copper plates in front of each 5-stamp battery and through spitzkasten on to Woodbury tables. When this mill was erected there was considerable comment from different sources as to whether it would be a success on the ores of Gilpin county. It was a revolution in the milling practice in that section.

In the custom mills the ore is seldom assayed before going into the mill, and the tailings are allowed to pass into the creek without knowledge of how much is being lost, no sampling being done. The mill man is not interested in how much is being saved or lost, as he is being paid a stipulated sum for handling a certain amount of ore.

The average value of the ore that is being put through the mills does not exceed $4 per ton, and the average value of the concentrates does not exceed $13 per ton.

The milling ore is a mixture of feldspar and quartz, carrying sulphide of iron (pyrite) and at times a small percentage of copper sulphide, chiefly chalcopyrite.

On account of the scarcity of water for milling purposes in the district it is inexpedient to erect mills at the mines for handling the low-grade material to advantage. When this material is hauled either by team or rail several miles to the mills, and the treatment charges taxed against the ore, the profits cannot be very great. There is some agitation at present for the formation of a company for the purpose of getting water from the higher range of mountains and piping it to the mines for milling and power. The scheme is claimed by responsible engineers to be perfectly feasible.

The smelters have made a low treatment charge on certain grades of ore from this district, and instead of the ore being treated at the mills, as heretofore, it goes direct to the smelters, which in itself has a tendency to cripple the progress of the milling industry in that county.

The Avon mill at Nevadaville, above Central City, has been closed for some time past on account of shortage of water. This mill was securing water from one of the neighboring mines, but the shaft buildings at the mine were destroyed by fire and they were compelled to suspend operations at the mine as well as the mill. It is understood arrangements are about completed for starting the mill.

A mill operator was doing some experimental work

in another district in the State, using different machines for handling his ore, and received a letter from a fellow mill man in Gilpin county to the effect: "You may make a trial of this new-fangled concentrating machinery and use it if you desire, but I fear that it may drive you in sorrow to the grave." That is a sample of what one has to contend with in the mining and milling of ores in that section of Colorado.

On Gregory hill, between Central City and Black Hawk, the Ontario–Colorado G. M. Co. is doing development work as well as shipping several tons of crude ore and concentrates each month. The main shaft is down 878 feet, and is equipped with 12x14 double-cylinder geared hoisting engine; 80 H. P. boiler, compressor and Rand drills. About 7000 feet of drifts and 800 feet of winze, raises and other shaft work has been done on the property. The vein on this property is an extension of the old Gregory vein, where gold was first discovered. The different levels are being connected with winzes to the ore bodies, and shipment is being made of the ore taken out during development work. The bulk of the ore in this property is susceptible of concentration and amalgamation. The surface plant of this property is illustrated in one of the accompanying engravings. Air hoists are used in the winzes.

Another engraving shows a portion of Central City as seen from the dump of the Ontario–Colorado Co In the background can be seen James peak and other high mountains. It is from these mountains that it is proposed to bring the water supply, as mentioned above.

It would seem, after visiting a number of the plants and conversing with many of the operators in the district, that the milling industry has not kept pace with some of the other mining camps throughout the State.

The Yukon-Tanana Region, Alaska.

L. M. Prindle, of the United States Geological Survey, has recently returned from the Alaskan field. During the last summer he has been making a geologic reconnaissance between the International Boundary and Fairbanks. This was Mr. Prindle's third season in the Yukon–Tanana region, and he has therefore had exceptional opportunity to note the rapid development of the country. He reports that the output from the mines has increased tenfold each year. The gold production of Fairbanks amounted to approximately $40,000 two years ago, and to more than $400,000 last year. It is estimated that it will be worth between $5,000,000 and $6,000,000 this year. The productiveness and prosperity of this region are attested by these remarkable figures.

Fairbanks is now a thriving town of about 2500 inhabitants. Alfred H. Brooks, chief of the Survey's Alaskan Division, passed over its site in 1898, and knew it then as naught but a howling wilderness, unvisited by white men. The nearest Indian village was 75 miles away. The region now is humming with industry. The town of Fairbanks is lighted by electricity and heated by steam. It supports three banks, one daily paper, one weekly paper, and a public school system. Business in all lines is good. Although every valuable claim was said to be staked a year ago, the books in the recorder's office show that his receipts are nearly double what they were last year.

Among the most important improvements of the district is the railroad which has been built since the season of 1904. It connects Fairbanks and Chena and has been extended along Gold Stream to the junction of Gilmore and Pedro creeks. The railroad has already proved of great advantage to the miners, and in connection with the government wagon road to be built from the termination of the railroad over the divide to Cleary creek will greatly facilitate the handling of freight.

This year's production makes the Fairbanks district the peer of the Nome region in output, if not its leader. The diggings at Fairbanks are mostly deep, extending to 80 or even 100 feet, so that shafts have been sunk. The gravels are frozen, and mining is usually done by steam point process. Work is carried on the year round. The character of the deposits makes mining more expensive here than in the Nome district, so that the profits from an equal production is not so great.

The gold from the Fairbanks district has come from Cleary, Pedro and Fairbanks creeks, and the greatest of these, in point of production, is Cleary creek. Since the summer of 1904 Cleary City, a town of nearly 300 people, has made its appearance. It is situated on Cleary creek, a tributary of Chatanika river, itself a tributary of the Tanana. This creek is remarkable in that pay has been found along almost its entire course. Gold has been mined from its headwaters to a point 4 miles below the place at which gold was first discovered, that is, to a point at which the creek widens into the valley of the Chatanika river. At Cleary City an electrical plant is now in process of construction which will furnish light for the town and power for the operation of mining machinery.

Dome creek and Ester creek, to the southwest of Cleary creek, are promising streams. Considerable work has been done on Dome creek, and pay has been located at a few points. Ester creek is already a producer.

To the east of the Fairbanks region, on the tributaries of the Salchaket, prospecting is active.

The main excitement at present is, however, in the area west of the Fairbanks district, on the headwaters of the Kantishna river, a tributary of the Tanana from the south. Some gold has been found there in shallow diggings, and between 700 and 1000 people are now on the ground.

Battery Stem Guide.

Herewith is illustrated the Pacific battery stem guide, made minus bolts, nuts, set screws, wedges or keys. It will be observed that the device consists of a guide frame with sockets to receive removable shells, which the manufacturers say are its only wearing parts. The accompanying diagram shows the dimensions of these frames, with bolt sizes and centers for standard 5-stamp batteries. The guide is made by the Angels Iron Works, Angels, Cal.

Battery Stem Guide.

THE Journal of the Worcester Polytechnic Institute states that in unloading iron ore at the Lake Erie docks, the shovelers are paid by the ton, and the following records have been made: The prices paid are 13 cents per ton on straight work, and a maximum of 18 cents per ton cleaning up, after 80% of the cargo has been removed by automatic machines. Men working at the 18 cent rate have made as high as $12 per day of 10 hours, which means 6.67 tons of ore were shoveled in one hour. Working at the 13 cent rate, with eight men in the hold shoveling into 1-ton buckets, each man can handle from 5 to 6 tons of ore per hour and sometimes a rate of 8 tons per hour has been reached, the daily wages running up to $6.50 to $7.80.

A TON of the highest grade of anthracite should measure 32 cubic feet—that is to say, it should fill a bin 4 feet long by 4 feet wide and 2 feet high, says Fuel. The poorer coals will run as high as 40 cubic feet. The coal weighs lighter, and consequently more of it is needed to make up the ton, hence an increase in the cubic measurement. A coal that contained a considerable proportion of stone would measure less than 32 feet, but the best grade will every time fill that space.

Dredging for Gold in the Nome Goldfields.

Written for the MINING AND SCIENTIFIC PRESS by OTTO HALLA.

Six years ago the world was astonished by reports of wonderful discoveries of gold in the beach sands on the Bering sea, and it is now six years since the town of Nome sprung into existence.

A continuous and steadily increasing harvest of gold is being sent from this northern town to the mints in the United States; the commerce with the States has assumed large proportions, the little town of Nome keeping ten ocean vessels engaged in supplying her with foodstuffs, building materials, machinery, railroad iron, etc., and when one understands that the gold deposits of the Nome goldfields have hardly been commenced to be developed, one may imagine the vast possibilities of this most western portion of United States territory.

It has taken only these short six years to devise methods of working the vast deposits of auriferous gravels systematically and profitably, either by the hydraulic method, or, where the ground is favorably situated, by dredging and steam shovels.

The first successful attempt in this direction was made by W. L. Leland, manager of the Three Friends Mining Co., on Solomon river. At an expense of $140,000 this company erected a 54-bucket dredger, with a capacity of handling 4000 cubic yards of gravel in twety-four hours. It is operated by two 110 H. P. steam boilers and a crew of only five men.

The operations last season were satisfactory. The ground which is not frozen averages $1 to the cubic yard; the depth of gravel is about 15 feet, but the steel buckets cut into the soft mica schist bedrock about 8 feet.

This dredger was shipped to Solomon in sections

during the last summer, was set up and in running operation for about fifteen days.

Solomon river is very favorable for big operations of this kind, the ground being unfrozen, the gold distributed evenly in the gravel and the gravel deposits sufficiently extensive to justify a large investment.

Another enterprise which has been started on Solomon river this season, and has proven a success, was the steam shovel operated by Vinal & Webb on the Halla bar. A 1-yard railroad shovel was used to first cut a drain 1500 feet long, 25 feet wide and about 12 feet deep, to the mica schist bedrock to open up the property. The gravels were taken up by the shovel, dumped into 2-yard cars and these pulled on rails to the flume, 1000 feet distant, where a ditch with a capacity of about 800 inches supplied the water to wash the gravels. The ground on this property averages about $1.50 to the cubic yard; the cost of operating is about 18 cents per cubic yard. The average capacity last season was about 500 yards in ten hours; but by some needed improvements in the handling of the cars faster the capacity can be doubled.

It was possible to get only a few days of actual mining operations on this plant the last summer season, the time having been consumed in installing the machinery and cutting the drain—the freeze-up coming this year about three weeks earlier than usual.

The Seward Peninsula Mining Co., Wilkins manager, has built a 60-bucket dredger—the Philadelphia—above Dexter creek, on Nome river. It did not have any chance at mining operations, the winter season closing in before its completion.

Mr. Johnston is building a big bucket dredger on Snake river, and by next season there will be in operation several of the latest improved dredgers, which will materially increase the output of gold in the Nome goldfields.

The successful operation of these dredgers and steam shovels has proven that the possibilities of this section of Alaska, as far as producing gold is concerned, can at present hardly be estimated.

The new discoveries on the tundra, where eight men take out during one season a half million dollars, as on Little creek, or, again, the strike on Jess creek during the last summer season, where $100 to the pan is common, makes an observer wonder what will be the result when Snake and Nome rivers are worked by dredgers.

The entire valley of Snake river, as well as Nome river, is favorable to dredging operations, the ground being unfrozen and the distribution of gold sufficient to pay large profits, even if the operations are confined to the three summer months.

It is safe to say that a few years hence Nome will be one of the largest gold-producing sections of the United States.

THE PROSPECTOR.

While "The Prospector" learned long since not to judge the value of ore wholly from its physical appearance—particularly gold ore—the sample marked Atwater No. 1 has a most promising appearance, and should be assayed for gold and silver, particularly the former.

The rock samples from the north side of Bear river, Nevada county, Cal., are: No. 1, a much altered dike rock. No. 2, gabbro. No. 3 is a felsitic dike rock. No. 4 is syenite. No. 5 is serpentine. No. 6 is halloysite, a product of the alteration of feldspar (orthoclase).

The rock samples from Lida P. O., said to have come from Death Valley, Cal., are principally magnetite—no oxide of tin. One of them is coated with copper carbonate, and is from the outcrop of what may prove to be a copper mine.

The rock specimen from Thunder Mountain, Idaho, is a typical rhyolite, showing the fluidal structure, the drusy cavities, etc. The quartz blebs are characteristic; some of them appear to be fragmental. The rock presents somewhat the appearance of a breccia, there being several small fragmentary looking places on the rock. A larger mass of the rock would, perhaps, show this feature more prominently.

The rocks from Mayer, Arizona, are: No. 1, a fine grained mica schist; No. 2, a metamorphic rock in which there is considerable carbonate of lime, a little quartz and considerable chlorite, which may have been derived from hornblende. It is not a typical rock and therefore can only be classed as metamorphic.

The minerals from near Ocala, Churchill county, Nev., are: No. 1, gypsum (calcium sulphate); No. 2, a variety of obsidian (volcanic glass); No. 3, red and yellow jasper with impure limonite (brown iron oxide). This rock may contain gold. It is similar to the jaspers often found in the gossan of copper deposits. No. 4 is mostly calcite (carbonate of lime), with yellow iron oxide and iron sulphide. Should be assayed for gold. The silt-like yellow mineral is similar to same at Goldfield, Nev., which is rich in gold. Similar mineral in Arizona, Colorado and South Dakota is often rich in gold.

Notes on the Assay of Gold Bullion.*

By T. KIRKE ROSE.

The following is a brief account of the principal changes in the assay of gold bullion which have been introduced at the Royal Mint, London, during the last three years.

The assays are still made in batches of seventy-two, and the object of most of the improvements is to promote uniformity of treatment, so that the "surcharge" on the cornets may be identical. Six proof or check assay pieces are distributed through the charge.

The cupels are ranged on a plumbago tray, which is lifted in and out of the muffle by means of an iron "peel" or fork with two flat prongs, each 11½ inches long, 1¼ inch wide and $\frac{3}{16}$ inch thick. The tray itself is 11½ inches long and 6 inches wide, and has a raised edge to keep the cupels in place, and two grooves below for the prongs of the peel to slide in. The plumbago tray can be used about twenty or thirty times. Iron and fireclay trays were tried, but not found to be serviceable. The use of the cupel tray makes block cupels of little advantage, as single cupels, when cold, are rapidly ranged on the tray by hand. Cupel tongs have been entirely discarded.

The seventy-two assay pieces are charged in simultaneously by means of a nickel charging tray with a sliding bottom. This charging tray was devised and introduced by Arthur Westwood, in 1893, at the Birmingham Assay Office, and has been adopted at other offices.

The draught of air through the muffle has been made independent of the draught through the fuel chamber of the furnace, so that the temperature and the air supply can be regulated separately. The muffle has been increased in length to allow of the assay pieces being placed farther away from its mouth, the distance from the front of the furnace to the first row of assays being now 7 inches. The fuel space behind the back of the muffle is filled with fireclay to prevent overheating at that point. Air is admitted only near the top of the mouth of the muffle and the front row of assay pieces is protected from the direct draught by a firebrick, 2 inches high, so as to promote the regularity of the air supply throughout the charge. With the same object, deep cupels are used, the hollow being 0.75 inch in diameter and 0.3 inch in depth. The charges, with 4 gms. of lead in each assay piece, are worked off in ten or fifteen minutes. If the draught is increased and the time shortened, the results are not so uniform.

PARTING ALLOY.—It has been the practice in the Mint for many years to add 1.375 gm. of silver to 0.5 gm. of gold in making up the "inquarted" alloy for parting. This ratio of 2.75 to 1 is convenient in some respects, but the alloy is attacked with great violence when parted with nitric acid, and small fragments of gold are often detached from the cornets, and either carried away and lost, or else become firmly attached to other assay pieces. A ratio of 2 parts of silver to 1 part of gold has, therefore, been adopted recently, after a long series of experiments, with the result that the risk of injury to the cornets has been greatly reduced and the general accuracy of the work increased.

This is a reversion to a very ancient practice. In the year 1627 Savot stated that the French assayers used the ratio of 2 to 1, but that in earlier times the ratio of 3 to 1 had been preferred. In 1830, however, the ratio of 3 to 1 was always used in France, according to D'Arcet and Gay Lussac, and the ratio of 2.75 to 1 has probably been in use in the London Mint for more than half a century.

The acids and time of boiling are the same as before. Curiously enough, the surcharge is slightly lower than when the smaller proportion of silver is used, the loss of gold being greater and the amount of silver retained in the cornet being less.

ASSAY WEIGHTS.—Attention has been drawn to the difficulty of obtaining accurate assay weights by A. Whitby. This difficulty was recognized in the Mint some years ago. Efforts were made to obtain assay weights free from errors of more than 0.025 per 1000, but without success, and since then weights have been adjusted by the assay office staff whenever necessary. If too light, the weight is increased by gilding in a cyanide bath. If too heavy, it is reduced by mechanical means. As the adjustment of small weights was found to be tedious, the use in the balance pan of all weights of less than 5 mgms. has been discontinued, and carefully adjusted riders of 5 mgms. and 1 mgm. are substituted for them, horizontal notched balance beams suitable for use with riders replacing the older form of beam. It is hardly necessary to point out that the effect of errors in riders is proportionally reduced as the rider is moved nearer to the central knife edge.

The weights are tested on an Oertling balance said to turn with 0.005 mgm. This has been slightly altered and improved in the Mint, and results are obtained, by the method of swings as shown below, correct to 0.001 mgm. A magnifying lens is used for each pointer. The pointers, which are prolongations of the beam, have been greatly reduced in thickness and made black, so as to be easily seen. In order to avoid the complication of plus and minus readings, the ivory scales read downwards from 0 to 80 at the right hand end, and from 80 to 0 at the left hand, the position of rest when the pans are empty being at No. 40 on the scale in each case. To avoid parallax, the eye is applied to holes in fixed cards placed opposite the ivory scales and about 12 inches from them. A series of readings are taken alternately on the right and left hand scales. The scale divisions are easily divided into ten parts by the eye, so that the indications are read correct to about 0.0005 mgm.

The method of comparing two weights—say 1000A and 1000B, where 1000 = 0.5 gm.—is to place 1000A in the left pan and 1000B in the right pan. The beam is then released and, after two or three swings, four successive readings are taken at the right hand end. The beam is then arrested and again released, and after two or three swings four successive readings are taken at the left hand end. This is enough in ordinary cases, but for the most exact work the double operation is repeated three times. The weights are then interchanged and the weighings repeated. Lastly a small weight, usually 0.1 mgm., is added to one side by means of a rider, and the weighings are again repeated so as to determine the value of one division on the scale. This need be done only two or three times a day if the balance is working well. Care must be taken to avoid unequal heating of the balance case.

A record actually taken is given below, l_1, l_2, l_3, l_4, being the numbers at the limits of successive swings. Then L, the position of rest, is equal to $\frac{l_1 + 3l_2 + 3l_3 + l_4}{8}$. If only three swings are observed, then $L = \frac{l_1 + 2l_2 + l_3}{2}$, but the latter value of L is not quite so exact as the former.

WEIGHINGS MADE ON NOVEMBER 14, 1901.

Left Pan.	Right Pan.	READINGS OF INDEX DIVISIONS. l_1.	l_2.	l_3.	l_4.	L.	Means.
1000A	1000B	38.1	39.2	38.2	39.2	38.69	38.65
1000A	1000B	30.2	46.6	31.0	45.9	38.61	
1000B	1000A	39.0	33.9	38.9	34.0	36.43	36.26
1000B	1000A	39.6	33.0	39.0	33.1	36.09	
1000B + 0.1 mgm.	1000A	13.0	38.0	14.3	36.8	25.84	25.65
1000B + 0.1 mgm.	1000A	12.0	38.4	13.0	37 5	25.46	

Then 0.1 mgm. = 36.26 — 26.65, or 10.61 divisions, so that 1 division is equal to 0.00942 mgm. And 1000A is equal to $1000B - \frac{38.65 - 36.26}{2}$, that is, 1000B — 0.011957 mgm. These weights are supposed to be each equal to 0.5 gm., and, taking 1000A as correct, then 1000B = 1000.0225 half mgms., only four places of decimals being retained. On repeating such observations as these, it is found that the maximum differences in the results are about 0.002 per 1000, or 0.001 mgm., so that the fourth place of decimals is of little value.

The divergences or errors in the results are, no doubt, due in part to imperfections in the balance, the knife edges being subject to slight displacement on arresting, and again on releasing, the beam, but the errors are mainly caused by vibrations of the building. The balance is placed on an ordinary table on the first floor, and the traffic in the neighboring streets and the Mint machinery cause vibrations in the swings, although these are imperceptible on an ordinary assay balance read in the usual way. By placing the weight balance on a shelf secured to the wall of a cellar 12 feet below the surface of the ground, more concordant results are obtained, but the cellar was soon given up, as the observations made in the pleasanter situation were sufficiently accurate for the purpose. In a building subject to great vibrations it would be necessary to place the balance on a wooden or stone pillar built up from the foundations and not touching the building.

It will be observed that although two weights are compared, their absolute masses are not obtained. The rider of 1 mgm. must be in agreement with the 1000A, which has been taken as correct. No allowance is made for the displacement of the air, as any such correction does not affect the results when the weights are all made of platinum. If a brass rider of 5 mgm. is used, the results are affected only in the fourth place of decimals (0.0001 mgm.) by the difference of specific gravity.

The method of building up a set of weights from 1 mgm. to 1000 mgms. is too well known to need description. The most satisfactory course for an assayer to pursue when the series of comparisons have been made is to assume that his "1000" weight is correct, and to calculate the errors of the other weights on that assumption. For ordinary work the practice at the Mint is to adjust or reject any weight having an error of more than 0.025 per 1000. Errors less than this are usually disregarded,

*Abstract Jour. Chem., Met. and Min. Soc., S. A.

but for the most exact work allowance is made for the known errors.

It is convenient to have two weights, each of 1 gm. or of 0.5 gm., the exact difference of which from standard has been observed by the standards department of the Board of Trade or the Bureau Internationale des Poids et des Mesures, or some similar institution. The absolute error of any assay weight can be obtained at any time from these two "standard" weights, and as long as they preserve their relative difference it may be assumed that they are uninjured.

Results.—Although each of the precautions described above, when taken by itself, is not of great importance, their aggregate effect on the accuracy of the assays is considerable. The number of standardized gold pots rejected and set aside for remelting at the Mint, on account of incorrect composition, has fallen from 8.55% in the year 1901–1902 to 2.06% in the year 1904–1905, and the value of the gold used for standardizing the rejected pots has fallen from £139 per £1,000,000 to £7 per £1,000,000 during the same period. These results appear to be due to the increase in accuracy of the assaying.

There is no very material difference between the British Mint methods above described and those in vogue in the United States, except that some of the later practice of the British Mint is similar to that which for years has been employed in the United States mints. There are some small differences in apparatus employed. For instance, in the English mints the rider is used in weighing minute quantities, and in the United States mints weights only are employed. Where the ratio of silver to gold is 3 to 1 in the United States mints, 28° nitric acid is employed; where it is 2 of silver to 1 of gold, 32° acid is used. The methods are practically similar in both countries, and represent the best practice.—Ed.

Transvaal Government Commission on Safety in Shafts.

A commission has been appointed by the Lieutenant-Governor of the Transvaal to consider the question of the safety of persons traveling in shafts, and the following gentlemen have been appointed to serve on the commission:

U. P. Swinburne, Acting Government Mining Engineer (Transvaal), chairman; J. A. Vaughan, Chief Inspector of Machinery (Transvaal); J. S. Fisher, Inspector of Mines, Johannesburg; F. Drake and E. Hopper, consulting engineers, representing Transvaal Chamber of Mines; R. M. Catlin, consulting engineer, Consolidated Gold Fields of South Africa, Ltd.; H. C. Behr, consulting mechanical engineer, Consolidated Gold Fields of South Africa, Ltd.; S. C. Thomson, consulting engineer, Messrs. Neumann & Co.; J. F. Cook, consulting mechanical engineer, Messrs. Neumann & Co.; G. C. Fox, consulting mechanical engineer, Messrs. A. Goerz & Co.; K. Schweder, assistant consulting mechanical engineer, Messrs. A. Goerz & Co.; E. Farrar, consulting mechanical engineer, General Mining & Finance Corporation; J. H. Johns, consulting engineer, Johannesburg Consolidated Investment Co.; D. Gilmour, consulting mechanical engineer, Johannesburg Consolidated Investment Co.; C. J. Price, general manager central administration, Rand Mines, Ltd.; A. M. Robeson, consulting mechanical engineer, Messrs. H. Eckstein & Co.; F. Hellmann, consulting engineer, East Rand Proprietary Mines, Ltd.; W. L. Honnold, consulting engineer, Consolidated Mines Selection Co., Ltd.; W. Bradford, manager, Langlaagte Deep, Ltd.; H. R. Skinner, manager, Durban Roodepoort G. M. Co., Ltd.; J. W. H. Stubbs, general manager, Randfontein Estates; E. J. Way, general manager, Kleinfontein group of mines; J. A. Hebbard, manager, Langlaagte Estate and G. M. Co., Ltd.; Secretary, J. R. Mackinlay, Mines Department, Johannesburg.

I. Sectional committees have been formed to consider more particularly the subdivisions:

1. Winding ropes—structure and material.
2. Winding ropes—preservation and examination.
3. Winding ropes—the best method of testing the same.
4. The best method of attaching the rope to the load. The reliability and adaptability of safety catches and appliances in shafts.

II. The Commission invites the attendance of all persons who are willing to give evidence who are acquainted with the matters of reference set forth in the schedule above, and which are more particularly described hereunder.

It is requested that any intending witness will communicate with the secretary of the Commission (address, P. O. box 1132, Johannesburg, or room 74, Winchester House, Johannesburg) as to his willingness to appear and give evidence; his address, whither notifications may be sent; and a short statement as to the evidence he is willing to give, specifying those points he considers of particular importance.

The Commission also invites statements from persons conversant with mining matters, who are unable to attend personally to tender evidence. Such statements may refer to any one or all of the sections of the enquiry, and should be forwarded to the secretary, supported by affidavit, and type-written if possible.

III. With special reference to the respective sections that they concern and under which they are classified, the following points are brought to the notice of persons intending to give evidence or furnish statements:

1. Winding Ropes (Structure).—(a) For what conditions of winding are the following the most suitable? 1. Ordinary lay. 2. Lang's lay. 3. Other special lays.

(b) What are the advantages or disadvantages of lays of various angles? 1. In the rope. 2. In the strand.

(c) What special advantage or disadvantages pertain to lock-coil ropes, flattened strand ropes, cables, flat ropes, many stranded ropes?

(d) For what conditions of winding are the following strand constructions the most suitable?

6 round 1—wires all the same size.

7 round 5 round 1
8 round 3 round 1
8 round 5 round 1
8 round 6 round 1
8 round 7 round 1
} Wires differing in size, outside circle composed of larger wires, and often of a little higher grade material.

9 round 6 round 1
10 round 5 round 1
11 round 6 round 1
12 round 6 round 1
} All wires practically the same size, tending to have outside wires slightly larger, say .003 in difference.

8 round a flat wire core of same grade as outside wires.

9 round 3 twisted in opposite direction to outside wire.

9 round 12 round a triangular core, etc.

(e) re Core of Strand.—What are the advantages or disadvantages of hemp, hard wire, soft wire, flattened wire, triangular wire, core of other special shape or material? What proportion of the strength of the strand can be assigned to it?

(f) The advantages or disadvantages of a strand composed of large wires outer?

(g) Should the various lengths of wire in a rope be connected, and if so, the most approved method of joining, such as brazing, etc.?

(h) The best method of construction of a tapering rope, with special reference to the difficulties in its manufacture.

(i) The most suitable material for the main core of a winding rope and its most suitable form. What proportion of the strength of a rope can be assigned to it?

(j) Other particulars of interest with reference to this subject?

Winding Rope (Material).—(a) For what conditions of winding are the various grades of steel ordinarily used in the construction of ropes specially suitable?

(b) To what extent is ductility sacrificed in the gain of tensile strength?

(c) What are the tensile strengths and ductility of the steels (untempered) of which wire ropes are drawn? 1. How do these increase or decrease during the drawing process? 2. What are limits of tensile strength and ductility of wires of the various standard sizes?

(d) What special alloys (e. g., nickel steel) have been experimented on for the manufacture of wire ropes, and with what results?

(e) How does any special treatment (e. g., galvanizing) affect the strength and ductility of the wires of a rope?

(f) Any other particulars of interest with reference to this subject?

2. Winding Rope (Preservation).—(a) To what extent this may be influenced by preservative treatment during manufacture.

(b) The composition of various preservative and lubricating dressings for ropes working in: 1. Dry shafts. 2. Wet shafts — acid, alkaline or neutral waters.

(c) The efficiency of various dressings in respect of corrosion and wear.

(d) The frequency of application of dressing under the various conditions.

(e) The method of application of dressing.

(f) To what extent the dressing obscures the condition of the rope in the customary frequent examinations.

(g) The efficiency of any metallic covering, such as galvanizing.

(h) To what extent the life of a rope is affected by working conditions such as: 1. Description of winding plant. 2. Variation in direction of shaft. 3. Use of rests in loading. 4. Speed of winding. 5. Description of guide pulleys, etc.

(i) To what extent the life of a rope is increased by periodical recapping.

(j) Any other particulars of interest with reference to this subject.

Winding Rope (Examination).—(a) Nature of examination.

(b) Frequency of examination.

(c) Appliances for assisting examination.

(d) The portion or portions of a rope that should be most carefully examined.

(e) The necessity or otherwise of relieving the rope from strain during the examination.

(f) The best method of examining a rope internally.

(g) The best method of assessing deterioration.

(h) Any other particulars of interest with reference to this subject.

3. Winding Rope (Best Method of Testing).—(a) How can the true strength of a new rope be best ascertained?

(b) How far does the true strength of a rope differ from the nominal strength (breaking load) as quoted by the manufacturer?

(c) The various methods adopted by manufacturers to assess the ultimate strength of a new rope.

(d) What considerations affect the choice of a factor or safety?

(e) In the tension test of a sample of the whole rope, what length of test piece would be considered sufficient to give a true indication of the strength of the rope?

(f) How should the specimen be gripped during the test?

(g) What other tests beside tension tests are of value in determining the quality of a new rope?

(h) Regarding the utility of a periodical test, during the working life of a rope, of its elongation under known loads. (Should the loading be in excess of normal conditions, and if so, to what extent?)

(i) In what manner, and how frequently, should such elongation tests be made?

(j) What indications in respect of deterioration of strength could such test furnish?

(k) What length of rope is it advisable should be cut off at the time of recapping, and what tests—mechanical, chemical, etc.—should be applied to such portion?

(l) During the working life of the rope what tests can be applied — mechanical, chemical, electrical, microscopic, etc.—to show the deterioration in quality of the material of which it is composed?

(m) Is the reduction in cross-section, as ascertained from circumferential measurements at various parts of a loaded rope, a reliable indication of its loss of strength?

(n) Is the visible wear on the external wires a useful indication, in itself, of the loss of strength in a rope?

(o) Can the internal wear be assessed separately from that visible externally?

(p) Any other particulars of interest with reference to this subject.

4. The Best Method of Attaching the Rope to the Load.—(a) Regarding the various methods of securing a rope to a thimble, or in a socket—their efficiencies, advantages or disadvantages—the various constructions of rope also being taken into consideration.

(b) Regarding the various methods of connecting up a load to the eye of the thimble, or socket. Should swivels be used?

(c) Regarding the advantages or disadvantages of spring connections, or other special connections designed to minimize shocks.

(d) Regarding the advantages or disadvantages of supplementary safety chains.

(e) Regarding the frequency with which connecting appliances should be annealed, and the methods adopted for this purpose. Have variations in temperature (climatic) any deleterious effect?

(f) Regarding the practice of connecting up a man-cage, as necessary, below a skip or other cage.

(g) Regarding the material of which connecting appliances should be constructed, and the proper factor of safety to be adopted.

(h) Any other particulars of interest with reference to this subject.

The Reliability and Adaptability of Safety Catches and Appliances in Shafts.—(a) Regarding the utility and reliability of the various methods of providing against excessive speed in winding.

(b) Regarding the utility and reliability of the various methods of preventing an overwind of the load in either the up or down trips.

(c) Regarding the utility and reliability of the various methods of disconnecting the rope from the load in the case of an overwind in the head gear, and the means adopted to support the load after disconnection has occurred.

(d) Regarding the utility and reliability of safety appliances designed to stop, check, or suitably govern the motion of the load in case of the rope breaking on either the up or down trip.

(e) Concerning any other safety appliances in use for winding—e. g., safety crosshead guide for sinking buckets, etc.

(f) To what extent do any of the safety appliances above referred to constitute an additional danger to winding operations?

(g) Particulars (authenticated) are desired concerning accidents that have occurred during winding operations, with special reference to the reliability or otherwise of safety appliances.

(h) Any other particulars of interest with reference to this subject.

IV.—With special reference to Section II, and in order to assist the enquiry into the reliability and adaptability of safety appliances for use in connection with the raising and lowering of persons in mine shafts. Inventors and manufacturers of such safety

appliances are invited to forward to the secretary drawings and plans of their schemes, together with full descriptions of their working.

All drawings should be on tracing cloth and suitable for sun print reproduction, of scale 1 inch to the foot for general views, and 3 inches to the foot for special details. Models may also be forwarded, but these are not obligatory.

Drawings and models will not be returned, but will remain the property of the Transvaal Government.

Practical tests under normal working conditions will be made of appliances selected, and for this purpose it will be necessary for each inventor or manufacturer when submitting drawings to also furnish written permission empowering the Commission, if they so desire, to construct or cause to be constructed the appliance in question for purpose of the test. The modifications, if such be necessary, or if such be possible, to enable safety catches or grips to be used in shafts fitted with either wooden or steel guides, should be specified.

V. Copies of the report, embodying the findings and recommendations of the Commission, will be sent to all persons whose evidence is published; to those who submit drawings or models of safety appliances; and to all papers and periodicals in which this notice is inserted.

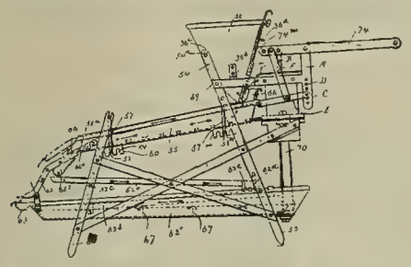
All communications, statements, drawings and models must be dispatched so as to reach the secretary not later than January 31, 1906.

Mining and Metallurgical Patents.

PATENTS ISSUED OCTOBER 31, 1905.

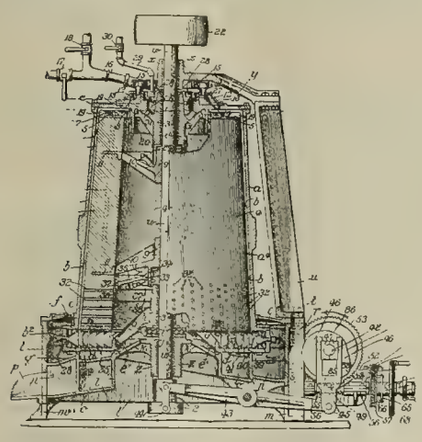
Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

MINERAL WASHING AND SEPARATING APPARATUS.—No. 802,399; J. H. Lancaster, New York, N. Y.



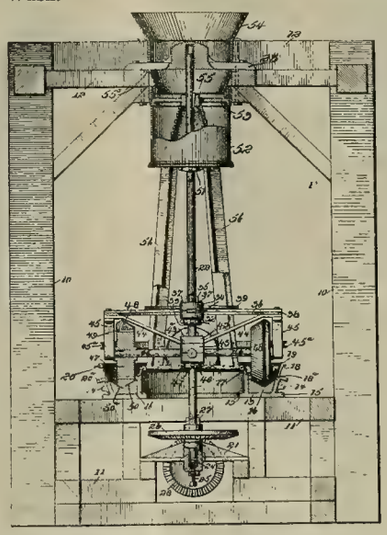
In gold separating apparatus, combination with supporting frame, of inclined riffle tray adjustably suspended for variable longitudinal vibration, removable upper screen within and carried by riffle tray and having screen surface extending from head to tail thereof, independently and vertically vibratable hopper delivering to head of screen and having adjustable gate controlled opening, and devices including a common actuating provision, located closely contiguous to hopper and head of tray for operating latter and positively and vertically jarring hopper.

CENTRIFUGAL CONCENTRATOR.—No. 802,724; P. H. Adams, Chicago, Ill.



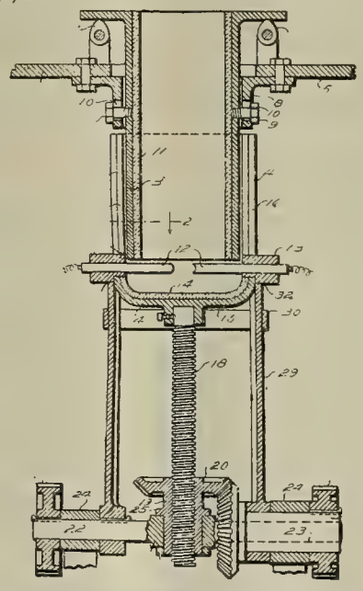
In centrifugal concentrator, combination of rotatable treatment vessel having separating surface, and hollow differentially rotatable reciprocatory deflector therein, and with one or more feed channels at one end and one or more discharge orifices at other end and having enlargement at discharge end of width approximately as great as reciprocating movement of deflector, ring or similar portion in such enlargement having chambers or recesses leading from inner side to discharge orifices, means for employment of water whereby material can be removed from desired portion of separating surface near discharge end without removing material from near feed end, such means embodying deflector, latter having water passages through lower portion of wall and adapted to alternate periods of longitudinal reciprocation and rest and means for producing such periods of reciprocation and rest.

QUARTZ MILL.—No. 802,787; R. A. Vaughn, Ballard, Wash.



Combination with mortar, of rotatable shaft, separated heads rotatable with shaft and comprising independent blocks, arms extending between blocks, means for connecting arms at outer ends, hangers fixed to arms at junctures with connecting means, shafts journaled in hangers and in one of heads, and rolls mounted upon shafts and operating within mortar.

ELECTRIC FURNACE.—No. 803,147; E. Appleby, Chicago, Ill.

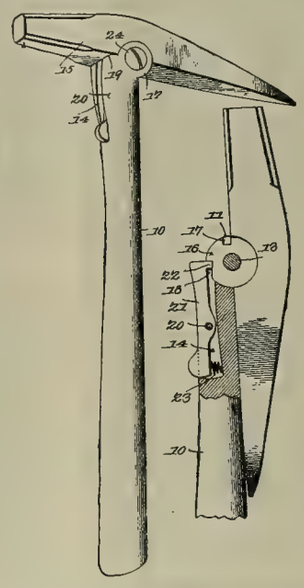


In electric furnace, combination of frame, vertically disposed receptacle mounted in frame and open at bottom; second receptacle open at top and telescoping with first; pair of electrodes mounted in frame and extending into furnace near lower end of first receptacle; mechanism for drawing second receptacle downward with respect to first; and mechanism for tilting second receptacle and discharging contents after it has been drawn out of telescopic engagement with first receptacle.

MINER'S LAMP.—No. 802,978; G. A. Duncan, Deadwood, S. D.

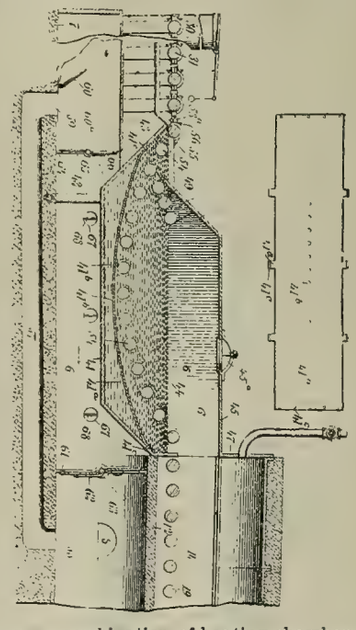
Miner's lamp comprising chambered body for holding illuminant; tubular cylindrical extension superimposed upon such body of suitable diameter and length to be held in clasp of miner's candle-stock and to protrude above clasp, such cylindrical extension being of greatly less diameter than body, and wick sheath extending through cylindrical extension and protruding thereabove with intervening air space between sheath and tubular extension and means closing air space at both ends.

MINER'S PICK.—No. 802,541; F. N. Wilson, Cripple Creek, Colo.



An implement of class described comprising handle member having spaced ears at one end offset laterally therefrom and with shoulder on end of handle adjoining ears, ears provided with transverse apertures and handle member provided with longitudinal channel extending through shoulder and communicating with space between ears, pick head having perforated tongue provided with spaced marginal notches and operating between ears and bearing upon shoulder when in operative position, pivot bolt movably uniting ears and tongue, and spring-actuated pawl operating in channel and guarded thereby with one end for alternate engagement with notches in tongue.

METALLURGICAL FURNACE.—No. 803,337; H. H. Goodsell, Leechburg, Pa.



In furnace, combination of heating chamber, pan, and wall disposed adjacent to pan and provided with by-pass merging into heating chamber, means for closing heating chamber so as to divert gases of combustion through by-pass, thereby avoiding heating of pans.

METHOD OF SEPARATING PYRRHOTITE FROM CHALCOPYRITE AND GANGUE.—No. 801,879; J. N. Judson, South Strafford, Vt.

Method of treating ores containing non-magnetic or weakly magnetic varieties of pyrrhotite, associated with chalcopyrite and gangue minerals, which consists in heating ore to degree sufficient to make pyrrhotite more magnetic than chalcopyrite and without considerable loss of sulphur, and subsequently removing pyrrhotite from other minerals by magnetic attraction.

MINING SUMMARY.

Specially Compiled and Reported for the MINING AND SCIENTIFIC PRESS.

According to the report of the United States Geological Survey, the production of gold in the United States during 1904 amounted to 3,910,729 fine ounces, valued at $80,835,648. This represents an increase of $7,243,948 over the production of 1903. After a period of very rapid advance in the gold production from 1892 to 1900, during which an increase from $33,000,000 to $79,171,000 took place, there followed two years of nearly stationary output, and one year, 1903, of very decided decrease. The production of silver in 1904 amounted to 55,999,864 fine ounces, valued at $32,035,378. This represents an increase of 1,699,864 ounces over the production of 1903, and an increase in value of $2,713,378. There is, therefore, a total increase of $9,597,326 in the value of gold and silver produced in 1904 over that of 1903. The record output of silver in 1892, amounting to 63,500,000 fine ounces, has not been reached in late years, nor has the coining value attained the figures of that year, which amounted to $82,101,000. The price of silver in 1904, according to the Director of the Mint, varied from 55 to 61 cents per fine ounce, representing a decided increase over the prices of 1903, which varied from 48 to 59 cents, and only exceptionally rose to 61 cents in October, 1903. The principal sources of the great increase in the gold production of over $8,000,000, compared with that of 1903, are easily traceable. Colorado added nearly $2,000,000 to her production of 1903, most of this coming from the mines of Cripple Creek. Nevada's output increased about the same amount, chiefly by reason of the phenomenal yield of the Goldfield mines. The greatest progress is reported in California, whose production exceeds that of 1903 by $2,300,000, the increase being caused partly by a strong development of the quartz mining industry and to a less degree by the activity of the dredgers. Alaska and Arizona show increased yields, amounting respectively to $476,893 and $748,708. A number of States show smaller increase, while Utah, Montana and Washington have less gold to their credit in 1904 than in 1903. The increase of value in the production of silver of $2,713,378 is somewhat evenly distributed among the various States and Territories, but it is to some extent due to the better price of silver obtained. Colorado leads, with an increase of $970,320. California, Idaho, Montana, Nevada and Utah also added considerable value to their silver production. The number of producing mines in the Western States, exclusive of Alaska, in 1904, was 3254. To this should be added several hundred producers in Alaska and probably over a hundred in the Southern Appalachian States, which would make a total of about 4000. The total number of placer mines reported is 1349, and of deep mines, 1905. Colorado has the largest number (567) of deep producing mines, and is followed by California, with 474. In number of placer mines, California leads with 711, and is followed by Idaho with 263, and by Oregon with 211 mines. California has by far the greater number, 1185, of producing mines, and is followed by Colorado, in which the number is 588. One of the most important features of W. Lindgren's report is his classification of the gold and silver product according to its derivation from the placers, dry or siliceous ores, lead ores, copper ores, and zinc or zinc-lead ores.

ALASKA.

Manager R. A. Kinzie's report to the Alaska Treadwell G. M. Co. for the year ending May 15, 1905, states that development during the year comprised 4650 feet of drifts, 1332 feet of crosscuts, 4475 feet of raises, 1152 feet of stations, and 223 feet of shafts. The main shaft has reached a depth of 1155 feet and preparations have been made for sinking it farther. The average of fifty-four samples taken in the last 173 feet was $1.14. The open pits have been sunk to a depth of 600 feet. Slides of foot wall rock will prevent the extension of the open pits to the south. The cost of extraction from these open pits is now about the same as from large underground stopes. Of the 876,234 tons of ore mined and sent to the mill, 781,397 tons came from stopes, the remainder being supplied by development work. The cost of mining, hoisting, crushing and delivering to the mill bins the above tonnage was $0.96, including development and the mining of the broken ore left in the mine. The open pits and underhand stopes above the 220-foot level contributed 35% of the output, and the stopes on the 440-foot level an equal amount. Of the other levels, the 600-foot was the heaviest contributor. The average of 4716 samples taken throughout the mine was $2.65. Machine drills are employed throughout the mine. There were forty-two of them at work every day, on the average, during the year, of which twenty were stoping, eleven driving development, and the rest working in the open pits or cutting-out stations. Those in the open pits accomplished the most work. Each one would drill an average of 3.57 11-foot holes, or 39.4 linear feet, per ten-hour shift, breaking down 57.26 tons of ore at a cost of $2.77 for explosives. Those underground, cutting 7-foot holes, would average 4.8 holes, or 36 linear feet, per shift, and broke about 31.5 tons of ore apiece, at a cost of $2.66 per day each for explosives and of $2.59 for supplies, power and repairs. To break 1 ton of ore required 1.13 foot of hole to be drilled. The company has two stamp mills, one of 300 stamps, operated entirely by water power, and one of 240 stamps, capable of running part of the time by steam power, the remainder by water. Details of operations of these two mills are instructive:

	240-Stamp.	300-Stamp.
Running time, steam	125d 11h	.....
Running time, water	234d 12h	286d 7h
Lost time	5d 1h	78d 17h
Tons ore crushed	396,094	481,076
Per stamp per day	4 58	5 60
Sulphurets saved, tons	8,420	9,633
Per cent of crushed	2.126	2.003
Quicksilver used, ounces	73,810	89,007
In batteries, ounces	60,480	68,369
On plates, ounces	6,925	17,303
On vanners, ounces	357	404
Cleaning amalgam, ounces	6,048	2,931
Quicksilver lost, ounces	24,879	38,796
Supplies used, shoes	865	951
Dies	595	930
Stems	469	173
Tappets	58	51
Recovery from amalgam	$478,621	$485,139
Concentrates saved, tons	8,420	9,633
Concentrates saved, value	$460,357	$552,293
Tailings, total value	$77,949	$93,028
Per ton	$0.20	$0.19
Gross recovery per ton ore crushed	$2.57	$2.35
Value amalgam per ounce	$6.13	$6.39
Value bullion per ounce	$18.86	$18.86

Operating and construction expenses were:

	Totals.	Per Ton Milled.
Recovered in bullion	$ 970,462	$1.1064
In sulphurets	1,037,381	1.1826
Profits on stores and supplies	69,317	0.0790
Interest and dividends	18,304	0.0209
Total receipts	$2,095,464	$2.3889
Mining and development	$ 841,785	$0.9597
Milling	123,547	0.1522
Sulphuret treatment	133,253	0.1519
All other operating	36,075	0.0411
Construction and repairing charged to profit and loss	41,365	0.0472
Total operating and construction	$1,186,025	$1.3521
Net profit for year	$ 909,439	$1.0368
Balance brought forward	827,633	
	$1,737,072	
Dividends (18%)	$ 900,000	
Depreciation, etc	150,852	
	$1,050,852	
Balance carried forward	$ 686,220	

Other construction, charged against capital, amounted to $120,626. The company is capitalized at $5,000,000, and in its fifteen years has made operating profits of $7,331,644, from ore which, during that time, has averaged $2.51 in value per ton. Operating profits for the year under review were the largest ever experienced, although operating expenses have reached lower averages in past years. During the fifteen years they have averaged $1.24 per ton.

ARIZONA.

The owners of patented mines in Arizona are waiting the outcome of the suit instituted by Attorney-General Clark to enforce the payment of the increased tax levy on such mines. In August the Territorial Board of Equalization, acting on the suggestion of Governor J. H. Kibbey, raised the valuations on patented mines returned by the several assessors of the following counties, as appears below: Cochise, 1500%; Gila, 400%; Graham, 400%; Mohave, 400%, Pima, 500%; Santa Cruz, 500%; Yavapai, 100%; Yuma, 500%. These counties constitute the chief mining districts of the territory, and without exception they objected to the raise. Yavapai county, among others, refused to obey the order of the Board of Equalization, and the Supreme Court has issued an alternate writ of mandamus to the Board of Supervisors, citing them to appear and show cause why they should not obey the order. The test case will be heard this month before the Supreme Court of Arizona. The patented mines of Graham county were returned by the local officers at $595,532.66. The 634 patented mines in Cochise county were assessed by the local board at $223,015.47. This is the county in which the Copper Queen is located, and from the patented mines of this county the product of gold, copper and silver last year was $15,000,000. Last year the total product of the mines of Arizona was about $30,000,000. They were assessed at a valuation of $5,000,000.

Cochise County.

The main shaft of the Tombstone Con. Mines Co., at Tombstone, is down 840 feet and sinking continues at the rate of 9 feet per week. The water is less troublesome than some time ago and there is daily pumped out of the mine 3,700,000 gallons. The company is shipping from eighty to ninety tons of ore to El Paso, Texas, daily. Work on the mill is progressing rapidly and the company expects to have its forty stamps in operation during December. At Imperial the ore shipments are 100 tons daily. They are 80 feet below the 500-foot level, in high-grade ore, and are still sinking. The management is at work on plans for a smelter and concentrating mill. The capacity of the smelter will be 300 tons per day to begin with, but the plant will be so constructed that 300-ton units may be added as development necessitates. The present production is at the rate of 600,000 pounds of copper per month.——S. J. Entrikin, general manager of the Arizona Con. Co., near Johnson, reports that the Arizona Con. is making regular shipments of high-grade ore to the smelters while pushing development work.——The Black Prince Co. of Johnson is sinking a double-compartment shaft.——The Hershal mine of Tombstone was transferred to Douglas Gray of the El Paso Smelting Works. Miners are sinking a new shaft to cut the vein at 300 feet. F. C. Earle, manager of the El Paso Smelting Co., is president and Douglas Gray manager.

The product of copper at the Copper Queen Reduction Works, at Douglas, during October amounted to 7,100,000 pounds from a little more than 5 furnaces. During the month the old furnaces from Bisbee went out of commission to make room for No. 6 furnace, which is now being put in. Furnace No. 5 is to be overhauled and enlarged to the same capacity as furnaces Nos. 8, 7 and 6. The present force at the Copper Queen is about 900 men.——The Calumet & Arizona production for October was 16,692 tons. This is an increase for October of 392 tons and is due to the smelting of the Lake Superior & Pittsburg and Pittsburg & Duluth, which were commenced October 16. This represents an increase in Bonanza Circle production for the remainder of the year at the rate of 784 tons per month. Last year the Calumet & Arizona produced 32,000,000 pounds of copper. At the smelter the increased equipment, including the extension of the building, widening the converter room, the dust flue and the big stack, has been completed and work commenced on the final contract to complete the steel trestle and ore bins. It is estimated that when the new trestle is completed a saving of at least $100 a day will be effected over the present method of handling the fuel, etc.

Maricopa County.

The Ryland group, in White Picacho district, near the northern line of Maricopa county, northeast of Phœnix, is being worked under the superintendency of C. W. Platt.

Mohave County.

Ore shipments are to be made from the Minnesota-Connor mines, near Kingman.——The Vanderbilt shaft at Cerbat is down 300 feet.——The Oro Plata mine, near Kingman, is to be unwatered and developed. The shaft is to be sunk deeper.——James Uncapher, of Mineral Park, near Kingman, reports rich ore in the Keystone mine.——J. Dundon of Cerbat has bonded a mine fraction between the Tub and Silver, Union Basin, to E. M. Carson. The Green Linnet tunnel is to be driven under the mines, cutting them at depths of from 200 to 300 feet and draining them.

Yavapai County.

The cave-in in the fire district of the United Verde mine, near Jerome, which caused some of the surface buildings to settle, has proved to be less serious than it was at first thought it would be. Ore is still being removed from that section of the mine, and will continue to be until the entire fire zone has been exhausted. If the working of this zone proves practical it will mean that the fire has been a source of benefit rather than of harm. The ground now being worked is known as the Hampton stope and has always been considered the worst in the fire district. The fire serves to remove the excess sulphur in the ores, obviating heap roasting on the outside of the mine. The Hampton stope opened an ore body that is known to contain a body of ore 90 feet in width and as far as opened several hundred feet in length, with some distance still to go. The mine now employs between 530 and 540 men, which is the largest number ever employed at that location. The company is beginning prospecting on some of its minor claims. After many years of idleness the North and South Venture claims are being prospected.

W. Duke of Cleveland, Ohio, is working placer ground on Lynx creek, near Prescott, and by the last of January expects to have a grizzly and sluice boxes, able to handle 200 tons per day, in operation.——J. Chambers reports opening up a 5-foot ledge of ore by an open cut on the Mormon mine, 6 miles south of Prescott.

CALIFORNIA.

According to F. H. Oliphant's report on the oil production to the United States Geological Survey, the most remarkable event in the production of petroleum in the United States in 1904 was the increase in California. The output of this State has been increasing by leaps and bounds since 1899. It has increased sevenfold since 1900. For the last two years it has produced more than any other State, the output amounting to 25.33% or more than ¼ of the entire production of the United States. As a large percentage of the petroleum produced is used for fuel, it was marketed at a low value, about 63% being sold for 17½ cents per barrel, nearly all of which was produced in Kern county. The highest price paid was $2 per barrel for a small production of a superior grade of petroleum in San Mateo county. The entire value of the production in 1904 was $8,265,434, which amount placed California in the fifth place when rank in the value of the States producing petroleum was considered. The average price paid in 1904 was about 28 cents per barrel, a decline of about 2 cents compared with 1903. The largest percentages of gain in production were, in the order named, Santa Clara, Santa Barbara, Fresno and Ventura counties. The only county showing a decline was San Mateo. On December 2, 1904, a remarkable well was drilled in at a depth of 2860 feet in Santa Barbara county, a few miles southeast of Santa Maria, belonging to the Union Oil Co., which began producing at the rate of 10,000 barrels per day. The gravity is 22.8° Baume. Immense quantities of loose sand were vomited out of this well with the petroleum, which in a short time covered the derrick floor for a number of feet. At a depth of 2200 feet a deposit of petroleum was found in a loose sand which would have made from 300 to 500 barrels per day, but this was cased off and the well drilled deeper. Owing to lack of tankage, attempts were made to "shut in" this well without success. Finally the pipe parted 90 feet from the well's mouth. The petroleum is now flowing out of the cracks in the ground at different points from 2 to 3 rods away from the well, as well as through lead lines, and is collected in temporary drains across the canyon. The Union Oil Co. had about 200,000 barrels, which at first was stored in these reservoirs and subsequently was shipped by a pipe line to tanks at Gaviota. The Brooksline Oil Co. had several wells near this large gusher, and they closed down at once. One of these wells afterwards broke loose and started to flow at the rate of 4000 barrels per day. Indications are that this territory extends from 8 to 9 miles to Lompoc, and that it will contribute largely to the production of 1905. The petroleum ranges from 22° to 28° Baume. The lighter grades are found in the northern portion of the field. There were 458 wells drilled in 1904; of this number about 158 were dry, leaving 300 productive wells. There were 252 wells abandoned. During the year there were 2772 wells operated and 647 wells shut in. About 75% of the new wells drilled were in Kern and Los Angeles counties. There were 57 rigs up at the close of 1904. There were 398 wells drilled in 1903. Of these 75 were dry holes, and 77 rigs were put up at the close of the year.

The Bakersfield oil district in Kern county kept up its production of nearly 55,000 barrels per day in a remarkable manner, although at times half the wells in this field were shut in for want of transportation. The specific gravity averages 15½° Baume. There were over 3,000,000 barrels held in steel and 3,500,000 barrels held in earthen reservoirs in this field at the close of 1904. Large quantities were shipped north by the Pacific Coast Oil Co.'s lines to Point Richmond, and from 150

to 200 tank cars were shipped daily from this field in 1904.

The Coalinga oil field in Fresno county in 1904 more than doubled its production of 1903, yielding 5,114,958 barrels. The gravity of the petroleum produced in this field ranges from 12° to 45° Baume, the larger proportion being 33° Baume. There were 148 producing wells during 1904 and 11 wells shut in for want of transportation. Four pipe lines, from 5 to 10 miles in length, connect this field with the tanks on the Southern Pacific railway near Coalinga. The Pacific Coast Oil Co.'s branch line from Coalinga reaches the main line at Mendota station, 166 miles south of Point Richmond. In October a 6-inch pipe line was completed to the Pacific coast at Montgomery bay, distant about 100 miles. One of the serious obstacles to the rapid development of this field is the scarcity of water. There is a partial supply furnished by two water pipe lines operated by the Coalinga Consolidated Water Co., which secures it from wells in the valley.

The Los Angeles oil field in 1904 slightly more than maintained the production of the previous year. The production in 1904 was 2,102,892 barrels, the product of 1273 wells. There were 148 wells drilled and 99 abandoned during the year. The specific gravity averaged about 13° Baume.

The oil production in Santa Barbara county increased 158% in 1904 over that in 1903, owing to the immense wells opened up toward the close of the year near Santa Maria, with indications of a much larger increase in 1905. The particulars of the well secured by the Union Oil Co. have already been described. Wells near Summerland, in this county, have long been noted, owing to their rigs being located on piles in the ocean.

In Ventura county, the oil wells are quite deep in this field. Many are over 2000 feet, and a great part of the petroleum is as light as 25° Baume, some of it going as high as 35° Baume. There was a marked increase in the production in 1904 over that of 1903, amounting to 49%, and the price averaged 90 cents per barrel, which was the highest paid for crude petroleum in California during 1904, except for a small production in San Mateo county.

Alameda County.

The shipping of magnesite from the mines at Red mountain, 30 miles from Livermore, has begun. The factories that are to reduce and handle this ore are in Oakland. California is the only State in the Union that produces magnesite which is a native magnesium carbonate, composed of 47.6% magnesia and 52.4% carbon dioxide. During 1904 the quantity of crude magnesite produced was 2850 tons, valued at $9298. With the exception of 51 tons mined in Fresno and Napa counties, this was all derived from the deposits at Porterville, Tulare county. For 1903 the quantity reported was 3744 short tons crude, valued at $10,595, equivalent to 1361 tons calcined, worth $20,515. The demand for both crude and calcined magnesite on the Pacific coast is limited, and prohibitive freight rates have thus far prevented shipments to the East. Oregon and California consume the entire native production. In the crude state magnesite is used for the manufacture of carbon dioxide gas; calcined, it is used in the manufacture of paper from wood pulp and as a refractory material, in brick or concrete form, for lining furnaces, covering steam pipes, as artificial lumber, as composite stone for lithographing, etc. Magnesium chloride is an excellent bleaching agent. Calcined magnesite, generally in the form of brick, is now universally recognized as the best material for lining basic, open-hearth furnaces, cement kilns, etc. The distinctive characteristics of a magnesite lining are durability, freedom from moisture and silicic acid, and resistance to corrosion when exposed to the action of basic slags and metallic oxides. These qualities make the lining cheaper than most others in the long run. The magnesite bricks made in this country come from the Fayette Manufacturing Co. of Layton, Pa., the Harbison-Walker Refractories Co. of Pittsburg, Pa., and the Rose Brick Co. of Oakland. This is one of a number of companies formed to work the product of the American Magnesite Co. The Pacific Carbonate Gas Co. was formed to utilize the CO_2, and the Plastic Construction Co. to manufacture tiling from the magnesite rock. H. C. Stilwell, Kohl building, San Francisco, is manager.

Butte County.

Diamond mining is being tried near Cherokee. In the past twenty years sixty diamonds are said to have been found there.

The Dewey mine, near Forbestown, is to be opened up by new owners.

El Dorado County.

(Special Correspondence).—At the Gopher-Boulder quartz mine, near Kelsey, good ore has been developed. The mill is being repaired.——The Kelsey gold and silver quartz mine, which has recently been purchased by an Eastern company, will begin work soon. ——The Eureka slate quarry near Kelsey, under the management of C. H. Dunton, are putting in modern machinery and methods for the exploration of slate.—— At the Rosencrans mine, near Garden Valley, they are still sinking.——The Live Oak gravel mine above Placerville continues producing.——Work has been started at the Gold Bend gravel mine near Smith Flat district.—— The Snow gravel mine, near Newtown, has been bonded to a Colorado company and they are making preparations for developments. This property has been worked by Snow Bros. as a hydraulic mine for years, but the fight against hydraulic mines stopped it. The present company is running a tunnel to tap the deeper channel and will work the claim as a drift mine.——The American River Electric & Power Co. intend putting in a transformer near El Dorado, which will be a distributing point to furnish power to the Union quartz mine, also to the Church, Cook, Crusader and other quartz mines near by.——The Church mine is looking well.——At the Golden Gate quartz mine they are still sinking and have struck a fine body of ore.

Placerville, Nov. 13.

It is reported that a company has commenced mining for diamonds at White Rock hill, 2 miles northeast of Placerville.

The El Dorado County Miners' Association, at its annual meeting, elected as president A. Baring-Gould; vice-president, N. H. Berger; secretary, C. H. Weatherwax; treasurer, M. Q. Meehan, all of Placerville.

Inyo County.

(Special Correspondence).—It is reported that the lead, silver and gold mines at Resting Springs in the southeast part of Inyo county, 100 miles northeast of Daggett, have been sold to the Guggenheim syndicate by J. B. Osborn. About forty years ago these mines were equipped with smelters and extensive operations carried on, but work was discontinued because of difficulties of transportation.

Daggett, Nov. 13.

Los Angeles County.

Capital is being interested in dredging placer ground in Soledad canyon, near Saugus.

Nevada County.

Superintendent Eddie has put in an air compressor at the Delhi mine, near North San Juan. The new 10-stamp mill at the Oustomah mine, near Nevada City, will soon be ready to drop stamps.——The Deadwood mine, in Willow Valley district, near Grass Valley, has been bonded to a San Francisco company represented by J. M. Esselstyn. A new hoisting and pumping plant is to be put in preparatory to sinking a new shaft.

J. P. Myers and J. L. Bryson are developing the Celia ledge at Omega, near Washington. The Celia is being worked through open cuts and the Huntington mill is crushing 35 tons of ore daily.——At the Banner shaft, near Nevada City, the 600-foot level has been reached and the shaft is in good condition. Superintendent Kendall has put in another pump. As soon as the mine is clear of water, sinking will be commenced and the shaft will be continued to a depth of 1200 feet. Superintendent J. H. English will put in at the Spanish Ridge mine near Washington a new air compressor.

Placer County.

It is reported that the Hidden Treasure mine, at Bullion, has been temporarily closed down.

San Bernardino County.

Southern Pacific officials state that the engineers and riprappers who have been at work for months at Salton sea in an effort to check the flow of water from the Colorado river have been successful, and that the waters are now practically under control. Experiment after experiment had proved unsuccessful, and the railroad company has been compelled to build several succe-sive new tracks to get away from the encroaching water. The engineers, by constructing a heavy riprap of re-enforced piling 600 feet long across one channel of the river, forcing the water to back up and flow through the other channel and away from the company's property, have stopped the damage.

Sierra County.

(Special Correspondence).—T. K. Code, superintendent of the Empire mine at Gold Valley, is sampling the Comet mine in Jim Crow canyon, near Downieville. He reports thirty-five men at work at the Empire. The continued dry weather has caused inconvenience.—— Mr. Filting, operating a mine near Lovelock, Nev., is examining the Alice and Pappoose claims in Jim Crow canyon.

Downieville, Nov. 14.

It is hoped to have the Sierra Buttes mine and 60-stamp mill at Sierra City regularly producing by December 1. The new 40-stamp mill has been built near the mouth of the No. 9 tunnel and is connected with No. 5, the main working tunnel, by means of an aerial tram, operated by gravity and having a capacity of 200 tons per day. The old 20-stamp mill at No. 5 is being overhauled and new foundations and mortar boxes put in. The new 40-stamp mill has eight batteries of five stamps each, the foundations being set with concrete on bedrock. The batteries are in two divisions. The tailings are to be cyanided. There are eight tanks holding 150 tons each. A separate plant will treat the tailings from No. 5 mill, the tailings being sluiced down the hill. The deposit of tailings from the old operations, which had accumulated up on the hill, were sluiced down to the lower plant and have been treated in the tanks of the new mill. Hydraulic power is in both mills and mine. The water is conveyed by ditches and flumed from the high altitude lakes on the northeast slope of the mountain. James Clinton, superintendent of the Rainbow mine, near Alleghany, states that five stamps of the mill are running, and that as soon as there is sufficient water all of the stamps will be started.

Tuolumne County.

The Rising Star, owned by Jos. Maddox and situated near Confidence, has been bonded for $7,500.——The Grizzly 20-stamp mill, near Carters, will be kept running. ——The company operating the Grizzly is also working the New Albany. A tramway has been built from the latter to the Grizzly mill, through which rock from both mines will be run.

COLORADO.

Effective November 15, the American Smelting & Refining Co. announced concessions which mean that the lead miners will receive from 10 to 17 cents more a unit for their product. The new schedule makes advances ranging from 9 to 16 cents on the different percentages in lead. Railroad men, producers and buyers agree that the rearrangement of prices will give an impetus to the mining industry of Colorado. Old mines, which have been closed because of the absence of profit, are to be reopened and property which has been worked for a bare percentage over running expenses will be put on a paying basis. The smelters are preparing for an influx of ore and should the output come up to expectation it is probable that some of the Colorado smelting plants, which have lain idle for years, will resume.

Boulder County.

At Ward the San Blas mill is being remodeled by the Myrtle Co. A new furnace has just been put in and the company expects to start up for a continuous run on ore which experiments with the old furnace demonstrated could be satisfactorily treated by cyaniding.——At Jamestown the Wano mill is being overhauled and fitted for cyanide treatment. At Eldorado a change will be made from the Bailey chlorination mill to a cyanide plant.

Clear Creek County.

The Continental Mines, Power & Reduction Co. has been formed by H. I. Seemann of Denver to drive the Seemann tunnel, which has been started on Fall river, 5 miles from Idaho Springs, to be driven in a direct line toward James Peak.

Ore being opened in the eleventh level of the Terrible mine, near Silver Plume, continues to increase in value. The drift has been driven over 100 feet since the lower workings of the mine were unwatered. The fourteenth level has been cleaned out. This level will be driven east. It is not expected to run the mill during the winter.——The Mineral Chief, owned by the Linn Con. M. Co., have a concentrating mill to handle the quantity of low-grade material. The No. 2 level, which is now in 800 feet, will be driven ahead and connection made with the No. 3 level by means of a raise.——That part of the Griffith property near Silver Plume owned by the Annetta Co. is making a large output of ore.——The Independent Mining Co., which recently purchased and is operating the West Griffith, is meeting with success.—— Experimental runs are being made at the Waldorf Co.'s mill, near the Wilcox tunnel, to determine the process best adapted to saving the values contained in the copper-lead-zinc combination found in a number of the veins that have been opened in the Wilcox and Tobin tunnels. ——Manager E. J. Wilcox of the Waldorf Co. has located the Tobin millsite and a pipe line between Silver Plume and Georgetown, and has also secured by purchase other millsites in that vicinity and commenced the construction of a dam below the Pay Rock mill in order to secure water power for an electric plant for furnishing power for the operation of the Waldorf properties and the Argentine Central Railroad.

The new Dover & Brighton concentrating mill at the mouth of Fall river, near Idaho Springs, has been started up on ore from the Brighton mine at Freeland. The ore is concentrated six to eight tons into one. The concentrator was designed and built under the direction of J. G. Roberts. J. Lindstrom has charge of the mill.

Work has been started on the Pay Rock mines, near Silver Plume, by Superintendent E. F. Kendall.——The Dominion M. Co.'s claims on Payne's peak, near Silver Plume, have been sold to a new company which will start work under the management of H. J. Crist.—— Superintendent F. A. Babcock of the Southern M., M. & D. Co., has resumed work in the Robert E. Lee tunnel.

Gunnison County.

C. T. Snedaker, representing Chicago capital, is working the OO lode on Cochetofa creek above Sillsville. A shaft now 110 feet deep is being sunk and the vein will be opened by levels.

Near Bowerman, Superintendent Slaughenhaupt has retimbered the Bradley tunnel and is pushing toward the David Lee and Good Hope veins.——The Abe Lincoln, near Bowerman, is running a full force under the management of L. P. Merriman.

The Continental Group M. Co. is developing the Continental, south of Gunnison. A shaft has been sunk on the vein 150 feet and is connected with a 300-foot tunnel. ——Work on the 100-ton cyanide plant of the Raymond Consolidated Mines Co. is progressing and the company expects to have it in operation before the first of the year.

San Juan County.

The blacksmith shop and ore house at the Champion mine, at Sultan mountain, 1 mile south of Silverton, were destroyed by fire Nov. 11. The loss amounts to $5000, partially covered by insurance. The fire is supposed to have been of incendiary origin.

Work on the new mill of the Sound Democrat, near Animas Forks, is being pushed. The foundations are completed.——J. C. O'Neill, general manager of the Mayflower M. Co., of Silverton, has given a contract for 700 feet of tunnel work to Martin Semelzer of Silverton. A compressor plant will be put on the company's ground, after which stoping will commence. A milling plant will be built next year.——At the Highland Mary mill, in Cunningham gulch, near Silverton, there are twenty-five men work under the superintendency of Wm. Cole.

San Miguel County.

The Contention G. M. Co., operating the Contention mines, owned by the Smuggler-Union Co. at Telluride, has made a trial run of 567 tons and produced 630 ounces of amalgam. A. A. Clute is superintendent.

Gilpin County.

The manager of the Evergreen mine at Pine Creek, near Central City, has put in the new hoist and is prepared to sink the shaft 500 feet deep.——The Sleepy Hollow mine near Central City is being unwatered and is to be developed after ten years of idleness.

The Elk Park M. Co. has let a contract for a shaft building and a 40 H. P. hoist on its Annie H. property, near Apex. Superintendent McNeill reports that the company will overhaul its 25-ton mill this winter. New machinery has been purchased for the mill of the Boston-Occidental Co. on Colorado hill, near Apex, to treat ores from the Mascot property.

Lake County.

At Leadville the Felicia Grace Robinson has been opened with good ore in the shaft. Sinking will continue until the bottom of the ore is reached.——The President shaft, Breece hill, Leadville, will be sunk deeper. Its present depth is 330 feet, and it will probably be sunk to the 750-foot mark. Prospecting in the upper levels will continue and the shaft will be enlarged. ——It is reported that high-grade ore has been struck in the upper tunnel of the Fidelity M. & M. Co.'s Bull Hill lode, near Twin Lakes.

Summit County.

(Special Correspondence).—Breckenridge during October shipped 2080 tons of high-grade ore and concen-

trates. Of this quantity the local sampler handled 105 cars.——The Gold Pan suits have all been settled. A. B. Sculley of the Sculley Iron & Steel Co. of Chicago came to Breckenridge and on behalf of his associates and himself paid all judgments, using $75,000 in the settlement. The property will be operated on a large scale next year and a number of improvements made.——The manager of the Jessie mine, being worked under a lease and bond, has struck a rich gold vein in the Jessie tunnel workings.——The Abundance M. & M. Co. of Breckenridge have realized that they have too much water to cope with for shaft mining, so have secured a right of way from the owners of the Mono group on Mineral hill for a tunnel 1200 feet long to strike their own property. This tunnel when completed will cut their ore bodies at a depth of 650 feet, 350 feet below their present main shaft. Work has begun on the tunnel.——In the French Creek tunnel in Mount Baldy, which is now in 1650 feet, a fine looking vein of zinc has been cut.——The Carrie M. & M. Co. has its mill in shape for its trial run, and crushing and cyaniding have been started.——The Reliance dredger is still running full time and will continue to do so as long as the weather is favorable.——Boyce Bros. are shipping lead-gold ore from the Fountain Ledge on Farncomb hill, near Breckenridge.——The Kitty Innes mine, near Frisco, is being worked and a streak of lead-copper ore, carrying gold and silver values, has been cut in the main tunnel.——The power plant working the machine drills and electric lights for the North American and Mary Verna mines has been started up, and both tunnels are now being driven with machines.——The Buffalo Placer M. & M. Co. of Boston, operating at Dillon, has elected L. Kingsbury president and general manager.

Breckenridge, Nov. 13.

Edward Huter, superintendent of the Square Deal M. & Dev. Co., working in West Ten Mile, near Breckenridge, is running a 500-foot crosscut tunnel, which will tap several veins. In the spring a 3000-foot tunnel will be started from the base of the mountain.

Teller County.

The Iron King shaft on Ironclad hill, Cripple Creek, is to be sunk from the 85 to the 185-foot level and machinery is to be put in. The mine is being worked by leasers.——A 15 H. P. electric hoist has been put in by lessees Schiele & Co. in block 197 of the Stratton estate on Bull hill, Cripple Creek. Work is being done between the surface and the 400-foot level.——B. I. Shell & Co., lessees, have started work on the Hoosier mine on Tenderfoot hill, Cripple Creek.

Sinking has been resumed in the Home claim of the Cedar Hill Gold Mining Co. of Cripple Creek by N. Gardner and associates, lessees.——It is proposed by O. D. Fogleman, lessee of the T. Merritt claim of the Reno Co., on Womack hill, Cripple Creek, to continue the shaft to the 220-foot point.——The capacity of the cyanide mills at the Los Angeles mine on Bull hill, Cripple Creek, is to be doubled so that 500 tons of ore can be handled daily.——Morrison & Co., leasing the Silver Tip on Bull hill, are putting in machinery to handle ore that is being broken at a depth of 65 feet.

IDAHO.

Elmore County.

The mill at the Tahoma mine, near Atlanta, is running constantly. The machinery for twenty more stamps is all on the ground, but will not be installed at present. The cyanide plant will not be put in this year. There are twenty-nine men at work in the mine and mill.——There is no work being done at the Petit mine, near Atlanta.——Work on the Boise-Atlanta road is being pushed, but it will be impossible to complete the contracts this fall, as it was impossible for the contractors to secure enough laborers on the work.

Idaho County.

The Buster mine of Elk City has been sold by S. M. Smith to San Francisco people. Men have been put to work.

Shoshone County.

It is reported that good strikes have recently been made on the Ozark and the Klondike claims near Pierce City. The Ozark company is starting a 500-foot shaft, and is also putting in a 5-stamp mill. Ten men are working, and supplies are being taken in for the winter. On the Klondike the strike was made in the lower tunnel, the ledge having widened out to 4 feet.

A. D. Coplen has started work on the Ruth group at Mullan.

The Great Western Co., at Burke, has let a contract to extend its main tunnel 200 feet, which will bring the face of the tunnel within 100 feet of a point below the surface outcrop.——Negotiations are in progress for the sale of the Nabob mine, on Pine creek, near Wardner, to Spokane, Wash., parties. J. L. Safford has inspected the property. It is the intention of the purchasers to run a tunnel from the creek level that will tap the ore chute at a depth of 1500 feet. The ore is said to be clean galena, carrying very little zinc.——C. E. Poor of Los Angeles, Cal., is in charge of the work now being done by the Dominion Co. on its claims on Carbon creek, 1 mile from Carbon Center and 2 miles from Morrison's station, near Murray, and is driving a 700-foot crosscut tunnel to tap the ledge at a depth of 500 feet.——The Hecla Co. of Burke intends getting a new hoist. The present plant is intended to work only to the 900-foot level, and within a year its capacity will be taxed to the utmost. A hoist capable of working to a depth of 2500 or 3000 feet is to be bought. The Hecla plant uses electricity for power.——Work on the Reno & Idaho Co.'s claims at the junction of Military gulch with Canyon creek, 2 miles above Burke, is being done through a 300-foot crosscut tunnel.

R. N. Bell, State Mine Inspector, reports that the bonanza lead-silver mines of the Cœur d'Alenes are making another record year of production. The six principal producers of the district combined will pay dividends during 1905 of over $6,000,000.——At the Hercules a new concentrating plant with a capacity of 500 tons a day is being completed. The developments at No. 3 level indicate that when No. 4 level is completed rich ore may be struck.——At Burke the Hecla mine is being operated at a profit. It occurs in the only true contact fissure in the district, accompanying an intrusive dike. There have been several other properties throughout the district developed to the shipping stage during the year, and others that give evidence of developments in the future. Along the copper belt above Mullan the year's development has produced some results. The Snowstorm lease will ship over 60,000 tons of ore this year of a grade ranging between 4% and 5% copper and six to eight ounces silver. A trial run was recently made with a new leaching plant for the treatment of the ores of this mine and some important results obtained. The mechanical features of this plant, however, need adjustment.——The Monitor mine, 6 miles east of Mullan, has developed sulphide copper ore bodies carrying values in gold.

Washington County.

H. Houston has charge of Carroll & Wheaton's mine on Cuddy mountain, near Council. It is reported that a mill will be built in the spring.

MONTANA.

The October receipts at the United States Assay Office at Helena exceeded those of the preceding month by more than $30,000, according to the report of Assayer B. H. Tatem. Of this increase $11,000 is accounted for in the increased gold production of Lewis & Clarke county. The total receipts for October aggregated $248,583. Of this amount Montana contributed $207,981. The remainder was distributed among the Northwestern States as follows: Idaho, $2241; Washington, $9365; Nevada, $7296; British Columbia, $13,364; Oregon, $788; Alaska, $6410. Of the Montana counties Fergus was the leading producer, with $94,271; Lewis & Clarke second, with $31,131, and Madison third, with $37,206.

Fergus County.

A company has been formed to work the Anderson mines at Maiden.

Jefferson County.

It is proposed to sink a 400-foot shaft on the Minnesota mine near Wickes. T. Mullvahill is interested.——The shaft on the K. & H. mine, near Corbin, is being continued 100 feet deeper.

Silver Bow County.

(Special Correspondence).—The Butte district in October produced 28,517,520 pounds of copper, worth, on a 16-cent market, $4,562,803.20. The by-products of gold and silver amount to 2½ cents for each pound of copper, a total of $712,938, or a grand total value of the copper, gold and silver products of $5,275,735.20. There was an increase of 1,547,520 pounds over the September copper production. The ore tonnage, the yield per ton and the total yield for the month is shown in the following table:

	Tons of Ore.	Pounds Per Ton.	Total Pounds.
*Boston & Montana Co.	79,980	71	5,678,580
*Anaconda	148,800	52	7,737,600
*Butte & Boston	20,150	68	1,370,200
*Parrot	16,120	67	1,080,040
*Washoe	24,800	72	1,785,600
*Trenton	18,600	65	1,209 000
North Butte	19,220	145	2,790 000
United Copper	46,500	65	3,022,500
Clark mines	38,750	68	2,635,000
Miscellaneous	18,600	65	1,209,000
Totals	431,520		28,517,520

*Amalgamated.

The total output of the amalgamated companies was 18,861,020 pounds, and the output of the Washoe smelter, which treats the ores of the Anaconda, Parrot, Washoe, Butte & Boston, Trenton and North Butte companies, was 15,972,400 pounds.——Boston & Montana lost about 10,000 tons in ore production during the month because the Great Northern Railroad Co. could not supply sufficient cars to transport the ore from Butte to the smelter at Great Falls.——The North Butte is still mining only very high-grade ore, owing to the expense and trouble of hoisting it through a neighboring shaft while its own shaft is being rebuilt. When the hoist is completed the grade of ore mined will be reduced, but the tonnage will be nearly doubled.——The new Pittsburg & Montana Co. has joined the regular producers and made its first shipment of copper a few days ago.——There was a material increase in the tonnage of the Anaconda, North Butte and United Copper. The miscellaneous list received increased contributions from the mines comprised within the options of the new East Butte Mining Co.

Butte, Nov. 13.

NEVADA.

Storey County.

Considerable assessment work is being done near the Comstock this year. There is a big force at work at the Sutro tunnel doing construction work, under the management of Leon N. Hall, general manager of the Sutro tunnel for the Comstock Pumping Association. Assessment work is being done at the Brunswick lode. Gold rock, averaging $3 a ton, is being taken out of the Alpha mine in Gold Hill, which is now under a lease to J. Dietrich.

Lincoln County.

A 10-stamp mill is to be put in at Ibis, on the Santa Fe Railroad, near Searchlight. It will treat ore hauled from the Chiquita mine, in the southern end of the Searchlight district. A 500-foot shaft has been started from the lower tunnel. If water can be developed at the mine, they expect to move the mill from Ibis to the mine.——A new pump will be put in the Pompeii shaft at Searchlight to handle the increased flow of water. Sinking has been stopped at a depth of 315 feet. F. J. Spare is superintendent.

The Nevada-Utah M. Co. of Pioche will increase its force and retimber the old Phœnix shaft. As soon as the shafts are in working shape a modern pumping plant will be put in and the mine developed.

Nye County.

The Beatty Bullfrog Miner estimates that 400 men are employed in Bullfrog district. Among those working are the Providence, Lucy Jack, Red Oak, Piute Con., Crystal, Guthrie, Dores-Montgomery, National Bank, Montgomery-Shoshone, I. X. L., Mike Ryan, Starlight, Mayflower, Steinway, Eclipse, Denver, Tramps, Bullfrog Mining Co., Original Bullfrog, Gold Bar, Bullfrog Annex, Ohio Bullfrog, Bullfrog Central, Sunset Bullfrog, Great Eastern, Peerless, Golden Scepter, Diamond Queen, Gold Center Mining Co., Pick Up, Gibraltar Mines Co., Paradise and Bullfrog Western. The deepest hole in the district is the shaft of the Amargosa Mining Co., near Bullfrog. It was sunk 330 feet in the wash, on the desert in the hope of striking the ledge which shows near Ladd mountain. They found neither bedrock nor water.

Washoe County.

The Miners' Union of Olinghouse has taken the first step toward the enforcement of its law, that no Chinese be allowed in the camp, by driving two Chinese from Olinghouse canyon.

OREGON.

Baker County.

The dumps of the Golconda mine, near Bourne, have been leased to F. Ferguson, who will build flumes through which the rock will be sluiced. The rich specimens will thus be separated from the refuse and then hauled to the Sumpter smelter for treatment.

Josephine County.

At the Greenback mine at Greenback, near Grants Pass, forty stamps are dropping. The concentrates are cyanided. The main shaft is down 1400 feet. Electric power has recently been put in. W. H. Brevort of New York City is owner.——Several placer mines are being worked along upper Grave creek, 12 or 15 miles above Grants Pass. The Blalock mine will be operated all winter, and several others will start up as soon as sufficient water can be obtained.——Preparations have been completed for work on the hydraulic ground of the Columbia Mines Co., on the east fork of Grave creek, 1 mile from Placer. C. E. Foss is superintendent. Some hydraulicking has already been done in cleaning bedrock that was stripped last winter and in cutting down a bank of red clay to the gravel level.

Superintendent L. B. Wickersham has the additional ten stamps for the Granite Hill mill, near Grants Pass, in place, making a total of twenty stamps. The American Gold Fields management, owning the mine, announces that twenty more stamps will be placed by May of next year. The double-compartment shaft opens the Granite Hill vein to a depth of 450 feet, and levels have been established on each 100-foot level. —— The Condor Co is stringing its wires into the Granite Hill camp, and the change from steam to electricity will be made before the new year.

UTAH.

Salt Lake County.

The Fortuna mill, at Bingham, is to be started on low-grade ore from the mine. Concentrators are to be added.

The Kempton mining case, involving the ownership of ores valued at $16,500,000 in Bingham, has been reopened. The circuit court of appeals some time ago dissolved the injunction secured by E. A. Wall and associates, and the United States Mining Co. resumed the work of extracting ore from the property. This injunction has been reinstated by Judge Marshall and the extraction of ore has been discontinued. The litigation was started by the United States Company by bringing a suit against L. M. Lawson et al. and the decision was for the defense. The company then appealed to the circuit court. It was then that Wall entered the suit, the territory in question being about the same, the issues of Wall, the Ivanhoe Mining Co., and L. M. Lawson were joined. An injunction was obtained restraining the United States company from taking out any ore. When the matter was finally decided by the circuit court an appeal was taken to the supreme court of the United States. The court was not in session. The justice before whom the matter was brought declined to hear the case, and the dissolution of the injunction followed. A petition was then filed in the supreme court requiring the circuit court to send up all papers concerning the case. This was granted on the ground that the decisions of the Utah supreme court, the court of appeals and the supreme court of the United States were at variance with the decision of the circuit court. The question of priority of rights in locations and patents is involved. The Kempton ground is held by a location younger than the one held by the United States Mining Co., though patented before that company got out a patent. The supreme court has held that the first patent holds. The Wall interests feel that they have won a victory by having the case reopened.

Summit County.

The water in the Ontario mine at Park City has been tapped and the mine drained through the tunnel. Development work is to be resumed.

Piute County.

The Annie Laurie mill at Kimberley has been remodeled and its capacity increased to 300 tons per day. The lowest tunnel, in 4000 feet, has cut a good vein. The chute system of handling the ores has been changed to a skip system.

WASHINGTON.

Okanogan County.

P. S. Harris is working the California claims on Mount Ellemeham, near Loomis, for Drumheller & Voorhees of Spokane.

Stevens County.

T. F. Hertzell, general manager of the Enterprise mine, near Chewelah, says that on the Copper King mine a large body of ore has been opened up by tunnel at a depth of 300 feet. The Jay Gould property, 3 miles east of Chewelah, has rich silver-lead ore. The main shaft is 150 feet deep. On the Nellie S., 2 miles from Chewelah, the main shaft is 250 feet deep. The old Eagle mine is being pumped out. On the Enterprise property good results are coming from the 100-foot level.

SOUTH DAKOTA.

Pennington County.

The Blue Lead mine, near Sheridan, is being opened up by John Harnan, who is sinking a shaft to connect with a crosscut tunnel at a depth of 600 feet.——The Dakota-Calumet and the Custer Peak companies have done some work in the same district.

FOREIGN.

AFRICA.

Transvaal.

There were 425,000 ounces of fine gold output from the Transvaal mines during October, a total of 4,032,621 ounces fine gold for the first ten months of 1905.

AUSTRALIA.

Queensland.

According to the Queensland Mining Journal, the yield of gold in Queensland for September was 46,700 ounces fine, as against 52,005 ounces for September of last year, or a decrease of 5305 ounces. The falling off is spread over all the principal fields except Ravenswood, where the yield was 3817 ounces, or 849 ounces more than for the corresponding month last year. The principal decreases, however, were at Charters Towers. At Mount Morgan the falling off was 200 ounces, but the quantity of quartz operated on was larger, there having been a decrease in the value of stone treated of 1s. per ton. Charters Towers, Gympie and Croydon were also worse off in this respect than in September last year; but at Ravenswood, not only was there an improved yield, but the value of the stone treated increased from £4 15s. 11d. per ton in September of 1904 to £6 15s. 5d. per ton last month. The yield of gold for the nine months of 1905 that have elapsed was 436,286 ounces fine, as against 466,394 ounces for the corresponding month of last year, or a decrease of 30,008 ounces. The dividends for the month totaled £51,409.

CANADA.

BRITISH COLUMBIA.

Boundary District.

Work has been resumed on the Big Four group, near Eholt. James Moran is in charge.——On account of the difficulty of packing in supplies to Franklin camp, the McKinley mine will not be operated all winter, but work will be resumed again in the spring.——The Napoleon mine, near Marcus, is being worked under Harry Johns for the British Columbia Copper Co.

The Dominion Copper Co. is shipping ore from the Brooklyn, Rawhide and Stemwinder mines. The new compressor for the Rawhide has been shipped by the manufacturers.——The Oro Denoro mine, in Summit, is to be worked under the direction of R. H. Anderson. The lower ore quarry is to be opened up and ore shipments will be made over the Great Northern.

Cassiar District.

The British America Dredging Co., operating on Spruce and Gold Run, Atlin, during the past summer built 9 miles of transmission line from the central hydro-electric power plant on Pine creek to Spruce creek where, at Blue canyon, the company built a dredge with a capacity of 3500 cubic yards of gravel daily. This dredge has a digging range of 40 feet. It was started on September 10 and run until the close down for the season.

Slocan District.

No work is being done on the Fisher Maiden group, near Silverton, and it is reported that the owners will not lease it. Many other nearby properties are being worked by leasers at a profit. The lessees at the Flint have made their first ore shipment; the Enterprise on Ten Mile creek is being worked; as is also the Wakefield on Four Mile, which is under lease to Wm. Hunter. The Noonday, 1½ mile southeast of Silverton, has started up again under lease to Mr. Crow of Slocan City.

Vancouver Island.

(Special Correspondence).—The Tyee Copper Co.'s smelter at Duncans Station ran sixteen days during October and smelted 2975 tons of Tyee ore, giving a return, after deduction of freight and refining charges, of $51,237.

Duncans Station, Nov. 11.

The Britannia Smelting Co.'s works at Crofton were built primarily to reduce ore from the Lenora mine at Mount Sicker, which is connected with the smelter by 8½ miles of railway, but now the Britannia mines on Howe sound on the mainland coast, 60 miles by water from the smelter, and also the mines of southeast Alaska are expected to be the chief sources. Elaborate arrangements have been made to receive the ore from vessels. The equipment includes a sampling mill, briquetting plant, roasting yard and smelter buildings. The 42x160 water-jacketted stack has a capacity of 350 tons, the Garretson furnace 200 tons, and the cupola for remelting matte, 65 tons. Hand-charging is used and the slag is granulated. The converter plant has four shells of the trough type. Thos. Kiddie is manager, H. C. Bellinger consulting engineer, and L. E. Gooding assayer and chemist.

The main shaft of the Tyee mine at Mount Sicker is nearly 1000 feet deep.

MEXICO.

Jalisco.

The Guadalajara smelter has been taken over by the Fundicion Metalurgica de Guadalajara, S. A. Diego Moreno, president of the Bank of Jalisco, is president and Jose S. Diaz, general manager. It is expected to begin smelting operations within two months. The Guadalajara plant now consists of a single lead furnace. The new company plans building a copper furnace. The small copper smelter at Etzatlan, which was recently taken over by the Etzatlan Copper Smelting Company, has been blown in.

Sonora.

R. K. Clancey, of the Oro Maximo mine, near Bacoachic, states that work on that property is progressing satisfactorily. They are working 120 men, and have sunk two shafts, one of two compartments, to a depth of 100 feet, as far as they could go without machinery. They are running a tunnel on one of the veins.

SIBERIA.

A recent consular report says that very little progress has been made in the Siberian mining industry, the most antiquated methods being in general use. The application of machinery or chemical processes is very rarely found. Mining machinery and appurtenances, properly introduced, will eventually meet with a big demand. Engines, pumps, boilers, cables and belts are the things most needed. Agents of concerns manufacturing these should visit Tomsk, Krasnojarsk and Irkutsk, the centers of this trade, and make enquiries as to necessities, customs and financial conditions of the market. Competition in all these products is sharp, the dealers naturally buying where the best terms can be secured. A large number of the dredges now in use were shipped from Great Britain. In Krasnojarsk agents of a British factory are competing with those of the Putiloff works in St. Petersburg. The chief local competitors are two Russian concerns, which, however, buy the principal parts from foreign countries. There is a demand for cables of medium weight. One firm running a large English commission house can handle cables of ¼, ½, ⅝ and ¾ inch in diameter. Sheet iron, used chiefly in eastern Siberia, is supplied by English concerns.

Personal.

W. A. PRICHARD is at Mexico City.

JAMES DOUGLAS is at Globe, Arizona.

H. H. MILLER, of New York, is now at Mexico City.

JOHN A. CHURCH passed through El Paso on November 7.

FRANK FOURNIER has returned to El Oro, Mexico, from Paris.

C. C. BURGER, of New York, is inspecting mines at Clifton, Ariz.

L. L. HUBBARD, of Houghton, Michigan, is visiting Tonopah, Nevada.

WM. M. BREWER has returned from California to Vancouver, B. C.

J. H. CURLE has been visiting Tonopah, Nev., and is now at New York.

A. L. GRANT has charge Grouse Mountain properties, near Grants Pass, Or.

CHAS. FIEHI has been appointed manager Virgilia G. M. Co. at Eldora, Colo.

THOS. CARLYON is now head mining captain at the Arcadian, Houghton, Mich.

W. M. THOMPSON is general manager Rosario y Anexas M. Co. at Elta, Oaxaca, Mex.

JAS. W. MALCOLMSON has returned to El Paso from a trip in western Chihuahua.

W. H. KINNON, Denver, Colo., is in Tucson, Arizona, where he will probably locate.

W. E. SHARPLES has resigned his position with the Power & Mining Machinery Co.

W. A. KIDNEY has been made general superintendent Heinze interests at Butte, Mont.

JOHN BOYLE has been appointed general manager Oro Plata mine, near Kingman, Ariz.

F. J. SEIBEL is superintendent Burlington mine, near Sutter Creek, Amador county, Cal.

GEO. MILLER has been appointed superintendent Sunnyside M. Co. at Twin Lakes, Colo.

C. T. PETERSON is manager Nighthawk M. Co. at Nighthawk, Okanogan county, Wash.

W. H. FROST succeeds E. W. Guthrie as president Western Gas Engine Co., Los Angeles, Cal.

D. G. DAVIES, superintendent Carnegie-Montana M. Co., Sheridan, Montana, is in Pittsburg, Pa.

C. J. BANDMANN of San Francisco has charge of mines of Magdalena M. Co., near Llano, Sonora, Mexico.

B. H. BENNETTS has been appointed superintendent American Smelting & Refining Co.'s smelter at Garfield, Utah.

N. H. EMMONS has been appointed mining engineer for the Old Dominion Copper M. & S. Co., at Globe, Ariz.

R. S. SHAINWALD, secretary The Paraffine Paint Co., San Francisco, Cal., was in Denver, Colo., last week on his way East.

W. C. HAMMATT has been reappointed assistant superintendent Iron Mountain mine of Mountain Copper Co., near Redding, Cal.

F. M. SIMPSON is in charge of a cyanide works at Zacuma, Ecuador, South America, for the South American Development Co.

R. P. KIRK has resigned as superintendent Big Bend Cinnabar M. Co., at Big Bend, Texas, to resume consulting work at El Paso.

GEO. W. MEYERS, representing Chrome Steel on the Pacific coast, who is at present in Australia, expects to return to San Francisco, Cal., by January 1st.

JAS. C. H. FERGUSON, Pacific coast representative Midvale Steel Co. at Philadelphia, has gone to El Paso to attend the session of the American Mining Congress.

G. E. SCHROEDER has been selected as successor to A. C. Beatty, who recently resigned as consulting engineer Stratton's Independence mine, at Cripple Creek, Colo.

N. D. PHELPS has been appointed sales manager mining, crushing and cement machinery department Power & Mining Machinery Co., to succeed T. H. Tracy, who has resigned.

H. W. TURNER, E. M., superintendent of mines for the Ladd Metals Co., of Portland, Or., left San Francisco, Cal., for Portland on the 15th inst. He contemplates an early trip to southeastern Alaska.

F. M. ESTES, JR., has been appointed chief engineer Camp Bird, Ltd., at Ouray, Colo., succeeding W. F. Harris, who has gone to Nicaragua to become general manager Leonesa M. Co., Matagalpa, Nicaragua.

C. M. BECKER, general manager Stratton's Independence mine at Cripple Creek, Colo., has returned from London, where he spent two months with the officers of the Venture Corporation, owners of the mine.

A. P. PECK has joined the Allis-Chalmers Co. and will hereafter be connected with the New York office of that company. He will travel throughout the New York district, giving attention particularly to the sale of power and electrical machinery.

THE following left Denver, Colo., Nov. 12 for the American Mining Congress at El Paso, Texas: E. M. De Lavergne, general manager Elkton Con. G. M. Co., F. C. Costello and Geo. L. Keener, Colorado Springs, Colo.; V. C. Alderson, president School of Mines, Golden, Colo.; J. G. May, E. L. White, Commissioner of Mines, and G. W. Schneider, assistant Commissioner of Mines, Denver, Colo.; Chas. Himrod, Boise, Idaho, and A. H. Roller, manager Shafter M. Co., Idaho Springs, Colo.

Books Received.

The United States Geological Survey has issued, as Water Supply and Irrigation Paper No. 140, "Field Measurements of the Rate of Movement of Underground Waters," by C. S. Slichter, and, as No. 152, "Review of Laws Forbidding Pollution of Inland Waters in the United States," by E. B. Goodell.

"The Production of Petroleum in 1904," by F. H. Oliphant, forms an extract from "Mineral Resources of the United States," as published by the U. S. Geological Survey. This is a comprehensive and detailed analysis of the world's petroleum production and contains considerable information regarding the productive fields and regarding the uses of oil.

The Mines Branch of the Department of the Interior of the Dominion Government at Ottawa, Canada, has issued two valuable monographs by Fritz Cirkel. The first deals with "Mica, its Occurrence, Exploitation and Uses," the second with "Asbestos, Its Occurrence, Exploitation and Uses." In the former the author presents an exhaustive discussion on the physical and chemical properties and geographical distribution of the micas, specifically in Quebec and Ontario, but devoting considerable space to foreign occurrences. He then describes the mining and preparation of mica for commercial purposes, comparing different methods. In the latter he discusses the location and geology of Canadian asbestos deposits, the mining and separation, foreign occurrences and the practical applications. Each is evidently the result of considerable research in the Canadian field and is valuable as an intelligent portrayal of present conditions there. Foreign deposits are described apparently from the works that have already been published and which since have been antiquated by recent developments. The chapters on geological occurrence and economical working are excellent.

"The Proceedings of the Chemical, Metallurgical and Mining Society of South Africa, May, 1902–June, 1903," Vol. III, published by the society at Johannesburg, Transvaal. In this volume there conveniently are assembled the papers read at the monthly meetings, with complete discussion on each. These are: "Notes on the Analysis of Cyanide Solutions," by A. F. Crosse; "Treatment of Slimes by Filter Presses," by C. Dixon; "Smelting and Refining Zinc-Gold Slimes," by E. H. Johnson and W. A. Caldecott; "Improvement in Extractor Boxes," by S. B. Hutt; "Improved Wash Bottle," by E. H. Weiskopf; "Residual Products of the Dynamite Factory and Their Value to the Gold Industry," by W. Cullen; "The Thermo-Hyperphoric Process," by A. T. Firth; "Notes on Valuing a Gold Mine," by T. L. Carter; "Lead Smelting of Zinc Gold Slimes," by P. S. Tavener; "Mine Sampling of the Main Reef Series," by D. J. Williams; "Use of Petroleum Oil Gas as Applied to Smelting, Laboratory and Drill Heating Furnaces," by David Laird; "Theory of Misfires," by E. H. Weiskopf; "Notes on Commercial Cyanide of Potash," by A. Whitby; "Miners' Phthisis," by W. Cullen; "Regeneration of Working Cyanide Solutions Where Zinc Precipitation Is Used," by A. F. Crosse; "Quartz Milling on the Rand," by Fraser Alexander; "Extraction of Gold from Cyanide House Slimes," by John Fleming; "Automatic Sampler," by C. H. Pead; "Refining of Lead Bullion," by F. L. Piddington; "Remarks on Banket Formation," by A. R. Sawyer.

Obituary.

H. I. HIGGINS, a well-known Colorado mining man and former manager American Smelting Co., died in Denver, Colo., on the 10th inst.

P. P. BUSH, an old and honored business man of Denver, Colo., died at his residence in that city on the 10th inst. His was a genial, kindly nature and he will long be held in cordial remembrance by those who knew him.

BEAUCHAMP H. SMITH, second vice-president of the S. Morgan Smith Co. of York, Penn., died in his home in Los Angeles on November 1st, at the age of 36 years. Mr. Smith went to Los Angeles about five years ago for the benefit of his health, since which time he has resided there, and hopes of a complete recovery were entertained.

Trade Treatises.

Bulletin No. 61 of the Crocker-Wheeler Co., Ampere, N. J., details the construction and use of large sizes of their Belt-Type D. C. machines.

"Water-Wheel Type Alternating Current Generators" are pictured and described in all details of construction in Bulletin 360 of the National Electric Co. of Milwaukee, Wis.

The new catalogue of Wm. Jessop & Sons, Ltd., 91 John St., New York City, gives many practical points regarding the use of their high-grade tool steel, of value to steel users.

A finely arranged array of testimonials and references, illustrated by portrayal of some of their telephones, is received from the Stromberg-Carlson Telephone Mfg. Co., Chicago, Ill.

The Ingersoll-Sergeant Drill Co., 11 Broadway, New York City, show the varied uses to which their stone channelers are put in catalogue No. 60. The details of construction of different types are illustrated and described, and their operation is portrayed under various conditions.

From the department of publicity of the Allis-Chalmers Co. are received: Catalogue No. 127, sampling plants and equipment; bulletin 1405, portable rock crushing plants; bulletin 1406, forged steel balls; and bulletin 1407, Bennett's pouring spoon, all of which are replete with practical and accurate data of special interest to all users of those devices, and prepared in a most attractive and interesting manner.

"Gold and Silver Milling," catalogue No. 5 of the Power & Mining Machinery Co. of Cudahy, Wis., presents pictures and descriptions of the various machines used in the treatment of gold and silver ores. It is of value to anyone intending mill construction. Accompanying bulletins give more detailed treatment to certain auxiliary apparatus. No. 25 describes the Niedermeyer jig, which treats unclassified ore and has a great stated capacity. Improved Huntington mills and crushing rolls are represented in Nos. 27 and 28.

Commercial Paragraphs.

A GOLD MEDAL has been awarded to the exhibit of the Department of Pharmacy of the University of California by the Lewis & Clark Exposition at Portland. This exhibit as prepared under the direction of Prof. F. T. Green was described in a recent issue of this journal.

AT a meeting of the directors of the Taylor Iron & Steel Co., held in New York City, Oct. 31, 1905, several changes were made among the executive officers of the company. L. H. Taylor resigned as president, and was succeeded by R. E. Jennings of Jersey City, N. J., who has been vice-president of the company since it was organized in 1891. P. Chrystie was elected vice-president to succeed Mr. Jennings. Knox Taylor was elected general manager. The officers at present are as follows: President, R. E. Jennings; vice-presidents, P. Chrystie and H. M. Howe; secretary and treasurer, T. F. Budlong; general manager, Knox Taylor.

THOSE in charge of smelting plants recognize the importance of giving personal attention to small details in the purchase of supplies. Regarding an item like Stephenson bar belt dressing which is made by the Stephenson Mfg. Co., of Albany, N. Y., E. A. Kellogg, treasurer of the company, reports that their volume of business is steadily increasing despite the fact that they have no personal representative in the field. They make their appeal for the patronage of belt users in asking permission to send a free sample of their product by mail to anyone interested. And they do this immediately upon receipt of a 2-cent stamp. They assert that "Stephenson" stands for quality, economy and efficiency, and that those who bought it 18 years ago still use it—and on the same old belts.

AT a meeting and banquet of the Technical Publicity Association held at the Aldine Club, New York, November 3, the following officers were elected: President, C. B. Morse, Ingersoll-Rand Drill Co.; 1st vice-president, H. M. Cleaver, Niles-Bement-Pond Co.; 2d vice-president, Frank H. Gale, General Electric Co.; secretary, Rodman Gilder, Crocker-Wheeler Co.; treasurer, H. M. Davis, Sprague Electric Co.; members of executive committee, Graham Smith, Westinghouse Companies and Chas. M. Manfred, Johns-Manville Co. Mr. H. M. Davis addressed the Association on "The Advertising Appropriation." An informal discussion followed, in which the members exchanged views on the disposition of advertising appropriations, the relative amount that should be spent in magazine and circular advertising, the relation between the advertising appropriation and the volume of business, etc.

THE De La Vergne Machine Co., of New York, which has recently completed its contract for 40,000 H. P. of Koerting two-cycle double-acting gas engines, of which 32,000 H. P. is employed for driving blowing engines and 8000 H. P. for driving direct current and polyphase alternating current generators, have recently been given a contract for three 500 H. P. Koerting gas engines to be direct connected to 325 K. W. 550-volt direct current Crocker-Wheeler generators for the Boston Elevated Co. These engines will be put in operation about January 1, 1906. The company has established a branch agency at Atlanta, Ga., to cover North Carolina, South Carolina, Alabama, Florida and Georgia. This agency will handle business connected with the three lines of machinery manufactured by the De La Vergne Machine Co., viz., refrigerators and ice making machinery, Hornsby-Akroyd oil engines and Koerting gas engines. Their representative will be Mr. W. M. Hargreaves; the office will be at 510 Candler Building.

Latest Market Reports.

SAN FRANCISCO, November 17, 1905.

METALS

SILVER. — Per oz., Troy: London, 29¼d (standard ounce, 925 fine); New York, bar silver, 63½c, refined (1000 fine); San Francisco, 63½c; Mexican dollars, 51c, San Francisco; 48¾c, New York.

The price of silver quoted to-day is still higher than last week—63¼ cents. The direct cause of this continued increase in price is not apparent.

COPPER.—New York: Standard, $16.35@; Lake, $16.50 @ 17.00; Electrolytic, $16.75; Casting, $16.25 @ 16.50. San Francisco: $16.75. Mill copper plates, $18.00; bars, 18@24c. London: £75 5s spot per ton.

Copper shows another movement upward this week, the price once more touching 17 cents. It is said that most of the large consumers have placed their orders, and that the price is unlikely to take another advance at once, and even may fall off a fraction. Production and consumption of the metal at the present time are remarkably even.

LEAD.—New York, $5.55; St. Louis, $5.15; San Francisco, $5.00, carload lots; 5½c 1000 to 4000 lbs.; pipe 7½c, sheet 8, bar 6¾c. London: £15 6s 3d ℔ long ton.

SPELTER.—New York, $5.55; St. Louis, $6.00; London, £28 10s ℔ ton; San Francisco, ton lots, 7c: 100-lb lots, 7¾c.

TIN.—New York, pig, $33.15@33.40; San Francisco, ton lots, 34c; 500 lbs., 35c; 200 lbs., 36c; less, 37½c; bar tin, ℔ lb., 40c. London, £152 2s 6d.

PLATINUM.—San Francisco, crude, $18.50 ℔ oz.; New York, ingot, $20.50 ℔ Troy oz. Platinum ware, 75@$1.00 ℔ gram.

QUICKSILVER.—New York, $40.00@$40.50, large lots; London, £7 5s 0d; San Francisco, local, $38.00@39.00 ℔ flask of 75 lbs.

BABBITT METAL.—San Francisco, No. 1, 10½c; No. 2, 8c; No. 3, 7½c; extra, 17½c; genuine, 32½c; Eclipse, 35c.

SOLDER.—Half-and-half, 100-lb. lots, 22.00c; San Francisco, Plumbers', 100-lb. lots, 19.15c.

ZINC.—Metallic, chemically pure, ℔ lb., 50c; dust, ℔ lb., 10c; sulphate, ℔ lb, .04c.

NICKEL.—New York, 55@60c ℔ lb.; ton lots, 40@47c.

ALUMINUM.—No. 1, 99%, small lots, 37c ℔ lb.; 100 lbs.. 35c; 1000 lbs. 34c; ton lots and over, 33c, Pittsburg. No, 2, 90%, small lots, 34c; ton lots and over, 31c, Pittsburg.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, $17.35; gray forge, $14.60; San Francisco, bar, 3½c ℔ lb., 3¾c in small quantities.

STEEL.—Bessemer billets, Pittsburg, $26.00@$27.00; open hearth billets, $27.00@$28.00; San Francisco, bar, 7c to 13c ℔ lb.

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 7¾c; less than 500 lbs., per lb., 8c; in 25-lb. tin pails, ½c ℔ lb. above keg price; in 1 and 5-lb. tin cans, 100 lbs. per case, ½c per lb. above keg price. Dry Lead.—In bbls., 1 ton and over, 7½c; do. in kegs, 8c.

LIME.—Santa Cruz, $1.35 country, $1.25 city ℔ bbl.

CEMENT.—Imported, $3.00@4.00 ℔ bbl.; California, carload lots, $1.80 f. o. b. at works; small lots, $2.10 ℔ bbl. in sacks, 4 sacks to bbl., 5c for each sack returned.

LUMBER.—(Retail): Pine, ordinary sizes, $24.00@ 25.00; extra sizes higher; redwood, $28.00@30.00; lath, 4 feet, $4.50@5.00; pickets, $21.00;shingles, $2.50 for No. 1, and $2.25 for No. 2; shakes, $13.50 for split and $15.00 for sawed; rustic, $28.00@35.00.

NAILS.—This week the basic prices are: Wire, $2.77; Cut, $3.25. Meanwhile the nominal quotations per keg (list prices) are: No. 20d to 60d, Wire, $3.35; Cut, $3.55; 10d to 16d, Wire, $3.45; Cut, $3.35; 8d, Wire, $3.50; Cut, $3.50; 6d and 7d, Wire, $3.60; Cut, $3.60; 4d and 5d, Wire, $3.70; Cut, $3.70; 3d, Wire, $3.85; Cut, $3.85; 2d, Wire, $4.10; Cut, $4.10. Special rates for carload lots.

GENERAL SUPPLIES.

ANTIMONY.—New York, Cookson's, 11½c; Hallett's, 12½c; San Francisco, 1000-lb. lots, 14c; 300@500-lbs. 12c; 100-lb. lots, 13c.

BISMUTH.—Subnitrate, ℔ lb., $2.10.

BONE ASH.—Extra No. 1, 5@6c ℔ lb; No. 1, 4@5c.

BORAX.—Concentrated, 7@8c ℔ lb; powdered, 9@10c; fused, 25@30c; crystal, 7c.

CANDLES.—Spear Brand, 16 oz. adamantine, 40s., 11c ℔ set; 14 oz. adamantine, 40s., 10c; 12 oz. adamantine, 40s, 9c; 10 oz. adamantine, 40s, 8c; 16 oz. stearic, 40s, 12½c ℔ set; 14 oz. stearic, 40s, 11½; 12 oz. stearic, 40s, 10½c; 10 oz. stearic, 40s, 9½c. 100-case lots and over, ½c less. Not less than 50-case lots, ¼c less. Boxes of 20s, price ½c advance.

CAPS.—3x, $5.50@6 per 1000; 4x, $6.50@7; 5x, $8@8.50: Lion, $9@9.50, in lots not less than 1000.

CHEMICALS.—Cyanide of potassium, 98%–99%, jobbing, 23@24c ℔ lb.; carloads, 23@23½c; in tins, 30c; soda ash, $2.00 ℔ 100 lbs.; hyposulphite of soda, 3@3½c ℔ lb.; caustic soda, in drums, 3@3½c ℔ lb.; Cal. s. soda, bbls., $1.10@1.20 ℔ 100 lbs.; sks., 90c@$1.00; chlorate of potash, 12@13c; nitrate of potash, 6¾@7c; caustic potash, 10c in 40-lb. tins; roll sulphur, 2¼@2½c; powdered sulphur, 2¼@2½c; flour sulphur, French, 2¼@—c; alum, $2.00@2.25; California refined, 1¾@2c; sulphide of iron, 8c ℔ lb.; copper sulphate, 5½@5¾c; chloride of lime, spot, $2.50@2.75; sulphuric acid, in carboys, 66% B, 1¾@2c ℔ lb.; nitric acid, carboys, 8c ℔ lb.

CHROMIUM.—90% and over, ℔ lb., 80c.

FIRE BRICK.—Domestic, carloads ℔ 1000, f. o. b., factory square, $25.00; soap and split, $22.50; arch and wedge, $27.50; skewback, $30.00; circle, $32.00.

FIRE CLAY.—Domestic, ℔ ton 2000 lbs. in 125-lb. bags double, and dry ground, f. o. b., factory, $8.50.

FUSE.—Triple tape, $4.00 per 1000 feet; double tape, $3.55; single tape, $3.10; Hemp, $2.85; Cement No. 2, $3.10; Cement No. 1, $2.75, in lots of 3000 and up.

OILS.—Linseed, boiled, bbl., 50c; cs., 55c; raw, bbl., 48c; cs., 57c; Lucol oil, boiled, bbl., 48c; cs., 53c; raw-bbl., 46c; cs., 51c. Kerosene—Pearl, per gal., 17½c; Astral, 17½c; Star, 17½c; Extra Star, 20½c; Eocene, 19½c; Elaine, 26c; Water White, in bulk, 11c; Mineral Seal, iron bbls., 18c; wooden bbls., 20½c; cs., 24c; Mineral Sperm, cs., 26½c; Deodorized Stove Gasoline, bulk, 14½c, do., cs., 21c; 86° Gasoline, bulk, 25c; do., cs., 31c; 83° Naphtha or Benzine, deodorized, in bulk, per gal., 12½c; do., in cs., 19c; Lard Oil, E. W. S., bbl., 75c; cs., 80c; Neats-foot Oil, pure, bbl., 63c; cs., 78c; Sperm, crude, 63@68c; Natural White, 68c; Bleached, do., 68@73c; Whale Oil, cs., 52@67c.

LITHARGE.—Pure, in 25-lb. bags, 9½@10½c ℔ lb.

MAGNESIUM.—Pure, N. Y., $1.60.

MANGANESE.—Black oxide, ℔ lb., 2¾@4c.

MERCURY.—Bichloride, ℔ lb., 77c.

MOLYBDENUM.—Best, $2.75 ℔ lb.

PHOSPHORUS.—American, ℔ lb., 70c.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitroglycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1**, 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2, 35%, carload lots, 9½c; less than one ton, 11½c. No. 2**, 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2.00 per keg.

RED LEAD.—500 lbs. and over at one purchase, ℔ lb. 7½c; less than 500 lbs., 7¾c.

SILVER.—Chloride, ℔ oz., 90c@$1.00; nitrate, 54c

SODIUM.—Metal, ℔ lb., $1.

TUNGSTEN.—Best, ℔ lb., $1.20.

URANIUM.—Oxide, ℔ lb., $3.40.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS United States and Foreign Patent Agency the following are worthy of special mention:

VEHICLE WHEEL BEARING.—No. 803,849. Nov. 7, 1905. H. C. Peterson, San Francisco, Cal. The object of this invention is to provide an anti-frictional bearing for wheels in which the parts of the bearing are attached to ends of the wheel hub without any interior box, and they are especially useful for converting old wheels. The invention consists in a ball-bearing for vehicle wheels, collars having annular channels in their inner ends, and concave interior ball-bearing cups, bands upon the wheel hub, to which said ball cups are fixed, an axle spindle extending through the hub, having a nut at its outer end and a collar on its inner end, ball-bearing cones fixed to the nut and to the collar, respectively, and dust-including disks inclosing the collar and bearings, said disks having lugs by which they are secured to the wheel hub.

CONVEYING APPARATUS.—No. 803,944. Nov. 7, 1905. T. Wallace and F. Nash, San Francisco, Cal. The particular object of this invention is to provide a simple, practical means for the expeditious loading of vessels with such goods as flour, grain, rice, and the like, which goods are usually put up in sacks or bags and, being soft, can be tumbled about more or less without injury. The device comprises an inclosed chute, having means at its upper end for suspending it, and provided with a series of inside oppositely disposed inclined arresters, said chute having a feed opening at the top and discharge openings at one side opposite the corresponding arresters, hinged closures for said discharge openings, and a deflector fitting one of said openings and arranged to be held in continuation with the corresponding arrester.

GOLD SAVING APPARATUS.—No. 803,868. Nov. 7, 1905. W. D. Baney, Tonopah, Nev. The chief object of this invention is to provide a convenient, simple, practical amalgamating machine and washer of large capacity for use particularly in localities where water is scarce. It consists in a gold saving apparatus, the combination of a tank, a horizontally disposed amalgam cylinder supported to rotate in said tank and having ingress and egress openings at opp site ends, a cylindrical agitator extending through the cylinder and supported to rotate independently thereof, a screw conveyor operating in the agitator and means for rotating the cylinder, the agitator and the conveyor. There are other details of construction arranged and combined to bring about the desired result.

QUICKSILVER TRAP. — No. 803,934. Nov. 7, 1905. P. Somerville, Bishop, Cal. The invention relates to a trap which is designed to separate quicksilver from slimes, tailings, and other material with which it may be associated, and to allow worthless material to pass off while the quicksilver is diverted and saved. The device comprises a pair of amalgamating and vertically disposed plates and an intermediate iron plate with insulating supports and gaskets to form joints at the bottom of the amalgamated plates, and a yoke having shoulders by which the lower edges of the plates are forced into close contact with the gaskets, pivots about which the yokes are turnable and screws bearing upon the pivots whereby the yokes may be adjusted to regulate the pressure upon the gaskets.

SUBMARINE BOAT.—No. 803,885. Nov. 7, 1905. H. O. Eiane, of the United States Navy. This invention relates to improvements in submarine vessels or those capable of traveling at will either beneath or on the surface of the water. The main objects are to provide a vessel or boat of this character which will be capable of a wide range of action, being quickly turned about in either direction and easily and quickly raised or lowered, which will necessitate a minimum intake of water for purposes of submergence, which will enable the replenishment of the air supply from the surface when submerged, and which will have a novel form of closure for the torpedo tubes.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market street, San Francisco, has official reports of the following United States patents issued to Pacific Coast inventors:

FOR THE WEEK ENDING OCTOBER 31, 1905.

803,084.—ADVERTISING DEVICE.—M. S. Alexander, Los Angeles, Cal.
803,150.—WAVE MOTOR—W. P. Clinton, Point Richmond, Cal.
803,400.—CABINET—G. F. Conley, Joseph, Or.
803,402.—CONVEYOR—T. Cox, Portland, Or.
803,405.—VENDING MACHINE—Davis & Swetland, Portland, Or.
803,238.—CAR COUPLING—G. C. Harlin, Seattle, Wash.
803,484.—SINKING WELLS—Hickox & Killefer, Los Angeles, Cal.
803,485.—TABLE AND DESK—E. Higgins, Soldiers' Home, Cal.
803,287.—LEVEL—J. Hodgson. Thornton, Wash.
803,230.—SPACING DEVICE—F. F. Hough. Seattle, Wash.
803,231.—PIPE WRENCH—E. Huntley, Seattle, Wash.
803,167.—FRUIT PICKER—C. B. Hyson, Everett, Wash.
803,232.—CORRUGATING PIPE—Isaacs & Speed, Oakland, Cal.
803,114.—BOTTLE SEAL—G. Knutzen, Berkeley, Cal.
803,182.—LUBRICATOR—L. B. Manes, Elsinore, Cal.
803,535.—GARMENT SUPPORTER—Mensor, Greenblatt & Pelta, Seattle, Wash.
803,432.—SAW SET—J. C. Reckweg, Los Angeles, Cal.
803,367.—CUSHION TIRE—W. J. & C. G. Shaw, Los Angeles, Cal.
803,369.—MORTISING MACHINE—C. J. Stafford, Bakersfield, Cal.
803,376.—WEIGHING MACHINE—F. F. Wear, San Francisco.
803,382.—SWITCH TONGUE—J. C. Wilson, Nespelem, Wash.
803,384.—DRUM CORD BRACE—D. M. Wright, San Francisco.
37,600.—DESIGN—S. T. Stuver, Bellingham, Wash.
37,601.—DESIGN—S. T. Stuver, Bellingham, Wash.

Common Sense

teaches us that **RUBBER** against an article creates friction. In fact, we wear rubber soles—use rubber on steps, etc., to prevent slipping—to create friction.

Why do you use **ENGINE PACKING** with rubber on top—on the bottom—and in between—where it is rubbing against the rod all the time—creating excessive friction—loss in power—fuel—money?

No such mistake in

"EUREKA" PACKING.

The rubber is where it should be—embedded in flax—which takes the wear—the lubricants prevent friction.

Isn't it up to you to try **GENUINE "EUREKA,"** particularly as the price is one-half less?

JAS. L. ROBERTSON & SONS, 195 Fulton St., New York

AIR COOLED DUNTLEY ELECTRIC DRILLS

Capacities 0 to 2½ inches. Under test have removed largest amount of metal of any portable drilling device yet devised.

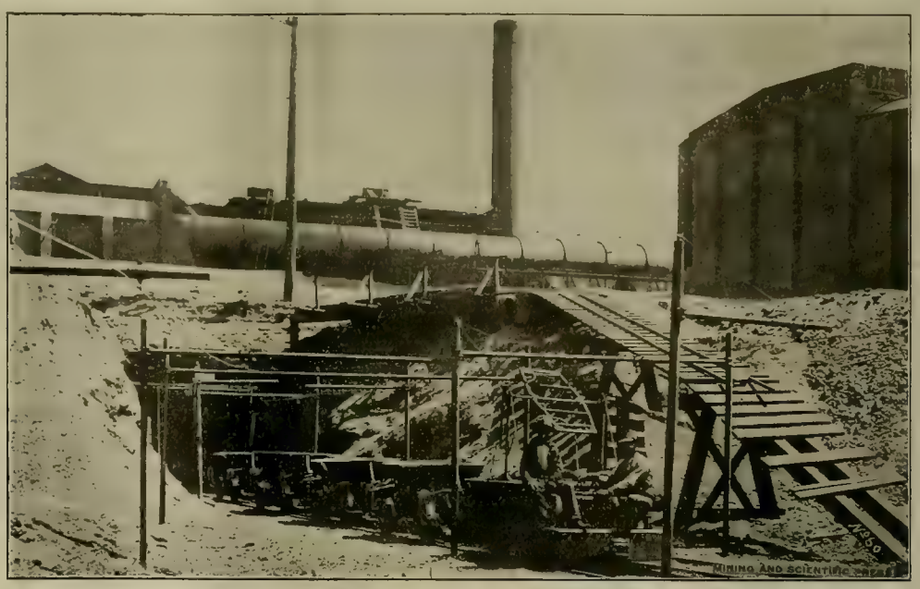
Mine Capitalization.

In the incorporation of new mining companies it is often a question with those most interested what figure to set upon the property, or, in other words, for what amount to incorporate. A glance at the list of capitalizations of mining companies finds them to run from a few thousands of dollars into many millions. It is not always the large and rich, productive mine that has the largest capitalization. There are many mines which have never paid a dividend, and which, in all probability, never will, which have a capitalization of $5,000,000 to $10,000,000, and even more; while, on the other hand, some of the most profitable mines have a relatively small capitalization. Of this class the Calumet & Hecla mine at Houghton, Mich., affords the most striking example and represents an extreme case. The property is capitalized at $2,500,000 and has paid over $85,000,000 in dividends. The Homestake Co. was originally capitalized at $10,000,000, which was increased to $12,500,000 upon adding other property to its holdings, and then to $21,000,000, and later, as additional property was acquired, the capitalization was again increased until it has reached the sum of $21,840,000. The consolidated property has paid over $18,000,000 in dividends, and indications are it will pay many millions more. As there appears to be no direct ratio between capitalization and dividend-paying capacity, as demonstrated by developed and operating mines, it must then be considered a matter of expediency what capitalization to place upon an undeveloped mining property. In manufacturing, the capital is usually determined by the interested capital; but in mining this cannot be similarly employed with equal advantage, for the reason that a rich mine may be profitably worked with a plant costing but a small portion of its annual output, while a large and expensive equipment on a low-grade mine may produce only limited results. Generally it may be considered good business to place the capitalization at as low a figure as is commensurate with the dignity of the company and its probable capacity to pay dividends. To place the capital stock at too low a figure suggests to some the probability that the proposition has only fair or uncertain merit, and that it is in the category of small affairs, while an excessive capitalization may give it the appearance of being unsound and an unsafe investment. After all, the capital stock does not furnish a fair index of the value of the mine nor of its earning capacity. The average new mining corporation may capitalize at any reasonable figure, but the price at which the public is asked to subscribe for the stock is a matter requiring much more careful consideration. It should be shown by the promoters of the enterprise that the proposition is reasonably worth development; that it has the elements of success if these be properly handled, and that the amount of money asked for it is not in excess of its needs.



Electric Haulage at Cananea, Mex. (See Page 359.)

MINING at the Mount Morgan mine in Queensland, Australia, has seen many changes in methods since the discovery of the property. At first it was assumed that it was a superficial deposit — a sort of siliceous sinter deposited from hot springs. In accordance with this view the mine was worked superficially. Later it was found that the ore deposits were due to other causes and extended downward, and extensive underground workings were opened in the great deposit. Now, after twenty-five years of steady operation, it is found that it is more economical to work the deposit by benching in open cuts, employing steam shovels in handling the broken material. In this work the large timbered underground workings are laid bare, and much of the timber is recovered for use in the lowest workings of the mine in the sulphide zone. As this work of benching progresses downward it has been found that the waste overlying portions of the ore body is becoming troublesome and must be removed to prevent collapse into the open pits, which are constantly growing deeper as the work proceeds. This great open cut is now approaching in depth the deepest of the diamond pits at Kimberly in South Africa, as they were formerly worked. The waste from the surface will now be sent into the lowest levels for filling the stopes. What further change will take place in the working methods, the ore, and the metallurgy of this great mine, time alone can tell.

SOME base metal mines are quite as satisfactory to own as gold or silver mines. The Bunker Hill & Sullivan lead-silver mine has gradually increased its output until it is now enabled to pay a monthly dividend of $180,000. Some of the larger copper mines of the United States are more profitable than most of the gold mines, while in Missouri large profits are derived from zinc and lead deposits lying close to the surface and in which only comparatively limited capital is invested.

IT is in the discussion of the papers of technical societies that the greatest value of these contributions lies. A critical analysis of statements contained in technical papers must lead to fuller knowledge of the subject discussed. By criticism of this kind, which need not be either sarcastic or cynical, but earnest and fair, the facts are brought forth. The discussion may not dispute a single statement of the original paper, but may possibly add much of value to it. On many important matters in the mining business there is diversity of opinion. There are always old questions to be revived and new ones to be considered. What important question, as an example, has more theory wasted on it that the genesis of ore deposits. There have always been contradictory opinions on this subject and there probably always will be. With all the light which recent research and voluminous literature has thrown on this matter the theorists still contend with each other, and few are fully satisfied, even with their own theory. If all of the statements made by those contributing technical papers to scientific and technical societies are to be accepted without analysis, the records of such societies would soon be found teeming with misstatements due to various kinds of errors. These the discussions have a tendency to correct, and to the facts are added new facts and additional information until, as a result, there issues a treatise which may be considered as embodying all that is known of the subject in question at the time.

The Equipment of Small Mills.

When large mining enterprises are contemplated, and there is abundant money available to equip the property on a large scale, there is usually little difficulty in arranging matters so that "ends meet." With the small concern, however, where available capital is limited, and the contemplated equipment, although not extensive, is nevertheless as important to the success of the enterprise as that of the large concern, and frequently more so, there is room for the exercise of care and good judgment. This is a matter requiring experience. Ordinarily, the first thing to be considered is power. In many places there is a variety of methods of obtaining power available—steam generated by wood, coal or oil; water power direct; electric power generated by water, or by steam, and transmitted to the plant. This may be either a private enterprise of the mine or it may be bought from a distributing company. There are also gas engines of the various makes, and using gasoline or distillate, etc. That means of securing power which is most convenient and least expensive is usually selected.

Having decided what kind of power to install, the question arises how much power shall be provided. The requirements of each power-consuming department must be carefully considered, and when the total amount needed has been figured, care being taken not to underestimate, it is well to add at least 25% for losses, and possible required extension of plant. This latter contingency is of such uncertain character that really little consideration can be safely given to it in the figuring. It is not good business to equip a new mine with heavy and expensive machinery far in excess of its requirements for probably several years. An experienced superintendent will not purchase and set up a hoisting plant capable of lifting 5 or 6 tons from a depth of 2000 feet in one minute for the purpose of sinking a shaft from the surface, nor will he order a mill of 500 tons or more daily capacity when he has not enough ore in sight to supply 10 stamps. If mistakes are made about large plants they can usually be discovered and corrected before serious damage results, but with the small mine, a mistake of this kind will frequently result in disaster, as funds are exhausted by extravagant and unnecessary equipment, and no results beneficial to the concern accomplished.

In some districts there are numerous small mines, no one of which will justify a milling plant, because of the limited amount of ore available, and yet the ore is sufficiently rich to pay a profit even if treated in a custom mill. In such districts as this the owner of the custom mill will usually make a much higher charge per ton than the cost of milling; the money which this difference between mill charge and actual cost of milling represents would build a mill in a short time. Obviously it would be good business, then, for the several mine owners to form an association for the purpose of building a mill in which the ores from the several mines represented could be treated at cost. This would be an advantage to every mine owner concerned, and incidentally to every mine in the camp, as custom rates could be charged those mines not represented in the association.

In the same way a power-distributing company might be organized to supply power to each of several companies interested in the enterprise, thereby effecting a great saving to all concerned, both in first cost and in future operating expense. There is a decided disposition among mine owners to stand alone on individual merit, independent of others, but co-operation has in this matter many advantages, as it has in other things, and where the several owners of a number of small mines associate themselves for the common good of all an advantage must accrue to each of those interested.

THE proposition of the Alaska convention held in Seattle, Wash., suggesting that Congress pass a law restricting the number of 20-acre placer claims any one person may locate to two on any creek or tributary in that Territory, is intended to put a stop to location by agent and to wholesale location by individuals in their own interest. Such a law would probably be unconstitutional, and it is unlikely that such will be enacted. The further suggestion that each locator pay a license of $250 cash, in lieu of $100 worth of assessment work, will probably fail of accomplishing the desired result, as only a few of the prospectors in the far North can afford to pay so large a sum in cash, while the performance of $100 in work requires mostly time and small cash outlay. These efforts, while well intended and seeking to meet requirements of existing situation, seem to have been, unfortunately, misdirected. What Alaska needs is a law requiring a stated amount of assessment work within specified and limited time—say, ninety days—and then the rigid enforcement of the law.

The Metal Market.

The producers of metals, both precious and base, must certainly feel great satisfaction at the present state of the market. Without exception, metals are in demand and consequently high priced. Gold, always in demand, is the standard of values, compared with which all other metals are considered as high or low. For several weeks past silver has been gradually going higher and higher. July 1st last, silver was quoted in the New York market at 58⅝ cents. By the middle of August it had risen to 59⅝ cents, and by September had advanced to 62¼ cents. Since that time the advance, though slow, has been continuous nevertheless, until the present price of 64⅝ cents has been reached. This is a peculiar, though gratifying, condition to the miners of silver, and in many instances means just that much more profit per ounce. Where there has been no profit, it means a reduction in the cost of production in ratio to the raise in price. Silver currency of the Philippines and other countries, where the ratio of 32 to 1 was assumed a safe relationship to establish, is now in demand for melting into bar silver, for the reason that the silver dollar of those countries is, at the present price of the metal, worth more as bullion than as coin, and the laborious and carefully considered efforts of the International Exchange Commission, which adopted this ratio of gold to silver, now fail. What the future has in store for silver will be awaited with interest, particularly by the producers of that metal.

Copper is now higher than in some years past, the latest quotations being $17.25 in New York. While it may be difficult to actually obtain this price in the open market for a quantity of copper, it is the figure which affords the basis for transactions in that metal.

Tin is also high, the price now having reached $33.60, with a firm market, which indicates that there is no immediate likelihood of production exceeding the demand, with consequent drop in market price.

Lead and zinc continue to bring good prices, lead being quoted at $5.25 to $5.70 and zinc at $6.10 to $6.20 in New York.

The steady and apparently increasing demand for all of these metals indicates the prosperous condition of the industries of the country, and there is at present no sign that there will be any material decline in the prices of any of the metals above quoted; in view of which miners may look forward to a continuation of the present prosperous conditions far into the coming year.

THE American Mining Congress concluded its session at El Paso, Texas, November 18, and some of the papers read during the meeting will be found continued elsewhere herein from last week. This week the California Miners' Association is in session at Nevada City, Cal., being the first time in its history, since its organization at Auburn, Placer county, that the Association has met outside of the city of San Francisco. A number of interesting and practical papers were also read at this meeting.

IN mine sampling, in a crosscut where the ore body occurs as a zone of impregnation in schistose rock, it is manifestly not proper to take samples parallel with the schistose structure of the rock, as the values are likely to occur in streaks or in lenses. The sampling should be taken under such conditions by making continuous channels along the roof and sides of the crosscut and not at disconnected intervals as is ordinarily done when sampling along the strike of the vein.

CONCENTRATES.

In large streams a fall of 3 inches per mile will give a velocity of current of about 3 miles per hour, where the stream is straight.

The output of carborundum for 1904 is officially stated to have been over 7,000,000 pounds, an increase of 2,300,000 pounds over the production of 1903.

Why a mine owner should build a stamp mill to treat gold ore when no values can be saved in an arrastra is a question "Concentrates" is unable to answer.

Where boiler water contains a small percentage of salt (sodium chloride), it is good practice not to carry over 90 pounds pressure per square inch on the boiler.

A number of experiments made on radium-bearing minerals lead to the knowledge that the radium content of minerals bears a direct relation to the amount of uranium present.

The statutory limit of length of a quartz lode location is 1500 feet. The side lines need not be parallel, but may have angles and elbows, but the line must not exceed the statutory limit.

Cement tanks were substituted for lead-lined wooden vats at Mount Morgan mine, Queensland, Australia, several years ago. The change has been found economical and otherwise satisfactory.

When black powder is fired by electricity the electric exploders used are of low power, there being no advantage in using high power caps, as the black powder is fired by the spark, and not by detonation.

Miners' wages in the Black Hills of South Dakota are $3.50 to $4 per shift of eight hours, helpers $3 to $3.50. This is in Lawrence county, but in some of the mines of the southern Hills the regular wages are $3 per day.

A boiler may be set in brick or stone. If the latter, stone must be selected which will not spawl nor crack. Some volcanic tuffs make excellent boiler foundations. Blocks of steatite are also used for this purpsse with satisfactory results where the rock is firm.

When patent has issued for railroad grant land to the railroad company it is useless to attempt to claim mineral on such lands. The discovery must be made prior to patent, and the fact that the land is more valuable for mineral than for other purposes demonstrated.

Tungsten and molybdenum, and minerals containing cerium and thorium (chiefly monazite), are in demand. The tungsten minerals are principally wolframite, scheelite and hubnerite. The principal molybdenum mineral is molydenite. Zirconium is also coming into use in electricity.

The cost of drilling with diamond drill varies according to the material drilled through, and to the depth of hole drilled, it being cheaper per foot to bore holes of limited length than long holes. It is also more expensive to bore down holes than those which are horizontal or inclined upward.

The practice of placing a detonating cap attached to a fuse in a stick of nitro-powder, and bending the fuse sharply backward, so that the fuse may be on the outside of the stick, is bad practice, for the reason that the abrupt bending of the fuse is liable to open it at that point and cause a misfire.

Twelve hundred inches of water under 14 feet head will supply the power required to run a 10-stamp mill, including rock breaker and 4-drill compressor, and if the water supply is permanent, much more than this. The power required to run the above mentioned machinery is about 85 H. P. when the entire outfit is in operation.

Mine timber is best which has narrow rings and a solid appearance on the cross-section. Timber exhibiting large rings, and soft, pulpy appearance on cross-section, will rot more quickly and has not the initial strength of the fine-grained wood. Young timber of the kind known as second growth is likely to be brittle and deficient in strength.

Where a vein crosses one end of a location and then swerves and crosses a side line, it is restricted in the extralateral right to that portion of the vein between the crossed end line and the point where the vein crosses the side line where the plane is projected downward in the direction of the dip, and parallel with the crossed end line.

Good ventilation may be secured in a tunnel by means of ventilating fans, blowers, exhaust fans, water blast, and draught by means of outside furnace. The method selected should be that which will operate satisfactorily at least expense at the point of installation. The fans or blowers may be driven by any kind of power most cheaply available.

When a man has been mining for years in a single camp, and has had little or no experience outside of that camp, his judgment on mining conditions and probabilities in that camp should be good and are entitled to much consideration, but he knows so little of other districts that his opinion as to them is of little value and is likely to be erroneous. One cannot always safely reason from analogy.

When it is required to refine granulated gold by fusing with niter and borax, if a graphite pot can not be obtained and a small clay crucible must be used, it will be found that, by adding clean quartz sand, the affinity of metallic oxides and the potassium of the niter for silica is satisfied, the charge will not attack the sides of the pot. Where this precaution is not taken, broken crucibles are not of uncommon occurrence.

It is claimed that producer gas has a calorific value of 140 British thermal units per cubic foot of gas. The gas is used as motive power in driving gas engines, and in generating steam under boilers. It is also employed in furnace work and in many other ways. It is represented as the cheapest form of energy from fuel. It is made in gas producers by passing a mixture of steam and air through a bed of incandescent fuel in a closed producer.

In some shafts a distance piece (a piece of plank 2 inches thick) is inserted between the guides and the end plates, or dividers, for the purpose of keeping the guides in perfect alignment in the event of slight movement of the main timber sets. This is likely to occur where the ground is soft, or there are fissures carrying gouge. When necessary the distance piece is removed and the guides adjusted by the insertion of pieces of the proper thickness.

Salt crystallized from natural salt lake or ocean waters contains the chlorides of both sodium and magnesium. When these two salts occur together the crystalline product of evaporation is dried, pulverized and subjected to a blast of air from fans, by means of which a large percentage of the magnesium chloride is blown aside, leaving the chloride of sodium nearly pure. Salt scraped up on the shores of salt lakes, dry lakes, etc., usually contains more or less dirt, according to the care taken in collecting the material.

The specific gravity of vein quartz is about 2.6. A cubic foot weighs about 162.5 pounds. Ordinarily 13 cubic feet of quartz are estimated as representing one ton of ore in place, though generally somewhat less, but the difference is allowed, probably as a factor for safety. The amount of rock in place to constitute a ton varies greatly with the character of the ore. Thus Homestake ore requires only 10 feet to constitute a ton. Heavily sulphuretted ore requires proportionally less than clean quartz.

The value of a bar of bullion of given dimensions can only be determined even approximately by knowledge of the fineness of the metal. As gold at the present market rate is worth about thirty-two times as much as silver, it is evident the presence of a comparatively small amount of silver will greatly reduce the value of a given weight of bullion. The average value of mill gold from gold quartz mines generally is about $17 per ounce, but it ranges several dollars above and below this figure in certain particular cases.

Unless the work of rock excavation in a shaft is carried a long way in advance of timbering, it is unsafe to fire the round of holes by electricity, as the shock and flying rocks will greatly damage the timbers. There should be at least 50 feet from the last set to the bottom of the shaft for reasonable safety in such cases. Generally speaking, it is more satisfactory to fire the holes by hand, the fuses being prepared of such length that the center cut holes will be discharged first, the others following in proper order from the center outward.

Maps of the greater portion of the mining regions of the Western United States have been published, or are in preparation, by the United States Geological Survey. For sketch maps showing what portions of the several States of which maps are desired address the Director of the United States Geological Survey, Washington, D. C. From these selections may be made of the maps covering the areas desired. The several States are divided by the Survey into quadrangles and the small maps indicate the progress of the survey in the several States.

Without doubt there is a vast amount of difference between the results obtained by different men in stoking a steam boiler. The man who adds too much coal lowers the temperature in the fire box unnecessarily, which should be avoided, and this is followed after a time by a hotter fire than is required, with a consequent increase in steam pressure and generally blowing off. A stoker who understands his business will secure a greater evaporation per unit of fuel consumed than another who is inexperienced or careless about the work.

The ores of Cripple Creek occur for most part in altered andesites, and are not the white quartz veins familiar to the miners of many other districts. In a large number of the mines the higher grade ore is friable and breaks into fine material, the coarse rock containing only relatively small values. The ore is washed and sorted on reaching the surface, this rude concentration raising the value of the ore considerably. More or less sorting is done underground in most of the mines, the large waste being used in building rock walls and in filling stopes.

Where a man is employed in the capacity of watchman on idle and unpatented mining claims, he may relocate said claims for his own benefit should they become subject to forfeiture for neglect to perform the assessment work. This watchman cannot be considered as holding a fiduciary relation to the owners, being merely an employe, in no position of trust involving the control of the finances of the owners. If the owners are in arrears for wages, suit may be brought in the usual manner, but if the claims are really worth anything it would be good business to wait until Jan. 1, 1906, and to then relocate the claims, bringing suit for wages later.

Assessment work may be commenced at the last moment at the end of the year, and if continued until $100 worth has been performed this work may be charged to the year 1906, the year 1905 having had no representation. This is on the theory that the locator's title is good, whether he does any assessment work or not, until another party enters his claim and relocates it for failure of the first party to perform the work required by law. The claim may be held for years without performing this work, but always at the risk of the original locator, for at any time he is liable to lose his claim by forfeiture for non-performance of the assessment work.

The best caps to use in shooting nitro powders are the high grade varieties—XXXXX and XXXXXX. It is never good practice, nor economy, to use lower than XXXX caps. The more powerful the concussion of the cap on the nitro powder, the more perfect the explosion, and consequently, also, the result of the blast. In the winter season nitro powder often becomes chilled, and, although it may not be frozen, is too cold to shoot well unless exploded by high power caps. These high grade detonators, although more dangerous than the lower grades, are always the best, either winter or summer, because of their superior force and the results accomplished in blasting.

A recent Belgium patent thus describes a method by means of which the gold supposed to be present in sea water may be recovered: A ton of sea water is treated with about 5 cubic centimetres of concentrated aqueous stannous chloride, when the gold is converted into purple of Cassius and precipitated, together with magnesium hydrate and the excess of tin, by the subsequent addition of about a pound of slaked lime. From this precipitate the gold is extracted with dilute potassium cyanide solution, and isolated by any of the methods commonly used in the cyanide process (precipitation with zinc). Sea water from the Mediterranean and the English channel yielded no gold by this process, whereas samples from the Atlantic furnished traces.

There is considerable difference of opinion as to the amount and kind of tamping to be used in the firing of nitro powders in drill holes, or as to the necessity of tamping at all. A series of tests might do much to throw light on this subject, provided these tests could be made where the conditions as to the character, hardness and resistance of the rock mass was uniform or approximately so for the series of tests. Some maintain that no tamping is necessary; others say a little is good, and others believe that water is a sufficient tamping, while others insist if a little tamping is good, more is better. As a result of these conflicting theories we have both extremes. The manufacturers of nitro powders generally advise the use of tamping. For safety it is well to put the first tamping in lightly, only using the wooden tamping stick when the tamping has covered the charge to a depth of several inches.

As to the receiver's certificate issued to the person making application for patent for a mining claim, "Lindley on Mines" says: "Strictly speaking, the certificate of purchase does not convey or purport to convey the legal title. As between the purchaser and the Government, it carries the complete equitable title. It is evidence that the recipient has complied with all the terms and conditions which entitle him to a patent to the tract therein described, and that he has acquired a vested interest therein. The public faith has been pledged to him, and any subsequent grant of the same land to another party is void, unless the entry is vacated or set aside. When the price is paid, the right to a patent immediately arises. If not issued at once, it is because the magnitude of the business of the land department causes delay; but such delay in the mere administration of affairs does not diminish the rights flowing from the purchase, or expose him to the assaults of third parties. A right to a patent once vested is treated by the Government as equivalent to a patent, so far as it may be necessary to cut off intervening claimants. After the issuance of the receiver's certificate annual labor is no longer required on a mining claim, as the applicant is then proven to be entitled to patent, the issue of which is merely delayed by the great magnitude of business to be handled in the land office."

Plant of the Cananea Con. Copper Co., Cananea, Sonora, Mexico.*

NUMBER II.—CONCLUDED.

Written for the MINING AND SCIENTIFIC PRESS by O. P. FINDLEY.†

CONCENTRATOR.—The concentrating plant is on the side of a deep gulch, ½ mile southwest of the reduction works and on the line of the company's narrow-gauge railway. The plant proper consists of two main buildings, covering an area of 29,650 and 33,430 square feet, respectively. Concentrator No. 1 is of wood frame and corrugated iron sides, with fire-proof roofing. Concentrator No. 2 is of steel construction throughout.

The system is divided into four divisions, designated as Sections A, B, C and D. The accompanying diagram gives an accurate idea of the relative location of the main structures and various auxiliary buildings. At present an extension of 70 feet by 85 feet is being added to each of the four sections. When these are completed they will increase the total ground space to 75,000 square feet.

The original plant, completed in 1902, had a capacity of 600 tons daily. In 1904 it was found necessary to increase this to 1000 tons and add another unit capable of handling the same amount, so that at present the total capacity of the plant is 2000 tons per day.

The equipment of remodeled concentrator No. 1 is complete, comprising all the machinery usually installed and including 258 concentrators.

There is also being put in a large number of additional water clarifying tanks and spitzkasten for providing feed for the new equipment out of various slime waters now going to waste. Any power other than what is already provided will be furnished by motors.

The system of distributing and recovering the water will be noted from the diagram of the flow sheet. The general scheme is not wholly original, but has been ingenuously worked out by L. D. Ricketts, consulting engineer for the concentrators, and D. Cole, superintendent concentrator department of the C. C. C. Co. About 80% of the water leaving the mill in the tailings launders is recovered and used again.

The crushing of the ore is done in a building separate from the main plant.

The second class ore is run in on the narrow-gauge railroad in hopper bottom cars and dumped into the receiving bins. The bins consist of eight pockets, with an aggregate capacity of 2100 tons. The different classes of ore from the various mines of the company are distributed into separate bins in order that in the subsequent handling the ore may be mixed to the best advantage for concentrating purposes.

Underneath the bins runs a 30-inch conveying belt, which receives the ore from the chutes and conveys it to a grizzly with bars ¾-inch apart. The oversize from this grizzly passes to a 36-inch picking belt moving at the rate of 30 feet per minute, while the screenings descend upon a 16-inch conveyor and are transported to the concentrator bins. Sorters pick out the native copper and high-grade ore on the picking belt and load it into the tram cars, in which it is transported to the narrow-gauge railroad cars. The largest lumps of ore are broken by the sorters so that it can be handled by the automatic feeders of the crushers. The crushers are supplied by 12x24 plunger feeders, modified to handle material as coarse as 10-inch cubes without clogging.

After passing the crushers and rolls, the ore, which has been reduced to 1-inch cubes, passes to an 18-inch belt conveyor, which carries it up an incline of 18% to the concentrator bins, receiving en route the screenings from the grizzlies heretofore referred to. An automatic tripper working over the bins distributes the ore evenly over the entire surface. By means of an automatic device a uniform sample of the ore is secured as it is delivered.

Under the mill bins, conveniently situated, automatic feeders deposit the ore into launders, where it is mixed with running water and carried to the 18-inch bucket elevator No. 1, at the top of which it is divided into a double line of trommels. The course then taken, as outlined in the flow sheet, which was prepared by D. Cole, is as follows: The oversize from the ⅝-inch and ⅜-inch trommels passes to the coarse jigs and the undersize to ⅛-inch trommels. The oversize from ⅜-inch and 2½-inch trommels passes to middle jigs, and undersize to coarse hydraulic classifiers. The spigot feed of coarse classifiers goes to sand jigs and overflow of classifiers to discharge of No. 3 elevator, mixing with the crushed material from the Chilian mills. The tailings from the coarse jigs pass through 36-inch rolls to No. 2 18-inch bucket elevator; tailings from middle jigs pass through 27-inch rolls to No. 2 elevator, and tailings from the sand jigs through Chilian mills to No. 3 elevator. No. 2 elevator delivers material into ⅛-inch trommels, enabling the reground coarse and middle jig tailings to pass to the next finer jigs in the series, or, if sufficiently fine, directly through the hydraulic classifier system to the shaking tables and vanners. Auxiliary trommels with ⅜-inch holes handle the oversize from the ⅜-inch trommels, returning any spawls or pieces that may by chance have passed the coarser rolls at sizes larger than ⅜-inch. Since the jigs make no "waste" tails, this treatment insures that the limiting screens will be those of the Chilian mills, which are 20 mesh.

After being sized, either by hydraulic classification or screen, to 20 mesh, the now impoverished ore is passed to the fine sand and slimes treating department. Upon the tables handling the granular feeds, the sand middlings, tailings and muddy water middlings are separated into the table side launders. The concentrates go by shaking launder to the concentrates bins; the sand middlings to other tables at a lower level for retreatment; the muddy water middlings through centrifugal pump to pulp thickeners, thence to vanners, and the tailings to waste.

The pulp thickeners are round, wooden tanks 10 feet in diameter and 18 feet high. The slimes enter through a 12-inch wooden pipe placed in a vertical position in the middle of the tanks, and terminating within a short distance of the bottom. The tanks have hopper bottoms converging to the point from which the feed is taken out. The volume of feed taken out is much less than that coming in and a considerable overflow of clear water runs over the top of the tank in a thin sheet and is immediately recovered for use as dressing on the tables, or is sent to the settling tanks if the water has not been sufficiently clarified, as is the case when very slimy ore is treated.

No attempt is made to classify the thickened pulp, but a device is used which cuts the volume into many equal parts, both as to volume and quality, which compose the feed of the vanners, which latter produce clean concentrates and satisfactory tailings.

All tailings are gathered into one launder and conveyed to the settling tanks, where a large part of the water is made available for use in the mill again. An automatic sampler cuts through the stream of tailings at regular intervals and secures a uniform sample.

Horizontal water boxes are used as conduits wherever possible and the water is used over and over again as long as practicable. For instance, the water from the coarse jigs is largely recovered on the jig floor and used on the middle jigs, middle jig water upon the sand jigs, thence by local pump back to coarse jigs again. Muddy water from the tables goes to the pulp thickener as already indicated.

All concentrates made upon the jigs and tables pass automatically into bins located alongside the railroad spur. These bins are water tight and hopper bottomed and are fitted with water tight bin gates of a special design. The material from the bins is drawn by gravity into the railroad cars.

The water circulating plant consists of one Corliss cross compound condensing engine of 250 H. P., belted to a quill shaft having four quills with dental clutches. Each quill operates a 6-inch two-stage turbine pump at 1100 revolutions per minute, with a capacity of 1000 gallons per minute; thus the set has a capacity of 4000 gallons 150 feet high per minute. These pumps sometimes handle muddy water for considerable periods and the water is slightly acid, for which reason a 16-inch banded redwood column, discharging into the storage tanks above the plant, is used. These tanks are of redwood and have a combined capacity of 200,000 gallons. This pumping plant gives perfect satisfaction.

An additional pair of high pressure boilers are in course of erection. These will bring the boiler capacity up to 1500 H. P. at builder's rating.

There will also be installed another direct current electrical unit of 300 K.W., direct connected to a cross compound condensing Corliss engine. This, with the additions to the condensing system, including a large cooling tower, will complete the works.

When all projected work is finished, according to the present plans, the capacity of the plant will be approximately 3000 tons of second grade ore, producing from 700 to 900 tons of concentrates daily.

Some original devices that are in advance of the usual practice are found in these works and are proving very satisfactory, notably the following:

By placing small spitzkasten ahead of the hydraulic classifiers—compound classification is practiced—the feed to classifiers is drawn by spigot from the spitzkasten, and is thus very uniform in quantity, containing all of the sands suitable for hydraulic classification. The excess of water carrying the slime that is unfit for hydraulic classification passes over the spitzkasten and is laundered directly to the pulp thickeners that furnish the vanners with feed. Thus the slimes and occasional rushes of water are automatically by-passed around the classifiers, much to their benefit.

All classes of feed are unwatered before being fed to the regrinding machinery. This is accomplished by the use of specially constructed shovel wheels that are admirably adapted to the work. These wheels not only remove the feed from the water in a perfectly drained condition and act as feeders, but also separates the chips and all floating material that comes with the ore. About ten wheelbarrow loads of wood are removed from the ore in each division of the plant by this means daily. This system prevents the annoying choke-ups, etc., that come from wood chips, and since the wood is removed before it can pass through the regrinding machinery, there is no water-soaked wood pulp to plug spiggots and cause annoyance farther along in the process.

Concentrates made upon Wilfley tables and sand jigs are conveyed horizontally by shaking launders, some of which are 100 feet in length. They are made of wood, lined with rubber, and are operated by machines locally designed purposely to handle them. The vanner concentrates are removed by a special device that automatically transports them horizontally to their respective bins by the railroad track without attention or labor. Thus there is no shoveling or the use of cars, barrows, trolleys or tram tracks, with the attendant sloppy floors and extra labor found about the mills.

Each set of crushing rolls has an attachment that enables the operator to open them as much as 1½ inch instantly and without turning off the feed. This is a great advantage. The device was worked out here and applied to all machines used about the plant.

All machines that require frequent repairs have cranes or trolley tracks over them, so that repairs may be finished quickly, and the machines are so arranged that feed may be diverted and any machine cut out for repairs without interfering with milling operations or loss in feeding time.

A well equipped machine shop is situated so as to be served by the narrow gauge railroad and is connected to each section of the concentrating plant by an inclined tram track. Thus any machine on any floor of either mill can be taken to the shop for overhauling with very little trouble. Duplicate machines are kept in stock, and in the case of the smaller machines, such as centrifugal pumps, head-motion machines, shovel wheels, etc., the machines are replaced entire, the old one being sent to the shop and completely overhauled before going into use again.

SMELTER.—The process of treating the ore is by the matte and converter method. Most of the ore is smelted here, but a small portion is shipped to the American Smelting & Refining Co.'s works at El Paso, Texas. The company expects to be able within the next year to take care of its entire ore production and also do customs smelting.

The plant at present consists of eight furnaces, the dimensions of which are as follows: No. 1, 42x120 inches; No. 2, 48x120 inches; No. 3, 54x160 inches; No. 4, 54x160 inches; No. 5, 42x180 inches; No. 6, 42x210 inches; No. 7, 42x210 inches; No. 8, 56x180 inches. The latter furnace, installed about one year ago, is the largest in the Republic of Mexico and one of the largest in the world, being 56x180 inches at the tuyeres and carrying a charge of 14 feet in depth. It discharges into a forehearth 15 feet in diameter, which, as well as the crucible in the furnace proper, is lined with chrome brick. This furnace has a working blast pressure of 1¾ pound and can put through 6½ to 7½ tons of burden (or 450 to 525 gross tons) per square foot of hearth area per each twenty-four hours.

Over each furnace, except No. 8, there is a steel hood 20 feet square by 22 feet high, excepting that of furnace No. 1, which is 15 feet square by 16 feet 10 inches high.

The flue gases, after leaving the hoods mentioned above, pass through a steel flue 400 feet in length to a dust chamber 60x180x20 feet in the clear, constructed of brick and steel and designed to handle 600,000 cubic feet of free air per minute. Thence the gases pass through a brick flue 17x20x400 feet and a brick-lined steel chimney 20 feet in diameter and 200 feet high.

Serving each furnace is a steel forehearth, into which the matte and slag run in a continuous stream, the two fluids separating by reason of the difference in specific gravity. The matte from the settlers is drawn off into cast steel ladles of 67 cubic feet capacity. These ladles are handled by means of two electric overhead traveling cranes. These cranes have each one main and two auxiliary hoists, the main hoist of one having a capacity of forty tons and the other fifty tons. The auxiliary hoist of each crane has a capacity of five tons. Each crane is provided with five motors, as follows: One 50 H. P. main hoist, two 25 H. P. auxiliary hoists, one 25 H. P. bridge travel and one 7½ H. P. cross travel on the 50-ton and one 5 H. P. cross travel on the 40-ton crane. The crane runway is a continuous 30-inch plate girder carried on 8-inch Z-bar columns, spaced 16 feet and 21-foot centers, alternately. The distance between the centers of the runway girders is 50 feet, thus allowing a clear way for the main hoist of 40 feet.

The slag flows off into self-dumping cars drawn by electric locomotives, of which five are in use. Two of these are of the single-motor type, weighing four tons each, equipped with one 20 H. P. motor. The other three are of the two-motor type, weighing ten tons each and equipped with two 40 H. P. motors. These motors are fitted with a teetering trolley, which enables the motormen to reverse the direction of running with the least possible trouble through changing of trolley.

The slag cars are of the type built by the Colorado Iron Works, with a bowl holding about 33 cubic feet. A portion of these bowls are of cast steel, the others being ordinary cast iron bowls.

The slag is drawn from both ends of the smelter, the east dump being some 60 feet high. At the west end of the smelter the cars run through a tunnel and thence to a gulch, which has been filled to such an

*See illustrations on front page.
†Condensed.

extent that about twenty acres of ground have been made available for various industrial purposes.

The converter building is a steel frame structure 296 feet long and 65 feet wide, with 36½-foot walls, roofed with heavy corrugated iron.

The six stands for the converter shells are furnished with hydraulic operating mechanism, air-blast connections and valves for regulating the blast. There are twenty-two converter shells, 8 feet in diameter by 11½ feet long, fitted with 10-inch blast pipe and 14 1¼-inch tuyeres and constructed of standard steel shell plates of a thickness of 1 foot. The shells are rotated by means of hydraulic cylinders 24 inches in diameter, with a stroke of ram 7½ feet, describing an angle of 270°. The movement is controlled by a rotating slide valve of a special design. The rack is thrown in and out of gear by means of a screw and sliding crosshead operating a set of toggle links.

The converters are operated by water under a pressure of 200 pounds per square inch, provided by two accumulators each 30 inches in diameter, with 10-foot stroke of ram, equipped with steel frames, guides and weight holders.

The gases ascending from the mouth of the converters are received into collecting hoods and primary steel dust chambers, which move upon a steel track located immediately above the stands. The gases are then conveyed upward through a 48-inch uptake into secondary dust chambers, of which there are three, 8½x9x14½ feet, carried on the roof of the building. These latter are connected by an 8-foot flue carried on the roof to the west end of the converter building to a steel stack, 8 feet in diameter and 125 feet high.

The copper from the converters is poured into cast steel bullion molds, which, when full, form a bar weighing 400 pounds; but, as the metal ordinarily runs, the bars average about 300 pounds. Steel cars holding six molds each are run in under the converters to receive the metal. The bars are delivered to the bullion floor and are there trimmed of all rough edges. Assay samples are extracted by means of a small electric hand drill, and the bullion is then weighed and loaded into the standard gauge cars parked at the end of the building.

The slag skimmed off the converters during the process of blowing is poured into large molds on the floor, forming buttons of a thickness of from 8 inches to 1 foot. These buttons are allowed to cool, are then broken up and crushed and are then elevated to the feed floor and used as flux in the furnaces.

CARBON MONOXIDE is probably the prime cause of more than 80% of the deaths resulting from a coal-mine explosion, says Fuel. This gas is largely, if not entirely, generated by the partial oxidation of coal dust. If coal dust could be removed from coal mines as fast as it is produced, the danger from explosions would be very considerably reduced.

The Machine Miner.

Mining costs have been reduced in various ways, but largely by the introduction of the machine drill. This useful adjunct of modern mining has undergone an evolution, as almost everything else in mining has, until the various types of machine drills now on the market are all of superior workmanship, and all capable of doing excellent work in proper hands. This is self-evident, for the standard has long since been set, and the machine which cannot do satisfactory work is quickly rejected for one that will. The machine drill is used in every kind of mining—shaft sinking, tunneling, raising, stoping, and in outside quarry work. One of the accompanying engravings illustrates its use in driving a tunnel, where two machines are set up side by side, each on its own column bar. The other shows the employment of a machine drill in raising.

Some engineers maintain that shaft sinking with machines possesses no advantages over hand work, but there are as many — or more — who are of the contrary opinion. The record shaft sinking of the world has been done with machine drills.

Machine Miners Driving a Heading.

Machine Drill Operating in a Raise.

Gold at a Depth of 4224 Feet.

An important report was made by the manager of the New Chum Railway mine, Bendigo, recently, that good gold was showing in the stone in the crosscut east from the center country winze at 4224 feet, says the Australasian. The stone is 4 feet thick, and when broken disclosed splendid gold. The quartz is richly mineralized and well laminated, and fine gold is associated with the seams of slate and minerals. There are also a few large specks of gold in the quartz. In the top the formation is 4 feet wide, and in the bottom it has a width of 2 feet 6 inches. It is the east leg of the formation revealed in sinking the winze at a depth of 4165 feet. The bottom plat is at 3756 feet, but the shaft has a depth of 3896 feet. In order to work the reef to advantage, the company will have to sink 400 feet, and then crosscut at 4265 feet. The discovery is of considerable importance, as further evidencing the existence of gold at a great depth. In opening up the formation at a higher point gold was seen, but this development is the most important which has yet attended operations in the mine at over 4000 feet. The fact that this is the greatest depth at which gold has been obtained in the world lends to the development more than local interest.

Geology of Tonopah, Nevada.*

The most comprehensive description yet written of the Tonopah mining district is that by J. E. Spurr, entitled "Geology of the Tonopah Mining District, Nevada." It comprises a volume of 295 pages, handsomely illustrated, and with many geological sections, sketches, etc. It is issued by the United States Geological Survey as Professional Paper No. 42.

Much contained in this valuable contribution has already been published herein, but in the concluding pages the author makes some interesting comparisons with other similar mining districts elsewhere, from which the following is abstracted:

COMPARISON WITH SIMILAR ORE DEPOSITS ELSEWHERE.—It is often advisable to study an ore deposit or a mining district not by itself alone, but also in comparison with others. Similar districts often present information, through their likeness or dissimilarities, concerning the nature, origin, and future possibilities of the district under examination.

VEINS OF PACHUCA AND REAL DEL MONTE, IN MEXICO.—Among the nearest analogies to Tonopah yet described anywhere in the world are the contiguous mining districts of Pachuca and Real del Monte, described by Aguilera and Ordonez.

These celebrated districts are 62 miles north of the City of Mexico, on opposite slopes of the Pachuca mountains, which bound the great valley of Mexico. The mines support the city of Pachuca, which contains 35,000 people, most of whom are actually engaged in mining. The ore deposits were discovered in 1522, and have been worked almost continuously to the present day. Pachuca is the most important mining district in Mexico, and is estimated to have produced since its discovery 3,500,000 kilos of silver.

The geology is similar to that of numerous other mineral regions of Mexico. The whole Pachuca range is formed of Tertiary andesites, rhyolites, and basalts. The andesites are of Miocene age and have a varied appearance, due to alteration, the normal type being green and propylitic. The feldspar (labradorite) has often been transformed to sericite, calcite, chlorite, epidote, and clayey products; the pyroxene to chlorite,

*Abstract Prof. Paper No. 42, by J. E. SPURR.

viridite, and epidote. The rocks are silicified near the veins, so as often to resemble dacites or rhyolites, this alteration being due to the influence of hot solutions during the formation of the veins. Rhyolites cover the andesites, occurring as flows and dikes. The last eruptions were of basalt. The veins strike east and west. Secondary veins branch out from the smaller ones, and splitting and reuniting are common phenomena. The veins are more remarkable for constancy and extension than for thickness. They seldom exceed 20 feet in thickness, while they have a length of from 2½ to 10 miles.

The quartz croppings carry pyrite and oxides of manganese. They are always argentiferous, with an appreciable amount of gold. They may be divided into two zones, one overlying the other. The upper is composed of oxides (red ores) and the lower of sulphides (black ores). The upper contains, besides iron oxide (always auriferous), oxides of manganese and chlorides and bromides of silver; it has a maximum downward extent of nearly 1000 feet. The lower zone contains sulphides of lead, silver, etc. The lower limit of the upper zone corresponds to the ground-water level.

Calcite is found only in small quantities. Of the sulphides, pyrite, galena and argentite were in most cases deposited simultaneously with the quartz. The abundant manganese oxide in the upper zone is replaced in the sulphide zone by a lesser quantity of the silicate, rhodonite. Pyrite is frequent in the mineralized parts of the veins, and is also abundant in the country rock, but in the country rock it does not contain even traces of the precious metals. Native silver has been found at all depths; ruby silver has not been observed at Pachuca, but is found at Real del Monte.

Rich ores occur in certain parts of the veins called bonanzas, which are of irregular form, frequently nearly elliptical. The bonanzas of the different veins group themselves in a northeast-southwest zone nearly normal to the vein strike. Some are in the oxidized, some in the sulphide zone; the former are more numerous. In some cases bonanzas were encountered at the surface; in others they were found in depth, where the vein was barren at its outcrop. The size of the bonanzas varies; one of the largest was encountered at a depth of over 300 feet and was elliptical, the greatest axis being over 3000 and the smaller 1300 feet, with a thickness of 8 feet.

The veins become impoverished at great depths. At the bottom they change to barren galena and blende, too poor to repay working. However, certain developments lead to the belief that at still greater depth new bonanzas might be found. Most of the mines are only about 1300 feet or less deep; in only one has a little work been done as deep as 1800 feet.

This district is similar to Tonopah in the character and age of the wall rocks (Miocene andesites); in the nature of the alteration of the rock near the veins (silicification near the veins, propylitic alteration farther away); in the structural characters of the veins, which form a splitting and reuniting group); in the general character of ores (both oxide and sulphide), and of gangue, though adularia as a gangue material and selenides as ores have not been recognized at Pachuca; and in the occurrence of the rich ores in bonanzas, which seems to be due to the intersection of transverse fractures with the main vein zone.

THE COMSTOCK LODE.—Pachuca is about 2000 miles southeast of Tonopah, but a similar analogous deposit (the Comstock) lies 150 miles to the northwest.

The Comstock lode is a vein 4 miles long which has formed in Tertiary eruptive rocks, chiefly andesites, along a fault line having a maximum displacement of 3000 feet. At both ends it branches and so dies out.

It strikes east of south and dips easterly. It was discovered in 1859, and worked up till the present day, but most actively from 1861 to 1880. Up to June, 1902, it had yielded $369,566,112.61 worth of ore, of which about 42½% was gold and 57½% silver. The rocks of the district in the order of their succession are, according to Hague and Iddings, andesite, dacite, rhyolite, andesite and basalt. The andesites are coarse-grained in depth (diorites and diabases). Near the lode, and for some distance away, in a space about 5 by 2 miles, the country rock (chiefly andesitic) is extremely decomposed, the period of alteration having succeeded an andesitic eruption. The hornblende, augite and biotite have altered to chlorite, pyrite, epidote, etc., the feldspar to quartz and an undetermined white aggregate. This altered andesite is the famous "propylite." The basalt, which is the latest rock of the district, has not been altered in the same way as the andesites. The alteration of the rocks and the lode was due to solfataric action which accompanied the faulting.

The lode material is quartz, certain limited portions of which contained large quantities of silver and gold (bonanzas), while the rest is low grade. Calcite is much less than quartz in amount and is generally insignificant. Most of the bullion has been derived from a bluish quartz, like that at Tonopah, the color being mainly due to disseminated argentite, which is the principal ore mineral and is accompanied by gold, probably free. Bunches of stephanite, polybasite and ruby silver were also found. In the bonanzas, near the surface, chlorides and native silver occurred. Frequently the ore grew base, and carried large quantities of galena, zincblende, etc.

Pyrite occurs abundantly, both in the altered country rock and in the ore. The mineralizing solutions are thought to have derived their heat from volcanic rocks, and thus the general phenomena are classed as due to solfataric action, but the materials precipitated, including the ores, are thought to have been derived from the decomposed wall rock.

The workable bodies or bonanzas represent the smaller portion of the lode. The value of the ore in them ranges from $15 a ton to (very locally) several thousand dollars. They are encountered at varying depths, from the surface down to 3000 feet. The vein down to nearly 2000 feet contained sixteen workable ore bodies, while below this level the ore has proved mostly low grade. One large bonanza (that of the Con. California & Virginia) extends vertically from about 1250 feet to 1950 feet below the surface, and has a greatest diameter of about 1100 feet. It yielded about one-third the product of the lode. The ore minerals were chiefly stephanite, argentite and gold, the latter probably free.

The source of the heated waters which are encountered in the mines, and which are thought to have accomplished the rock alteration and ore deposition, is concluded from thermal surveys to be not less than 2 miles deep, and the heat and the active reagents, such as carbonic and sulphydric acids, are thought to have a volcanic origin, while the waters may have had an atmospheric source. The waters above 800 feet had a temperature of about 70° F., while from about 1000 feet down hot waters of above 100° F., rising under pressure, were repeatedly encountered.

The Comstock district is similar to Tonopah in respect to the character and age of the rocks in which the lode lies (Tertiary andesites), in their "propylitic" alteration, in the nature of the gangue and ore, and in the occurrence of the rich ores in regular "bonanzas." The chief distinction is that the Comstock consists of a single very strong lode, while at Tonopah there are a number, of less size.

SILVER CITY AND DE LAMAR DISTRICTS, IDAHO.—Another region having many striking peculiarities in common with Tonopah lies about 400 miles due north of Tonopah. The districts of Silver City and De Lamar (5 miles apart) are situated in the Owyhee range, in southwestern Idaho. The range has a granite core, almost covered by Miocene rhyolite and basaltic lavas. The ores were discovered in 1863. The total production to 1899 was 313,448 ounces gold and 10,540,000 ounces silver. The deposits are normal fissure veins, chiefly in rhyolite. In one type the principal ore minerals are small quantities of argentite and chalcopyrite, with a gangue of quartz and orthoclase (adularia). The proportion of gold to silver by weight averages 1 : 120. In the other type scarcely any sulphides are ordinarily visible, though occasionally pyrite, argentite and pyrargyrite occur. The gangue is quartz, pseudomorphic after calcite or barite. The relation of gold to silver by weight is about 1 : 10. At De Lamar there is a strong silicification of the country rock near the veins, with the formation of abundant pyrite and marcasite, and a little sericite. Farther away from the veins the country rock is softer and more pyritized. The veins strike northwest and dip southwest, both strike and dip varying considerably. The system comprises ten veins, 20 to 80 feet apart. The strike of these veins is such that parts of the group are like some of the radii of a circle, as is the case at Tonopah, and each vein may join and fork in the manner of linked veins, both horizontally and vertically. The width of the veins is from 1 to 6 feet, averaging 3 or 4 feet. The rich ore occurs in large, continuous bodies extending from the surface to a depth of 1000 feet, dipping gently (20°–30°) southeastward along the plane of the vein. They are generally about 200 feet long and ordinarily 1 to 6 feet thick.

In other veins the ore bodies do not extend so deep, and, while having often a generally definite course, are so irregular and discontinuous as to constitute irregular bonanzas rather than definite shoots. No considerable ore shoots have been yet found below 1000 feet, though the veins remain strong. Cerargyrite, pyrargyrite and argentite occur locally (the latter being common to nearly all the mines), as well as polybasite, proustite, native gold and silver.

Besides occurring in rhyolite, some of the veins are also in granite and basalt.

The rock alteration and the ore deposition are considered to have been accomplished by ascending hot waters, whose nature is indicated by the silicification of the rhyolite and the formation of adularia, chlorite and epidote. The period of formation is post-Miocene. The veins extend along the strike sometimes for a mile or so, but average less; they die out on both ends. The ore at present mined at De Lamar goes $14 in gold and $2 in silver. In 1872 the value of the ore mined was from $12 to $60 per ton in different mines.

The districts of Silver City and De Lamar just described are similar to Tonopah in that the ore occurs in Tertiary volcanics, and are probably in both cases post-Miocene in age; to a striking degree in the character of the ores and gangue materials; in the structural character of the veins, which form a group knit together by branches; in the general character of the alteration of the wall rock; and in the occurrence of the rich ores in irregular bonanzas.

(TO BE CONTINUED.)

Milling Ores at Tonopah.

The recent announcement that the Tonopah Mining Co. of Nevada are about to build an extensive milling plant near Tonopah is of interest. It is intended, so it is stated, to treat the ore by concentration and cyanidation. The capacity of the proposed plant will be several hundred tons of ore daily. In contrast with the extensive and expensive proposed installation, the accompanying illustration of the first mill in Tonopah district is of interest. The ore was delivered to the mill by teams. As the entire proposition was somewhat of an experiment, everything about the plant was more or less primitive, which is in strong contrast with the intended new mill, which will represent the latest in all that is considered essential to a modern milling plant of its kind.

First Mill on Tonopah.

A WRITER in the London Mining Journal, speaking of Cornish tin mines, says: "A point which I have not seen mentioned, but which has had a far-reaching effect, is the old system of the underground manager cutting down a contract when the men were making a little more than their wages. This has through a long period rendered the men indifferent, and the general rule is that they will not try and make more than the ordinary wages on contract, as any inducement to do so was withheld. When any mining engineer accustomed to the up-to-date appliances of well equipped mines visits Cornwall, a feeling of amazement comes over him when he sees the old, and in some cases very old, Cornish batteries at work; and if he should further have to work on one of these old mills, it is distressing to find the small efficiency obtainable from them. Yet, in many cases where they are used, it is exceedingly doubtful if, without a considerable outlay in further exploration of the mine, it would pay to replace them with an up-to-date Californian mill. The same remark applies to the dressing plant."

THOUSANDS of dollars have been added this summer to the thousands already made by the diggers of coal from the bottom of the north branch of the Susquehanna river, between Sunbury and Nanticoke, says Fuel. One man averaged $25 a day since early in May. Nearly 1000 tons were taken from an area hardly a mile long, between Sunbury and Espy, during the past four months. This river coal, which is carried down stream out of the Nanticoke and Nescopeck coal fields during high water, and deposited in bars in the eddies of the river, finds ready sale at the river bank.

The American Mining Congress.

At the session of the American Mining Congress held last week at El Paso, Texas, a number of addresses were delivered and important papers read the latter part of the week which were received too late for the issue of the 18th inst.

In addressing the American Mining Congress, its president, J. M. Richards, referred to the constantly increasing development of mining in Mexico and the equally constant inflow of American capital into that Republic, which he considered but the beginning of this international industrial progress. It was the expressed opinion of the speaker that the American Mining Congress could be made an instrument of great usefulness to the mining industry of the United States, and made a plea for sufficient financial aid to render the Congress permanent. He proposed that at its headquarters in Denver, Colo., there be started a collection of ores and minerals of commercial and educational value, and that each mining State be urged to make a display of samples of its mineral wealth in any amount it was considered the industry justified. He urged co-operation in mining, as a step by which much desirable to the industry might be accomplished. The speaker urged that continued efforts be directed toward securing the creation of a National Department of Mines and Mining. On this matter he spoke as follows:

This Congress, and especially with the assistance of a Mining Department, could be of great service to the mining industry in helping to bring about a greater simplicity, harmony and unity in the mining laws of the country, to meet the varying wants of the numerous branches of mining, and in a way to minimize litigation.

Litigation, by reason of defective laws and laws of doubtful wisdom, is one great source of waste, uncertainty and disappointment in mining. A great work along this line lies before this Congress.

A great field of usefulness, and especially with the co-operation of a department, is open to the Congress in the collection of mineral statistics. These statistics could be made of most practical utility. And no one more than the practical miner could be of service in suggesting how to complete such statistics so that they may be of real value, both accurate and comprehensive.

The subject of drainage districts, which often cross State lines, is one that is becoming of vital importance, and will prove of even greater importance as the years go by. On subjects of this character this Congress can be of great practical assistance.

The line of demarcation between agricultural and mineral interests had not yet been clearly defined. This question is constantly arising under varying conditions. Any law relating to such rights should be based on good and sound reasons, so that it may be clear and easily understood. This subject is bristling with interesting questions, which when wisely settled will prove of much practical benefit.

The question of water rights is one of extensive importance to mining. There is no uniform rule as yet adopted as to what constitutes an inch of water for mining purposes. This question is of most vital importance, and especially to such sections as Alaska. An act clearly defining a water right and a means of easily ascertaining the quantity of water acquired, would be of inestimable value to new mining sections, and especially to such districts as Alaska, where the great distances from courts and enormous expense of adjudicating such rights make an act of this character a real necessity.

The question of taxation of mining property is in a state of chaos. Every class of property should bear its just proportion of taxation. Just what is a just proportion, as applied to mining, is wholly unsettled. There should be some equitable system devised that will be as uniform as possible and yet not be a burden upon undeveloped and unremunerative properties.

The relation of employer and employe, while a somewhat delicate question, it would seem that an organization of this character might be of assistance in shedding light upon a subject so important to the advancement of the mining industry. There must be some basis which intelligence, guided by an unselfish purpose, could discover, which would aid in making these relations more harmonious in the mining industry than heretofore. There are vast numbers of American citizens engaged in mining coal, iron, zinc, lead, copper and the precious metals, and a great army of children being prepared for American citizenship, who are living under conditions not suited to the development of a very high order of citizenship. Can this Congress be of assistance to them and still do justice to the employer?

It is not the purpose of this Congress to consider technical questions nor the technical phases of questions relating to mining, but such questions of a general nature as are or may be understood by those not schooled in technical subjects. Nor is it the purpose of this Congress to consider political questions, as that term is generally understood; but it is important to the mining industry, and therefore to this Congress, to have those steps taken and those things done which will stably yet speedily advance the mineral development of Alaska. It is believed by many who purport to know, that Alaska will yet be one of the most stable influences in our industrial development.

The paper by R. Gilman Brown on "Examination of Mines" is particularly valuable and contains much information of value to engineers, students, miners and the public generally who are interested in mines. The paper is published in full:

EXAMINATION OF MINES.—I feel myself fortunate in enjoying this opportunity of elaborating before such a representative body some of the fundamentals of mine examination; the more so because they have not always been fundamentals, because it has been largely due to the dispassionate business sense of business men that fundamentals they now are, and because, more than anything else, to the observance of such fundamentals by the investor and engineer alike, is the view of mining as a business and not a speculation to be attributed.

But in these matters the business man is the main spring. Where there is a demand there will be a product to satisfy it, and the modern mining report is made to answer a simple business question: "What will be the profit?" Stated at length my subject is: "The Examination of Mines Preliminary to Purchase: To-day as Compared with Twenty-five Years Ago."

It is naturally "to-day" that has the most practical interest for us, but all advance is relative, and if any of you will take the pains to "dig" up some of the reports upon which mines were bought in the early '80's, and compare them with modern ones, the advance towards definiteness will be the most impressive point of difference. Then, more stress was laid upon generalities, more weight given to empirical conditions; ore reserves and net values were less considered; a telegram from the man in the field stating that the mine was worth it would be sufficient to make the capitalist pay out his thousands, by hundreds. Engineers, the best of them, cheerfully advised their clients to take all sorts of chances on persistency in depth on the various uncertainties attendant upon underground work.

I would here pay my tribute to the pioneer engineers; with a text-book assistance that was meager as compared with to-day, with little besides their individual experience and good sense, they were wonderfully successful in their prognostications. Their work is to be no more disparaged than should an engineer now venture to ignore the use of the extensive kit of tools, the accumulated experience of the past quarter of a century has provided for him.

It is not that people are now less ready "to take chances," but that it has gradually come to be the belief of engineer and capitalist alike that the chances should be recognized as taken; that if the buyer wishes to speculate for big returns, he should have the opportunity, so long as he is posted on what he is doing. Along with this belief has come the particular recognition of the general law, applicable not alone to mining, but those who would participate in a "dead sure thing" must be satisfied with a small per centum of returns; that those who wish to plunge stand to lose all or to gain fabulously, with the whole gamut of intervening possibilities.

So far as this paper is concerned, the last phase can be dismissed in a few words. It is to-day by no means an infrequent occurrence for business men to "take flyers" in undeveloped mining claims. Rich and poor, those who can afford to lose the money, and those who can not, seem equally addicted to this sort of thing, but I must emphasize, and all must agree, that this is not investment in mines; it is a venture, pure and simple, a speculation without reserve (and without reserves), and though the competent engineer with his wide knowledge of costs, of various regions and of what goes to make up a mine, can undoubtedly lessen the percentage of loss in such transactions, it is not to-day his most useful sphere. The most he can do in such a case is to tell his client whether he will have a run for his money, whether the possibilities are such as to constitute a good mining chance. The pity of it is that the lay capitalist does not recognize, as a rule, the essential difference between this game and the sober business of legitimate mining investment. This is particularly bad because the business man, turning for the first time to mines, is more likely to take up with some such "long shot" of this category than with the other. He pays small attention to the details of the matter—not a fraction of what he would if the same sum were to be put into a warehouse scheme, say, outside of his regular line—and if the time comes when he must either abandon his "investment" or put up more funds, whichever course he follows, he feels he has been bitten, and in the future views the word "mining" askance. This works another way as well, for he has come to look on mining as outside of business laws, and should he get into a mine that is really an investment, he is still apt to view it loosely as such, and not to inquire too closely into the business details of the management.

Doubly important, then, is it that the lines be sharply drawn between the two classes of mining, and that the layman in mining matters does not settle down to his layness as the end of the matter. The investigation of one class may take an engineer a week; of the other, months; in the case of the prospect, the report is largely a brief statement of possibilities, with the pros and cons clearly given; in the case of the mine, it is an exhaustive study, and exposition of facts and conditions, with carefully drawn conclusions. It is this latter that particularly concerns us.

The fundamentals of the modern mining report demand that the examination should have been conducted on certain lines; that certain matters should have been investigated; that certain tests should have been made; and when a report comes to hand not matching, point by point, with this formula, with some of these fundamentals slighted or missing, the investor will do well to refer it to independent engineering scrutiny, or, failing this, to send it back by the first mail.

These fundamentals are by no means esoteric; in their recital, they are not formidable, and to the uninitiated give small evidence of the weeks and months of laborious investigation they have cost the engineer.

They are: The assay plan showing the tonnage and assay value of the ore reserves; the table of costs; the summary of profits; the chances for the future; the question of title, and, if in the United States, the safety against litigation, arising from our deleterious law of the apex. It will not be without interest to see roughly how these are determined.

The assay plan is the multum in parvo of the report; to its production has gone more plodding work than to all the rest of the examination. It is an accurate, large-scale map showing ore bodies with their average values. Average values can only be truly determined by thorough and painstaking sampling, going over the workings yard by yard and laboriously breaking down rock that will represent the whole mass at each point. It is a tedious job at best, but cannot safely be slighted. It is frequently claimed that milling tests are better; that tests of the ore as it comes out from the drifts and raises of development work are better, that this, that or the other short cut to the result is better, as well as easier. All of us who have sweated in this sampling of mines will admit that there are many things easier, but the general consensus of those mining engineers who have been conspicuously successful in their prognostications is that there is no short cut that does not involve long and perilous leaps. From this it results that if the property is not in shape to be sampled, it is not in shape to be bought as a mine and it is only a prospect.

Strictly, I should close the paragraph right here, but I am so anxious to carry conviction on this point that I venture a word more. It is plausible to claim that from a tunnel driven on a vein of ore must come ore that will give a fair average of that vein; and this would be the case were the tunnel of uniform height from end to end, but it happens to be almost the rule that where the ore has been more valuable the tunnel has been run higher in accordance with the law of human conduct that puts the best foot forward, with the result that a certain proportion more of the better ore has been included in that coming from the tunnel. What becomes, then, of our average value?

Each of the assay values must be tabled with the width of ore it represents, and for each block in the mine averaged. Here no mere arithmetical average will do, summing the results and dividing by the number of them, for that would give the same weight to a 6-inch high-grade streak and the 6-foot low-grade. The true average must be gotten. For each sample width is multiplied by value, these products are added and divided by the sum of the widths. This is kindergarten teaching, so far as engineers are concerned, but hardly so, I fear, as regards the investor, to whom particularly I am speaking.

The determination of the tonnage represented by the ore blocked out is largely simply surveying work, but the engineer must use great caution in what he includes as ore reserves. Fortunately the old easy term of "ore in sight" is passing into disuse, thanks to the influence of a prominent mining society, and the modern engineer is expected to designate closely just what degree of certainty he has about the tonnage of each block. It is obvious that a tunnel driven 1000 feet in ore does not in rigid interpretation block out any ore, though an engineer is frequently justified in assuming certain distances above and below as "probable," or "reasonably to be expected;" but each such estimate is in its own category. The ore blocked out, as commonly understood, is ore with three or four sides showing in the workings. All of these data are collated on the assay plan; on the map showing the tunnels and workings to scale are plotted in proper position each sample with its width; the value for each block is given and the tons and average width, the one determined by multiplying the average width by the area of the block measured on the vein and dividing by the cubic feet going to make up a ton of ore in place; the other being the true average of the assays for that block. I venture to insist here, with an insistence that may to some savor of dogmatism, that an assay plan should be prepared in every case where a mine is being bought for its ore; nothing better than this shows whether the examination has been slighted, nothing is more readily comprehensible to the lay purchaser.

The costs of extraction in the case of an operating mine might seem to be a mere determination of results that a competent bookkeeper could prepare, and to a certain extent this is so. But more often than not the value of a particular mine hinges upon the introduction of improvements, increasing the capacity of the plant, and on economies to be gained in the present scale of operation. Light can be shed on these only by a proper segregation of the items of cost.

To a varying degree each mine is a lonely entity, with strong individual characteristics at times amounting to eccentricities. This is true even of mines in a single district, even in a district of the marked uniformity of the South African Rand, and thus it results that the engineer cannot safely say costs will be so and so because these have been attained elsewhere.

In the case of an operating mine he segregates the items over an extended period into reasonably narrow categories. A comparison of each of these with the work of other mines may give him a hint as to what items are normal and what not, but for definite figures he goes out through the works and mine, noting the duties of the men and their efficiency, both eyes open, his mind bent to a big interrogation point. In the light of this investigation he makes fresh calculations of what ought to be the costs on the present scale of working. Then he proceeds to a fresh segregation that will separate from the whole mass the fixed general expenditures, those that do not depend upon the yearly tonnage. As these will be practically the same in total, they will obviously be less per ton with a larger tonnage, so that, when the ore reserves are big enough, increasing the scope of operations affords a most profitable field for the investment of capital. The importance of this warrants reiteration in a different form; general fixed costs are constant in total, and inversely proportional to tonnage in per ton figures. Other costs are directly proportional to tonnage in total and constant in per ton figures.

This estimate tests most severely the ability and judgment of the engineer, and everything depends upon its correctness. It cannot be ignored, and yet, in the hands of the mere office man becomes academic and a snare. An error here is quite as serious as in the sampling, and, as examinations are nowadays conducted, it is easier to "salt" the cost sheets than the mine—and fully as effective.

The profits in the ore reserves of various kinds is a plain calculation from these premises, and, notwithstanding the serious drawback that the sampling can physically only represent the real values of the boundaries of the blocks of ore, has been found, except in unusual cases, to closely approximate the facts.

I have reserved until now speaking of the interval at

which samples are taken because the importance of this factor is now more clearly to be seen. The experience of the engineer and his preliminary inspection of the mine and assay books have told him what is likely to be the proper interval for his sampling. If the ore is high grade and spotted, he naturally takes a closer spacing, and 2-foot intervals are by no means unknown. Such close spacing is sometimes called for by even low-grade mines if the values are very irregular. The engineer recognizes that in a multitude of samples lies safety, and very frequently as the work progresses finds that the interval selected is too wide, and has to go back over his work and interpolate other samples. But he considers it an absolute essential that the distance apart shall be uniform for each individual block, it being obvious that if he has twenty high-grade samples from a 100-foot tunnel and ten low-grade ones from another 100-foot length, by even correct averaging, the result for the 200 feet will be too high. At times it happens that the high-grade ore would be more erratic in its sampling than the low, and that it would be a waste of time and expense to sample the low grade at as close an interval as the high. In these cases he is frequently justified in estimating each separately and then combining the two in the proportion of length that each represents. There is more than one way of doing this and it will hardly be interesting to explain fully such merely technical things.

It is rarely, however, that a mine is sold for merely the profits in the reserves; certain assumptions are made about continuance of ore, and it is the difficult task of the engineer to decide what assumptions are justified by the conditions. Indeed, it may be pertinently asked why any one should sell at all for only as much as he has already assured, and, on the other hand, why another should care to buy if he only expects to get back what he pays out. The answer to this question is outside the scope of this paper, but it can be briefly said that in the answer is involved the essential difference between the buyer and seller in any transaction, as well as certain peculiarities inherent in mining transactions alone. The vendor's knowledge of his mine is more sketchy than that of the buyer after his examination, and, while he is apt to be more hopeful of the prospects, this may be more than offset by imperfect realization of the possibilities of improvement. Aside from this, and in the case of the professional promoter, he is apt to figure on a price that will give him a good profit on his outlay and trouble. Logically and practically, then, it is the prospect that is bought, and we here come into close contact with the work of the engineers of the '80's and with that of the man who sets out to value a prospect.

A moment's consideration, however, shows that there are certain facts that here help out. The history of the mine affords certain clews to the future. The workings give vast advantages for the study of the particular geology. Moreover, almost a new science has been elaborated in recent years—that of economic geology. The servants of this have been enthusiastic and earnest and are opening out avenues of discovery that make our resources of twenty-five years ago appear, by comparison, sophomoric. This branch of geology is, however, only new so far as its general use is now common to the engineer. The painstaking studies of a generation of students go far to make it now possible; but what was being done in the '80's was the devoted work of a few; that of the present is being done by an army of investigators. By this the examining engineer now profits; indeed, he is very frequently assisted by a geological specialist in his investigations.

All the data of the assay plan are studied for the light to be thrown on the future as to change in dimensions of the ore bodies and of tenor in their contents, and to these questions of persistence they give prompt, if empirical, answers. The geological study of the vein, the existence of dikes, cross-veins, of changes in wall rock—all of these have a bearing on the future. Then there is the pertinent inquiry as to the extent the deposit owes its value to surface conditions, which are now recognized as often reaching to profound depths. It is practically impossible to do more here than state the prime factors in the case, which must all be combined into a trustworthy opinion. This is a severe test of judgment. No mine examination is to be lightly approached; but when the engineer reaches this summation of all his work, the responsibilities of his position have, in truth, come home to him. He is now to form his conclusions, the answer to the question with which he began, "What will be the profit?" He has certain definite facts arrived at by painstaking investigation; he has a number of facts of less definite demonstration, and he has a swarm of the small impressions that have buzzed around him during the examination. He must give due weight to each and combine the whole into a decision with logical sequence of conclusion to premise, so that no one can say "non sequitur." Just how this is done constitutes the personal factor, and who shall declare its course of operation? It is far removed from mere guesswork, it is the special faculty of the well-balanced mind; with no direct relation to personal predilection, we know it as but that imponderable quality of "judgment." But this talk about judgment must not blind us to the clear separation of fact from future. With all his innate habits of mind, the engineer strives to give his report the one, distinct from the other; and this is made clear no less in the use of his data than in the deduction of his conclusions. He virtually says: "These are the facts as nearly as can be determined, there are the uncertainties, the true weight of the uncertainties is thus and so, the chances are such and such. The problem is before you, make your decision; what will you do?" With this the scope of the engineer is reached, his work is done; he has investigated, and found the facts. He has studied, and evolved the probabilities; he has stated the one and the other with logical succinctness, and it is now up to the other man, as it always must be up to the man who provides the funds. When all is said and done, his decision is final.

I started out with the aim of showing what were the recognized fundamentals of the mining report of to-day, devised by experience to lessen the hazards of purchase; I have tried to show how guesswork has been eliminated, how certainty has been sought, whenever attainable; what the limits of definite information are, and what degree of reliance is placed on the purely personal factor of judgment. I have explained how the mining engineer, in his appraisement, makes the practice of separating the positive from the tentative factors; of presenting the one categorically, imperatively, as becomes the expression of ascertained physical facts, the other modestly, as things probable but concerning which the best judgment may be at fault.

If this serves to give the investor a better idea of what to look for in a mining report, I shall be pleased; if it aids him to place due value on the work of the engineer, I shall be gratified. If it leads some few to appreciate the essential qualities of mining as business without inordinate risk, I shall be more than satisfied.

The following paper, by James W. Malcomson, on the "Relations of Mining and Smelting Between Mexico and the United States," was an interesting contribution on this subject, which is of recognized international importance:

Twenty years ago practically all the gold and silver ores of Mexico were treated on the spot where they were mined by various local methods of treatment, amalgamation and leaching processes being very commonly employed.

Since 1885 a great change has taken place. Most of the ore now mined is transported by railroads to central smelting plants, and the precious metals contained reduced to bullion with the aid of lead or copper.

An enormous and prosperous smelting industry has thus developed to the mutual advantage of the mine operators and the railroads.

To-day the miner operating near the railroad finds himself able to turn his ore into cash immediately by shipping it to any of these smelters. He usually receives an amount which yields him as great or greater profits than he could obtain from local processes, and this, too, without any investment beyond the actual cost of mining the ore. The miner of refractory ores also finds himself almost as well off as the favored producer of free milling ores owning his own reduction plant, and it is only in those districts far removed from the railroads that the former cumbrous methods of local treatment are employed.

In order to form some idea of the importance of this change, it has been estimated that before 1885, 90% of all the silver and gold ore mined in Mexico was treated locally where it was produced, but to-day over 75% of all the ore mined is shipped over railroads to the smelters of the country.

Until 1890, lead ores were generally employed for this purpose, and Mexican gold and silver ores were shipped to Denver, Pueblo, Omaha, Kansas City and San Francisco, where lead smelters were in operation. Extensive smelting works in the city of El Paso were also erected at this period to handle ores from Mexico, which were actually crowding the ore markets of the United States

After the discovery and development of the lead mines of Sierra Madre and Nuevo Leon, in northern Mexico, the lead ore miners of Colorado in 1892, fearing that the introduction of Mexican lead ores into the United States would destroy their control of the lead ore market, succeeded in having a prohibitive duty imposed on this metal. The control of fluxing ores by the lead miners of Colorado at that time enabled them to dictate such terms to the smelters that smelting charges on lead ores were abolished entirely, but for a time the smelters were compelled to pay more for the lead contents of the ore than its market value to them. The result of the imposition of this duty was that the gold and silver miners of the United States were still left at the mercy of the lead ore miners, whose demands made it necessary for the smelters to obtain their margins from the miners of the siliceous ores, who were thus compelled to submit to higher treatment charges, while several millions of dollars of United States capital were invested in Mexico in the erection of custom smelters at Monterey, San Luis Potosi, Aguascalientes and other points.

During the past few years it has become evident, however, on account of the enormous increase in gold and silver production in Mexico, that the capacity of these lead smelters is insufficient, and that enough lead cannot be obtained to take care of the increasing production of gold and silver ores. One large smelter in the central part of the republic has already replaced its lead base with copper, although more than one-half of the copper employed is shipped south from the United States through El Paso, and on account of this unsatisfactory condition of the lead resources of Mexico it is inevitable that others of the principal smelting plants will soon be partly altered from a lead to a copper basis.

The greater part of the gold and silver produced in Mexico is found in siliceous ores, and the problem of the metallurgist is to get rid of this silica as slag, in the cheapest possible way, leaving the precious metals alloyed with the lead or copper used as a collector.

In a lead furnace the charge can not carry more than one-third of its weight as silica, and, owing to the relatively low temperature at which lead smelting is being carried on, the speed of operations is not great. In a copper furnace, owing to the higher temperatures employed, the charge may carry as high as one-half of its weight as silica, and twice the amount of charge can be smelted as in a lead furnace of similar dimensions. In other words, a copper furnace will smelt three times as much siliceous silver ore as a lead furnace of the same size in the same time.

Copper as a collector offers other points of superiority to lead. It can be enriched to a much greater extent with gold and silver. A copper furnace smelting gold and silver ores is often operated successfully with less than 1% copper in the charge, the volume of matter produced being made up by the use of iron sulphide ores, while a lead furnace can not be successfully operated with less than 7% lead.

There is, therefore, very little reason to doubt that the bulk of the silver and gold ore smelted in Mexico will be reduced in copper instead of lead furnaces in the near future, and the question arises: Where will this copper come from?

The silver and gold output of Mexico is large and increasing very rapidly. The silver production of 1904 was 71,880,000 ounces, or 18,000,000 ounces greater than that of the United States, Mexico being the greatest silver producing country in the world. The value of the gold produced during 1904 was $11,530,000, United States currency.

The greater part of this gold and silver is found in the central plateau of the Republic and along the lines of the main railroads, the principal districts being Pachuca, Guanajuato, El Oro, Zacatecas, Mapimi, Parral, Santa Eulalia, Catorce and Matehuala.

The production of copper in Mexico has increased from 900 tons in 1891 to 57,500 tons in 1904, largely owing to the opening up of the mines of Cananea. The bulk of this metal is mined in northern Sonora and Lower California and a considerable distance west of the gold and silver mining districts before mentioned. The adjacent territory of Arizona also supplies a large and steadily increasing output of copper, the output during 1904 being approximately 70,000 tons.

At the same time it is interesting to notice that the copper ores of Sonora and Arizona usually carry low values in gold and silver. At present they are smelted locally, the copper produced being shipped to New Jersey and other points on the Atlantic shore for refining.

There exists therefore to-day a temporary and abnormal condition of affairs which, when remedied, will have a profound influence on the development of mining and metallurgical enterprise, both in the United States and Mexico.

On the one hand, we have in Mexico a steadily increasing output of siliceous ores, rich in gold and silver, with a stationary or decreasing production of lead ores suitable for smelting purposes. The result is that gold and silver mining operations throughout central Mexico are handicapped by excessive treatment rates, and many gold and silver mines are now shut down which were formerly operated with profit.

On the other hand, there is in Arizona and southern Sonora a large and steadily increasing production of copper eminently adapted to the requirements of customs smelting, but which is not yet utilized for this purpose.

After the attention of the great copper producers of Sonora and Arizona is directed to the possibilities in smelting the gold and silver ores of Mexico, together with the copper ores of the West, there is no reason to doubt that very much greater profits will be made than is now the case.

Copper will be shipped to the refineries rich in gold and silver contents, instead of, as at present, without precious metal values of importance, and profits will be made by the combination that will benefit the miners and railroads quite as much as the smelters themselves.

When this copper smelting industry, now in its infancy, is developed along these lines, there can be little doubt that El Paso, lying as it does on the lines of communication between the copper mines of Arizona and Sonora and the gold and silver mines of Mexico, will become a copper smelting center of great importance, and a messenger of prosperity to the many gold and silver mines of northern Mexico.

A paper by F. A. Jones, on the "Mineral Resources of New Mexico," gave a comprehensive idea of the mineral possibilities of that Territory. The following is an abstract of this paper:

The mineral wealth of New Mexico first attracted attention at the time of the Spanish invasion in 1541, under Coronado. The natives exhibited ornaments and masses of silver, gold and ores, and also specimens of turquoise, which was used by them for ornamental purposes, and also as a medium of exchange. This gem stone was known to the ancient Indians (and also to the Aztecs) as "chalchihuitl." Turquoise was probably the first mineral mined in the United States. It is found in Los Cerrillos district, Burro mountains, Jarilla mountains and Old Hachita. The oldest known copper mines of New Mexico are those at Santa Rita, and these were the first copper deposits to be worked in America within historic time. The Santa Rita mines are the largest producers of copper in New Mexico, and are embraced in the copper belt of the southwest, that includes the deposits of Arizona and northern Mexico. The boundary line of this belt in New Mexico begins in the Mogollon mountains, and extends in a southeast direction through the Jarilla mountains. All that area lying to the southwest of this line belongs to the copper belt. The discovery of gold in New Mexico was made in gravels at the base of the Ortiz mountains, in Santa Fe county, in 1828. In 1839 new placers were found in the Tuerto mountains, south of the Ortiz mountains. The area, though not extensive, has produced approximately $2,500,000. Elizabethtown, in Colfax county, has made the greatest production of any district in New Mexico. Gold was discovered there in 1866, and the gravels have been constantly worked ever since. Rich silver mines have been found in New Mexico. Prominent among the silver camps are Lake Valley, Georgetown, Kingston, Hermosa, Chloride, Chloride Flats, Victoria, Mogollons and the Pyramid district.

The lead and zinc areas are principally confined to the west side of the Rio Grande, with the exception of the Organ mountain district. These ores are associated and found in the carboniferous limestones.

In the production of lead, the Magdalena and Cook's Peak districts take first rank; each of these districts produced several millions in lead carbonate and sulphide ores. At Granite Gap, in southwestern Grant county, are some promising lead-carbonate properties. A large quantity of lead is mined in the vicinity of Silver City.

The Magdalena district has come rapidly to the front as a zinc camp within the past two years. About $180,000 was credited the district in 1903. The output during the year 1904 reached nearly $1,000,000. Immense bodies of zinc-lead sulphide occur in the Magdalena mountains and at Cook's Peak.

Eastern Socorro county and western Lincoln county are the principal iron fields of the southwest. On the upper Gila are large alum deposits, not a pound of which has ever been marketed.

Sulphur abounds at "Sulphur" Hot Springs, near

White Oaks, near the Texas border and at Guadalupe.

Deposits of mica are found in the locality of Petaca, in Rio Arriba county. Other deposits are at Nambe, in Santa Fe county; at Talco, in Mora county, and in the San Andreas mountains, near Mocking Bird springs.

Pumice stone is to be had near the foot of Mt. Taylor, in Valencia county, and also east of the Rio Grande, in Socorro county.

Salt exists commercially in central New Mexico, but has not been utilized other than by ranchmen for their stock and local domestic purposes. The most interesting of these deposits is at the Zuni crater lake, in Western Socorro county. Here the process of salt making is continuous, due to the waters circulating through the underlying "red beds," whence they derive a strong brine as they flow into the shallow lake basin, depositing salt by evaporation. Other valuable salt deposits are found in the Estancia plain, in the eastern and northern parts of the plain of the "white sands," and in the region of the Pecos.

New Mexico has abundant gypsum, but only one plant exists in the Territory that manufactures cement plaster from this material, at Ancho, in Lincoln county. Many of these beds are several hundred feet in thickness. What is said to be the most extensive deposit of gypsum in the world is known as the plain of the "white sands," situated southwest of Alamogordo, in Otero county. This snowy waste of gypsum is about 35 miles in length north and south and about 18 miles across its broadest part.

Graphite abounds in the Raton mountains and in the Sandias east of Albuquerque. Guano is found in caves and extinct volcanic craters. Asphaltum exists on the Perea grant, in Guadalupe county, north of Santa Rosa. But little prospecting has been done for oil. Oil seepages are reported from different localities in the Territory, and there seems no good reason why paying wells will not be found sooner or later. The geological structure of probable fields in New Mexico is similar to that of Florence, Colo., and to the oil horizons in Wyoming.

In New Mexico coal is found in the Cretaceous rocks. In general, all of the coals of New Mexico are clean and make a good fuel. Some of these coals make a splendid coke, while others possess no coking qualities whatever. The areal extent of the New Mexican coal fields is not definitely known.

Among the interesting and valuable papers read was that of W. G. Swart, which follows, on the "Zinc Industry of the Rocky Mountain Region:"

For many years the zinc industry of the Rocky mountain region consisted almost wholly of efforts on the part of the miner to sort out, or mill out, and throw away enough zinc to bring his lead or copper ores below the penalty limit set by the smelters. Eight years ago this was changed through the purchase by European zinc smelters of some Leadville ores for their zinc contents. This was followed by a shortage of ore supply in the Joplin district, in Missouri, coincident with the enormous increase in demand for spelter, forcing the American zinc smelters to turn to the West for an adequate ore supply. The Rocky Mountain States have so far not been able to furnish ores of as high a grade as Missouri, nor will they ever do so, save in exceptional, scattered instances. This has greatly retarded the industry in those States.

Among the common metals, the metallurgy of zinc is the least advanced, and requires the cleanest ores unless iron furnaces be considered, which in the West is not necessary. A copper furnace can be successfully run on ores carrying 1% copper; a lead furnace on 7% lead; but a zinc furnace calls for at least 30% zinc, and 40% and 50% is much more apt to be profitable. Lead and copper furnaces are also built of great size, and charged like iron furnaces, automatically, in carload lots. The zinc retort still holds but a few hundred pounds, and must be charged by hand with a shovel. The consumption of fuel is also from eight to twenty times that of the lead or copper furnace. All these, and the further important factor that impure zinc ores produce low-grade metal or oxide, give the clean zinc ores a great advantage, and it is therefore not strange that the Joplin ores have always been standard, and have formed the basis of American spelter production, while the low-grade Western ores have remained untouched, or have been grudgingly shipped to the lead and copper smelters for their precious metal values, paying there the heavy zinc penalty. From the standpoint of the lead and copper smelters this penalty has ample justification. It is safe to say that the average smelter manager would be glad to eliminate zinc from his furnace as the miner would to escape the penalty. These two objects are at last accomplished, and Western zinc ores of almost any composition can be successfully dressed and profitably marketed.

This is largely the result of the increased demand for spelter mentioned above, and the consequent effort on the part of the zinc smelters to keep their output up by modifying and adapting their methods to these lower grade ores. This has taken time and money, and there have of course been disappointments and failures. Progress is shown by the fact that the first Western shipments carried a minimum of 45% zinc. Ores are now being regularly shipped assaying 30% to 35%.

Lead and iron are the impurities causing most trouble to the zinc smelter. Since these are the metals that are most desirable for the lead or copper smelter, and zinc the least so, one says naturally, "Separate them and sell each to its own smelter." It is along these lines that the future of the Rocky mountain industry lies. Most of the Western ores are complex sulphides, mixtures of galena, pyrite and blende, occurring in a variety of gangue rocks. In many instances hand sorting or simple concentration in jigs or on tables will give shipping products, but in the majority of cases some further or different treatment is necessary. This means that when, after trial, older and well-known processes fail to yield clean products, as they usually do, the newer methods must be utilized. Zince blende has too nearly the specific gravity of many of its associated minerals to be successfully removed by jigs or tables, and such work must be supplemented or replaced.

There are several methods now offered to the miner for the accomplishment of this purpose. All these methods are comparatively new and mistakes will be easy and costly, hence the miner should understand thoroughly that the work of selecting and installing a plant for handling zinc ores belongs strictly to the experienced engineer. This cannot be too forcibly stated. No two zinc ores are exactly alike, and since it is not possible to adapt the ore to the process, the process must be adapted to the ore. This is work for an expert and success depends on its recognition.

A number of chemical processes, based on leaching the ores both before and after roasting, have been tried. Such processes are attractive and are likely in the future to be entirely successful, but the fact remains that there is no such plant in commercial operation to-day in America, and work along these lines ought only to be attempted by strong companies having plenty of money for experiment.

In Australia successful commercial work has been done with what are known as "flotation processes," which depend for their operation on the selective lifting action of small bubbles of hydrogen gas on wet crushed ore. Experiments along these lines have also been conducted in America, but there is nothing commercial offered in this country as yet.

While these and other wet methods are full of promise for the future, the fact is before us that the only successful mills in operation in the Rocky mountain region are those using magnetism or static electricity. There are twelve such mills in the West at present, with a daily capacity of about 430 tons. Half this tonnage may be taken as zinc concentrates, which may be assumed to average 45% zinc. The indications are that in another year this will be doubled.

I have spent the past six years working exclusively on this zinc ore problem. I am free to admit my preference for wet work, but I cannot escape the fact that electricity is to-day making the Western output of zinc ore, and it is being done dry.

If put into the shape of high-grade concentrates, zinc ores are worth more per unit than lead ores, but low-grade lead ores can be marketed and smelted direct, while zinc ores cannot, hence the stipulation "high grade," and the broad assertion now made that in almost every case zinc ores must be dressed before shipment. Not only is this necessary to raise the grade of the zinc product, but to produce at the same time a by-product as valuable as possible, carrying the gold, silver, lead and copper, so that they may not be lost, but made a source of profit.

Any zinc ore can to-day be handled successfully, and many an old, abandoned mine be made to pay. There are exceptions, and the whole matter is so new that the statement made above will bear repeating—if failure is to be avoided, an expert must be consulted.

In Missouri, ores carrying 3% or 4% zinc, with no other values, are mined and milled at a profit. At present it will usually not pay to handle a Western ore carrying less than 10% zinc, provided there are no other recoverable values. One mine in Colorado is working a 7% zinc ore, but there is also recovered some $3 in gold, silver and lead.

Methods are daily improving. In three years ores carrying 5% zinc should be worked, in which the zinc will represent the sole profit, though not the sole value. Such ores are not being touched now, but we all know them to exist in large bodies, and as the knowledge of proper treatment spreads they will come into market.

The vital point in the whole matter is the recognition of the facts that, since zinc is penalized at the lead and copper furnaces, and lead, iron and copper are likewise treated at the zinc furnace, they must be separated and sold as cleaned products in the high market. Exceptions must be made here also, since the new zinc smelter at Pueblo buys mixed ores, and so do the Belgian furnaces; but it will be found that the prices offered are usually such as to make it profitable to the miner to separate his products before shipment. Even the furnaces just mentioned prefer the high-grade material, and will pay accordingly for it. It is a fortunate thing for the miner that his gold and silver values usually follow the lead, copper and iron, rather than the zinc, for the zinc smelters do not ordinarily recover these values, nor pay for them in low-grade ores.

Several things aside from new processes have contributed to the present activity and opportunity. The price of spelter has been uniformly high for some time, and bids fair to remain so as long as general financial conditions are good; many of the European mines have been obliged to curtail production on account of decreased ore reserve, causing the European smelters to look abroad for ore supply; the Western railroads have been generous in the matter of lower freight rates on these zinc ores, reaping their reward in the building up of a promising new business.

It has been suggested that the opening up of these large zinc deposits will lead to the establishment of zinc smelters in the West. This is possible, but there are certain considerations that must not be overlooked. Cheap labor, cheap transportation, and, above all, cheap fuel, are essential to zinc smelting. Unlike lead or copper smelting, it usually pays to haul zinc ores to the fuel rather than the fuel to the ores. If Western smelting can be made to pay, it will come in time, but it will not pay to wait for it, and meanwhile the miner should make the most of his opportunities, and recognize the fact that in his heretofore troublesome zinc ores he has to-day a most valuable asset.

As to the future, only a prophet dare speak. It is known that this Rocky Mountain region contains enormous zinc deposits. A prominent mining engineer has estimated 3,000,000 tons of zinc ore in Leadville alone, actually exposed; but it must not for a moment be supposed that all of this, or a tenth part of it, can be thrown on the market for years to come. Other extensive deposits are already opened in Utah, Idaho, Montana, South Dakota, New Mexico and Arizona, but they are apt to be even slower in coming into the market. One thing is sure, however: The zinc industry of the Rocky Mountain region is to-day on a firm basis, and is certain to expand and add increasing amounts to the world's tonnage as the years go by. This is certainly worthy the attention of every man interested in mining. Fortunes exist in these deposits, and a fortune in zinc counts just as many gold dollars as a fortune in lead or copper.

"The Mineral Resources of Alaska" was the title of a paper read by A. H. Brooks, who outlined the achievements and possibilities of our most northern Territory. Following is an abstract of his paper:

Last year the output of Alaska's gold mines was $9,300,000, while this year it bids fair to exceed $15,000,000. In 1880 the pioneers found the Juneau placers and soon after the auriferous lodes from which the alluvial gold was derived. These men soon found means to overcome the obstacles to inland travel, and discovered the alluvial gold of the Yukon about 1882.

The fifteen years that followed witnessed continuous progress in the exploitation of the auriferous lodes in the coastal zone, but the development of the Yukon placers, attended by so many difficulties, was of slow growth. Great changes were wrought in 1898, when the wave of excitement attending the Klondike discovery swept thousands of gold seekers into the Yukon region. This was followed by the Nome rush of 1900, which carried a vast horde of inexperienced men to the Seward peninsula. The Territory is continually attracting greater numbers of experienced mining men and larger amounts of capital. During the past decade it has been the placer fields which have received most attention. Meanwhile, the auriferous lode mining has been constantly on the increase, copper mines have reached a shipping stage, tin deposits are being actively prospected, and the coal fields are receiving much attention.

Of the total—$65,000,000—up to 1904, which, including this year, will be at least $80,000,000, about one-half has been taken from the mines of the Pacific coastal belt, and chiefly from lode deposits. The Seward peninsula has furnished about a third, and all of that in the past five years. The Yukon basin, though it has been a producer for twenty years, has only become of importance during the present year, since the discovery of the Fairbanks district. While exact figures are not yet available, it is probable that the Yukon region will yield nearly $7,000,000 in 1905, of which about $6,000,000 have been taken from the Fairbanks placers. During the first year of the Nome excitement the Nome placers produced less than half of the present output of Fairbanks. Yet Fairbanks is known only among mining men, while 20,000 people went to Nome the first year.

Tin has been found only in the extreme western part of Alaska, close to Bering strait, and but 60 miles from the Siberian coast. It occurs both in placers and in lodes, but the future of the tin mining industry can not yet be foretold. The lode deposits are similar to those of Cornwall, England, and the outlook is hopeful that they will become producers. Placer tin has been mined for several years and some shipments have been made, and the lodes are being carefully prospected.

At a number of localities on the Pacific seaboard there are large seepages, and at some, at least, the rock structure appears favorable for the formation of oil pools. The drilling that has been carried on has not met with much success, though some oil has been found.

The marble of southeastern Alaska is being developed, and the same region affords some mineral waters. At several localities gypsum deposits have been found. Of the other mineral resources of Alaska, granite, which is very abundant, should be mentioned. There are also extensive deposits of iron. Some cinnabar has been found in the Kuskokwim valley, but little is known of the character of the deposit.

Though up to the present time the gold and silver deposits have yielded practically all of the mineral wealth of Alaska, the copper mines are rapidly forging ahead. Copper is found in three districts. Two of these are on the coast and are now shipping ore, while a third lies inland. The southernmost field is in the Ketchikan district, on Prince of Wales Island, where half a dozen mines are in operation and two smelters have been built. The ores are chiefly sulphides, but also include some carbonates. Its accessibility and the abundance of timber make the Ketchikan district the ideal mining region of the Territory. Sulphide ores are also being mined in Prince William sound, where two mines are shipping ore and a dozen other localities where active prospecting is going on.

In the Copper and White river regions large masses of native copper occur in the glacial gravels, and these deposits furnished the natives with the only metal they had. After the Russians settled in Alaska, the copper deposits became of less value to the Indians, as they secured a better sub titute from the white men. During 1898 and 1899 search for the source of placer copper resulted in the finding of lode deposits on White river. The workable ore bodies are chiefly sulphides and occur in two belts, north and south of the Wrangell mountains. Their inaccessibility has made systematic prospecting difficult. There is no question but what Alaska is going to be an important source of copper.

At Cape Lisburne, in the extreme northwestern part of the Territory, an excellent quality of coal has been found by the United States Geological Survey in workable seams. It is of interest to note that this is the only known occurrence of Carboniferous coal west of the Rocky mountains. The region to the east has been but little explored, but the facts indicated a broad coal-bearing belt running parallel to the Polar sea. This field, locked in the ice for all but two months in the year, has no immediate commercial importance, but forms a part of the ultimate fuel resources of the world. A second bituminous coal field has been mapped which stretches along the lower Yukon, where some developments have been made, but there are no shipping mines. Lignitic coals are not uncommon in the Yukon basin, and these will eventually find a local market, but are undeveloped.

By far the most important coal fields are those near the Pacific seaboard. Best known is that of Controller bay, where there is a coal-bearing area of at least 150 square miles but 25 miles from tide water. Here numerous seams exceed 20 to 30 feet in thickness. This coal ranges from a high-grade bituminous to a semi-anthracite. A second field, carrying similar coals and probably in equal abundance, stretches along the Matanuska river north of Cook Inlet. This will probably receive early

development, as it is the immediate objective point of a railroad now under construction from tide water. Coal mining is being carried on at but few places and the total annual production does not now exceed a few thousand tons. As Alaska is annually paying $2,000,000 for fuel, it would appear to be an attractive field for the coal miner.

Whatever the future of copper and coal mining, the gold mines are every year adding millions of dollars to the wealth of the world. Two broad gold belts are recognizable. The one stretching parallel to the Pacific seaboard, through the Panhandle of the Territory and following the great bend of the coast line, is lost among the islands of southwestern Alaska. This zone includes practically all the auriferous quartz mines of the Territory and also some of the smaller placer districts. A second belt extends northwestward from the international boundary, near the Klondike, to the Seward peninsula. The interruptions in the belt indicate either that the field is unexplored or that the gold-bearing terranes are mantled by younger sediments. With the exception of the yield of one quartz mine on the Seward peninsula, all the gold from this belt, embracing about half the production of Alaska, has been taken from placers.

The coastal mineral zone, though it includes some important placer districts, is primarily a region of lode deposits. It has produced nearly half of the entire gold output of the Territory, and most of this has come from the Panhandle, or southeastern Alaska, as it has been called. In this field most of the gravels have been swept away during the recent extensive glaciation. Here a belt of metamorphic rocks, skirting the mainland from Dixon's entrance to Lynn canal, embraces the main lode system, which has many features in common with the mother lode belt of California. Workable auriferous veins have been found in a number of widely separated localities in this zone. Besides the mainland belt, other lode systems are found in the islands to the westward, but are less known.

The Yukon–Tanana gold belt, embracing the oldest producing classes of the interior, has been exploited for nearly a quarter of a century, but it is only this year that its output has run up into the millions. The placer gold finds its source in quartz veins and impregnated in a belt of metamorphic rocks. Some of these may yet be found to carry values, but no lode mining has yet been attempted.

The ever active prospector has found a new and what is said to be a very rich placer district lying to the south of Tanana. While much of this region has been run over in a hurried way, but little of it has been systematically prospected, and there is reason to believe that the limits of new discoveries have been reached. Moreover, under the present cost of transportation, only the richest deposits can be mined. It is fair to assume that this field will continue to be an important producer for many years to come.

Passing westward, what appears to be the same gold belt is found again in Seward peninsula. Up to the present year the Seward peninsula was the largest placer producer of Alaska, but its output this year bids fair to be exceeded by Yukon camps. This does not signify that the placers of the peninsula are on the decline, for they will not reach their maximum for many years. The cost of mining is much less than in the interior camps, and operations are on a much larger scale. At present much of the activity is being directed toward the installation of extensive plants, but comparatively few of which are in operation. The area of the gold-bearing gravels of the Seward peninsula is about equal to that of California.

One lode deposit has been developed in the peninsula, and this field may yet become a quartz mining region. When its gravels are swept away by the extensive mining operations which are now being carried on, the source of the placer gold will be revealed. Some of the deposits can be made to yield a profit, for even comparatively low-grade deposits will be mined, as the ditches now furnishing water for placer mining can be turned into power, and the railways for cheap transportation will have been built.

In Fairbanks district the broad valleys and low stream gradients present different problems to the miner than the coastal region. Cleary creek is one of the richest in the Fairbanks district. The pay streak being covered by an over-burden of 30 to 60 feet in thickness, drift mining is resorted to. The frozen condition of the gravels makes it impossible to tunnel throughout the year without the use of timber. It is said $6,000,000 worth of gold will be taken out this year.

The rapid evolution of mining methods in this northern field during the last five years is striking. For two years after the discovery of Nome, much of the gold was taken out with hand rockers, but this has been in part superseded by more economical methods.

The beach deposits of the Seward peninsula, though now nearly exhausted, have been the richest in the world. Near Bluff 400 yards of the beach averaged probably $150 to the cubic yard. Though there have been many improvements introduced in mining on Seward peninsula, shoveling in sluice-boxes is still practiced. Though there are in the Seward peninsula none of the tremendous bodies of gravel which have made the California placer fields famous, nor are there here the steep gradients and extensive water reservoirs which have made hydraulic mining in California the cheapest in the world, yet this method has its place in the Seward peninsula, and is constantly on the increase. The frozen ground has developed some new methods of mining, the most novel of which is the use of steam points. Dredging operations are constantly on the increase, and though they are not applicable to all parts of the placer districts of Alaska, they here find a legitimate place in economic mining.

The advancement of the mining industry in Alaska during the past decade, attested by the value of the annual mineral product, which has risen from less than $2,000,000 to over $15,000,000, has been great. The territory cannot reach its true position as a mining field until improvement in methods of transportation cheapens the cost of production. Besides the inland lying coal fields and copper district, there are scores, if not hundreds, of placers which must remain undeveloped until reached by railways and wagon roads. This fact has been recognized in Washington, and a move has been made toward highway construction, and means have been provided for explorations which must precede the choice of a railway location.

The Yukon basin is accessible by an all-water route from Bering sea, but this is closed by ice for nearly nine months in the year.

The means of river navigation have improved. The scow has been replaced by the steamer. The absence of a harbor and shoal water in northern Alaska makes the landing of freight expensive and this has been a severe tax on the mining interests.

Alaska's greatest need to-day is transportation facilities. It is necessary for a proper development of its mineral wealth that a railway should be constructed from some point on the coast to the Yukon region. A route for this railway can be chosen so as to include important coal and copper deposits, and it will open up a vast field which is now inaccessible. A railway to serve the mining interest must be constructed from some one of the good harbors, which are abundant on the Pacific, to the Yukon through American territory. The explorations and surveys of the Geological Survey have determined the general location of such a route. There are several classes which are feasible for railway construction, any one of which would reach the gold fields by a line not over 400 miles in length. A proper choice of location must be determined, not only on the topography, but also on the distribution of the mineral wealth, for on this will depend the tonnage of the road.

THE PROSPECTOR.

When going into the field the prospector should provide himself with a small steel pan for washing out samples to test for gold; a small steel mortar and pestle—a piece of drill steel "upset" at one end is best, as it cannot be broken, whereas the ordinary cast iron pestle is easily broken; and a pocket magnifying glass to examine samples. If the prospector has any knowledge of mineralogy, he should also have several bottles with ground glass stoppers for hydrochloric, sulphuric and nitric acids, and one for ammonia, and a good-sized bottle of pure water for washing, etc; two dozen test tubes, a blowpipe and alcohol lamp, several pieces of charcoal suitable for blowpipe use; litmus paper, red and blue; filter paper, glass funnel, and beakers for filtration, etc., and also a small scale for weighing materials. If the prospector is not familiar with the scale of hardness, he should have some small samples for test. The important ones are: 1, talc; 2, gypsum (selenite); 3, calcite; 4, fluorite; 5, apatite; 6, orthoclase (feldspar); 7, quartz; 8, topaz. The sapphire (No. 9) and the diamond (No. 10) may be dispensed with. Of course, he must also have the necessary working tools—picks, shovels, drills, hammers, etc. Most prospectors, however, go out with a very limited equipment, taking merely the mortar and pestle and pan, and some do not even provide these, but bring all samples collected back to town for determination and assay.

The interesting rock and ores from Lone mountain, Esmeralda county, Nev., are classified as follows: No. 1, an altered intrusive rock, carrying 10% or more of iron sulphide, which may contain gold and silver. The rocks should be assayed to determine these values. The dark-colored rocks in this package are similar to the light-colored ones, being simply oxidized, containing iron oxide instead of sulphide. The black, red and yellow colors are due to oxidation. Package No. 2 contains three pieces of crystalline, and partly crystallized vein quartz, showing iron sulphide (pyrite) and iron oxide (hematite), with a little green copper carbonate. This lot should also be assayed for precious metals. No. 3, consisting of four pieces of mineral, contains a white piece, principally carbonate of lime, with a little quartz, and a few yellowish-green garnets. The largest piece, consisting of a mass of crystals with pearly luster, is almost wholly garnet. A little copper carbonate can be seen. The smallest piece consists of a siliceous iron-stained rock containing some green copper carbonate. The dark-colored heavy piece is principally yellow copper sulphide (chalcopyrite), altering to bornite. It is a good grade of copper ore, and may also contain gold or silver, or both. It should be assayed for all three minerals. No. 4 contains a quantity of much-altered ore, principally iron oxide. It may be a part of the gossan of a copper-bearing vein. It also should be tested by assay. The white mineral in No. 4 is calcium carbonate.

The ores from Helena, Mont., are evidently from a zone of brecciation into which mineral waters have infiltrated, depositing iron sulphide, and probably also gold. The rock has since been oxidized and now shows iron oxides, while the brecciated structure of the material can be plainly seen. In a deposit of this character there may be walls on either side or on one side only, or the fissure may be in the central portion of the deposit, the mineralization having penetrated both walls. What the rock was originally it is impossible to say, owing to extreme metamorphism.

The rocks from Mineral hill, Pony, Mont., are: G, gneissoid granite; B is quartz-mica diorite.

Concentration and Separation of Zinc-Lead Ores.

Written for the MINING AND SCIENTIFIC PRESS by D H. LAWRANCE.

The county of Summit, Colo., long famous for its great gold production in the past, and for the fact that its collection of gold specimens is seldom equaled for rarity and beauty elsewhere in the world, is now becoming widely known as a center of importance for the production of lead-zinc ores.

For a long time past Breckenridge, the county seat of Summit county, has been a shipper of large quantities of high-grade zinc and lead ores to various smelting and chemical works, but only this year has it come to the fore in milling the ores of lower grade, so concentrating the metallic values and afterwards effecting a separation of the different metals as to make readily marketable products that are sought by the various metal works.

The first plant erected in Breckenridge district to make a good concentration and separation is the large mill of the old Union M. & M. Co., built during last winter and spring on the property of that company at the foot of Mineral hill, in French Gulch, one mile from town. The plant is so located as to handle all the ore trammed directly into it from the lowest level of the mine, and at the same time is conveniently situated for the hauling in of custom ore by the road. The building of the old Union mill was completed in July, 1905, and has been making trial runs and test crushings and concentrations ever since. It is the largest plant of its kind in Summit county, and one of the best arranged in the State. The dimensions of the building are 70x130 feet in length, and 73 feet in height at the apex, and in its erection over 200,000 feet of lumber has been used. The pulverizing machinery consists of one 9x15 jaw rock crusher, and two sets of 14x24 rolls. The concentrating and separation plant is a combination of eight jigs, eight No. 5 concentrating tables and two No. 5 slimers. Besides the above are the usual accessories in the shape of automatic feeders for the rolls and concentrators, elevators, classifiers, tanks, etc.

The power is supplied by a 100 H. P. tubular boiler, 16 feet long and 52 inches in diameter, and a 150 H. P. Corliss engine 14x36.

The sizing and classifying are done by a combination of revolving screens and hydraulic classifiers.

The flow of the ore is as follows: The ore trammed in from the mine or hauled from customers' properties is dumped directly into ore bins at the top end of the mill, and is all fed automatically to the crusher by means of a trough. From the crusher it is passed by an automatic feeder into the coarse rolls, whence it gravitates into the elevator boot and is lifted to the top of the building, to the main screen line. It first goes to an 8-mesh revolving screen, the oversize passing back to the fine-crushing rolls. The fine passing through the 8-mesh goes to a 10-mesh screen, the oversize from that being conveyed to two 4-compartment jigs called Nos. 1 and 2. The fines from the 10-mesh go to a 24-mesh screen, the oversize therefrom going to jigs 3 and 4 The product that passes through the 24-mesh is conveyed to a 30-mesh screen. That which passes through the 30-mesh is carried on to the hydraulic classifiers. The oversize goes to jig 5. The hydraulic classifiers make three sizes, the coarsest of which goes to jig 6 and the intermediate to four tables, and the finest to two tables. Jigs 1, 2, 3 and 4 take out the iron and lead in the different compartments, and the zinc and silica overflow to two more 4-compartment jigs on the lower floor, where the zinc is taken out and the rest of the material runs down the tail-sluice. Jigs 5 and 6 are 6-compartment machines, and separate the zinc and lead and iron direct in the one operation on the upper floor. The tailings from the four tables handling the intermediate product of the classifiers go on to two tables on the lower floor, and that from the two tables handling the fine classified product go on to two slimers, where another good zinc product is made.

The company is doing good work, and is shipping three different products: First, the lead concentrates carrying the high silver values and some gold; second, the iron concentrates carrying gold and silver values; third, the zinc concentrates carrying gold and silver values, all of which are finding a ready market.

The capacity of the plant is 120 tons per day, and the output will average 30 tons per day of concentrates.

The officers of the company at the operating end are: Albert E. Keables, general manager; David H. Lawrence, M. E., consulting engineer; George Smith, mine superintendent; Charles F. Gilbert, mill superintendent.

The company is an Eastern organization, the majority of the stock being held in Illinois and Wisconsin, the head office being in Oshkosh, Wis. The success of the old Union mine and mill will give a great stimulus to zinc-lead ore mining in Breckenridge and surrounding districts, and other mills will be the order of the day where low-grade ores are found in large bodies.

Reduction Plant and Process at the Oroya-Brownhill Mines.*

Written by Robert Allen.

The ores from the three mines are similar in character—schistose, and crush freely; also they are free from minerals harmful to the cyanide process. They contain from 50% to 65% of silica and insolubles, about 7% carbonate of lime, 3% to 5% carbonate of magnesia, about 5% of alumina, the balance being principally iron compounds. Tellurides of gold and silver are found throughout the ores, also coloradoite (a telluride of mercury). These, with considerable auriferous iron pyrites, form the great bulk of the concentrates, and contain the greater proportion of the gold contents of the ores. The amount of free gold is small, existing in a very fine state of division, disseminated through the mass as a rule.

As the result of a lot of experimental work upon the Kalgoorlie sulpho-telluride ores by Dr. Diehl, the present process was installed upon the Brownhill mine in 1901. Some modifications of methods have been adopted and extensions of plant made since then, the process of treatment being briefly as follows: The ore is coarse-crushed by breakers, milled in a battery through a coarse screen without amalgamation; the tailings separated into "sand" and "slime" products; the former is sized, its coarser sizing being coarse-ground in Wheeler pans; the whole of the "sands" are passed over tables, the eliminated concentrates being roasted, fine ground with mercury, agitated with cyanide and filter pressed, while the balance of the "sands" tailings is slimed in flint mills. This product is agitated with ordinary cyanide and bromo-cyanide and filter pressed; the gold solution is precipitated, as well as that from the concentrates, in ordinary zinc extractor boxes.

The great advantages of the process are that it is a wet crushing process, and consequently there are no dust troubles, and the treatment of the ore is completed within a couple of days.

Ore Breaking and Transport.—The Oroya ore is dumped from the brace on to 1½-inch spaced grizzlies, the coarse portion being broken by a No. 6 Blake breaker. The crushed ore is conveyed by an aerial tram to the bin of the Brownhill mine, a distance of about half a mile. The Brownhill ore is crushed by a similar breaker and drops into the same bin, which holds 600 tons. At the bottom of the bin are five belt-driven feeders delivering the ore on to a horizontal 18-inch belt conveyor, delivering to a second belt conveyor, which elevates the ore and delivers the full length of the battery bins, operating a traveling tripper, which distributes the ore evenly. The battery bins hold about 360 tons. The power used by the rock breaker is 15 H. P., by the aerial tram 7 H. P., and by the belt conveyor 4 H. P.

Milling.—The battery has fifty stamps, each of 1100 pounds. It is fed by suspended feeders from the battery bins. The ten mortars are of the ordinary Homestake pattern. End, side, and shoulder liners of malleable cast steel are used in the boxes. The boxes are 11½ inches wide at the surface of the dies, and 10 inches deep below the discharge. The dies and shoes are of forged steel, each of 9 inches diameter. The dies are worn down to about 2 inches thickness, compensation for loss of depth being made up by false dies. The depth of discharge is kept at about 2 inches by means of cleats. The steel consumption of the shoes and dies are respectively 4.36 and 4.56 ounces per ton crushed.

The stamps drop 108 times a minute a height of 7¾ inches, and with 10-mesh woven wire screens have a duty of 6.48 tons.

Plant water, kept to an alkalinity of .003% KOH by means of lime, and containing 0.04% KCN, is used in the battery, the amount used being eight gallons per stamp per minute. The power required by the battery is 160 H. P.

Classification of Battery Pulp.—The pulp from the battery is run direct from each box to a pair of conical spitzkasten in series, 14 inches by 16 inches and 24 inches by 28 inches, respectively, which eliminate two underflows of coarse sands and fine sands respectively, and a "slime" overflow—the last, amounting to 41% of the ore milled, can practically all pass a 150-mesh screen. The slime pulp passes directly to a pump sump. The coarse sands pass to five coarse-grinding pans, which are the 5-foot diameter improved Wheeler pans commonly in use on the field. The ground product from these pans passes on to a conical spitzkasten, 12 inches by 16 inches, which separates a coarse product and a finer product. The former is passed over five "coarse" tables, while the latter, with the fine pulp liberated by the battery spitzkasten, is sent to five "fine" tables. The ten tables separate out two concentrates products, while the tailings gravitate to the pump sump and are elevated, by means of four plunger pumps, 10 inches by 48 inches, a height of about 35 feet, to a nest of conical spitzkasten, consisting of eight rows of three each in series.

The sizes of the cones are 2 feet by 2 feet 9 inches, 2 feet 6 inches by 3 feet 6 inches, and 2 feet 6 inches by 3 feet 6 inches respectively, and the widths of the delivery launders of each set are 10 inches, 14 inches and 14 inches respectively.

The first two underflows, containing coarse sands, are sent to six flint mills for fine grinding; the third underflow, containing fine sands, is distributed over six tables, which eliminate a third concentrate product, the tailings being returned to the pump sump (A); the overflow containing slimes—i. e., material all passing a 150-mesh screen—is sent to the pulp condensers. These consist of five nests, three containing twelve inverted pyramidical spitzkasten, each 5 feet square and 5 feet deep, and two nests each containing twenty-four similar spitzkasten, where the slime pulp is thickened up in the underflows to a consistency of 1.41 specific gravity, which is sent to the agitator vats for treatment.

The slime from sump A is pumped by three-throw plunger pumps to three rows of four spitzkasten. The underflow from first row goes to flint mills, from second row to six tables, and the underflow from the third to the agitators, the overflow passing on to pulp condensers the same as above.

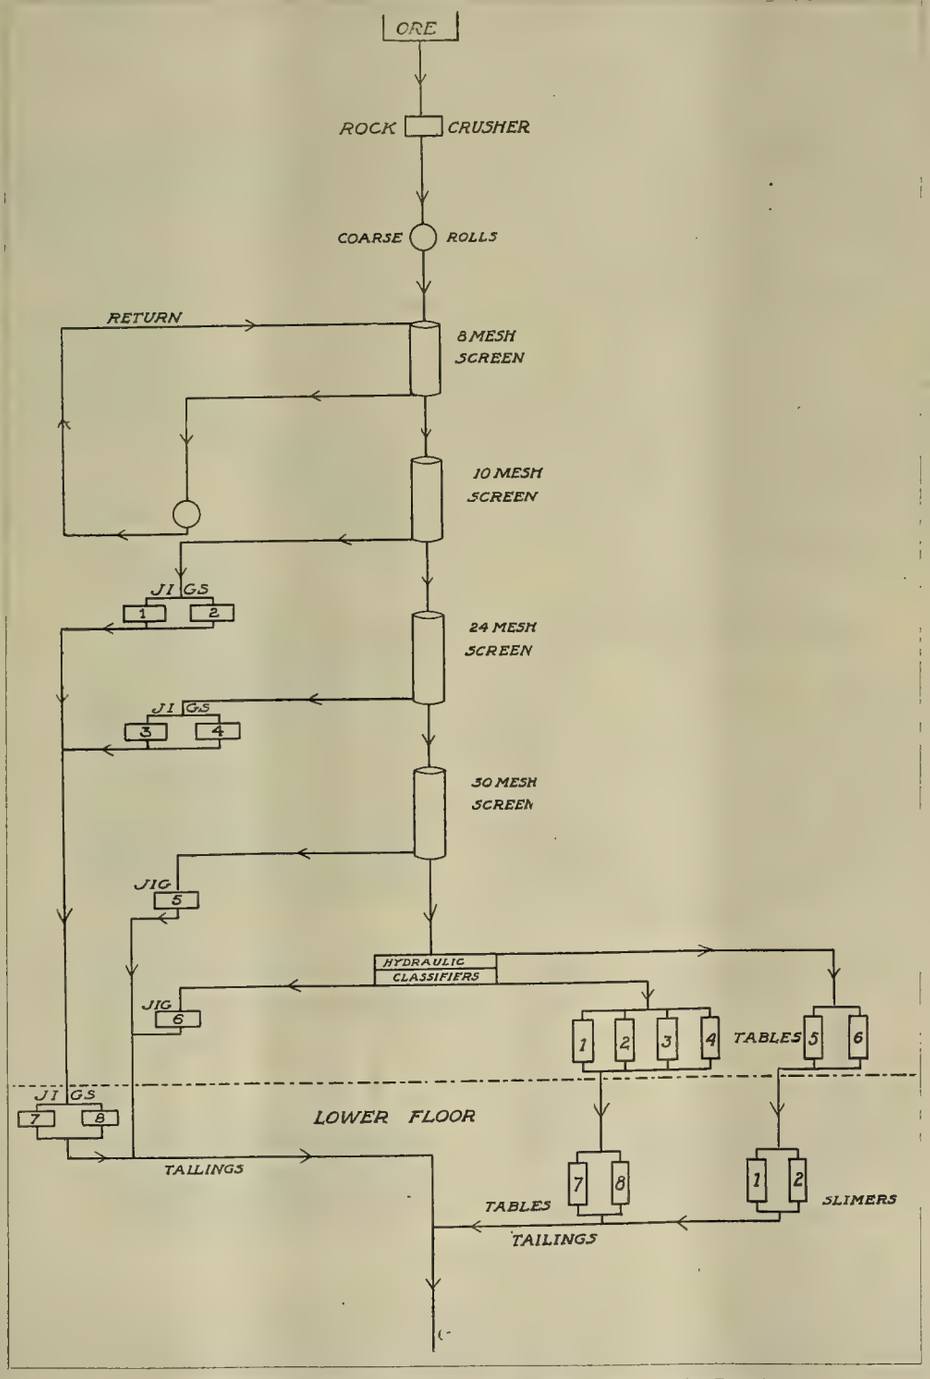
The overflow from pulp condensers—return water—is passed on to four intermediate settling tanks, where any suspended slime is settled, and thence on to a storage tank, from which it is sent by pump E to the battery overhead service tank. The flint mill products are sent back to the pump sump A.

Coarse Grinding Sands.—The grinding pans already referred to are used simply for grinding, with no mercury. They are run at fifty-one revolutions. A set of shoes and dies lasts three months; the shoes are worn down as far as possible, compensating rings, cast locally, being used to keep the grinding weight as uniform as possible.

Concentrates Treatment.—The concentrates already referred to contain the great bulk of the refractory elements in the ore. As far as possible these substances are eliminated with the concentrates to avoid consequent increased consumption of chemicals in the raw slime agitation vats. The concentrates, amounting to about 6% of the ore milled, and worth about eleven ounces per ton, are trucked from the various tables and sent to the feed floors of three roasting furnaces; salt in amount one-half pound to two pounds per ton, and sometimes acetate of lead, is used here. These furnaces roast ten tons of concentrates each per twenty-four hours, the duration of the roast being five hours. The furnaces have six rabbles each, two more than is usual. They require one-sixth ton of wood fuel per ton of concentrates, or 16⅔%, and absorbs 4½ H. P. One furnace man per shift attends to the stoking and feeding. About 600 tons are roasted per month, the sulphur contents being reduced from 35% to 0.2% (as sulphide). About 1.1% of the whole amount roasted is caught as fine dust in the furnace flues; it assays but a little higher than the roasted concentrates—about fourteen ounces per ton. Exhaustive tests have proved the loss from volatilization of gold to be inappreciable. The concentrates decrease in weight in roasting from 25% to 30%.

The roasted product is removed by a push conveyor with 22-inch flights to two pairs of grinding pans of the same type as above mentioned, worked in parallel. The first pair is used both for fine grinding and amalgamation, their overflows passing on to the second pair, which is used for fine grinding only.

*Abstract Jour. Cham. Mines, Kalgoorlie, W. A.



Flow Sheet of the Union Mill, Breckenridge, Colo. (See Opposite Page.)

Mercury is added three times daily to the first two pans, amalgamation recovering about 30% of the value of the concentrates. The greater part of the metallic iron slimes made by the battery and coarse grinding pans is caught with the concentrates, and prevented from entering the raw slime agitation vats.

The ground concentrate pulp is elevated by a 6-inch belt-driven plunger pump to a pair of conical spitzkasten, each 2 feet 6 inches by 2 feet 6 inches, which eliminate any coarse material for returning to the second pair of grinding pans. The overflow is distributed over a nest of nine inverted pyramidical spitzkasten, each spitzkaste being 4 feet 6 inches square by 4 feet 6 inches deep, the whole forming a settling surface 15 feet by 15 feet. The underflows united form a sludge of consistency 1.34 specific gravity. This is sent to three vats, in which it is agitated, with the addition of ordinary cyanide, for a period of about 100 hours, afterwards being filter pressed.

The overflow from these pulp condensing spitzkasten is sent to two settling vats, used alternately, the settled liquor being afterwards passed through the concentrates extractor boxes and returned to plant.

FIND-GRINDING SANDS.—The flints used in the flint mills are imported from the shores of the Baltic, and cost 7s 4d per cwt. in Kalgoorlie. Of the six mills on the Brownhill plant, five are 13 feet 7 inches long by 3 feet 8 inches in diameter, the sixth being 12 feet 11 inches by 4 feet 1 inch. Each is a long welded drum with cast steel ends, terminating in hollow trunnions through which the pulp passes. They are lined with chilled cast iron or cast steel plates 1 inch thick, locally made, each being bolted to the shell by two ⅞-inch bolts, with countersunk heads. The liners are worn down to from ¼-inch to ⅛-inch thickness, their thickness not affecting the efficiency of the mill. About 470 pounds weight of liners are worn down in each mill per month. The liners cost 30s per cwt., and a new set is put in by two men in seven hours. The mills are driven at thirty-two revolutions per minute, with spur gearing; each mill requires 21 H. P. to drive it. About 8 cwts. of flints are used up per mill every month. The mills are kept about half full of flints, a mill charge weighing about 2½ tons. Periodically the contents of the flint mills are removed, all flints passing a 1½-inch ring being rejected, the larger flints having been found superior for wet grinding.

On the Brownhill, of the material fed into the mills, about 17% will pass a 150-mesh, while the ground product contains 24%, so that about 7% of slimed material is eliminated by each passage through the mill. It is estimated that, under present conditions, 238 tons of ore pulp are passed through each mill per twenty-four hours, so that each actually fine-grinds about 27 tons per day, equivalent to 160 tons per day for the tube-mill plant.

RAW SLIME TREATMENT.—The raw sludge from the pulp-condensing plant is agitated with ordinary cyanide and bromo-cyanide in ten covered-in agitation vats (provided with the usual mechanical stirrers), from 20 feet to 25 feet in diameter and from 7 feet 6 inches to 8 feet deep. They hold from 90 to 110 tons of pulp, equivalent to from 41 tons to 50 tons of dry slime. Each agitator takes about four hours to fill. The solution, which forms about half of the bulk of the sludge, is plant water containing about .8 pound per ton, or .04% of cyanide; it is made up by the addition of more cyanide to 0.1% strength. The contents of each vat are first agitated for three hours, then bromo-cyanide in amount proportional to the value of pulp—about 1 pound to each ounce of gold—is added, and the agitation continued for another twelve hours, when solution is effected. Toward the end of the agitation—about two hours before its completion—lime in amount from 2 pounds to 5 pounds per ton is added. During the agitation about ¾-pound to 1 pound of ordinary cyanide per ton is consumed, while the whole of the bromo-cyanide is destroyed. After agitation the raw or roasted pulp is discharged into a sunken agitator, whence it is pumped to the filter presses under a pressure up to 70 pounds.

FILTER PRESSING.—The plant at present includes six modern presses of fifty frames, each 40 inches by 40 inches by 3 inches, with efflux taps to each plate, and external ports. There are four presses hydraulically closed, each holding 5.9 tons, and having a filtering area of 1111 square feet; also two with a patent angle lever closing arrangement, each holding 4.5 tons, with same area filtering surface. A press, with pressure up to 70 pounds, takes twenty minutes to fill, after which the cakes are washed with a weak solution of cyanide of about 0.02% strength under 70 pounds pressure for twenty minutes, when about 500 gallons are passed through the cakes. The cakes are next "dry blown" by compressed air under 30 pounds to 60 pounds pressure for ten minutes, the final effluent from the presses during this air-drying assaying from a trace to 6 grains per ton only. The press in then discharged, this operation taking twenty minutes more, the whole cycle taking about seventy minutes. The residual moisture of the cakes is about 14%, and it is interesting that filter press cakes from a dry process plant retain more moisture than those from a wet process plant. Formerly the presses were filled by montejus by means of compressed air, but that system has been abandoned in favor of the more economical practice now introduced in many filter press plants of filling by means of a three-throw belt-driven plunger pump 8 inches by 18 inches.

(TO BE CONTINUED.)

Filter Pressing Slimes.

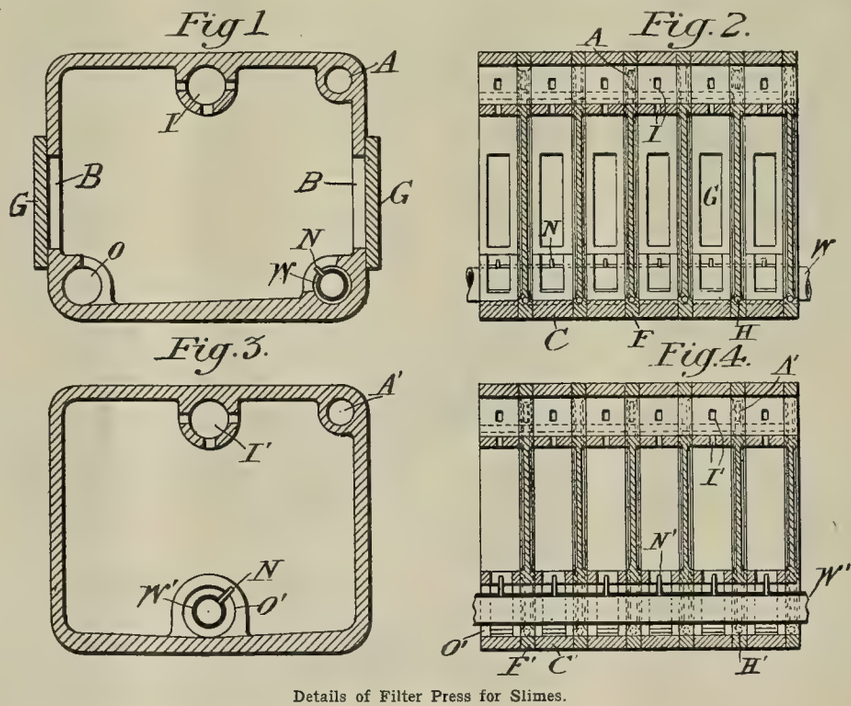
For four or more years the Homestake Co. at Lead, S. D., has been successfully treating its tailings, or rather a portion of them, by the cyanide process. The first plant with a capacity for treating 1200 tons daily was built in 1900–01, and took the pulp from three large mills crushing 2000 tons of ore daily. In the experiments made on this pulp it was found that better results were obtained if the slimes in the ores were separated from the sands. This separation was effected by means of hydraulic classification, for which a series of large cone-shaped settlers is used.

The thickened pulp is drawn from the bottom of these cones, the slimes overflowing at the top. The material drawn from the bottom of the cones is delivered to large leaching tanks where it is treated by percolation. The slimes, which contain values in gold, have for years been used in sluicing the sands from the large tanks, after first having been relieved of a portion of their water, the water being pumped back for reuse in the mills.

For a long time C. W. Merrill, who designed and built this great plant, with its several additions and improvements, has been experimenting to discover an economical method of treating the slimes at a profit. As a result of these labors he has been able to demonstrate that the slimes can be successfully and rapidly treated by filter pressing. This requires a filter press of peculiar construction and operating automatically and practically continuously. It is customary in the operation of filter presses to separate the several units of which the presses are made, known as the distance frames. Ordinarily it is the practice to do this by hand, and the process involves considerable labor and time, making the operation expensive. The time thus consumed also reduces the capacity of the press, and the wear on the filter clothes is quite an item in the expense account. As a natural result this limits the employment of the ordinary type of filter press to material of comparatively high grade.

Another feature of the usual filter press necessitates a high pressure in order to properly accomplish the filtration through the thick cake. Mr. Merrill has designed and built a filter press which does not require the distance frames to be taken apart in order to remove the semi-solid cake of slimes after the solution has been expressed from it. In this an inlet has been provided for each distance frame through which a liquid, vapor or gas is introduced under pressure, and the unfilterable material forced out of the container through an outlet in the frame.

The accompanying sketch illustrates the press and method of operating it.



Details of Filter Press for Slimes.

Fig. 1 is a longitudinal cross-section of a container, and Fig. 2 is a vertical cross-section, Fig. 1, of a series of containers put together in the manner usual in filter presses. Fig. 3 is a vertical longitudinal section of a modified form of container. Fig. 4 is a vertical longitudinal section of a series of such modified form of container put together. In Figs. 2 and 4 the views show the vertical cross-section when looked at from left to right.

In the construction shown in Figs. 1 and 2, C is the frame of the container, which may be in cross-section of any convenient shape. B B are openings in the sides. O is an opening or outlet at one side through which the solid, semi-solid, or unfilterable material, hereinafter for convenience called the "precipitate," is removed from the containers and which when a series of containers are put together in a filter press makes a continuous opening through the press, which is closed at the ends in any convenient manner and discharges into any suitable receptacle. A is a corresponding inlet for treating the precipitate in place with liquids, vapors, or gases, and which is preferably placed at either or both upper corners of the container and in like manner forms a continuous opening or openings when the containers are placed together in the filter press. I is an inlet through which the material to be filtered is introduced, which inlet is of the same general character and becomes continuous when the containers are put together in the filter press and is provided with the openings 1, 2 and 3, from which the material is introduced into the chamber. W is a supply pipe or channel through which the liquid, vapor, or gas is introduced under pressure for the purpose of removing the precipitate. This is provided with a nozzle, slit, or hole which enters into each container. F is the filter plate, which is introduced between the containers. G is a gate which is used to close the opening B B.

In the second construction, Figs. 3 and 4, the opening O′, which corresponds to O in the structure shown in Figs. 1 and 2, is placed within the container and contains in its interior the supply pipe W′, fixed or rotative, which corresponds to the pipe W and like it is provided with nozzles N′ N′, similar to the nozzles N N, which pass into each container, a series of these being employed, as in the previous construction. I′ represents the inlet through which the material to be filtered is introduced, which corresponds to the inlet I in Figs. 1 and 2.

A large plant is being constructed on McGovern hill, overlooking Deadwood, where the slimes from the two cyanide plants of the Homestake are to be conducted and treated by means of filter presses similar to those described, or some modification of them. This new plant will have a capacity of about 1600 tons per day.

ARGENTIFEROUS LEAD was first produced, according to Hahn, in 1866 or 1867, near Helena, Mont., and at Oreana, Nev. In 1869 the mines of Eureka, Nev., discovered in 1864, were opened, and the treatment of ore begun in the following year. Next came Utah, where smelters were erected in 1870, followed by Colorado, which came into prominence in 1878. Later, Idaho, New Mexico and Arizona were added to the list. Colorado has been since the largest producer, and it, together with Idaho, in the year 1900, produced about 50% of all the lead of the United States. The largest output of lead at present comes from the Cœur d'Alene district, Idaho.

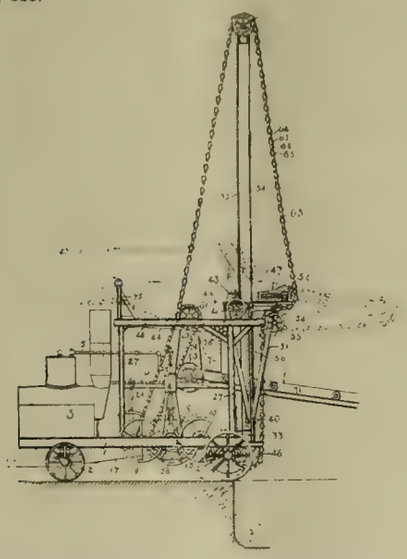
NOTHING has advanced the mining industry more effectively than the improvements in concentrating machinery, which have been made the past few years. The jigs, tables, and vanning machines, together with sizing and hydraulic classification, have accomplished much.

Mining and Metallurgical Patents.

PATENTS ISSUED NOVEMBER 7, 1905.

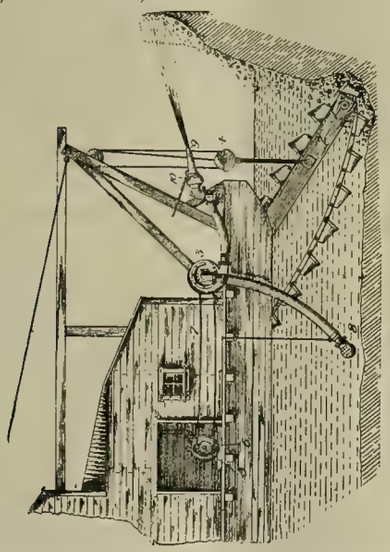
Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS

EXCAVATING MACHINE.—No. 802,985; J. Helm, St. Louis, Mo.



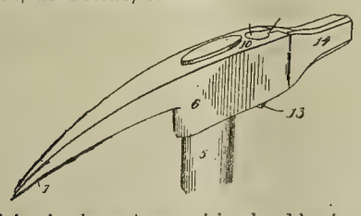
Excavating machine, comprising main frame, sprockets on main frame, guide frame pivotally mounted on main frame, yieldingly mounted sprockets on guide frame, shaft mounted on guide frame provided with sprockets and brake, conveyor frame reciprocatingly mounted on guide frame and conveyor passing over all of sprockets, sprockets on main frame engaging ascending side of conveyor, and sprockets on guide frame engaging descending side of conveyor, yieldingly mounted sprockets engaging conveyor at point behind point of engagement of sprockets on shaft provided with brake with conveyor.

DREDGING APPARATUS.—No. 803,587; R. G. Hanford, San Francisco, Cal.



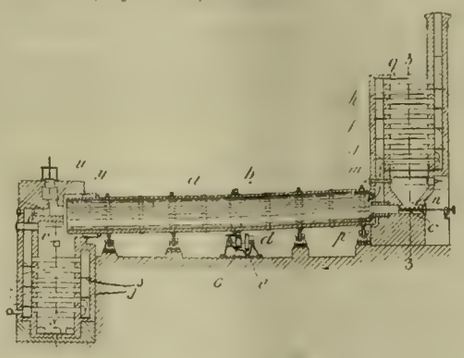
In combination with dredge hull, chain of buckets projecting below hull, pump, and hydraulic monitor mounted upon hull and connected to pump, and adjustable relatively to hull.

PROSPECTOR'S PICK AND AX.—No. 803,620; J. McMahon, Revelstoke, Canada.



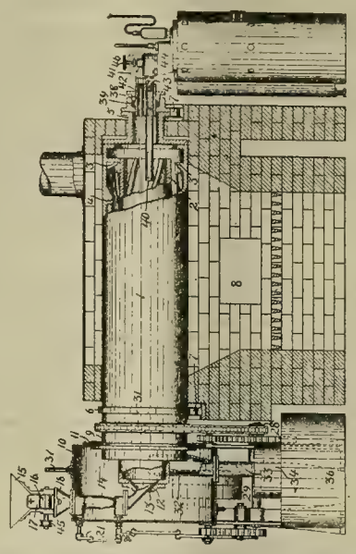
Mining implement comprising head having pick on one side, head formed with perforation between sides for handle, and recess parallel with perforation and terminating in ledge provided with perforation, insertible member having portion engaged in recess and seated upon ledge, and fastening member entered from under side of ledge and threaded into portion of insertible member seated on ledge, fastening member being disposed parallel with handle of implement.

FURNACE FOR BURNING CEMENT, ETC.—No. 803,530; G. Grondal, Djursholm, Sweden.



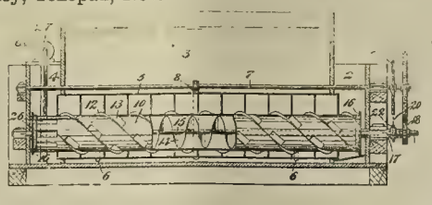
Furnace for burning cement or reducing or calcining ores comprising hollow rotating cylinder or drum slightly inclined to horizontal, vertical furnace located above upper end of cylinder, shaft located under lower end of cylinder, device for making gaseous mixture at lower end of cylinder and feeding device under vertical furnace conveying material therefrom to cylinder, construction of vertical furnace and shaft being such that air or gas may pass from lower part to upper part thereof in horizontal passages leading to and fro therethrough.

AMALGAMATOR.—No. 802,987; H. J. Horstmann, Fort Wayne, Ind.



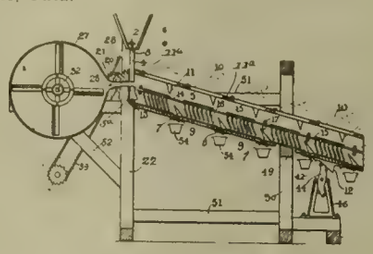
In apparatus of class described, revolving barrel having internal spirally disposed wings and being adapted to cause ore passing therethrough to become disseminated throughout interior; stationary vacuum hood surrounding discharge end of barrel and having closed relation therewith; chute having valves therein and communicating with barrel; funnel within hood and extending partially under discharge end of barrel; receiving tank adapted to contain water; discharge pipe extending external of hood and connected with funnel and communicating with tank; and retort having connection with barrel for charging interior thereof with vapor.

GOLD SAVING APPARATUS.—No. 803,868; W. D. Baney, Tonopah, Nev.



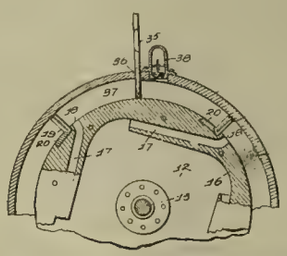
In gold saving apparatus, combination of tank, horizontally disposed amalgam cylinder supported to rotate in tank and having ingress and egress openings at opposite ends, rotary cylindrical agitator extending through cylinder supported in ends of tank and rotatable independently of cylinder, agitator having cylindrical sleeve projection at one end passing through end of tank, screw conveyor journaled concentrically with agitator and having shaft passing through sleeve, means exterior to tank to operate agitator and conveyor, and means for operating amalgam cylinder in unison with agitator and conveyor.

ORE CONCENTRATOR.—No. 803,830; J. J. Kennedy, Guthrie, Okla.



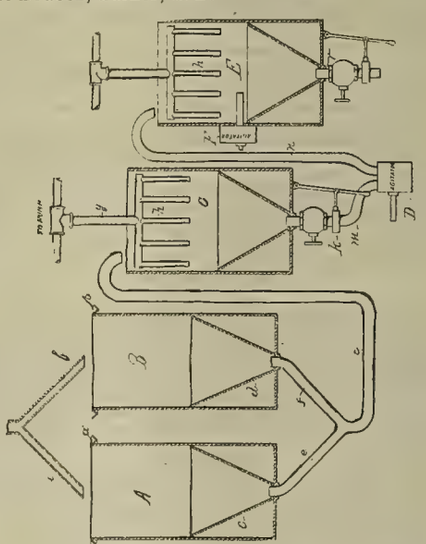
Ore concentrator, combination with sluice box, and mechanism for vibrating same, of doors arranged in top of sluice box and carrying air deflectors, riffles secured to bottom of sluice box, separable sections disposed in front of riffles and means for holding same combined with bottom of sluice box, reciprocatory agitators disposed between riffles, blast mechanism discharging in plane of deflectors, and means for supplying ore to sluice box below discharge from blast mechanism.

AIR COMPRESSOR.—No. 804,159; C. Neumann, St. Louis, Mo.



Device of class described comprising casing mounted upon base, shaft, revolving disk located upon shaft, and having air passages; pistons formed on revolving disk; shaft supported in A-frames located at each side of casing; flywheels and pulleys located upon shaft; crank disks located upon ends of shaft; connecting rods connecting crank disks of upper shaft with those of lower shaft; gear wheel located on upper shaft, short shaft located upon top of casing, operated by shaft, slotted cut-off disk carried by short shaft and arranged to allow pistons of revolving disk to pass therethrough during operation of machine; and means for discharging compressed air from machine.

PROCESS OF TREATING ORE SLIMES, ETC., CONTAINING GOLD, SILVER OR OTHER VALUES.—No. 804,186; L. J. Drabek, Turner, S. D.



Herein described continuous process of treating ore slimes to obtain values therefrom, consisting in charging slimes mixed with cyanide solution into tank, causing slimes to settle and accumulate in thickness in bottom of tank, discharging thickened portion by own weight and that of overlying solution into top of second tank containing barren solvent solution, filtering off value containing solution and allowing heavy slimes to settle and accumulate in bottom of tank, withdrawing thickened slimes, agitating and mixing them with water, discharging them into third tank containing water, filtering off liquid, causing thickened slimes resulting from filtering to accumulate in lower part of tank, thereby forcing liquid therefrom and discharging thickened slimes from time to time as necessary.

MINING SUMMARY.

Specially Compiled and Reported for the MINING AND SCIENTIFIC PRESS.

ALASKA.

The Alaska convention at Seattle, November 20th, adopted a platform and a number of resolutions to be presented to the National Congress. The platform demands a territorial form of government, a delegate in Congress, and numerous changes in the mining laws pending the granting of self-government. The passage of a law is asked making it impossible to locate mining claims by power of attorney, designating twenty acres as a placer claim, limiting the number of locations by any one person to two on any creek or any of its tributaries, and submitting, in lieu of the $100 assessment on placer claims, a license fee of $250, to be placed as a fund for the building of roads and trails.

The Bartel Co. will put in a 10-stamp mill and concentrator at Tin City, on Behring sea, 138 miles northwest of Nome. About twenty men are now employed by the company. They are paid $5 per day and board.

ARIZONA.

Gila County.

Since January 1, 1905, the following corporations have been formed to operate mining claims in Globe mining district: Arizona Commercial Copper Co., capital $2,500,000, principal office Boston, Mass.; Consolidated Mines & Development Co., capital $500,000, a local enterprise; Keystone Copper Co., capital $1,000,000, principal office St. Louis, Mo., controlling interest owned by Globe people; Rye Copper Co., capital stock $1,000,000, par value of shares $1, a Globe enterprise; Miami Copper Co., capital $500,000, a Globe enterprise; Mount Stanley M. Co., capital stock $1,000,000, California and Arizona capital, mines southwest of Globe; Arizona & Eastern Consolidated M. Co., capital $1,500,000, Washington, D. C., and St. Paul, Minn., mines in Globe district; American Copper Co., capital stock $1,000,000, a Globe enterprise; the New Dominion Mines Co., capital $1,000,000, par value $1, a Globe enterprise.

Graham County.

P. F. Crowley is developing claims near Metcalf.

Mohave County.

A compressor and air drills are to be put in the San Francisco mine of the Yucca Cyanide M. & M. Co. at Cedar, which has shipped a carload of concentrates to the Selby smelter.——At the Standard gold mine, in Mohave Wash near Kingman, the shaft is being sunk to the 300-foot level under the direction of J. D. Jordan. ——The Arizona-Birmingham M. Co. is working on its lease on the Samoan mines at Chloride. A tunnel is being run to tap the Lucky Boy vein at a depth of 500 feet. L. Hoffman is in charge.

Pinal County.

A. Collins will start work on the Pickwick claims, near Mammoth.——It is reported that the Calumet & Hecla Co. has secured control of the Mammoth mine at Mammoth and that it will begin operations soon.

Yavapai County.

A 150 H. P. boiler and four new Wilfley tables have been put in at the Crown King mill at Crown King by Superintendent G. F. Shurtleff. The Zika tunnel is in 650 feet.

Yuma County.

L. S. Judd is manager of the Colonial Mining Co. at Cinnabar, 14 miles from Ehrenberg. A double compartment shaft has been sunk to a depth of 180 feet.

It is reported that a 60-stamp mill is to be put on the Little Jessie mine, near McCabe. A new hoist is to be put in and the shaft sunk to a depth of 1000 feet. J. S. Jones is interested.

The North and South Venture claims of the United Verde Copper Co., near Jerome, are to be prospected by a tunnel.——The Eureka Gold & Copper M. Co. is sinking a winze from their main tunnel near Jerome.

CALIFORNIA.

C. G. Yale, in a recent Government report, says that the gold-producing area of California includes thirty-four counties out of fifty-seven. In 1904, seven counties produced each over $1,000,000, and two produced over $2,000,000. The increase from quartz mining amounted to $1,400,494, and from dredging to $711,289. The production of silver in California, while never very great, showed an increase of 400,000 ounces for 1904 over that of 1903.

Calaveras County.

J. L. Henry of San Andreas has an option on the North Star mine, owned by O. Dolling, near Angels.——The air compressors of the Clary Gold M. Co., which is operating the South Bank mine, near Sheep Ranch, will be operated by a 40 H. P. motor.

El Dorado County.

It is reported that they have struck rich rock in the Crane's Gulch mine, near Georgetown.——It is reported that rich gravel is being taken from the Alcimento and Alveoro mines, near Smith's Flat. Chas. Henson is superintendent.——Work has been started at the Gold Bend gravel mine, near Smith's Flat.——The Oro Fino mine, near Shingle Springs, is being reopened.

The Lone Star gravel mine, near Smith's Flat, is to be reopened with Wm. Rupley as superintendent. A new incline is to be sunk 400 feet to strike the channel under the lava hill.

Mono County.

The owners of the Liberty and the Pittsburg mines, in the Masonic Mountain district, near Bodie, have agreed to unite in building a 50-stamp mill. The mill built at Sweetwater several years ago, which is now not in use, will be purchased if the parties can agree upon terms.

San Bernardino County.

The Arizona-Mexican M. & S. Co. are slowly building their plant at Needles. The dust chambers have been completed and the base of the stack has been placed. The mixing floors are ready for the handling of ores and fluxes. The sampler building is nearing completion.

Shasta County.

Geo. Graves has charge of work on the Summit and Copper Crest copper mines near Kennett.

The second furnace of the Mammoth C. Co.'s smelter at Kennett was blown in November 22. The third and last furnace will be ready to blow in by December 1, marking the completion of the smelter to its full capacity of 750 tons per day.

Sierra County.

(Special Correspondence).—Recent rains will enable the following drift mines to commence more active operations: West Point, Golden Scepter, Hilo, Mugginville, South Fork, Mabel Mertz, Balsam Flat and Mobile Flat. ——The Twin Eagle mine, at Gold Point, is reported sold to C. F. Humphrey of San Francisco.——Fitting & Corbiere have completed their examination of the Alice and Pappoose mines, near Downieville.——The drift at the 50-foot level of the Elnore shaft of the Sovereign claims, near Downieville, is being extended.——At the Antlers quartz mine, 2½ miles east of Downieville, supplies have been laid in for the winter. J. W. Wallace has charge of the mine.

Downieville, Nov. 20.

The Herkimer tunnel, near Table Rock, has been driven 150 feet toward the channel. H. Fowler has charge of the work.——W. O. Frost is preparing for work on the Mineral Mountain placer claim in Hungry Mouth, 1 mile from Downieville.——The Marguerite shaft, near Sierra City, is being unwatered and work will be resumed from the 400-foot level by E. Westall.

H. L. Johnston has sold a four-fifth interest in the Tightner mine at Alleghany for $250,000. Senator Jones, Sam Jones, A. C. Hamilton and others of Nevada are in the company. W. S. Haskins has charge of the work.

Siskiyou County.

It is reported that a cyanide plant will be added to the stamp mill of the Jillson mine, near Hornbrook, by the Hazel G. M. Co.

The Wolverine mine, 4 miles from Hornbrook, is being opened up under the direction of L. B. Collins.—— It is reported that the Thos. Needham property, 15 miles northwest of Hornbrook, is to be opened up by A. R. Foss.——The Sterling mine, near Hornbrook, is said to have been sold to a Seattle company. S. J. Fore is superintendent. A 10-stamp mill is on the ground. ——A 10-stamp mill and cyanide plant are being put in at the Eliza mine, 12 miles from Yreka, by C. A. Patterson. A 600-foot tunnel has opened up ground below the old workings.——The Porto Bar Dredging Co. has a bucket dredger at Callahan, in charge of R. M. Wade.

Trinity County.

The McCampbell Gravel M. Co., under the management of G. W. Pelletreau, has completed a 2-mile ditch and flume to the mine near Hayfork.——G. Van Gorden, superintendent of the Drinkwater M. Co., near Hayfork, intends to prospect the property for dredging.

Tuolumne County.

The long deferred rains of the past week will cause a large number of properties to resume operations. Many of the larger mills have been closed for some time because of lack of water.——A new cable 2200 feet long has been put in at the Dutch mine at Quartz.——A new steam hoist has been put in at the App mine at Quartz.

COLORADO.

Boulder County.

A mill is being put up at the Corona mine at Summerville, in Four-mile canyon, near Salina. Other nearby properties being developed are the Quo Vadis, Elkhorn, Valley Forge, Crown lode and Gold lode mines.——Machinery is being put in at the St. Joe mine, near Gold Hill.——Good ore has recently been struck at the Keystone mine, at Gold Hill.——Near Wall Street, the Mile High mine and the Good Morning tunnel are being worked.——A mill is being put in at the Myrtle mine, near Ward.——Manager C. L. Mitchell has closed down the Struggler concentrating mill, near Ward, for the winter, and will make cyanide tests on the Struggler ore at the Myrtle mill.——Manager Wilson intends putting in a hoist on the King claims, near Gold Hill.

The Gold Medal mill in Four Mile Creek canyon, at Langdell, near Boulder, was destroyed by fire November 16. The origin of the fire is not known. The mill was new and equipped with the latest machinery. The engine and other machinery were ruined. It is believed the rolls may be used. The roasters were not put in. The total loss is about $5500, with insurance of $3000. The mill belonged to W. C. Knox of Boulder and G. W. Mabie.

Clear Creek County.

The Kittie Ousley mine, owned and operated by the Manhattan Union Mining Co., in East Argentine, near Georgetown, is being developed. At present thirty men are employed under the management of E. Wing. The drift from the shaft is in 250 feet. Stoping has been started. An ore house has been constructed capable of holding 150 tons of mineral.

B. J. O'Connell is getting good results from his lease on the Frostburg lode of the Mendota property, near Silver Plume. Drifting and stoping are carried on and the output is concentrated at the Mendota mill. The shaft is down 160 feet.

The Pay Rock claims on Republican mountain, near Silver Plume, are to be opened up by E. F. Kendall.

The Baby Eddie M. Co. has been formed with W. M. Stieren of Pittsburg, Pa., as president, to work claims in South gulch, near Freeland. The company proposes to run a crosscut tunnel. The work is under the direction of David Ellis, superintendent of the Brighton mine.

A. A. Ireland of Golden has secured from A. Johnson and O. Nelson a lease and bond on the Denver group in East Argentine, near Georgetown. He proposes starting work in the spring and a 50-ton concentrator is to be built for the treatment of the concentrating ore.

Gilpin County.

The Derby M. & M. Co. has been formed to work claims southeast of Sawmill gulch, near Apex, and are sinking the Venture shaft, which is down 60 feet. A steam hoist may be put in. J. R. Moler of Denver is president and manager of the company, and J. Field is superintendent. The Kimber mill at Apex may be started to handle ores from the Venture shaft.——The Sleepy Hollow property, in the Gregory district, near Black Hawk, is to be worked by the Black Hawk Leasing & Mining Co., formed by P. Feldhauser, J. F. Hopkins and P. McCourt of Denver, Colo.——Sinking has been commenced at the Carr mine on Bobtail hill, in the Gregory district, by the Carr Mines Co. The main shaft is down 850 feet and is to be sunk 200 feet deeper. Superintendent W. H. Hook will make connections with the Chicago-Carr lower workings for improved ventilation in both properties.——The 34-foot crosscut from the main shaft of the Running Lode to the vein has been completed, and opened up a crevice of smelting ore. The shaft is 1125 feet deep. Thomas Dunstone of Central City is superintendent.——W. M. Bloomer of Denver has let a contract for 250 feet of work in the Little Gem tunnel, up Moon gulch, near Rollinsville.——The new shaft building on the Southworth property in Moon gulch has been completed. The property has been leased and bonded to W. H. Knowles and associates of Denver, and the new company which is to be organized will be known as the Mineral Hill M. & M. Co. Manager Knowles has purchased a 25 H. P. hoister and a 40 H. P. boiler. The shaft on the Southworth is to be made a skip, and the work on the tearing out and fixing of the upper part of the shaft is now under way. The main shaft is down 200 feet, and as soon as the shaft work is attended to and the property is unwatered, the lessees will commence sinking.

It is reported that operations will be resumed on the Geiger mine, on Michigan hill near Apex, by E. E. Steffner of Central City.——The Apex G. M. & M. Co.'s Rochester shaft is down 125 feet.

The Iron shaft, adjoining the Pewabic mine, in Russell district, near Central City, is to be unwatered. As soon as the shaft and levels of the Iron are free of water, the Richardson, which is a part of the Pewabic group, will be worked through the Iron shaft. The Iron shaft connects with the Richardson at the 300-foot level. The North Pewabic is being worked through the main shaft of the Pewabic. The ore is sent to the New York mill in the Black Hawk, which is being operated by the Pewabic Con. Gold Mines Co. The mill has resumed operations after a short close-down while the shaft was being sunk on the Pewabic.

Gunnison County.

The Mono mill at Ohio City is to be started on ore from various dumps by J. S. Gardner. —— J. A. Holmberg, D. K. Anders and O. M. Aronson have purchased the Statesman properties, near Pitkin, and expect to commence development.——A 14-foot vein of ore running high in zinc has been opened in the drift run from the incline shaft on the Napoleon, near Pitkin. The property is being operated by the Lanyon Zinc Co. —— The Carter tunnel being driven from Ohio creek is in 1500 feet. A new compressor and drills have been put in.—— The cable and machinery for the aerial tramway for the Raymond Con. M. Co. at Ohio City has been delivered. The tram will be 2000 feet long and will carry ore to the mill from the Raymond shaft, which will be sunk on the vein to the tunnel, a depth of 1200 feet.

Hinsdale County.

The Silver Fleece shaft, near Lake City, is being unwatered by F. A. Ralph.

Lake County.

The Silver Nugget shaft on Breece hill, Leadville, recently cut a vein of high-grade gold ore 120 feet from the surface. The Silver Nugget is being operated by R. W. Spensley for New York parties.——Sullivan & Burkhardt have commenced shipments from the Governor mine on Mosquito range, near Leadville. They are using a pack train to pack down the high-grade ore.——J. W. Newell, manager of Bohn mine of Leadville, has resumed sinking.

Harrison, McCreary & Spears are working on the Copper King group, Red mountain, near Twin Lakes.——W. T. Buchanan is developing the Tom Paine group on Mt. Elbert.——The tunnel of the University group, on Red mountain, is in 350 feet, and the vein has been recovered after passing through a 50-foot fault and a large dike.

Preparations are being made by the smelter trust to enlarge its plant in Leadville. The smelter now handles 20,000 tons of ore a month and when the new machinery and apparatus is installed the capacity of the plant will be increased half as much again.

The shaft on the Belle of Granite, near Leadville, will be sunk another lift of 200 feet, making the total depth 675 feet.——At the Cloud City and Home Extension, in Leadville, the connecting drift is being pushed.

Mesa County.

The Grand Junction smelter has been blown in. The plant will employ sixty men, working three eight-hour shifts. General Manager Lavery stated that the blowing in was successful.

San Juan County.

The King mine, on Sultan mountain, south of Silverton, and operated by the Royal M. Co., has been closed down by order from General Manager Pyke.

At Animas Forks the Gold Prince Co. is putting up a 500-ton mill. ——The Mogul M. Co., at Gladstone, has its new 200-ton mill under roof.——The Old Hundred M. Co., 5 miles north of Silverton, will have its new 200-ton concentrator in working order by Jan. 1.——At its property in Cunningham gulch, near Silverton, the Green Mountain Co. is putting the finishing touches on its new 200-ton mill.

The management of the Sunnyside mine, near Eureka,

9 miles north of Silverton, are enlarging their mill by putting in magnetic separators to save zinc values which have been allowed to go down the river with the tailings from the plant, or have been shipped to the smelters with the concentrates. The product of the Sunnyside contains from 12% to 15% zinc, which, when shipped with the concentrates from the mill in the past, has lowered the value of the latter in the smelter from $3 to $4 per ton. The magnetic separators will make a 45% to 55% zinc product.

San Miguel County.

The Caribou-Montezuma mine of the Yellow Mountain M. Co., near Telluride, is to continue work during the winter under the superintendence of O. Erickson.

At the Black Bear mine, in Ingram basin, near Telluride, the drift has been run 200 feet from the bottom of the 150-foot shaft from the tunnel level. Work will be continued during the winter. The company expects to build their mill in the spring on leased ground. A tramway will be built from mine to mill, and hoisting machinery and air drills put in. L. Kaanta of Telluride is president.

Summit County.

(Special Correspondence).—The Beaver Creek M. Co., operating the Lucky mine in French gulch, is shipping high-grade lead ore from its main shaft workings. The lower grade ore from the same workings is being milled at the company's own mill. The same company is operating the Carbonate mine on Mt. Baldy and are shipping lead carbonate ore. The lead value is 40% and it carries 1½ ounce of gold per ton. F. A. Yauger is general manager and George E. Moon is superintendent of both properties. —— The old Union Co.'s mill at Mineral hill is turning out concentrates.——The Abundance M. & M. Co.'s directors recently approved of the tunnel development work started by the management. —— The owners of the Little Sallie Barber property on Nigger hill have struck a 3-foot vein of oxidized iron ore carrying gold and silver values.——The Novelty group on the same hill is being worked by J. G. Detwiler and the Summit County Mining Exchange. The main shaft has been sunk 100 feet vertically and the crosscuts are now being driven in both directions to cut the ore shoots.—— B. Fry is operating a lease on the Gold Dust property and has struck an 18-inch vein. —— The Washington-Joliet M. & M. Co. have their mill in shape with the addition of tables and slimers, and expect to resume operations at once ——The test run of the Carrie mill on Wise mountain proved so satisfactory that six 60-ton cyanide leaching vats are being added to the plant to enable the mill to run continuously. —— On the northeast slope of Mt. Gayot, near Georgia Pass, a tunnel is being driven into the mountain to cut a rich ledge at depth of 800 feet. The tunnel is now in 120 feet.

Breckenridge, Nov. 20.

The Morning Star lease, near Breckenridge, operated by Condon & Shrock, has made a working connection, from the tunnel through a stope, with the old workings of the Enterline shaft.——The Mekka G. M. Co. is continuing its 2100-foot drainage sluice near Breckenridge.

Teller County.

A strike has been made in the Mahoney shaft of the Empire State on Bull hill, Cripple Creek, by C. M. Crowder at a depth of 200 feet. —— The Little Giant M. & M. Co. has started their new cyanide mill, southwest of Cripple Creek. The mill has a capacity of 180 tons. —— The control of the Hull City placer at Independence has been sold to J. T. Miliken of St. Louis, Mo., president of the Golden Cycle M. Co. W. P. Dunham is general manager.

A 100-ton cyanide plant is proposed for the Golden Wedge property, on Raven hill, near Cripple Creek. J. Winchester is interested.——Galena has been found at a depth of 200 feet in the Gold Dollar mine, on Beacon hill, Cripple Creek.——Work has been started on the first unit of a cyanide mill on the south end of the Red Rock claim of the Colorado City & Manitou P. & M. Co. ——A. Morrison is sinking from the 40 to the 100-foot level of the Silver Tip mine, on Bull hill, near Cripple Creek.

A form of agreement to be entered into by the Cripple Creek Drainage & Tunnel Co. and owners of mining ground in the Cripple Creek district, providing a 2% assessment on mill and smelter returns, to raise funds with which to build the $800,000 deep drainage tunnel, has been approved by many of the mine owners. The agreement recites that the portal of the tunnel shall be located at an elevation of 7660 feet above sea level, in or near the bed of Cripple Creek, and the general course of the tunnel shall be: From its portal to a point in the vicinity of what is now known as the main shaft of the El Paso mine; thence to a point in the vicinity of what is now known as shaft No. 1 of the Vindicator mine. Provisions in the agreement are: 1. That on or about July 1, 1906, a sufficient amount of its capital stock will be subscribed and contracted to be paid for so as to realize at least $800,000 as required for the prosecution of work on said tunnel. 2. That within 60 days after $800,000 of its stock is subscribed it will commence the construction of said tunnel and will thereafter, with all reasonable diligence, prosecute such work of construction to completion. 3. To use all reasonable diligence in maintaining said tunnel in such condition that all water from said mining premises flowing into said tunnel, either by seepage or artificial means, may be drained through the same without any charge of any character upon the owner of said mining premises, except as hereinafter specified; provided, that such owner shall not suffer any third person who has not contracted for like service with the tunnel company to use any artificial means provided by the owner for the drainage of property other than said mining premises. The owner agrees that, beginning on the 1st day of July, 1907, the owner will pay to the tunnel company 2% of the value of all ores produced thereafter from that portion of the mining premises lying above the plane of the floor of that portion of said tunnel which runs through or nearest to said mining premises; said value to be the gross mill or smelter returns upon such ores, less transportation and treatment charges only.

IDAHO.

In 1904 Idaho derived $349,246 more from its gold mines than in 1903. The principal increase comes from siliceous ores in the Silver City district, Owyhee county, Buffalo Hump and Thunder Mountain districts, in Idaho county, and from various districts in Lemhi county. The silver product increased by 267,412 ounces, derived from the lead ores of the Cœur d'Alene and the Wood River districts and from the siliceous ores of the Owyhee fissure veins.

Bannock County.

The Fort Hill M., M. and S. Co. is working mines 6 miles from Pocatello. Ore was struck after driving the tunnel 3200 feet. W. M. Nesbit of Salt Lake City, Utah, has had charge of the property.

Blaine County.

The new Dollarhide mill, near Ketchum, has been started.

Custer County.

It is reported that the Mackinaw Copper Co. intend to put in a hoist in the spring at their mines in Copper Basin, 25 miles east of Hailey and 20 miles west of Mackay. E. Daft of Hailey is manager.

Idaho County.

The mill of the Jumbo mine at Buffalo Hump has been closed down on account of shortage of water, but the chlorination plant and active development work will continue all winter, says Frank Brown, the manager.

Shoshone County.

W. L. Gallagher has bonded the Columbus claims, owned by the American Lead-Silver Supply Co., operating on East Eagle creek, near Murray section.

MONTANA.

The United States Geological Survey reports that of Montana's gold production, amounting to $4,267,062 in 1904, more that $1,000,000 was derived from the cyaniding ores of Fergus county. The Butte copper mines contribute $971,046, a slight decrease from the figures of 1903. Madison and Lewis and Clark counties follow next, and only smaller amounts are contributed by the other counties. The most important placers are in Madison county, and 20,566 ounces, or about the same amount as from Idaho, were derived from the placers. By far the largest part of the silver, or 10,530,682 ounces, is produced by Silver Bow county.

Beaverhead County.

The company which recently bought the Polaris mine at Bannock is putting in new machinery to develop the property. A railroad shipping station is to be made on the Oregon Short Line 3 miles north of Redrock and the roads near the mine are being prepared for traction engines. John Cusick is assistant manager.——Work has been discontinued for the winter at the Ajax mill in the Big Hole basin, near Dillon. A tramway is to be put in to connect the mine and mill. A. J. Noyes is manager.

Fowell County.

The Kineo M. Co. is developing claims on the west side of Nigger hill, 6 miles from Elliston. A tunnel has been run 400 feet, with 230 more to drive before cutting the vein 86 feet below the shaft. A concentrating plant is to be put in early in the spring. Work will continue all winter.——The Sadie group, controlled by D. M. Platner of Elliston, joins the Kineo mines.——The Champion, near Elliston, has been allowed to fill with water. ——The only placer mine in this district, Nigger hill, is being opened for a fall and winter run by Wilson & Mack.——The Monarch mine, near Elliston, will be operated this winter by C. L. Friederichs of Helena.

Silver Bow County.

W. B. Orem, deputy State mining inspector, in his annual report to Governor Toole, states that during 1905 all of the large mining properties in the Butte camp have been operating continuously. There has been little litigation, the advanced price of copper stimulating both production and development. The mines of the large companies have yielded more than $31,000,000 of mineral and have disbursed more than $12,000,000 in wages to the miners, the average number employed daily at these properties being nearly 8000 miners and 2000 surface men. The Boston & Montana properties are hardly more than developed, the Mountain View mine being the first of its mines to put in skips for hoisting. The skips have a capacity of six tons and are attached either above or below the cages. Skip chutes are cut at the different stations and hold from fifty to seventy-five mine cars of ore, and furnish storage for the ore from the levels and stopes, thus avoiding any delay in tramming. Men, horses and compressed air engines are employed in tramming the ore to the skip chutes. The mouth of the skip chutes is in the shaft and the loading of ore into the skips is done by the station tender. The properties of the Amalgamated hoist 10,000 tons of ore daily, which is shipped to Anaconda and Great Falls for treatment. The Montana Ore Purchasing Co. hoists daily 1400 tons, which is treated at Butte and Basin. The Clark mines hoist 1350 tons daily, which is treated at the Butte reduction works. The North Butte M. Co. hoists 700 tons, which is treated at the Washoe works at Anaconda. The smaller properties are producing about 750 tons of ore per day. The depth of most of the large mines runs from 1200 to 2400 feet, the latter being the greatest depth at present. In the matter of fire protection the mines in Butte are well equipped for handling fires, both on surface and underground. There are maintained at each of the large properties hose carts, fire pumps and other necessary apparatus, and at the mines of the Amalgamated the employes are regularly drilled in order that they may be familiar with the equipment in case of fire. At the Anaconda, Washoe, Parrot, Colorado and Butte & Boston properties the fire apparatus is under the supervision of G. L. Lapp, who assumes direct command at all fires. At the Boston & Montana properties John Barclay is in charge. A regular fire alarm code is in use at all of the mines. The report shows that during the year ending November 1 there were thirty fatal accidents in the Butte mines, resulting in the deaths of forty-one men. There were also thirty-one non-fatal accidents, in which thirty-two were injured.

MISSOURI.

Jasper County.

The Bumblebee M. Co., operating on the Shewmaker land, southeast of Joplin, has completed its new mill and now has it in steady operation.——L. Stevison of Webb City has purchased the Little Hope M. Co.'s prospect on the Rex M. Co.'s land east of Joplin.—— G. W. Taylor and J. Carmean are building a mill on the prospect they recently opened up near Carterville.—— The United Zinc Co. of Boston, which owns mining land at Aurora, Joplin, Badger and Diamond, is preparing to go after the deep run of ore known to exist at about the 300-foot level at Aurora.

NEVADA.

Esmeralda County.

Buena Vista, the largest town of the Oneota mining district, is on the Carson & Colorado railroad, 65 miles west of Goldfield and 45 miles south of Sodaville. Gold Hill, the next largest town of the district, is 4 miles by trail and 8 miles by wagon road from Buena Vista. The mines are an equal distance from Gold Hill and Buena Vista. The main property of the camps are the Browny, the Tip Top, the Buena Vista, the Ticker, the Queen, the Summit and the Lilly. The Queen mine is reported sold to a company headed by Geo. Pardee of California. The Browny has four sets of leasers working; the showing of T. L. Jones and Riggs & Kanters is the best. The Tip Top, owned by the White Mountain M. Co., has been getting bids on ore haulage. The road to the mines from Buena Vista is being built.

Lincoln County.

Development work is being done in Antelope canyon mines, near Caliente, and on gold-silver properties in the Chief district, 8 miles northwest of Caliente.——J. A. Elston of Colorado Springs, president of the Josephine Gold M. Co., with properties 7 miles northwest of Caliente, and W. M. Shemwell, the manager of the company, have been at the mines. Within three months a mill will be built near the mines.

It is reported that G. F. Colton intends to sink a 1000-foot vertical shaft on the Duplex mine, near Searchlight.——It is expected that stamps will be dropping in the new 10-stamp mill at the Cyrus Noble, near Searchlight, by February 1, when sinking will be resumed.

NEW MEXICO.

In New Mexico the gold production for 1904 was $381,930, an increase of $112,307 over 1903, which is derived largely from the Rosedale district in Socorro county, and the Hillsboro district in Sierra county. Small decreases are reported from other counties. The placers yielded $149,424. A small increase, mostly from Socorro county, is noted in the unimportant silver production.

Grant County.

A new shaft house is planned for the Ivanhoe, at Hanover, by the Hermosa Copper Co. In it will be placed an engine and a hoist which will enable the company to sink 2000 feet.——The Copper Queen shaft, at Hanover, which several months ago was filled with water, has been unwatered and development work will be begun upon the property.

Otero County.

The Monument mine, at Chloride, has resumed shipment of silver ore to the smelter at El Paso. Work has been started on a long tunnel under the old workings. The work is to be done with power drills.

OREGON.

A recent report of the United States Geological Survey states that during 1904 Oregon showed a stationary gold production of $1,412,186, of which one-third is derived from the southern part of the State and the remainder from the Blue mountains in the northern part of the State. Baker county led in production, with $738,973, of which $51,855 was derived from placers. The silver output of Oregon is unimportant and principally derived from Baker and Grant counties.

Baker County.

The 10-stamp mill at the Taber Fraction mine, near Bourne, is said to have been started under the superintendence of A. Case. An additional ten stamps and a cyanide plant are to be put in. The Taber is being worked through tunnel 2 of the Eureka claim. G. Oswald is mine superintendent.

The North Pole, Columbia, Golconda and E. & E. mines, near Bourne, are all running full blast.——At Cable Cove the mill on the Imperial is approaching completion. Manager T. C. Gray of the Valley Queen group, near Cable Cove, reports No. 4 drift is in 110 feet. A rich strike of galena ore has been made in this drift.

Grant County.

The Badger mine, near Susanville, has been temporarily closed.——It is reported that N. Berkeley's report on the Buffalo-Monitor mines, near Granite, has caused the management to decide to put in a mill in the spring. The crosscut on the upper level is to be continued under the direction of W. Berkeley during the winter.

At the St. Anthony, near Alamo, work is to be continued during the winter on tunnel 2, which is in 1100 feet.

Jackson County.

The Mountain Lion mine, on Miller creek, near Applegate, is being worked and the 5-stamp mill will be started when water becomes available. In addition to the mill the mine is well equipped for operation. Bailey Bros., C. E. Harmon and L. L. Jewell of Grants Pass are the owners.

The Shorty-Hope M. & M. Co. announces that the

mill on this mine, near Ashland, will soon resume operation.

Josephine County.

R. E. Gilbert, superintendent of the Euchre Creek M. & M. Co., is developing the Half Moon and Black Bear placer mines on Lower Rogue river, below Grants Pass. A ditch flume 3 miles long supplies 2500 inches to the giants under a head of from 175 to 200 feet.

Lane County.

The directors of the Le Roy M. Co. have decided to resume work on their mine near Bohemia.

Yamhill County.

The owners of the Muir mine, near Grand Ronde, are making arrangements to put in a mill which is to have a capacity of thirty tons a day.

SOUTH DAKOTA.

In 1904 South Dakota produced within a small territory in the Black Hills gold to the value of $7,363,977, an increase of more than $500,000 over the output of 1903. This industry is based on the minnig on a large scale of low-grade amalgamating ores of the Homestake type and of siliceous ores of higher grades which are reduced by cyaniding or smelting.

Lawrence County.

The Homestake South Extension M. Co. is working the Skelley claims, near Deadwood. The president is Frederick Schroeder, and manager, A. H. Oleson of Deadwood. A double-compartment shaft is being sunk. A hoist has been ordered.——It is reported that the sinking is to be resumed on the Wauconda shaft, on Elk creek, near Roubaix, by Manager Goldman. It is down 135 feet.

The report of Superintendent T. J. Grier of the Homestake M. Co., at Deadwood, for the year ending June 1, 1905, states that the ore at the 1250-foot level has been reached and is being crosscut. A level is being opened up at the 1400-foot level of the Ellison shaft. The B. & M. shaft is down 1250 feet, the Golden Prospect 900 feet, the Old Brig and the Golden Gate 800 feet and the Golden Star 1100 feet. The expenses were 70.4% of the gross earnings. Of the expenses, 66.8% is charged to mining, 25.3% to milling and cyaniding and 7.9% to general expenses, including repair shops. Bullion receipts totaled $5,302,338, an average of $3.734 per ton.

	Amount.	Per Ton.
Mining expenses and charges	$2,492,257	$1 782
Milling expenses and charges	600,685	0 430
Cyanide expenses and charges	345,349	0 247
General and miscellaneous	295,396	0 211
	$3,733,687	$2 670

TEXAS.

Following are the results of the drilling contest at the American Mining Congress at El Paso: Chamberlain & Make, Dos Cabezas, Mex., first prize, $1000, donated by W. C. Greene of Cananea, 40 inches; Page Bros., Bisbee, Ariz., second prize, $600, 39 1/8 inches; Bradshaw & McIver, Bisbee, Ariz., third prize, $350, 39 5/16 inches. Later a claim for tie was made and Page Bros. drilled 40 5/16 inches, defeating Chamberlain & Make, who drilled 39 1/8. Their record of 42 1/4 is still unequalled.

UTAH.

Grand County.

W. Hayes and son of Mancos, Colo., and Long Bros. of Telluride have leased the Thomson stamp mill near Basin, and have it in operation on Double Standard ore from Montreal mountain. The capacity is to be increased from five stamps.——The Interstate M. Co., operating in Gold basin, 5 miles south of Basin, have started their cyanide mill. They have a tram 1800 feet long from the mine to the mill. J. H. Clark is superintendent.

Juab County.

It is reported that a new hoist is to be put in at the Bonanza mine, in the West Tintic district, near Eureka, by Depew & Jones. The shaft is down 152 feet.——At the New Utah mine in West Tintic the hoist is in operation and sinking is being pushed in the incline shaft.——Wm. Ball, J. F. Hayes and D. Depue have closed their lease on the Eureka Hill dump and will develop their lease on the 100-foot level of that property.——Two shifts are now at work on the North Mammoth property, near Eureka, under the superintendence of Wm. Mathews.——At the Raymond mine, north of Eureka, Superintendent J. C. Sullivan will push development from the 1500-foot level.——The Dragon Iron mine at Silver City is shipping 150 tons daily.——Operations have been started on the Old Brooklyn property at Silver City under the direction of Superintendent James Packard.——The Swansea mine at Silver City is producing a carload of ore per day. Several of the old producers at Silver City will be started up shortly.

It is reported that the Ridge & Valley mine, north of Eureka, is being worked through the Gemini tunnel.

The shaft of the South Eureka mine, near Robinson, is to be sunk to the 1000-foot level from the 500-foot.

Summit County.

A compressor and power drills are to be put in the Mount Masonic mine, near Park City, by Manager A. H. Spooner.

Piute County.

The Kimberley M. Co. has been organized to work the Deer Park, Surprise, Holland and other claims near Kimberley. W. F. Snyder is president. The Holland tunnel has already been driven 2600 feet to open up the claims and will be continued to open up the Surprise vein at a depth of 1350 feet.

Salt Lake County.

The Butterworth mine at Bingham is being worked under the direction of A. P. Hanson through the Queen tunnel.——A sampling mill is being built for the Boston Con. Co. at Bingham. The new mill is across the gulch from the Ohio ore bins. It is proposed to have the mill running before the beginning of the year. The plant will test the copper-bearing porphyry which is being opened up.

Tooele County.

C. W. Coe & Sons of Salt Lake City have resumed work on their mine in the Granite mountains, near Dugway.——The Midas mill, in the Deep Creek district, northwest of Deseret, has been shut down for the winter. The May incline is being connected with the old workings of the Midas.

Utah County.

The Commercial M. & M. Co. has been formed to work the Silver Glance property in the American Fork canyon, under a bond and lease.

WASHINGTON.

According to the report on the mineral resources of the United States for 1904, Washington produced less gold than in 1903, the decrease amounting to $193,422, with a total production of $314,463. This is explained by the idleness of several large mines in Ferry, Chelan, and Okanogan counties. In Ferry county the decrease seems due largely to the difficulty of treating the ores, which do not yield readily to amalgamation or cyaniding, while their siliceous character makes them undesirable for the smelters. That the State did not show a still greater loss is due to the Mount Baker district, which increased its yield from $36,388 in 1903 to $115,000 in 1904. The output of silver in Washington is small and is derived mainly from the lead ores of Stevens county, but in part from the siliceous ores of Whatcom and Ferry counties.

Chehalis County.

Engineers employed by the Geological Survey are investigating the black sand deposits of Ocean Beach about Willapa Harbor. Dr. Day says that the sand beds run to a depth of 70 feet. Samples have been taken from the surface sands and from the bottom of the beds. A plant may be established at Damons Point, near Hoquiam, for the manufacture of tool steel direct from the black sand.

King County.

(Special Correspondence).—The Portland M. Co., J. F. Merrill manager, operating on Miller river, 6 miles from Berlin, have finished their raise connecting No. 1 and 2 tunnels and are now ready to begin shipping. The ore is sacked, hauled on wagons to Berlin and shipped to the Everett smelter. The cost of hauling from the mine to the railroad amounts to $5 per ton.——The Apex gold mines, Abner Giffin manager, on Money creek, have made another shipment of high grade ore to the Ladysmith, B. C., smelters.——Kimball Creek M. Co. beve suspended operations for the winter and Manager Irvine has returned East. The Kimball Creek Co. have expended over $150,000 in this district during the last five years.

Berlin, Nov. 20.

Okanogan County.

The Mt. Chapaca M. Co. of Loomis has men clearing away and getting in shape to drive a 3000-foot tunnel with which to crosscut the main vein.——The Grand View Co. of Loomis has put in a 160 H. P. impulse wheel under 260-foot working head. This is being used to drive a 120 K. W. 400-volt belted generator. The voltage is transforming to 10,000 volts and the current carried 7 miles to the company's 20-stamp mill, which is almost completed. An aerial tram 1½ mile in length is being constructed from the mine to the mill.——The Palmer Mountain Tunnel & Power Co. is putting in the first unit of 750 H. P. on its water right on Toates Coulee creek, near Loomis. The power will be transmitted 2 miles to the mines of the company and used to run the power drills and other machinery, and will furnish power for a 300-ton reduction plant, yet to be built. A crosscut tunnel, 4000 feet in length, has been driven, crosscutting twenty-eight veins.——The Prize M. Co. of Loomis is running its mill and shipping concentrates to the smelters. C. Gehrhard has charge.——The Copper World Extension Co. has put in a 5-drill compressor and is sinking a double compartment shaft, which is down 200 feet. It is the intention to drive this shaft 500 feet, then crosscut the vein.——The Triune M. Co. is driving a crosscut tunnel to cut the veins that appear on the surface.

Stevens County.

The Daisy mine, 20 miles south of Kettle Falls, has resumed operations. The company will do development work during the winter and in the spring will put in a concentrator.——The Acme mine, 6 miles south of Kettle Falls, has been bonded to Eastern parties and active operations will commence soon. This property has a tunnel 1500 feet long.

WYOMING.

Carbon County.

A three-compartment shaft is to be sunk from the 600 to the 1000-foot level at the Doane-Rambler mine at Encampment.

FOREIGN.

AFRICA.

Transvaal.

The Simmer & Jack Proprietary mines were one of the first to employ Chinese labor on an extensive scale, and the results obtained go to prove to what extent the introduction of Chinese labor has been attended with success. The report for the past year shows the tonnage crushed to be 475,000 tons, equivalent to 5.39 tons per stamp per diem. The value of the yield was 32s and the costs 23s 3d per ton. At present the costs are about 20s per ton. The Chinese costs per ton milled are now practically down to the lowest Kaffir costs at this mine, despite the numerous expenses attending Chinese labor, while the tonnage developed is ahead of that milled during the year.

AUSTRALIA.

New South Wales

The Mining Journal reports that the example of the Broken Hill South Co. in selling their heap of mine residues has been followed by the Broken Hill Block 14 Co. The purchasers have now acquired from the three companies 1,500,000 tons of tailings, apart from the future output. At Block 14 a portion of the money received is to be expended in thoroughly exploiting the mine's lower levels. The main hauling shaft has been sunk 600 feet, but beyond cutting a chamber plat nothing has been done at this depth. The sulphide workings at the 500-foot level are confined to the southern section. The management has decided to prospect with the diamond drill. The De Bavay Sulphide Process Co., Ltd., is making arrangements for putting up their zinc apparatus plant. At the Central the lead mill is treating 2000 tons weekly. The new granulation process plant has been giving good results.

Victoria.

At the Victoria Quartz mine a vein 2 feet 10 inches wide has been found at the bottom of a winze, which is down 4105 feet. There is every facility for exploiting the reef, the mine being so ventilated by a series of winzes that the air in the 3824-foot crosscut is cool, and even in the bottom of the center country winze, which is down 281 feet, the atmosphere is not heated.

CANADA.

BRITISH COLUMBIA.

Nelson District.

A strike of 4 feet of milling galena ore besides a small streak of higher grade ore has been made on the 1000-foot level of the Ymir mine, near Ymir. The ore was found in the west drift of the crosscut, which has not been worked for two years. C. M. Hand is manager.——George Bell, of the Kootenay Belle, near Ymir, has rented the Yellowstone stamp mill for one month and will run 1000 tons of ore through the mill. He has built a road from the Kootenay Belle to the mill.

Slocan District.

The Rosebery mill has shut down, due to the inconvenience of handling the ore from the Monitor and cold weather.——The Goodenough Mines, Ltd., near Sandon, were the first shippers of zinc ore to C. Ferneau at the zinc reduction works at Frank. —— It is reported that the Payne mine, near Sandon, has been leased to W. Smith. The Payne Co. ceased operations a year ago, at which time the upper portion of the mine was leased to W. Smith and the lower portion of the mine and the concentration plant to B. P. Little. The mill has been running and there is enough ore in sight to keep it running until the end of the year, at which time Little's lease will expire.

MEXICO.

Chihuahua.

According to the El Paso Herald, there are eleven districts in the State of Chihuahua, as follows: Iturbide, Bravos, Galeana, Rayon, Guerrero, Camargo, Arteaga, Andres del Rio, Hidalgo del Parral, Jimenez and Mina. Each of these districts has a mining agent, who is a Federal officer, in the capital of the district, except that of Iturbide, which is divided into two mining districts—Iturbide and Abasola—with a mining agent in the city of Chihuahua for the former and another in the town of Cusihuiriachic for the latter district. In the offices of these agents all denouncements are made.

The district of Iturbide is south of Bravos, in the central part of the State, and extends to the Rio Grande on the east. Chihuahua is the capital. Santa Eulalia is 15 miles southeast of Chihuahua, in a low range of limestone hills which rise 1500 feet above the surrounding plains. The ores, which are usually carbonates, are found in the limestone, generally along or near fault planes or dikes in the lime. All the larger bodies are replacements of the limestone. Some of the mines have been worked to the depth of 1700 feet, are dry and still produce "sand carbonates" at that depth. Water has to be pumped from the river below Chihuahua 12 miles for the steam hoist. Two narrow-gauge railroads have been built from Chihuahua to Santa Eulalia to haul the ores from the mines. At Terrazas station, 25 miles north of Chihuahua, there are a number of silver-lead properties which produced 3500 tons of lead carbonates during 1903 and 1904. There are several copper properties near, among which are the Rio Tinto, on which there is a copper smelter and on which operations have been resumed. At Victorino, 10 miles west of Terrazas, silver and lead mines have been opened up. Oil, quicksilver, nitrate of soda and salt are being developed.

The Abasola district is a part of the political division of Iturbide, and lies southeast. Cusihuiriachic is the most important and the oldest camp. The Santa Marina has been worked to a depth of 1056 feet, and shows good ores at the bottom of the deepest workings. This mine is equipped with a large hoisting and pumping plant and 25-stamp mill. This camp is 12 miles from San Antonio station, on the Chihuahua & Pacific Railroad. The Burns mines are about 15 miles southeast of Cusihuiriachic. The Rema mine, of which Governor Creel is the principal owner, is 5 miles west of the Burns mines. It is developed to a depth of 416 feet. The ores are treated at the mill of the Burns mine at Buenos Aires. Milpillas is 15 miles south of Cusihuiriachic. There are several large, strong veins of silver-lead ore at this place, and one or two showing good values in copper. At Gavalana, 60 miles south of San Isabel, a station on the Chihuahua & Pacific Railroad, there are several silver properties, one of which has a small mill in operation and is a regular producer. Six miles east of Gavalano there are several silver-lead properties, one of which has over 1000 feet of development work on it. The ore is high in lead and carries good values in silver. A Pittsburg, Pa., company has equipped a 40-stamp concentration mill, which it proposes running as a custom plant. The Magistral copper mines of Governor Creel are 15 miles south of San Isabel station.

The district of Bravos occupies the northeastern portion of the State. There are silver and lead in many places. Near Ojo Caliente on the Mexican Central railroad, a number of gold, silver, lead and copper veins have been located. Small quantities of native silver have been found in some of them. Near Ahumada, some silver ore has been shipped. Near Ojo Caliente some rich bismuth ore has been found. Gold and copper have been reported at Tasesiqua, Lagunas Colo-

radas, Pilares and other points, and silver, lead and graphite at Pilares. There is coal west of Pilares.

The district of Galeana is in the northwest corner of the State bordering on Sonora on the west and New Mexico on the north. At San Pedro the Candelaria M. Co. has been working silver mines for twenty years. Within the last year a pumping plant costing $100,000 has been put in and a new concentrating plant is being put in to replace that at Juarez. There are mines being worked at Ascencion, north of Casas Grandes. There are two American companies working silver mines in the San Joaquin mountains, 30 miles south of Nueva Casas Grandes. In the extreme western part of the State and west of the Guerrero district, is Rayon, which includes Ocampo, Pinos Altos, Concheno, Otates Socorro, Sahuayacan, Yoquivo, Maguarichic, Uruachic, Candemania, and others of less importance. In this district and that of Guerrero, the Greene Gold-Silver Co. is operating. At Ocampo there are seven mills having a combined capacity of 250 tons daily. The process employed in all the mills is amalgamation, but at the Waterson Gold M. Co. the cyanide process has been put in to treat the tailings. The mills are not all operated regularly, owing to the great difficulty of obtaining wood for fuel. All the wood used has to be carried in on pack animals and costs $6 to $7 gold per cord, delivered at the mills. There is an abundance of timber in the mountains for all purposes, and an aerial tram would easily get it down the mountains at a moderate cost. Greene has recently bought for the Greene Gold-Silver Co. the Belvanera, Belen, Refugio, and other mines and controls the greater part of the camp. He has engineers planning a tunnel 8600 feet long to tap veins at the depth of 2000 feet below the present working. The deepest workings in the camp are on the Santa Juliana mine of the Belvanera group. The three mills on the Greene properties are idle preparatory to overhauling and remodeling. Pinos Altos is north of Ocampo. The old 60-stamp mill is being overhauled, twenty stamps are in commission and concentration is to be the process, probably supplemented by cyanide for the tailings. Concheno is northeast of Pinos Altos. An American company operating a 150-ton mill and cyanide plant here and the Greene Gold-Silver Co. is developing a group of claims and shipping in a 300-ton mill which will also be a custom plant which should be in operation early in next year. This same company is building a wagon road from Temosachic, the present west terminus of the Chihuahua & Pacific railroad, to Concheno. At Sahuayacan, 30 miles west of Ocampo, a Pittsburg company is operating a 20-stamp mill on high grade gold-silver ore, and at Portrerito, 2 miles from Sahuayacan, a 10-stamp mill is in operation. At Socorro, 20 miles west of Ocampo, an American company has a 10-stamp mill. The veins are small, but rich in gold and silver and are free milling. Yoquivo is 20 miles from Ocampo. Mines are also being worked at Otates, and at Maguarichic, 40 miles south of Ocampo.

On the north of the district of Rayon and south of Galeana and extending west to the Sonora line is the Guerrero district. W. C. Greene is exploiting the western part of the district. The Dolores gold-silver mine is 60 miles west of Temosachic. The mine is being equipped with a 15-stamp mill and cyanide plant. Copper prospects are being developed at Guaynopita and gold properties near Yepachic. There are silver properties at Namiquipa. Five kilometers from the San Isidro station, on the Temosachic branch of the Chihuahua & Pacific Railroad, with a narrow gauge railroad running to it, is the Calera zinc mine owned by an American company. This is the largest zinc mine in Mexico.

The district of Arseaga lies to the west of Andres del Rio. The most important points in the district are Guazapares, Palmarejo and Rialito. At Palamarejo an English company has been operating for fifteen years. The company has built and equipped 12 miles of narrow gauge railroad from the mines to the mill, which is at Chinipas, and 10 miles of stone aqueduct to take water from Chinipas river to run a 50-stamp mill and cyanide plant. An American company is operating a mine and 15-stamp mill at Aguas Callentes, on the river 5 miles north of Chinipas.

The district of Andres del Rio is east of the district of Arteaga. Batopilas and Urique are the principal camps. At the Barranca del Cobre a New York company is operating a copper mine and a 20-stamp concentrating mill. Other camps of less importance are Cerro Cohui, Cieneguita, etc.

The district of Camargo is in the east central part of the State and south of Iturbide. The Encinillas Mines, Ltd., has a 100-ton smelter at Santa Rosalia. It is understood that they will increase the capacity to 600 tons daily. Naica, 15 miles west of Conchos station, is producing 4000 tons of silver-lead ore. A narrow gauge railroad has been built from Conchos station to the camp. There is quicksilver near Encinillas, 65 miles northeast of Santa Rosalia, and at Sancillo, north.

The district of Jimenez is in the southeast corner of the State. Five miles south of Baca station the Cigarrero mine is shipping 3000 tons per month. The Mexican company which owns it has decided to build a railroad from Baca station to the bins at the foot of the mountain, where the ore is brought by gravity tram from the mine. Near Jimenez some copper mines are being worked with good results. The Las Adargas mine, 25 miles from Jimenez, is being operated by the Cia Metalurgica de Torreon, and it is from this mine that a large part of the lead fluxing ores at its smelter at Torreon have been obtained. J. F. Johnston, a prominent mining man of Parral, has a concession for building a smelter at Jimenez, and he has a number of properties in Cerro Almoloya, Rio Florido and other sections which he proposes to develop to furnish the fluxing ores.—— The Parral district is producing nearly 30,000 tons per month of low-grade silver and siliceous ores. A concession has been granted reduction plants aggregating 1000 tons per day, with immunity from taxes. This enterprise includes an electric power plant on the Rio Verde, in Durango, 65 miles distant, which is to furnish power for the mines. Work has been commenced by D. M. Evans on a new smelter. There are several parallel veins in Parral and all of them are strong and well defined. Concentration and lixiviation are the processes employed, and at Santa Barbara, where the ores carry a large percentage of zinc, magnetic separators have been put in.

The district of Mina is bounded on the south by the State of Durango and on the southwest by the State of Sinaloa and is south of the districts of Andres del Rio and Hidalgo del Parral.

Guadalupe y Calvo is one of the oldest camps in the State and has a record of production of $60,000,000. The famous mine of the camp is the Rosario silver mine, in Guadalupe y Calvo. Morelos is in the western part of the Mina district and 40 miles south of Batopilas.

Sonora.

(Special Correspondence).—The Arizpe M. Co., 15 miles southeast of Cananea, is making shipments to the smelter at El Paso and, according to Secretary G. D. Cash, the ore they have been shipping is netting the company about $1500 per carload of ore. J. P. Hallihan of El Paso is president.

Cananea, Nov. 20.

Zacatecas.

High grade ore has been uncovered in the lower workings of the San Rafael el Grande mine, near Zacatecas, which is being unwatered by the United States & Mexican Trust Co. A. E. Stilwell of Kansas City is president. Unwatering has been in progress for several months under the direction of J. W. Malcolmson.

Books Received.

The Department of Geology of the University of California has issued bulletins on "Sketch of the Geology of Mineral King, California," by A. Knopf and P. Thelen, and "The Differential Thermal Conductivities of Certain Schists," by P. Thelen.

The fact that a book has passed through four editions first causes the reviewer to ask why. On examining "Select Methods in Quantitative Analysis," by B. W. Cheever and F. C. Smith, the reason is readily found—not in the contents, for they differ little from similar texts, but in the authors' method of presenting the subject. The beginner is first introduced to a series of analytic methods designed to give him experience in diverse chemical manipulations. Simultaneously he is taught the necessity for careful selection of methods. A workman must know his tools before he can hope to use them. The first part of the book consists of laboratory notes for a beginner's course. Methods here presented are designed to supply the student with experience in the details of chemical manipulation. The author begins with the subject of specific gravity, continuing with gravimetric determinations, volumetric analysis and gravimetric separations. The author gives detailed instructions of manipulative methods, but says little regarding the calculation of results. In the second part the author presents a number of selected methods for inorganic quantitative analysis. These are standard methods covering the usual work of the commercial analyst. The text is excellent for students, as it embodies methods likely to be met in actual practice and shows the goal toward which they are working. It is published by Geo. Wahr, Ann Arbor, Mich., and will be sent postpaid by the MINING AND SCIENTIFIC PRESS for $2.

Verily we are the heirs of our forefathers. This apparently alien thought is suggested upon looking over "Machine Design," by A. W. Smith and G. H. Marx. For in it the authors show the processes of machine evolution. The first machine was built according to the best judgment of its designer; but that judgment was fallible, and some part yielded under the stresses sustained; it was replaced by a new part made stronger; it yielded again, and again was enlarged, or perhaps made of some more suitable material; it then sustained the applied stresses satisfactorily. Some other part yielded too much under stress, although it was entirely safe from actual rupture; this part was then stiffened and the process continued till the whole machine became properly proportioned for the resisting of stress. Coincident with the development of the science of mechanics has been the progress in the design of machines. The text deals primarily with the application of motion, force, work and energy. These are first analyzed, and then the student is instructed in the design of material shapes qualified to resist and direct them. The authors consider such design with regard to adaptation, strength and stiffness, economy and appearance. It is stated that adaptation requires all complexity to be reduced to its lowest terms, strength and stiffness require the machine parts subjected to the action of forces to sustain these forces; economy requires due consideration of the amount of metal and labor. "A machine to be beautiful must be purposeful." In successive chapters are treated sliding surfaces, axles, journals, roller and ball bearings, clutches, bolts, fly wheels, gears, springs and machine supports. In each case is given a brief definition, an analysis of stresses to be met, and the best method of design to meet such stresses. The clear, concise style of the authors is supplemented by a number of excellent drawings of various machine parts. The book is written primarily for students in mechanical engineering, and requires a thorough grounding in analytical mechanics to be of use. A series of practical illustrations make clear the theoretical contentions. This volume will undoubtedly find an immediate place in the designing room, for it gives reasons, not rules. It is published by John Wiley & Sons, New York City, and will be sent postpaid by the MINING AND SCIENTIFIC PRESS for $3.

Obituary.

J. J. TOLER, a well known mining man in central Idaho, died recently at Grangeville, Idaho, from pneumonia.

Personal.

H. KLINGENDER is at Goldfield, Nev.

FRED W. BRADLEY is in New York.

CHARLES BUTTERS is at Guanacevi, Durango, Mexico.

FRANK H. PROBERT of Los Angeles, Cal., is at Globe, Ariz.

C. W. LININGER is now at Parral, Chihuahua, Mexico.

THOS. H. LEGGETT in on his way to Guanajuato, Mexico.

J. H. CURLE sailed from New York for London on Nov. 15.

J. H. PRIAR is superintendent Pueblo M. Co. at Warren, Idaho.

J. B. EMPSON is in Guanajuato, Mexico, from Deadwood, S. D.

J. V. N. DORR has returned to Deadwood, S. D., from Denver, Colo.

P. BERTSCHEY has charge Eleventh Hour mill at Spearfish, S. D.

ROBERT LANKA has opened engineering offices in Searchlight, Nev.

T. V. CONNOR is superintendent Wild Horse mine, at Cripple Creek, Colo.

F. L. BOSQUI has returned to San Francisco, Cal., from Goldfield, Nev.

E. C. ENGLEHARDT has returned from Elizabethtown, N. M., to Denver, Colo.

R. J. GRANT of Denver, Colo., is examining mines in western Chihuahua, Mexico.

W. H. ESTABROOK is manager Yreka Creek Gold Dredging Co. of Yreka, Cal.

EDMUND SHAW has been made manager Mainstay M. Co.'s mill at Keystone, S. D.

FRANK MEE is superintendent Blue Jay mine, near Hornbrook, Siskiyou county, Cal.

HENRY SCHNITZEL has been made manager Golden Reward mines, near Deadwood, S. D.

EDMUND J. SKINNER has returned from San Francisco to the Leonesa mine, Nicaragua, S. A.

C. O. ELLINWOOD of Salt Lake City, Utah, has been in San Francisco, Cal., on mining business.

J. R. WOODBRIDGE has been made manager Tonopah sampling plant Western Ore Purchasing Co.

W. P. PRESSINGER, New York manager Chicago Pneumatic Tool Co., is in San Francisco, Cal.

W. R. THURSTON represents the El Paso branch of the Mine & Smelter Supply Co., Douglas, Ariz.

W. G. SWART, manager Blake-Morscher electrical separator of Denver, Colo., is in El Paso, Texas.

J. B. TOMLINSON of Prescott and Cananea is making examination of mining property in southwestern Arizona.

J. T. KESCEL has resigned as foreman Kearns-Keith mill to take charge Daly-Judge mill at Park City, Utah.

E. N. SKINNER has returned to Denver, Colo., from Nicaragua, where he has been examining mining properties.

W. A. DESBROUGH, representing Fulton Iron Works Co., San Francisco, Cal., attended the Mining Congress at El Paso, Texas.

H. F. BROWN of San Francisco, Cal., is at the Doane-Rambler mine of the Battle Lake Tunnel Site M. Co. at Encampment, Wyo.

H. H. NICHOLSON has returned to the United States from an extended trip through southern Mexico, in the interests of Eastern clients.

F. G. STEVENS, formerly superintendent Le Roi No. 2, Rossland, B. C., is now at the Santo Domingo mine, Etzatlan, Jalisco, Mexico.

T. A. RICKARD has returned to San Francisco, Cal., from Nevada City, Cal., where he attended the California Miners' Association meeting.

C. E. LANE, vice-president American Engineering & Reduction Co., Cleveland, Ohio, was a visitor at the Mining Congress at El Paso, Texas.

W. B. LEWIS, of the board of trustees of the Colorado State School of Mines, expects to have established a chair of coal mining in that institution.

ADAM INNIS of Columbus, Ohio, secretary Copper World Extension M. Co., operating near Loomis, Wash., spent several days at the property recently.

W. B. LEWIS, manager South Canon Coal Co. of Denver, Colo., has been appointed a member of the board of trustees of the School of Mines at Golden, Colo.

CASSIUS E. GILLETTE, Major Engineer Corps, U. S. A., former member of the California Debris Commission, has been appointed chief engineer Philadelphia bureau of filtration, at an annual salary of $17,000.

GOVERNOR PARDEE of California has appointed the following trustees of the State Mining Bureau: Curtis H. Lindley, vice T. B. Bishop, resigned; F. W. Bradley, vice J. E. Doolittle, deceased; E. A. Stent, vice Frank Monaghan, term expired; Louis Janin, vice Fred H. Harvey. This leaves Harold T. Power as the only remaining member of the old board.

Commercial Paragraphs.

IT is understood that Mexico is about to repeal its present duty on steel importations.

THE Chicago Portland Cement Co. has ordered of the Allis-Chalmers Co. of Milwaukee, two new rotary kilns, each to be 136 feet long, for its plant near La Salle, Ill., and extensions for four of the 60-foot kilns now in the plant, which will make these kilns each 136 feet long when they are reconstructed.

THE Best Manufacturing Co., of San Leandro, Cal., report that they received the highest award and gold medals from the Lewis & Clark Exposition at Portland, Oregon, for traction engines and logging and lumber trucks. They state that their sales of these machines the past season was unprecedented in the history of their business, and even at this early date are receiving orders for these machines and expect to double their output for 1906.

THREE centrifugal pumps, each having a capacity of 10,000,000 gallons daily, for the Massapegna pumping station, Brooklyn, N. Y., have been contracted for with the Allis-Chalmers Co., Milwaukee. The pumps will be driven by vertical cross compound engines. The Newport water works, Newport, R. I., has awarded contracts for a vertical, triple expansion, crank and flywheel pumping engine to the Allis-Chalmers Co., Milwaukee. The engine will have a daily capacity of 6,000,000 U. S. gallons against a head of 190 feet.

THE Fulton Iron Works of San Francisco, Cal., report the following recent orders: Air compressor and accessory equipment for the Kennedy M. Co., California; additional milling machinery, Challenge feeders, etc., for the Sierra Buttes mines, California; 4x6 double cylinder, single drum hoisting engine and 10x8 Blake crusher for German Roth & Co., Mexico; two 15 H. P. electric hoists and necessary equipment for the Llanos de Oro M. Co., Mexico; mining machinery, ore buckets, etc., for the Butters-Salvador mines, Mexico; milling equipment, crushers, rolls, concentrators, etc., for the Coso Reduction Co., California; 4x20-foot trunnion type tube mill for the California Ore Reduction Co., California; 10-stamp mill, latest type (1000-pound stamps), and complete equipment for the Don Pedro gold mine, California; one 36-inch lead furnace and accessory equipment for the Copthall Stores Co., Rhodesia, South Africa; and 6x7 single drum, double cylinder hoisting engine, 60 H. P. horizontal tubular boiler, two steam-driven air compressors and four 2½-inch Wood drills for the Querobabi Mines Co., Mexico.

Trade Treatises.

Catalogue No. 18 of the Chicago Pneumatic Tool Co., Fisher Bldg., Chicago, Ill., shows a large line of rock drills and compressors for all classes of work.

A handsomely illustrated booklet from the Westinghouse Machine Co. of East Pittsburg, Pa., minutely describes their Standard engine, its construction, economy and field.

Latest Market Reports.

SAN FRANCISCO, November 24, 1905.

METALS.

SILVER.—Per oz., Troy: London, 29 1/16d (standard ounce, 925 fine); New York, bar silver, 64⅝c, refined (1000 fine); San Francisco, 64⅜c; Mexican dollars, 53c, San Francisco; 49½c, New York.

Within the week silver has advanced 1⅛ cent, being on the 21st even higher than this. It would not be surprising to now see silver reach and possibly go beyond 65 cents.

COPPER.—New York: Standard, $16.87½; Lake, $16.87½@17.25; Electrolytic, $17.00; Casting, $16.50 @ 16.87½. San Francisco: $16.75. Mill copper plates, $18.00; bars, 18@24c. London: £75 12s 6d spot per ton.

Copper this week is quoted at a slightly higher price than last week and producers are reported well sold ahead, which gives a firm tone to the market.

Following are the figures of German consumption of foreign copper for the months January to September, as compared with the same period of time for 1904 and 1903:

	1905.	1904.	1903.
Imports, tons	82,445	83,845	63,527
Exports, tons	9 101	6,379	7,797
Consumption, tons	73,344	77,466	55,730

Out of the above, 69,177 tons were imported from the United States.

LEAD.—New York, $5.55; St. Louis, $5.15; San Francisco, $5.00, carload lots; 5½c 1000 to 4000 lbs.; pipe 7½c, sheet 8, bar 6¾c. London: £15 8s 9d ℔ long ton.

SPELTER.—New York, $6.10; St. Louis, $6.20; London, £28 10s ℔ ton; San Francisco, ton lots, 7c; 100-lb lots, 7¾c.

TIN.—New York, pig, $33.42@33.60; San Francisco, ton lots, 34c; 500 lbs., 35c; 200 lbs., 36c; less, 37½c; bar tin, ℔, 40c. London, £153 7s 6d.

PLATINUM.—San Francisco, crude, $18.50 ℔ oz.; New York, ingot, $20.50 ℔ Troy oz. Platinum ware, 75@$1.00 ℔ gram.

QUICKSILVER.—New York, $40.00@$40.50, large lots; London, £7 5s 0d; San Francisco, local, $38.00@39.00 ℔ flask of 75 lbs.

BABBITT METAL.—San Francisco, No. 1, 10½c; No. 2, 8c; No. 3, 7½c; extra, 17½c; genuine, 32½c; Eclipse, 35c.

SOLDER.—Half-and-half, 100-lb. lots, 22.00c; San Francisco, Plumbers', 100-lb. lots 19.15c.

NICKEL.—New York, 55@60c ℔ lb.; ton lots, 40@47c.

ZINC.—Metallic, chemically pure, ℔ lb., 50c; dust, ℔ lb., 10c; sulphate, ℔ lb, .04c.

ALUMINUM.—No. 1, 99%, small lots, 37c ℔ lb.; 100 lbs.. 35c; 1000 lbs. 34c; ton lots and over, 33c, Pittsburg. No. 2, 90%, small lots, 34c; ton lots and over, 31c, Pittsburg.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, $17.35; gray forge, $14.60; San Francisco, bar, 3½c ℔ lb., 3¾c in small quantities.

STEEL.—Bessemer billets, Pittsburg, $26.00@$27.00; open hearth billets, $27.00@$28.00; San Francisco, bar, 7c to 13c ℔ lb.

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 7¾c; less than 500 lbs., per lb., 8c; in 25-lb. tin pails, ½c ℔ lb. above keg price; in 1 and 5-lb. tin cans, 100 lbs. per case, ½c per lb. above keg price. Dry Lead.—In bbls., 1 ton and over, 7½c; do. in kegs, 8c.

LIME.—Santa Cruz, $1.35 country, $1.25 city ℔ bbl.

CEMENT.—Imported, $3.00@4.00 ℔ bbl.; California, carload lots, $1.80 f. o. b. at works; small lots, $2.10 ℔ bbl. in sacks, 4 sacks to bbl., 5c for each sack returned.

LUMBER.—(Retail): Pine, ordinary sizes, $24.00@25.00; extra sizes higher; redwood, $28.00@30.00; lath, 4 feet, $4.50@5.00; pickets, $21.00;shingles, $2.50 for No. 1, and $2.25 for No. 2; shakes, $13.50 for split and $15.00 for sawed; rustic, $28.00@35.00.

NAILS.—This week the basic prices are: Wire, $2.77; Cut, $3.25. Meanwhile the nominal quotations per keg (list prices) are: No. 20d to 60d, Wire, $3.35; Cut, $3.55; 10d to 16d, Wire, $3.45; Cut, $3.35; 8d, Wire, $3.50; Cut, $3.50; 6d and 7d, Wire, $3.60; Cut, $3.60; 4d and 5d, Wire, $3.70; Cut, $3.70; 3d, Wire, $3.85; Cut, $3.85; 2d, Wire, $4.10; Cut, $4.10. Special rates for carload lots.

GENERAL SUPPLIES.

ANTIMONY.—New York, Cookson's, 11½c; Hallett's, 12½c; San Francisco, 1000-lb. lots, 14c; 300@500-lbs. 12c; 100-lb. lots, 13c.

BISMUTH.—Subnitrate, ℔ lb., $2.10.

BONE ASH.—Extra No. 1, 5@6c ℔ lb; No. 1, 4@5c.

BORAX.—Concentrated, 7@8c ℔ lb; powdered, 9@10c; fused, 25@30c; crystal, 7c.

CANDLES.—Spear Brand, 16 oz. adamantine, 40s., 11c ℔ set; 14 oz. adamantine, 40s., 10c; 12 oz. adamantine, 40s, 9c; 10 oz. adamantine, 40s, 8c; 16 oz. stearic, 40s, 12¾c ℔ set; 14 oz. stearic, 40s, 11½; 12 oz. stearic, 40s, 10½c; 10 oz. stearic, 40s, 9½c. 100-case lots and over, ½c less. Not less than 50-case lots, ¼c less. Boxes of 20s, price ½c advance.

CAPS.—3x, $5.50@6 per 1000; 4x, $6.50@7; 5x, $8@8.50; Lion, $9@9.50, in lots not less than 1000.

CHEMICALS.—Cyanide of potassium, 98%–99%, jobbing, 23@24c ℔ lb.; carloads, 23@23½c; in tins, 30c; soda ash, $2.00 ℔ 100 lbs.; hyposulphite of soda, 3@3½c ℔ lb.; caustic soda, in drums, 3@3½c ℔ lb.; Cal. s. soda, bbls., $1.10@1.20 ℔ 100 lbs.; sks., 90c@$1.00; chlorate of potash, 12@13c; nitrate of potash, 6¾@7c; caustic potash, 10c in 40-lb. tins; roll sulphur, 2½@2¾c; powdered sulphur, 2½@2¾c; flour sulphur, French, 2¾@—c; alum, $2.00@2.25; California refined, 1¾@2c; sulphide of iron, 8c ℔ lb.; copper sulphate, 5½@5¾c; chloride of lime, spot, $2.50@2.75; sulphuric acid, in carboys, 66° B, 1¾@2c ℔ lb.; nitric acid, carboys, 8c ℔ lb.

CHROMIUM.—90% and over, ℔ lb., 80c.

FIRE BRICK.—Domestic, carloads ℔ 1000, f. o. b., factory square, $25.00; soap and split, $22.50; arch and wedge, $27.50; skewback, $30.00; circle, $32.00.

FIRE CLAY.—Domestic, ℔ ton 2000 lbs. in 125-lb. bags double, and dry ground, f. o. b., factory, $8.50.

FUSE.—Triple tape, $4.00 per 1000 feet; double tape, $3.55; single tape, $3.10; Hemp, $2.85; Cement No. 2, $3.10; Cement No. 1, $2.75, in lots of 3000 and up.

COAL.—San Francisco, coast, yard prices: Wellington, $8.00; Seattle, $6.50; Coos Bay, $5.50; Southfield, $8.00. Cargo lot, Eastern and foreign: Wallsend, $7.50; Brymbo, $7.50; Pennsylvania, hd., $14.00; Scotch, $8.00; Cumberland, $13.00; Cannel, $8.50; Welsh Anthracite, $13.00; Rock Springs, $8.50, long ton; Colorado Anthracite, $14.00. Coke, $11.50 per ton in bulk, $13.00 in sacks; Sunnyside, $8.50, long ton.

OILS.—Linseed, boiled, bbl., 50c; cs., 55c; raw, bbl., 48c; cs., 57c; Lucol oil, boiled, bbl., 48c: cs., 53c; raw-bbl., 46c; cs., 51c. Kerosene—Pearl, per gal., 17½c; Astral, 17½c; Star, 17½c; Extra Star, 20½c; Eocene, 19½c; Elaine, 26c; Water White, in bulk, 11c; Mineral Seal, iron bbls., 18c; wooden bbls., 20½c; cs., 24c; Mineral Sperm, cs., 26½c; Deodorized Stove Gasoline, bulk, 14½c, do., cs., 21c; 86° Gasoline, bulk, 25c; do., cs., 31c; 83° Naphtha or Benzine, deodorized, in bulk, per gal., 12½c; do., in cs., 19c; Lard Oil, E. W. S., bbl., 75c; cs., 80c; Neats-foot Oil, pure, bbl., 63c; cs., 78c; Sperm, crude, 63@68c; Natural White, 68c; Bleached, do., 68@73c; Whale Oil, cs., 52@67c.

LITHARGE.—Pure, in 25-lb. bags, 9½@10½c ℔ lb.

MAGNESIUM.—Pure, N. Y., $1.60.

MANGANESE.—Black oxide, ℔ lb., 2¾@4c.

MERCURY.—Bichloride, ℔ lb., 77c.

MOLYBDENUM.—Best, $2.75 ℔ lb.

PHOSPHORUS.—American, ℔ lb., 70c.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitroglycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1**, 50%, carload lots, 11½c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2, 35%, carload lots, 9½c; less than one ton, 11½c. No. 2**, 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2.00 per keg.

RED LEAD.—500 lbs. and over at one purchase, ℔ lb. 7½c; less than 500 lbs., 7¾c.

SILVER.—Chloride, ℔ oz., 90c@$1.00; nitrate, 54c

SODIUM.—Metal, ℔ lb., $1.

TUNGSTEN.—Best, ℔ lb., $1.20.

URANIUM.—Oxide, ℔ lb., $3.40.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market street, San Francisco, has official reports of the following United States patents issued to Pacific Coast inventors:

FOR THE WEEK ENDING NOVEMBER 7, 1905.

804,182.—ELECTRIC SIGNAL—Andriano & Herbstritt, San Francisco.
803,868.—GOLD SAVING APPARATUS—W. D. Baney, Tonopah, Nev.
803,974.—HOLDING ATTACHMENT—C. Benedict, Fruitvale, Cal.
803,978.—KNIFE—E. Bienseth, Seattle, Wash.
804,095.—LIFEBOAT—F. W. Brown, Tacoma, Wash.
803,668.—CLAMP—W. H. Clendenon, Healdsburg, Cal.
803,672.—IRONING BOARD—L. M. Darrow, Berkeley, Cal.
804,185.—TOOL COUPLING—E. A. Davison, Stockton, Cal.
803,564.—AIR BRAKE—J. Dillander, San Francisco.
803,885.—SUBMARINE BOAT—H. O. Eiane, U. S. Navy.
804,113.—LOCK—G. K. Glenn, Pasadena, Cal.
803,688.—SHOE DISPLAY DEVICE—Gruss & Alexander, San Francisco.
803,736.—BOTTLE WARMER—B. L. Gwynne, Sumpter, Or.
803,587.—DREDGER—R. G. Hanford, San Francisco.
804,124.—BRAKE—W. Heffiin, Michigan Bar, Cal.
804,125.—TIRE SHRINKER—Horner & Buck, Seattle, Wash.
803 903.—ORE CRUSHER—G. Johnston, San Francisco.
804,136.—AIR BRAKE—R. W. Kelly, Los Angeles, Cal.
804,144.—WIRE STRETCHER—M. K. Lewis, Lompoc, Cal.
803,767.—TRACING DEVICE—P. F. Limacher, Los Angeles, Cal.
803,769.—MOP—E. O. Loeber, Los Angeles, Cal.
803,699.—CHAIR—D. T. Matthew, Tacoma, Wash.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS United States and Foreign Patent Agency, the following are worthy of special mention:

COUCHES.—No. 804,538. Nov. 14, 1905. John Hoey, San Francisco, Cal. This invention relates to improvements in couch or bed bottoms, or equivalent surfaces in which it is requisite or desirable to have an evenly elastic surface. As an article of manufacture, it consists of a curved bar having notches in the convex edge and diagonally inclined surfaces extending from the lower side of each notch to the higher side of the next contiguous notch. There are other details of construction adapted to bring about the desired result.

ATTACHMENT FOR TALKING MACHINE.—No. 804,477. Nov. 14, 1905 Gabor Konigstein, San Francisco. Cal. This invention relates to an attachment which is especially designed for use upon the movable arms used in gramophones or talking machines, and which arms are swiveled and turnable, so that the points carried thereby conform to the movements of the disks by which the audible sounds are transmitted. It consists in a gramophone having in combination a record, a stylus to operate thereover, a stylus support, said support attachable to and turnable concentric with the sound-box and cushion means carried by the support and adapted to contact with the record to hold the stylus out of contact with the record. or to allow it to engage said record, and other details of construction.

AUTOMATIC GAS BURNER ATTACHMENT.—No. 804,509. Nov. 14, 1905. S. H. Ury, San Leandro, Cal. The object of this invention is to provide a device by which the flow of gas will be cut off whenever the flame is extinguished, and danger to life or health of sleeping persons or others who might be exposed to a flow of unburned gas will be prevented. The device comprises a burner and member thereon expansible by heat, a normally spring-retracted, gas-controlling cock, mounted to slide in a direction parallel with its axis, and a trigger mechanism between the cock and the expansible member whereby the cock is maintained in open position against the pressure of its returning spring as long as the gas burns, and is released and automatically returned to normal closed position when the gas is extinguished.

SAW FILING MACHINE.—No. 804,531. Nov. 14, 1905. C. M. Henderson, Berkeley, Cal. The object of this invention is to provide an apparatus for the convenient and automatic filing of band saws, which are suspended so as to travel vertically through the apparatus. It comprises in a saw filing machine clamps, between which the saw is vertically held, and a feeding device by which it is advanced; a longitudinally reciprocating file carrier, guiding means for said carrier, a hollow cylindrical housing carried by the file carrier, and having a slot in its lower portion, a cylindrical plug slidable within the housing, said housing serving to prevent saw filings coming in contact with the moving parts, and means for oscillating the plug.

DRIERS.—No. 804,518. Nov 14, 1905. Guy Bos hke, San Francisco, Cal. The particular object of this invention is to provide a means for drying fish, skins, leather, or any flexible substance which may be hung upon hooks or supports, and which is caused to travel through alley-ways by means of endless chains from which the hooks depend. During this travel the articles to be dried are subjected to a current of heated air passing through the alley-ways from one end to the other. The device comprises a drying chamber, an endless horizontally traveling chain movable therein, loosely dependent hangers suspended from the chain and having hooks for the attachment of substances to be dried, and resistant backing devices, in contact with which the hangers move while the substances are attached or removed. There are other details of construction, all constructed and arranged to bring about the desired result.

STOCK SUPPORTERS.—No. 804,529. Nov. 14, 1905. Minna B Foster, Sausalito, Cal. This invention relates to a device which is especially designed for supporting stocks of soft material, such as are used by ladies for neckwear. It consists in a stock support, of rigid bar having transverse tubular ends, said ends having extensions or enlargements, pins slidable through the tubes with the points projecting, the shanks of said pins being bent to return across and exterior to the tubes, and being again bent and having concavities with which the points of the pins may be engaged.

MINING AND SCIENTIFIC PRESS

Whole No. 2367.—VOLUME XCI. Number 23. SAN FRANCISCO, CAL., SATURDAY, DECEMBER 2, 1905. THREE DOLLARS PER ANNUM Single Copies, Ten Cents.

Causes of Failure in New Mines.

Why some mines fail to pay which have been unloaded on the investing public is a question asked in all seriousness by many of those who have purchased stock in these unprofitable propositions. The question is certainly a pertinent one. The prospective investor is led to believe that he stands little chance to lose in most of these ventures, and in some of them he is plainly told that his investment will be returned to him many fold—that it cannot fail to be largely profitable.

There are several reasons why some mines fail to pay which have started their career under apparently favorable auspices. The most usual reason for failure is that the property does not actually possess the elements essential to success and profit. The reports and prospectuses give some of the facts—those things favorable to it being given great prominence, while those unfavorable are lightly referred to or more often not mentioned at all. The size, and frequently the value, of ore bodies are mis-stated—often grossly exaggerated—and the estimate of costs is as often considerably below what is really necessary. It is usual to select as an example a successful mine where, owing to exceptionally favorable conditions, the costs are lower than the average of mines in the same district. The new mine, lacking these happy conditions, is unable to operate within the figure set by the optimistic promoter, and the result to investors is disappointing, if not disastrous.

Another reason for failure is the inexperience and incompetency of the management. In a rich mine this condition is not so much felt, for the rich ore can stand some extravagance, but a mine operating on a narrow margin of profit is likely to have this profit wholly absorbed in unnecessary expense or lost in faulty metallurgical operations.

General and office expenses are inordinately heavy, taking up much or all of the profit which should go to stockholders. This has been repeatedly proven where a good mine failed to net a profit under corporate management, but which by the leasing system paid the leasers handsomely in addition to a royalty of 20% or more to the company.

In many cases the mechanical equipment is out of all proportion to the demands of the property. A great hoisting plant and mill are built on a prospect which is insufficiently developed to warrant the large and expensive hoist, or to supply the mill with ore. Large plants can usually be operated at much lower cost per ton than small plants, when run up to their capacity, but there is no economy in a 500 horse power equipment to hoist forty tons of rock during twenty-four hours from a depth of 200 feet. Nor is a mill, concentrator or smelter many times larger than the mine can supply, a stroke of economy in installation.

Some promoters claim that it is impossible to raise money for mine development, if the property is not equipped with a mill, consequently a mill is one of the first things provided. The argument is then reversed—having a mill, required the ore, and development is undertaken in hope of finding ore to supply the mill. It would be indeed strange if this kind of management resulted in anything else than failure.

Open Cut Mining at Mount Lyell, Tasmania. (See Page 375.)

IT is not many years since the occurrence of gold in an intrusive igneous rock was stoutly disputed by men recognized as high in authority in matters geological. Now, it is known that gold and silver ores occur in many dike rocks in payable quantity. The experienced geological student is now slow to deny the existence of gold in any kind of rock, either basic or acid, for the reason that the research of recent years has shown that gold may be found in almost any kind of rock, either sedimentary, intrusive or volcanic, except possibly in the true glassy rocks and in the basalts. In these two latter types no gold has as yet been announced, though it would not be surprising to learn of its occurrence in basaltic rocks, as it is known to occur in diabase, which is but a little way removed from basalt in composition. As a rule, when igneous rocks contain appreciable amounts of gold they are considerably altered. The feldspars are kaolinized, quartz is usually infiltrated into the mass, replacing other normal constituents removed in solution, and ordinarily the sulphides of the base metals occur in greater or less abundance, particularly iron sulphide.

ONE of the latest ideas in modern mining equipment in Mexico is the proposed installation of a wireless telegraph plant near Guadalupe y Calvo, Chihuahua, to facilitate communication with the outside world. Truly Mexico is coming into the very front rank in up-to-date practice. The material progress of that Republic within the past ten years is really astonishing, even if the greater portion of it is due to foreign capital and brains.

IN consideration of the distinguished services he has rendered the California Miners' Association and the State of California, particularly in his masterly handling of the debris question before that Association, Prof. S. B. Christy, dean of the Mining College of the University of California, has been honored with a life membership in the Association.

COPPER has taken another advance and has touched the 18-cent mark. This brings aluminum into more active competition with copper in electrical work, and it is not probable that the price of the latter will go much, if any, higher. It is manifestly not to the best interest of the copper producers to force the price of the metal up to a point where other metals will be substituted for copper, which would be the result of an abnormally high price of copper.

THE efforts now being made at a copper mine in Mexico to produce copper direct from high-grade sulphide ore, by feeding the ore to a converter in blast, is one of the most interesting attempts at the lowering of cost in the production of copper. To what extent this new idea may be safely carried is at present problematical. The matte ordinarily running to a copper converter is an artificial copper sulphide. Whether the natural sulphide will work in the same manner on a large scale remains to be seen. With the copper ore is some matte, the result of previous operations in the blast furnace. At Butte, Mont., something similar is done by charging concentrates to a converter charged with molten matte, and this is said to operate successfully and economically. The idea in both instances is without doubt based on the Huntington–Heberline process of lead reduction.

THE deepest gold mines in the world are in Bendigo, Australia, where the mine workings have passed the 4000-foot mark. In California some of the mines in Amador and Nevada counties have worked to a depth exceeding 3000 feet on the veins, but no vertical shaft has yet reached that depth on a California gold mine, the deepest being the Kennedy, in Amador county, now down nearly 2800 feet. Theories concerning the depth to which gold-bearing veins may be profitably worked are undergoing some change, but it will probably be found in this, as in almost everything else in mining, that no arbitrary lines can be safely drawn, and while many gold mines will be found unprofitable below 2000 feet, there are those which will continue to pay at 3000 and 4000 feet, and possibly at greater depth. In the early history of copper mining in the Lake Superior region, it would have been commercially impossible to work to the tremendous depths at which profitable operations are now being carried on, but a change in economic conditions, by reason of which costs are diminished, will make profitable mining possible at increasingly greater depths as time passes. We have not, therefore, in all probability, yet learned how deep a gold mine may be operated with profit.

Open Cut Mining.

Inexpensive mining methods are always being sought by careful managers, who, in a desire to accomplish work at a minimum cost, look about for the least expensive way of breaking and handling ore. Obviously, that method is cheapest which operates by gravity. Where shoveling must be resorted to, the cost at once goes up, for manual labor is always more expensive than properly applied mechanical methods of handling materials such as ore and rock. When the conditions are such that an excavation can be made beneath the mass of rock to be mined, such as a drift or crosscut, and a raise put up from this adit to the bottom of the cut, ore broken on the slopes of the cut will descend by gravity through the mill hole, and may be drawn from a chute into cars without handling, and trammed to the reduction works. This fortunate condition is not always obtainable, and shoveling becomes necessary, as shown in the illustration on page —, which is that of one of the flat sheets of telluride ore in the Black Hills of South Dakota. There the ore is blasted down from the face and the ore shoveled into the cars, which are hauled away in trains, as shown. The waste is shoveled across the track and as the work of mining progresses inward the track is shifted nearer the face as it recedes. In this case it would probably be inexpedient to run a drift beneath the ore body as its thickness would not make available sufficient tonnage at any particular mill hole to justify the expense.

In excavating for mill grades it is often possible to remove the soil and loose rocks by hydraulicking, but where water is not available for this purpose the excess debris and alluvial must be removed by shoveling. Occasionally the cost may be reduced by the construction of temporary chutes on the several terraces of the mill grade, so that the rock removed from one bench may be easily loaded into cars on the next bench below and these trammed off the grade and dumped at one side. This is advisable where the benches are high and relatively narrow. The use of wheelbarrows on excavations of this kind is not to be recommended, as a given number of men can handle the material less expensively by the employment of track and cars. Where the benches are high—15 to 20 feet or more—30 to 40 feet wide and up to 150 feet long or more, it will generally pay to put in several turnplates, with a system of tracks so arranged that cars may be always held in reserve, near at hand, to immediately take the place of those which have been filled and pushed onto the main line, which runs longitudinally with the excavation. The shovelers are thus obliged to wait less than a minute for an empty car, when otherwise they may be obliged to wait from two to five minutes at various points along the line, a delay which in the aggregate would mean a very material increase in expense, for long waits are to be avoided wherever possible. The arrangements for expediting work should always be commensurate with the magnitude of the undertaking. It would be poor business to put in an elaborate system of trackage for a small job, but where from 7000 to 20,000 tons or more are to be handled on each terrace of the excavation, it usually pays to make the necessary preliminary arrangements to lessen the cost of handling the rock. In such situations, where large tonnages are to be removed quickly and cheaply, a double line of sectional track, which may be quickly moved, when necessary, to another situation, should be laid, provided with turnplates or turntables, at stated intervals—usually about 30 feet apart. This permits the loaded cars to be promptly moved off the grade while empties are returned on the opposite track and distributed wherever required. By systematic arrangement and skilled handling there need be no delay and the cost of moving material thus by hand is reduced to a minimum. The tracks used in operations of this kind may be employed again elsewhere about the works, or at the mine, so that it is not limited in its usefulness.

Some of the largest mines of the world handle enormous quantities of ore in open cuts. Many of the great iron mines of the Lake Superior region mine all of their ore in great open cuts. This is usually done in a systematic manner by means of cuts in which the ore is blasted down in terraces and loaded into cars by steam shovels. A few of these mines have mill holes, and rock broken in the cuts passes by gravity through the holes to loading chutes below, from which it is loaded into cars and trammed to a shaft or adit, and taken to the surface. In some of them, where mill holes are in use, steam shovels deliver the ore to these ore passes when it no longer will run to them from the face by gravity. The illustration on page 384 is that of the open cut and mill hole of the Big Indian mine near Helena, Mont.

Not infrequently there is a large amount of waste rock, or alluvial, overlying an ore body, and this must be removed before the clean ore beneath can be mined. Where such a condition occurs it is the most economical method to open underground stopes with raises driven to the surface, through which this overburden may be sent for filling. In some instances this use of the waste material so fortunately placed above the ore is not put into operation until a large open cut has been made in the superficial portion of the ore body, and the overburden has become a source of trouble and danger. It is the most natural thing to mine the ore lying at the surface and most easily obtainable early in the history of the mine, the more difficult engineering problems presenting themselves later, when some solution for them is worked out. The engraving on the first page shows a portion of the great open cut at the Mount Lyell copper mine in Tasmania. There the ore is being broken from the sides of the cut and the overburden removed to one side. Later this overburden became such a large proposition that steam shovels were put in to handle it. Large amounts of this waste were accumulated at the sides of the cuts. More recently this waste is being sent down into the lower workings for filling.

A CASE was recently decided by a jury trial in a Butte, Montana, court, where a locator of a quartz vein within a patented placer was declared to be within his rights. The ground was located in 1880 as placer. This placer was patented later, but in 1890 other parties entered the placer and located a lode claim on it. Defendant claims that the patent gave him exclusive right to the ground and that he had held undisputed and undisturbed possession of the claims for six years, and that the claim was good against all comers, and moved a non-suit. The court decided that such claim could only be allowed when the Government contested the title. The defendant further claimed that there was not a sufficient showing of quartz on the claim in 1880 to justify working the property as a lode claim. This contention was overruled by the court. A patent to a placer claim is not prima facie evidence of the fact that no known lodes exist within the limits of the placer claim at date of application. The disposition of the department is to consider that if the lode actually did exist at the time of filing application for placer patent, such lode is reserved by operation of law, whether located or not. The law relative to lodes within placers is another phase of existing mining legislation that needs a change to remove from it that element of ambiguity and uncertainty.

THE somewhat paradoxical statement is made by a current electrical journal that in the south of England large distributing electrical companies can supply power to coal mines at a rate cheaper than the power can be produced by the mining companies themselves, notwithstanding the fact that they have to buy the fuel (coal) from the coal companies. The reason for this lies in the fact that the electrical companies have built extensive power houses of modern design and burn a cheap grade of fuel, producing electrical power at a minimum of cost.

CONCENTRATES.

USUALLY where injury is done by the use of oily lubricants, or there is other objection to its use, graphite in some form may be substituted for grease or oil.

A CUBIC foot of quicksilver weighs 849 pounds. A flask contains 75 pounds, and at present price is worth $40, more or less, depending on where it is purchased.

A HOLE in a fly wheel or other iron casting may be filled by a cement made of one part gum arabic, one part plaster of paris and one part iron filings mixed with a little water.

GARNETS, unless very clear, of good color and free from flaw, are of no value as gems. The same may be said of any gem stone—the finer the stone the more value it has as a gem.

THE cost of treating silver ores of the Comstock by pan amalgamation at Virginia City is now usually figured at $6 per ton. This includes power, labor, chemicals, wear and tear, etc.

A GOOD iron cement is made from 20 pounds of iron filings, 1½ pound sulphur and ¼ pound sal-ammoniac. These materials are mixed to a pasty consistency with water, so it may be spread without running.

PULLEYS upon which a shifting belt is to be run should have a flat face, while those on which a belt is to be run without shifting have the face raised at the center, which keeps the belt from running off the pulley.

TUNGSTEN ores are bought by some of the steel manufacturers in the United States and Germany. The ore from Nevada, containing manganese oxide and tungstic acid is doubtless hubnerite, a tungstate of manganese.

IN constructing a dam in a stream, when the structure is not on bedrock, it is very necessary to so arrange it that the overflow will not undercut the dam itself. This is a fault that dams built on gravel, etc., often have.

MATHISON & CO. of Chelsea, N. Y., are engaged in the reduction of antimony ores. At present there is no reduction works on the Pacific coast reducing antimony ores, though there was one formerly in San Francisco, Cal.

ALL of the gold mines of the Transvaal, S. A., are not at or near Johannesburg, on the conglomerate beds, called there "banket." There are a number of producing mines in the schist area at some distance from the Rand.

RHYOLITE is not known as the lava of a recent active volcano, but is found in great quantities in beds, sheets, dikes and plugs. It is an abundant rock in the Great Basin region, between the Rocky mountains and Sierra Nevada.

THE minerals of economic value associated with serpentine are chromic iron, platinum, asbestos and chrysotile, gold, copper ores, cinnabar and mercury. The most important of these is chromic iron, which is particularly characteristic of serpentine.

IT is not always a safe proposition to trust wholly to a stone used for grinding gold-bearing rock when prospecting, for the reason that these stones are often "salted" with the gold derived from previous tests, particularly where the samples were rich.

QUARTZ commonly occurs in all acid rocks, but is rarely present in basic rocks, particularly in the highly basic kinds, like basalt. However, at a volcanic vent known as the Cinder Cone, 10 miles east of Lassen's peak, in California, is a black basalt flow in which there are abundant quartz crystals.

HAND JIGS may be employed to advantage where labor is cheap, or where there is only a small amount of material to be treated. These machines can not be given as many vibrations as are ordinarily given power driven jigs, but good work can be accomplished with them when properly manipulated.

IT is bad practice to divide mill plates into narrow strips. It is far better to increase the width of the plates and lessen their grade, that the pulp may be spread thinner and run more slowly and evenly. This usually results in better amalgamation than narrowing the plates and giving them a heavy grade.

BRUCKNER cylinders are horizontal roasting furnaces open at both ends and lined with fire brick. The smaller sizes are slowly rotated by means of friction wheels, the larger are driven by means of gears. The charge is retained in the furnace as long as desired, it not being a continuously discharging furnace like the White-Howell.

THE pressure gauge of a steam boiler should indicate the same pressure as that at the safety valve, where the latter is blowing off. If this is not the case the gauge should be examined and repaired. Never pump cold water into a boiler where the steam is low and the boiler hot. Better draw the fires and allow the boiler to cool down first, and thus avoid an explosion.

IN the United States the line of no magnetic variation passes through the Carolinas, eastern Tennessee and Kentucky, through Ohio and Michigan into Canada. In Colorado it is about 14° east; in Montana 18° east in the central portion, increasing to 22° east in the northwestern corner. In California it ranges from 14° east in the southern portion to 18° in the northern part.

WHEN it has been determined to stop the loss in mill tailings, it is necessary first to ascertain in what form and where this loss occurs. If it be in slimed sulphides, arrangements must be made for finer classification and concentration. If the loss be in the coarse sands, then finer crushing must be resorted to. Gold which will not amalgamate is often amenable to cyanide treatment.

SOLDERS for different metals are composed of different substances. A solder for lead is made of one part tin and one and one-half lead; for tin, of one part tin and two of lead; for brazing (hard), three parts copper and one part zinc; bronzing (medium), one of copper and one of zinc; for bronzing (soft), one of tin, four of copper and three of zinc, or two of copper and one of antimony.

A CURRENT wheel is an inefficient method of obtaining power. Only a small portion of the energy of a running stream can be applied to be wheel. Small powers may be obtained from a large stream, and a number of current wheels placed in series will supply power in proportion to the number of wheels. Generally speaking, such a plant would not justify the expense of its installation.

IN rotary rock breakers the power required to operate the machine is about 1 H. P. for each ton of rock crushed per hour—this varying with the character of the rock and its size upon reaching the crusher. Thus a crusher which will break from forty to sixty tons per hour requires about 50 H. P. Some makes of rock breakers require more power than others to produce stated results.

THE melting point of various rocks differs in the same manner that the fusing point of various metals differs. The acid rocks require a higher degree of heat to fuse them than the more basic ones. Thus basalt and the more basic rocks require about 2250° F. for fusion; andesites and rocks of this type melt at 2520° F., while 3000° F. or more are necessary to fuse trachyte and similar acid rocks.

BAUXITE is mined in the United States in Arkansas. The mineral is shipped to Niagara Falls, N. Y., where it is used in the manufacture of aluminum and in making carborundum. There is also a plant in East St Louis, Ill. The mineral is treated by electricity and as the entire business is in the hands of practically one company the costs are not available. There is no reduction plant handling bauxite on the Pacific coast.

TO prevent the loss of quicksilver in the stamp mill requires much careful attention to the condition and operation of the mill. Ordinarily, more mercury is lost where inside amalgamation is practiced than where all amalgamating is done on the outside plates, but better amalgamation usually results from inside amalgamation. The character of the ore must determine whether inside amalgamation shall be practiced or not.

IF sand banks at the side of the concentrator belt, the probability is that there is too little water being used. The remedy is to feed more fresh water to the machine. The arrangement of the mill should be such that this amount of water cannot vary except at the will of the concentrator man. Particular care must be taken to keep debris out of the pipes, such as leaves and small chips, which would have a tendency to clog the feed pipes.

WHENEVER black oxide of manganese occurs in the surface portion of a vein, it may be expected that manganese minerals will be found in depth. The primary manganese mineral may be the comparatively rare sulphide, alabandite, though more commonly the metasilicate, rhodonite, is found, and in higher zones the carbonate, rhodochrosite. These latter often occur in the same zone. These alter to the black oxide upon being subjected to oxidizing surface waters.

ASBESTOS occurs usually in greenstone schists and in serpentine. Those occurrences where the fiber crosses the vein-like deposit from wall to wall are chrysotile. This is often silky in fiber and usually of light green to white color. Both chrysotile and asbestos of the amphibole variety are mined commercially. Much asbestos must be cleaned and freed from impurities before it is suitable for the market. Clean and pure asbestos is unaffected by either heat or water. Impure ground asbestos is used as a non-conductor of heat on boilers, etc.

MINE DAMS may be made of timber and clay, of rock, of bricks and of concrete. Of the several materials that may be used, concrete is probably the best for permanent work. If considerable pressure is likely to be exerted upon the dam as by water, the dam must be securely anchored by cutting a channel in the solid rock at the bottom, top and sides. If the dam is extended up to the roof, it may be finished from the inner side, leaving a manhole about 20 inches square through which the workmen may pass. This manhole must be provided with a door or gate which may be tightly and securely closed.

WHERE gold is extracted from roasted sulphides by chlorination and the gold precipitated in the tank, after stirring the solution should be given plenty of time to settle, as there is usually considerable gold in an extremely fine state of division held in suspension in the solution. It has been held by some that if the gold long remained in contact with the iron sulphate or the iron perchloride, due to addition of iron sulphate as a precipitant of gold, the latter would be redissolved. Concerning this, C. H. Aaron says that iron perchloride does not dissolve gold in presence of the iron protosalts, and precipitated gold in the chlorination vat is not redissolved by remaining many hours in contact with the solution of iron per-salts, which is produced when gold terchloride is decomposed by iron protosulphate.

VARIOUS mixtures are used in greasing hoisting ropes—mixtures of crude petroleum, pitch, tallow, tar, etc., being used for this purpose. In California several mines have found the heavy viscuous crude oil produced in some of the oil districts of that State to make an excellent rope grease. Any oil used for this purpose should be tested for acidity, as the presence of acid would be detrimental to the rope. Rope grease is usually applied to flat ropes by carefully applying the "dope" with brushes, and round ropes are slowly run downward through a sectional hopper-shaped box having a hole in the bottom slightly larger than the diameter of the rope. A half gunny sack is packed around the rope in the bottom of the box and the hopper filled with the oil or heated compound, and the rope allowed to run through the box until the dope is about exhausted, when the hopper is again filled, and the process continued until the entire rope has been lubricated. The oil or compound employed must be of such consistency that it will not melt and run off the rope at the normal temperature of the shaft.

THE careful assay of raw iron sulphides containing gold, and an equally careful assay on the tailings after roasting with salt and the extraction of the gold by the chlorination process, which indicates a high extraction, but which fails to be represented by the recovered gold, suggests the loss due to volatilization of gold in the furnace. To chloridize silver it is necessary to add salt to the charge before roasting, but such addition of salt is almost certain to be followed by loss of gold from the cause stated. The effect of adding salt to auriferous sulphides before roasting can easily be determined by making the experiment in a muffle. Take two lots of the same ore, of even weight, add 3% to 4% of salt to one of them and none to the other. Place side by side in a muffle and roast with a bright heat. When the sulphur has been eliminated, withdraw from the muffle, add the necessary fluxes to each and assay separately. The ore which was roasted without salt will be found to assay more per ton than the raw ore, due to decrease of weight in roasting, while the other lot, though also decreased in weight, will show little if any gain in assay value per ton—due to loss of gold by volatilization.

THE loss of power by the slipping of belts may amount to 20% or more, but is usually corrected before so unsatisfactory a result is reached by use of a tightening pulley, or by shortening the belt. Where the loss is small by reason of only a slight slipping of the belt this may be remedied by the use of some material on the belt which will increase the friction between the belt and the pulleys. Among substances used for this purpose are resin, soap, asphaltum, etc. Some of the substances thus used, although affording a temporary remedy for slipping belts, do more damage to the belt than is gained in power. Resin, particularly, is bad, as it renders a belt brittle, and consequently short lived. Covering iron or wooden pulleys with leather by means of glue always gives good results, as it largely increases the friction between the surface of the belt and the pulley, and consequently gives higher power transmission. Where leather belts are used on iron faced pulleys the belts must be tightly drawn to secure the best results, and this makes the belts wear faster. Tallow warmed to 100° F. and applied to leather belts and dried in by sun or artificial heat makes belts soft and pliable, and also tenacious. When a belt becomes dry an application of neat's foot oil will be beneficial, but the belt must not be soaked in water before applying the oil, as some suppose. Belts are likely to slip immediately after oiling, but they soon become adhesive again and are better for the dressing. Another good belt dressing is made from one part beef kidney tallow and two parts castor oil well mixed and applied while warm. Rats will not attack a belt that has been treated with castor oil. Rubber belts from which the rubber has been worn off can be improved by painting the worn side with lead paint in which sufficient japan has been mixed to cause it to dry quickly. The japan is made by cooking linseed oil and shellac in a varnish kettle.

The California Miners' Association.

At the annual meeting of the California Miners' Association, which closed its session at Nevada City on November 25, a number of interesting papers were read and addresses made by representative men. One of the most important matters directly connected with the mining industry of the West is the mining law. This was reviewed by John F. Davis in his report of the committee on legislation, in so far as California laws affected mining. He said that the need of additional legislation had been recognized long since, and attempts made to remedy existing conditions by new legislation. At the last session of the Association, in 1904, a large amount of legislation was recommended, much of which was acted upon by the last session of the California Legislature. The following abstract is made of the remarks of Mr. Davis:

A new section was added to the Code of Civil Procedure, to be known as Section 1927, and to read as follows: "1927. Wherever any patent for mineral lands within the State of California, issued or granted by the United States of America, shall contain a statement of the date of the location of a claim or claims, upon which the granting or issuance of such patent is based, such statement shall be prima facie evidence of the date of such location."

This Act was approved March 7, 1905, and is to be found in the Statutes of 1905, at page 78.

There was also passed by the last Legislature an Act repealing the Act of April 23, 1880, and the Act amendatory thereof of March 9, 1897, requiring certain ratifications by stockholders of any act of a board of directors in a mining company in buying, leasing, selling, mortgaging or in any other way disposing of additional mining ground. The repeal Act was approved March 7, 1905, and is to be found in the Statutes of 1905, at page 74.

The attention of this Association has been called to the desirability of having a law for the punishment of frauds and misrepresentations in prospectuses and, in general, for punishment of fake mining promotion. In 1878 there had been passed an Act entitled "An Act to Protect Stockholders and Persons Dealing With Corporations in This State" (statutes of 1877-8, page 695), which read as follows: "Any superintendent, director, secretary, manager, agent, or other officer, of any corporation formed or existing under the laws of this State, or transacting business in the same, and any person pretending or holding himself out as such superintendent, director, secretary, manager, agent, or other officer, who shall willfully subscribe, sign, indorse, verify, or otherwise assent to the publication, either generally or privately, to the stockholders or other persons dealing with such corporation, or its stock, any untrue or willfully and fraudulently exaggerated report, prospectus-account, statement of operations, values, business, profits, expenditures, or prospects, or other paper or document intended to produce or give, or having a tendency to produce or give, to the shares of the stock in such corporation a greater value, or less apparent or market value than they really possess, or with the intention of defrauding any particular person or persons, or the public, or persons generally, shall be deemed guilty of a felony, and on conviction thereof shall be punished by imprisonment in the State prison or a county jail not exceeding two years, or by fine not exceeding five thousand dollars, or by both; provided, that this Act shall be construed to apply only to corporations whose capital stock has been or shall hereafter be listed at a stock board or stock exchange in this State, or whose shares be regularly bought and sold in the stock market of this State."

This Act was absolutely of no use whatever on account of the proviso at the end of it. On account of that proviso the Act, in terms, applied only where the stock of the corporation had been or should thereafter be listed at a stock board or stock exchange in this State, or whose shares should be regularly bought and sold in the stock market of this State. This, by inference, excepted the very class of cases where these frauds are most numerous, namely, where the faking is done by promoting corporations whose stock is not listed in this State at all. In by far the greater part of these great frauds the stock is generally listed in some Eastern board, nearer the home of the victim than the location of the property. The most gigantic promotion frauds have been of this class.

At the last session of the Legislature two bills passed, each of which received the sanction of the Governor and became a law.

The first was approved March 21, 1905, and is to be found in the statutes of 1905 at page 683. It consists in so amending and amplifying section 564 of the Penal Code that, as amended, it reads as follows:

"564. Every director, officer or agent of any corporation or joint stock association, who knowingly concurs in making, publishing, or posting either generally or privately to the stockholders or other persons, any written report, exhibit, or statement of its affairs or pecuniary condition, or book or notice containing any material statement which is false, or any untrue or willfully or fraudulently exaggerated report, prospectus, account, statement of operations, values, business, profits, expenditures, or prospects, or any other paper or document intended to produce or give, or having a tendency to produce or give, the shares of stock in such corporation a greater value or a less apparent or market value than they really possess, or refuses to make any book or post any notice required by law, in the manner required by law, is guilty of a felony."

The second Act was approved March 22, 1905, and is to be found in the Statutes of 1905, at page 786, and consists in re-enacting the original Act of 1878, with all its drastic provisions, and eliminating the proviso clause at the end thereof, which had heretofore rendered it nugatory. There is, therefore, more than enough State statutory legislation on this subject to cover every possible phase of fake mining promotion, and the Federal Statutes with reference to the use of the United States mails is already drastic enough to cover the subject from the Federal point of view.

Another law passed at the last session of the State Legislature was promoted by the State Mining Bureau, making an appropriation for the erection of guide posts on the deserts in certain counties of the State, approved March 22, 1905, to be found in the Statutes of 1905, at page 805, and is as follows:

"SECTION 1. The sum of $5000 is hereby appropriated from any money in the State treasury, not otherwise appropriated, for the purpose of procuring metallic guide posts, upon which are to be indicated the distance and direction from said posts, the location of wells, springs, or tanks of water fit for drinking purposes and other information of value, in the desert sections of California, particularly in the counties of Kern, Ventura, Los Angeles, Inyo, Riverside, San Bernardino and San Diego; providing, however, that each of said counties (for its own county) shall bear the expense of the proper erection of said guide posts at such points in the county as may be designated by the Department of Highways, and shall pay all expenses attendant upon the placing of said posts, as well as the expense incurred in placing the directions above mentioned upon said posts.

"SEC. 2. The purchase and distribution of such posts is hereby placed under the management and control of the Department of Highways of the State of California, and it is made the duty of said Department of Highways to designate the points at which said posts shall be placed. Said posts shall be at least 10 feet in length, and shall be made of not less than 2-inch nor more than 3-inch iron pipe, to be set in metallic cross-pieces of such size and to be sunk in the earth at such depth as will insure proper anchorage. Said posts shall have iron cross-arms on which shall be affixed metallic letters stating the information mentioned in Section 1 of this Act.

"SEC. 3. Any person removing, defacing or in any manner injuring said guide posts shall be deemed guilty of a felony.

"SEC. 4. The State Controller is hereby directed to draw his warrant in favor of the Highway Commissioner for the sum of $5000, and the State Treasurer is hereby directed to pay the same."

At your last convention your committee felt that the amendment of Section 1183 of the Code of Civil Procedure passed by the session of 1903 of the California Legislature, under which an attempt was made to defeat the right of an owner of a mine which was being worked under contract or agreement or bond from divesting himself and the mine from liability from liens that might be attempted to be placed upon it, was ill-advised. Two companion bills amending two other sections of the lien law had disclosed this to be the purpose of the amendments. These two other bills failed to receive the executive sanction. It was not admitted that the amendment of Section 1183 standing alone did accomplish the object intended by the author of these three bills, but it would take a decision of the Supreme Court to say just what its effect, standing alone, would be in this regard.

At the last session of the Legislature several bills amending Section 1183 were introduced, but a division of counsel among the men representing the mining sections arose, and it was too late in the session before any chance of a compromise measure came in view. It is believed that at the next session of the Legislature there will be no difficulty in obtaining such remedial legislation as shall be unobjectionable from any reasonable point of view.

As a prelude to further legislation looking to a rehabilitation of hydraulic mining in any degree, your committee has, for a number of sessions of this Association, strenuously urged that we obtain a decision of the Supreme Court of California testing the efficacy of such Federal legislation as we now have upon our Statute book. In a late issue of the Sacramento Bee that journal makes the following claim as to the result of the work of the Anti-debris Association under the working of the California Debris Commission Act:

"The Anti-debris Association has closed at least 95% of the hydraulic mines, and has closed all the large ones. There may be cases where hydraulic mining is prosecuted on a small scale, or where it is practiced so surreptitiously that the utmost vigilance cannot detect it."

Under present conditions an actual injunction is not necessary, for as long as there is no authoritative decision of this State or of the United States with reference to the efficacy of a permit to mine by the hydraulic process issued by the California Debris Commission, and as to whether the permit is a finality or not, capital will not invest in these mines. There will be no practical resumption, because capital will not be tempted under such conditions to resume.

Recognizing, therefore, that it is of supreme importance to the mining industry of this State that this question should be tested in the Supreme Court, your executive committee made arrangements under which such a test could be had, and it is proposed to obtain the same through a decision on an appeal in the case of the County of Sutter, plaintiff, vs. William Johnson and William Nichols, defendants, commonly called the "North Star Mine Case." A motion for a new trial in this case had been regularly made and denied and an appeal therefrom taken. A motion to vacate the judgment has been made and denied and an appeal from that decision has been regularly taken, and an appeal itself from the decision and judgment rendered in the case has been regularly taken. A statement on motion for a new trial has been settled, and a bill of exceptions has been settled. Every care has been taken so that in the review by the Supreme Court the very point desired by this Association to be decided shall be the only point to be decided, and that the record of the case shall be before the Supreme Court in every way possible so that a decision upon this point can be had. The Supreme Court has decided that upon an appeal from an order denying a motion for a new trial the court is limited in its review to the ground upon which the new trial was asked, and cannot review the sufficiency of the pleadings or findings to support the judgment or consider any errors in the conclusions of law or in the judgment.

In order that there might be no possible question of obtaining a decision upon the point of whether the conclusions of law arrived at in the lower court in the Polar Star mine case are supported by the findings of fact, a motion to vacate the judgment was made under the provisions of Sec. 633 and 633½ of the Code of Civil Procedure, and an appeal has been taken from the judgment of the court denying that motion. It is impossible to foresee at this time how the Supreme Court can, under such circumstances, allow the decision to go off on any other point than the one expressly desired by the attorneys on both sides in the action. All necessary stipulations waiving bonds on behalf of the appellants, allowing the whole record to be printed in one transcript, and allowing all appeals to be argued at one hearing, have been signed and filed. The printed transcript on appeal was filed with the Clerk of the Supreme Court in his office at San Francisco on Tuesday morning, November 21, 1905, and it is expected that the case will be set down by the Clerk for hearing by the Court on its coming calendar which will be called in February next.

This committee now hands to the secretary of the Association a printed copy of the transcript which has been filed.

In line with the suggestions of the detailed report of your committee at the Convention of 1903, showing the necessity for the legislation, three bills were introduced in the House of Representatives by Mr. Gillett of California, to-wit: H. R. 8891, being an amendment to the Removal for Federal Causes Act; H. R. 8892, being the amendment requiring the date of the original location to be inserted in the patent to a quartz mining claim when issued by the Government, and H. R. 8893, being the well-known bill for the classification of the mineral lands, and commonly known as the Mineral Lands bill. While none of these bills have been passed, Congress and the respective committees have become familiarized with their provisions and intent so that we are now in a position to forecast their course at the coming session of Congress.

In reply to my telegraphic request for the very latest word on the present status of these bills, I yesterday received the following telegram:

"All three bills will have to be re-introduced; 8891 will be favorably reported; 8892 opposed by the Secretary of the Interior; 8893, Land Committee divided, chairman against it. J. N. GILLETT."

This means that, with the proper work, in all probability two or three bills will become law at the next session of Congress, and that a desperate fight must be made to convert the chairman of the Lands Committee so that the Mineral Lands bill may be also saved.

The Debris Question in California.

OUTLINE OF ADDRESS ON THE DEBRIS QUESTION BEFORE THE CALIFORNIA MINERS' ASSOCIATION.

Professor S. B. Christy of the University of California, in his paper read before the Miners' Association in Nevada City, called attention to the fact that the placer miners had never asked for any aid from the United States Government until their industry, to which California owed her existence, had been closed down by the action of the Federal Courts, rendering property to the value of over $100,000,000 unprotected and worthless, and bringing ruin to large communities in the mountains. Under these circumstances he claimed that the National Government owed it to the miner to render him assistance in bringing about a resumption of this important industry as far as is possible without injury to the farmer and to the navigable waters of the State.

He called attention to the work which had been done and is being done by the Federal engineers who composed the Debris Commission, in restraining debris from the mines and protecting the navigable waters of the State from debris already contained in the beds of existing streams. He called attention to the fair-minded and impartial manner in which the Debris Commissioners have administered the features of the Caminetti Act, and to the energetic efforts which they had made to restrain the debris in the Yuba river above Marysville. He also called attention to the fact that these restraining barriers were experiments of very great importance, and that the problem undertaken was one of extreme difficulty, viz., the erection of an over-flow dam upon a gravel foundation, in which it was extremely difficult to prevent the undermining of the toe of the dam by water discharged from its crest, and that the undertaking was almost without engineering precedents, but had been executed with great skill, especially in view of the fact of the limited appropriations at their disposition. And he called upon the mining communities to give them their hearty support in the work that they have undertaken, as an honest effort to make the best use of the means at their disposition.

He next called attention to the fact that the Debris Commission was not responsible for the enactment of the Caminetti Act. They were simply called upon as officers of the Government to enforce its provisions as they found it, and that there was not a miner in the State who would say that their execution of the law had not been undertaken with even-handed justice to all concerned. He also called attention to the fact that the efforts of the Commission were limited by law to the execution of the provisions of the Caminetti Act, and to the protection of the navigable waters of the State, and that the efforts of this

branch of the Government service could be made more effective if it worked in conjunction with the reclamation service of the Geological Survey. He explained that this Reclamation Service had been originally formed for the storage of storm waters in mountain reservoirs and the irrigation of arid lands, and that a fund of $28,000,000 arising from the sale of public lands was already available for the purpose, and that this fund was now increasing at the rate of $4,000,000 a year. He pointed out that there were fully 800,000 acres of overflowed and swamp lands in the Sacramento and San Joaquin valleys of comparatively little value, which, if reclaimed by the deposition upon them in a rational manner of the finer sediment coming from the mountains, could be increased in value when entirely reclaimed so as to be worth at least $80,000,000. He pointed out that these swamp and overflowed lands needed sediment from the mountains just as much as the miners needed a place to deposit their sediment, and that if such a plan could be carried out it would render available for the benefit of the entire State mining and agricultural lands worth at least $200,000,000. He pointed out that the interests of the farmers and miners were not antagonistic, but supplementary, and urged the miners to suggest an increase of the scope of the Reclamation Service so as to include not merely the reclamation of arid lands, but also the reclamation of swamp and overflowed lands under conditions similar to those already enforced by the Government for the reclamation of arid lands.

He called attention to the prompt and cordial action of President Roosevelt in answering the request of the miners that the United States Geological Survey should undertake the solution of the two problems which had been presented to them last year, viz.: First, the selection of reservoir sites for the storage of flood waters in the mountains, so as to prevent destructive floods, and to conserve the waters for irrigation and power purposes; and, second, the selection of waste lands upon which to deposit the detritus of the mountains. He stated that the Director of the Geological Survey had promptly begun this work and had sent for the preliminary examination of the problem—Dr. G. K. Gilbert, one of the most experienced and able geologists in the United States, to investigate the problem; that Dr. Gilbert had been in the field the entire summer and had expressed himself as deeply interested and hopeful of the solution of this problem. He had collected data concerning the present condition of the streams in their dry condition, and expected to examine them again in their wet season; and that in order to determine the minimum gradients upon which detritus of various sizes, particularly the finer sorts, could be carried, he has undertaken an investigation as to the sediment-carrying power of running water, which will be undertaken with the natural sediments taken from our rivers, during the present winter, in the mining laboratory of the University of California; that he had also taken samples of sediment from a number of streams, and that analyses were now being made by the Reclamation Service to determine their food values for plants, and that there were also to be undertaken actual experiments upon the growth of various plants upon this sediment.

He requested all persons who are familiar with cases of the actual growth of plants upon this detritus to send to him at the University of California at Berkeley as much detailed information as actual results from their growth upon the "slickens" they may have at their disposition, with the promise of the Survey that all cases of importance will be given a thorough study by the Reclamation Service.

In order to prove that the interests of the farmer and the miner are not antagonistic, but supplementary, he read a very important letter from Prof. Hilgard, which is here given in full:

UNIVERSITY OF CALIFORNIA,
COLLEGE OF AGRICULTURE.

PROF. S. B. CHRISTY, University of California—DEAR SIR: It would have given me great pleasure to accept your suggestion to attend the meeting of the Miners' Association at Nevada City, to be held this week. But being unable to do so, I beg leave to communicate to you in writing, briefly, some of my views on the solution of the vexed debris question, which has agitated the State so long and has led to the practical stoppage of hydraulic mining. I do so because this seems a promising time for the rational adjustment of the claims of the contending parties—the miners, and farmers of the valley—to the benefit of both and of the State at large. It seems to me that a calm consideration of the subject, instead of hot contention in public meetings and in courts having but a limited and one-sided knowledge of the wide bearings, would serve to largely reconcile the conflicting interests.

In your excellent and judicially written paper read at the last meeting of this Association, you presented some points of view which are of great importance in this connection. While recognizing the serious injury inflicted upon certain portions of the valley lands by the wholesale rushing down of cobbles and gravel from the hydraulic mines, and that these coarse materials can and should be impounded by the miners within the mountains and foothills, you contend that the fine materials, now all comprehended under the unpleasant term "slickens," are on the whole not really different in kind from the natural wash of the mountain torrents, such as must always be brought down by them, and can, if properly distributed over the agricultural lands of the valley, be made a benefit instead of a detriment to the farmer. To this view I fully agree, it being evident from the rapid and vigorous growth of the trees and chaparral on the debris within the placer and hydraulic mines themselves that the finer material is well adapted to vegetable growth, even though lacking in humus content. It is the excessive amounts deposited over limited areas, and sorted into beds of sands of several feet here, and sheets of fine, impervious slickens there, that are chiefly objectionable.

Of course, the same things happen where there are no hydraulic mines or debris, wherever streams inundate agricultural lands, and it is not easy to define the exact increase caused by these mining operations, aside from the gravel masses clearly originating there. If the fine debris could be so controlled that only a relatively thin layer would be deposited each flood season, to be plowed in, or if they could be deposited on the peaty tule lands, they would be a material benefit to agriculture, as alluvial deposits are all over the world.

But a proper distribution of these materials means control of the flood waters of the rivers, an improvement now called for so urgently by so many interests that enormous sums have been set aside by the United States Government for the selection and establishment of reservoirs wherever, possible, to serve for irrigation as well as for the development of water power now so urgently needed in the numerous industries connected with electric power, including therein the working of the mines themselves.

Since it is the turbulent flood waters that have been chiefly instrumental in bringing down the debris promiscously upon the farming lands of the valleys, this work, placed under the direction of the United States Geological Survey, bears in the most direct manner upon the debris question and the possible renewal of hydraulic mining without injury to the agricultural interests. In fact, such efficient and accurate work as is now being done by the Geological Survey in this connection is the condition precedent of the practical usefulness of any Debris Commission, however competent in its membership. The first thing needed is a thorough ascertainment of the facts as they exist, not only in one limited region, but over areas sufficiently great to serve for the framing of a comprehensive policy, the operation of which shall not need amendment at each legislative session and give rise to renewed agitation and disturbance of industries; for the questions involved bear not only upon mining and agriculture, but as well upon commerce and navigation, upon the maintenance of deep sea navigation of the great port of San Francisco, and its bay and river connections, as well as the government works for coast defense. The problem is a very large one, but cannot be dealt with piecemeal.

In view of the broadness and importance of the interests involved, it seems to me that few questions of greater importance can come before this meeting than that of making a strong move for executive, or, if necessary, congressional action towards authorizing the Geological Survey to include within its reclamation work the matter of the proper utilization of mining debris and natural detritus for the reclamation of waste lands, in addition to the establishment of storage reservoirs for flood waters. The high character of Director Walcott, and his well-known promptness and efficiency in pushing the work under his charge, encourages the belief that if such action is taken we will in a comparatively short time be brought much nearer to the solution of the debris problem, and the resumption of the great hydraulic mining industry, than thirty years of contention and half-way measures have been able to bring about.

It cannot be too strongly urged that, instead of being antagonistic to each other, the agricultural and mining industries are vitally concerned in each other's welfare. The suppression of the development of the foothill and mountain regions of the State is injurious to the welfare and progress of the whole—both country and cities—and all good citizens ought to unite to work toward the establishment of a broad policy for the benefit of all.

Very truly yours,
Berkeley, Cal., Nov. 20. E. W. HILGARD.

Dust Chambers at Smelters.

Where the ore being treated is high-grade, and particularly where there are much fines, dust chambers are indispensable, if heavy losses are to be avoided. These must be so constructed that there will be no interference with the draft, which is a necessary condition where smelting is to be accomplished rapidly. The former practice was to build dust chambers with partitions alternately at the top and bottom, extending only part way between the floor and top of the chamber. This arrangement caused the dust to be carried under one partition and over the next, and so on throughout the series. This accomplishes only a small part of the desired result, as a strong draft still remains, which prevents the fine dust particles from coming to a state of rest.

The best and least expensive form of dust chamber is simply a considerable enlargement of the flue, constructed horizontally, and having transverse partitions extending from the floor upward toward the

Construction of Dust Chambers at the Smelter of the Shannon Copper Co., Metcalf, Ariz.

arch, but leaving a sufficient space for a quiet passage of the gases, while the dust settles downward into the zone of undisturbed atmosphere between the walls. It is not unusual for the dust particles of ore to assay higher than the average ore under treatment—thus the advisability of dust chambers. The accompanying engravings show the dust chambers at the Cananea, Mexico, smelter and that at the Shannon Copper Co.'s smelter at Metcalf, Ariz.

Mine Drainage by Bailing.

The question of unwatering a mine always is a serious problem to the mine management, especially so when the water is impregnated with acids. When the amount becomes excessive the means to be employed for disposing of it taxes the ingenuity of all concerned to the uttermost.

In the anthracite regions of Pennsylvania there are mines in which for every ton of coal raised as high as fourteen tons of water must be pumped, and the latter must be done at a minimum of expense. Nowhere, probably, have a greater variety of pumps and lifting devices been tried. One satisfactory type for handling large quantities of water at comparatively low heads has proved to be large bailing skips operated by steam engines. These, however, lack the mechanical regularity inherent in a pump, as they are necessarily operated by men, and it remained for the Delaware, Lackawanna & Western R. R. Co. and its electrical engineer, H. M. Warren, to finally develop a water hoisting equipment which would preserve all the valuable points of the steam hoist and at the same time operate automatically. The carrying out of the mechanical details of the hoist and its automatic devices were confided to the Wellman-Seaver-Morgan Co., of Cleveland, Ohio, who guaranteed the machinery to accomplish the desired results. Most of the electrical controlling devices were furnished by the Electric Controller & Supply Co., Cleveland, Ohio. In the original specifications the D., L. & W. R. R. Co. called for the hoist to be operated by an alternating current motor of 800 H. P., and the question of starting, stopping and reversing so large a motor had, at the outset, to be met. The duty to be performed by the hoist called for the raising of 4000 gallons of water per minute to a height of 550 feet.

4,000 gals. × 8.27 = 33,180 lbs.
500′ 2″ rope × 6.3 = 3,465 lbs.

36,645 lbs. to be raised at 550′ per min.

$$\frac{36{,}645 \times 550}{33{,}000} = \ldots\ldots\ldots \text{ 610 net horse power.}$$

Weight of bucket = one-half weight of water, so that weight on rope = 53,235 lbs., or nearly twenty-seven tons, requiring 2″ steel rope.

The various preliminary speed and movement diagrams are laid out per accompanying diagram.

It was decided in carrying out the design that it would be impracticable to design the hoist other than have a motor running continuously in one direction, as it is a well-known fact that the amount of current required to accelerate a large motor of this type is enormous, and greatly interferes with the proper running of the power plant.

The D., L. & W. R. R. Co. desired to use an A. C. motor directly at the hoist, and as the motor was to run continuously in one direction this necessitated the use of friction clutches for accelerating and reversing the load. As the Wellman-Seaver-Morgan Co. had several smaller plants already in operation using A. C. motors on hoists which are operated similarly to the present hoist, and as they are running successfully, and the repairs and renewals for clutches had not exceeded that required for the other hoisting engines, it was decided to use this method.

Figs. 1 and 2 show a front and side view of the hoist. As will be noticed the general arrangement consists of a motor driving a pair of bevel wheels through a single bevel pinion. The bevel wheels run loose on a shaft and are fitted with the Webster, Camp & Lane friction clutches. The operating mechanisms for the clutches are so designed that only one clutch can be thrown in at a time, but both clutches can be out at the same time. Throwing in one clutch runs the drum in one direction; throwing in the other clutch reverses the motion of the drum.

To the shaft on which the bevel wheels run there is keyed a pinion, meshing with main gear on the drum shaft. The drums are of the cylindro-conical type, 10 feet at the small diameter and 16 feet at the large diameter. At a hoisting speed of 550 feet per minute the drum makes about fifteen revolutions per minute. There is one main brake located between the drums. All of the clutches and brakes are operated by auxiliary air cylinders fitted with oil cushion cylinders, the compressed air being furnished by a motor driven air compressor and the necessary tanks located near to the hoist. The hoist is controlled by a mechanical device shown in Fig. 2. This device consists mainly of a drum rotated by means of a friction drive from the motor through a sprocket chain. The drum shaft transmits its motion to a secondary shaft fitted with variable speed, which in turn operates a secondary stop. The main hoisting drum shaft operates a traveling nut which is so located with respect to the controller drum that at either end of its travels it releases a stop and allows the controller drum to make a quarter turn; this movement, through suitable electrical connections, operates the solenoids on the clutch valve, releasing the clutch and the solenoids on the brake valve, setting the brake, the further movement of the controlling drum being arrested by the secondary stop. This stop is released by the variable speed shaft and its connections, which has been given a predetermined time movement corresponding to the interval for emptying the bucket. The further movement of the controlling drum releases the brake and throws in the reversing clutch, thus starting the hoist in the opposite direction, and also starting the traveling nut on the controlling mechanism in the opposite direction. At the end of the hoist the cycle of controlling movements is repeated, and so on, making the hoisting operation continuous and automatic. Every attention has been given to the safe operation of the hoist. The main brake is of the gravity type, and to be released the current must be on the solenoid operating the valve so that air can be admitted to the underside of the brake piston.

If, for any reason, either the supply of current or of air pressure is interrupted, the valve drops, and the weights on brake lever set the brake. The clutches are designed so that they are thrown out by weights. As is the case with the brake, either clutch can only be thrown in when the current is on the solenoid, and if either current or pressure fail, the clutch is off. The motor shaft is fitted with an emergency brake operated by a weight controlled by a solenoid — any interruption in the flow of current to the motor sets the brake and stops the motor. Any interruption of the flow of the current stops the machine, throws out the clutches and puts on the brake. A safety cut-out is provided for in the head frame so that in case a bucket is carried beyond the proper height, the current is cut off.

Fig. 3 shows the head frame. The head frame is 93 feet from the base to the center of the sheave at the

Efficiency in the Mining Industry.

In an address recently delivered by Ernest Williams, president of the South African Association of Engineers, before that Association, he indicated what he thought should be done to improve operating methods, particularly in the deeper levels. A portion of his address follows:

We no longer speak of stamp mills having 100 heads as the unit of equipment, as this is to be increased about ten times. The tonnage duty of the stamps will be almost doubled by the introduction of secondary reducers, principally of the tube mill type, and the recovery of the value is to be increased by about 10%. Never before in the history of this gold field has the same keenness for efficiency and permanency been in evidence. Standardization of work, simplification of method, multiplication of units and centralization of effort and control have been developed—it may be beyond what we are quite ready for, and, although I do not propose to cry a halt in the chase after magnitude, so as to give us breathing time, I would mention one or two points which seem to me to be worthy of consideration.

We must keep in view the necessity for economy in equipping as well as in the running of our undertakings. Every pound spent in excess of the actual necessary expenditure is so much money lost—it may be wasted—and it is here that good engineering judgment is best displayed. Our present system of work tends to specializing to a degree not serving in the best manner the greater interests of the country. We are in danger of raising a generation of engineers who can only equip on a magnificent basis, and we must guard against our successors saying of our work: "It was magnificent, but it was not true mining economics."

We are rapidly deliminating the area within which the payable banket beds occur in the Transvaal, and we are seeking for the reappearance in the Orange River Colony of the payable banket beds outcropping along the Rand.

Since the discovery of the main reef series and the realization of the gold values of these beds very many people have said we must revise our ideas as to the occurrence of gold, and such people would pass by the claims of the old and tried gold-carrying rocks of the world that for generations produced the most gold. But as careful engineers we must not allow the glamour of the new to deaden our hopes in the old, and in the Transvaal to-day the primary rocks or schists are being surely though slowly recognized as worthy of confidence, for they are proving to us their value as gold carriers. At points far apart in the Transvaal satisfactory gold values have been found in the primary or schistose rocks, and as prospecting is carried on further gold deposits will cetainly be found in these rocks, and this class of proposition will, I think, no longer be flouted by the financier, who is growing very specialized and wants the engineer's report setting forth in minute detail the value of any property he is asked to finance.

The mining propositions I have in mind—occurring in the schists—will, I believe, restore some of the romance of gold mining, and remove the present monotonous conditions surrounding the production of gold within the Rand area, which conditions are rapidly partaking of the routine obtaining in the production of pig iron. At our meetings we have had contributions from members dealing with this question of the probable gold-bearing value of the old crystalline rocks of the Transvaal, and the information given shows the advisability of paying more attention to these deposits.

Some good mining propositions in the schistose rocks have been exploited in the healthy districts of this colony, and the development of these in the so-called fever districts is progressing, but prospecting is difficult in some cases owing to the prevalence of malaria during the rainy season. I have recently visited some of the mines in the so-called fever districts, and am quite satisfied that one of the most important matters controlling the occurrence of malaria there is the almost utter disregard of all sanitary precautions. Most of us know something of the history of many of the gold mines in the north-eastern and eastern districts of the Transvaal—how the occurrence of gold deposits running a high value per ton was announced with great noise, and sometimes the company formed to work the mine ended in much more noise, after a career something like that of a rocket, going up like a comet and coming down like a stick. I make bold to assert that in many cases the ending of the life of such mines was not due to lack of payable gold value, but to lack of efficiency in other factors, chiefly—humanly controllable—at times through attempting to attain the magnificent on the surface before proving the actual value lying in the ground. Then came the old story, "No further money available for development," and then the end. It may be out of place to mention that the Klein Letaba gold field, with an area of hundreds of square miles, offers a splendid field for the prospector who understands his calling, as very good values have been proved, but so far the superior attractions of banket have depreciated the real value of such lines of country. It may be interesting to remark that in the Klein Letaba gold fields a new class of gold-bearing deposit has recently been proved. Here the occurrence of gold thus in the character of rock is a new mineralogical feature. We have gneissoid and stratified rocks, with an interbedded sheet of pyroxene rock, laid down under water, the whole strata subjected to lateral pressure, under which the rocks folded at points of greatest stress, when the elasticity of the sedimentary rocks, and of the lower and upper margins of the eruptive rocks, allowed these rocks to yield to this pressure, the central portion of the pyroxene sheet being crushed or fractured, and thus forming a somewhat permeable mass, through which chemical solutions circulated, altering its character. These solutions, which were auriferous, circulated freely throughout the mass, and deposited crystalline gold in the place of elements chemically set free by the action of such solutions.

THE PROSPECTOR.

Sample No. 1, Ukiah, Or., is quartz containing iron and zinc sulphide, and probably also contains gold. No. 2 is a piece of crystalline limestone (mottled marble), apparently of good quality if the stone can be obtained in good sized masses.

The ore sample from Homestead, Or., is mostly zinc sulphide (blende). It also contains a streak of more complex mineral, chiefly zinc and lead. This ore probably carries also gold and silver and should be assayed for those metals.

The mineral and rock samples from Quartzsite, Ariz., are described as follows: No. 1, jasperoid, possibly rhyolite which has been silicified. A number of rocks assume this appearance upon silicification. Shales may be compressed and silicified to resemble the sample. So may rhyolite, and petrified wood often looks the same. The geological occurrence is the best way to get a suggestion as to the origin of the material. No. 2 is green jasper. No. 3 is chalcedony. No. 4 is iron oxide and silica coated with chrysocolla (copper silicate) and malachite (copper carbonate). Package No. 5 contains one specimen of lead sulphide (galena), which is altering to lead carbonate (cerussite) around the edges. The gangue mineral is quartz, with a little calcium carbonate. The other specimen is mostly quartz, with some crystals of honey-yellow lead molybdate (wulfenite) on one side. No. 6 is chiefly jasper. The largest piece resembles petrified (silicified) wood. The black pebble in this package is a dense, silicified clay rock, probably originally shale, the others being jasper.

The ore from Ingot, Cal., is limonite (brown iron oxide). It may possibly contain gold, for which it should be assayed.

The rocks from Tombstone, Ariz., marked A. G., are: No. 1, basalt; No. 2, a scoriaceous lava considerably altered; No. 3, a much decomposed earthy lava or tuff.

The rock specimens from Lowden's Ranch, Cal., are: No. 1, amphibolite schist; No. 2, talc schist; No. 3, amphibolite schist colored black by carbon, and carrying considerable pyrite. It has the appearance of being a wall rock of a mineralized vein. No. 4 is diabase; No. 5 is scoriaceous lava; the vesicles were caused by inclusions of air or steam in the lava when it was molten, the rock solidifying before the gas could escape; No. 6 is seemingly a section of a small vein in a massive rock, and consists principally of epidote and feldspathic mineral; No. 7 is mispickel (arsenical iron sulphide.)

The rock samples from Cherry, Yavapai county, Arizona, are all of granitic character. No. 1 is probably aplite, much kaolinized and stained by iron oxide. No. 2 is a much kaolinized feldspathic rock, with remnants of hornblende, and may have been syenite. No. 3 is similar to No. 2, but is less granular and of finer grain.

The rocks from Prescott, Ariz., are mostly of similar character — altered greenstones, presenting various phases of texture and conditions of alteration. No. 1 is mica-diorite. No. 2 is the same, though finer in texture. No. 3 is diorite aphanite. No. 4 is evidently the same kind of rock, as No. 1 for instance, but is very much altered and silicified and carries a little pyrite. No. 5 is only finer in grain than No. 2 and much more altered. No. 6 is an aplite dike and is a granular mass of feldspar and quartz. No. 7 is diabase, and No. 8 is similar to No. 7, but more altered, and No. 9 is evidently a still further altered similar rock. All of these rocks have been so completely changed from various causes that in most instances the original minerals can no longer be determined, while the minerals now present may have been derived from any one of several original minerals. When the augite of a diabase, for instance, is changed to hornblende (uralite), and the change is complete, it is very difficult, if not impossible, to say whether the rock was originally diorite or diabase. Feldspars alter to kaolin, mica and other minerals, and the means of identifying the original material is lost in most cases.

Geology of Tonopah, Nevada.*

NUMBER II.—CONCLUDED.

RELATION OF THE DESCRIBED DISTRICTS TO TONOPAH.—Of all the described ore deposits of North America, therefore, Tonopah appears to be most closely related to many of the Mexican silver veins, and also to the Comstock in Nevada and the Silver City–DeLamar veins of Idaho. With Pachuca, as is seen, the relation is intimate, and Ordonez's description of the veins of this district would do, with a very little change, for a report on the Tonopah veins. The chief difference is in the occurrence of manganese silicate in depth at Pachuca, which has not been found at Tonopah, and also the less content of gold, with the absence of ruby silver. Ruby silver, however, occurs in the cognate and contiguous Real del Monte district; also gold in considerable quantity occurs with silver in some of the Mexican districts of this type. Those enumerated by Aguilera all occur in hornblendic andesite.

This group of veins is characterized by the following features: They occur in Tertiary volcanic rocks of similar character in the different localities, being chiefly Miocene andesites or rhyolites. They constitute strong masses or frequently branching and "linked" veins of quartz, which have as gangue essentially quartz, with frequently a little calcite, while adularia, barite, rhodochrosite or rhodonite may also be present in limited amount. The ore is characteristically a silver-gold one, silver being usually predominant in the values in varying proportions, though the relative value may be reversed, and in some extreme cases either metal may occur with little admixture of the other. In any case the abundance of silver or gold, or both, in reference to lead, zinc, iron, etc., is characteristic. Silver sulphides, especially argentite, also stephanite and polybasite (with ruby silver) and gold, probably largely in the free state, are distinguishing features in the great majority of cases. Tellurides and selenides may also be present. Pyrite, blende, chalcopyrite and galena are usually present in varying quantity. Where they become predominant the vein becomes relatively low grade. Tetrahedrite, stibnite and bismuthinite are also known to occur. The wall rocks are characteristically much altered to quartz, sericite, chlorite, calcite, epidote, pyrite and sometimes adularia, etc. Frequently the rocks nearest the veins are chiefly altered to quartz and sericite, those farther away to the softer "propylitic" alteration, consisting of calcite, chlorite, pyrite, epidote, etc.

The rich ores occur in regularly outlined portions of the lode called bonanzas. These bonanzas are of limited extent, both horizontally and vertically. They are believed to have arisen as a consequence of the irregular intersection of transverse fractures or fissures with the main vein channel, producing maximum deposition in these portions. Intervening portions may be low grade or barren.

In the oxidized zone silver chlorides and bromides, free gold, manganese oxide, etc., occur.

THE PETROGRAPHIC PROVINCE OF THE GREAT BASIN.—After a study of the lavas of the Great Basin region of Nevada in 1900, the writer came to the conclusion that the whole region "southward into the Mojave desert, together with a portion at least of the Sierra Nevada, constitutes a petrographic province—that is to say, it is underlain by a single body of molten magma, which has supplied at different periods lavas of similar composition to all the different parts of the overlying surface. The limits of this subcrustal basin, however, are not yet defined in any direction."

The general sequence of lavas, roughly outlined, was concluded to be as follows:

1. Rhyolite (Eocene).
2. Andesite (Miocene).
3. Rhyolite with occasional basalt (Miocene–Pliocene).
4. Andesite (Late Pliocene–Early Pleistocene).
5. Basalts and occasional rhyolites (Pleistocene).

EXTENSION OF THE GREAT BASIN PETROGRAPHIC PROVINCE INTO MEXICO.—Later in the same year, Ordonez, in a study of the rhyolites of Mexico over a northwesterly trending belt extending from the northern boundary southward past the City of Mexico, found that the author's conclusions were also applicable to this province. He writes as follows: "With very slight differences, which are without decisive importance, one may say that everywhere the relative order of eruptions, judging from the composition and structure of the rocks, has been the same. Let us here present the example of the Great Basin of Nevada. Many ranges of that region show a succession strictly comparable with that of Mexico."

The general succession is found to correspond with that given by the writer above, and the rhyolites occupy the same position and are of the same age (Miocene–Pliocene) as those under No. 3. The andesites, which preceded the rhyolites, correspond with No. 2 and are Miocene.

A METALLOGRAPHIC PROVINCE CO-EXTENSIVE WITH THE PETROGRAPHIC PROVINCE.—In the paper above referred to the writer brought forward the idea of metalliferous provinces (perhaps better, metallurgical provinces) characterized by the presence of certain metals, and pointed out that these provinces may or may not be closely identified with petrographic provinces, although they probably generally are so, to a certain extent at least.

Unquestionably, the close relation between the Nevada mineral districts, Tonopah and the Comstock, with the far more numerous array in Mexico, and the individuality of this group as compared with other known veins of North America, shows a metallographic province, which in this case coincides with a portion of the petrographic province previously mentioned.

In this metallographic province ores occur in Miocene andesites in the great majority of cases, and their formation followed soon after the eruption of these rocks. In occasionally recurring cases, such as Silver City and De Lamar, Idaho, and others, they appear in Miocene–Pliocene rhyolites, which succeeded the andesites.

In general, however, the Miocene andesites of this province are, as Humboldt noted, the metalliferous formation par excellence, and if the conclusions which have been arrived at regarding Tonopah are correct (which coincide with a number of similar conclusions concerning other districts reached by other authors), the ore is due to the after actions of the eruptions in the shape of fumaroles, solfataras and hot springs. Moreover, since similar manifestations (of fumaroles, solfataras and hot springs) follow most volcanic eruptions, it is probable that the metals deposited by the after processes at this period arose from an unusual proportion of them in the andesite magma; indeed, the very definition of a metallographic province implies this. The existence of such metal-

*Abstract Prof. Paper No. 42, by J. E. SPURR.

lographic provinces is evident; and the theory of their origin, as propounded by the writer, is like that long entertained by many petrographers for the origin of petrographic provinces—namely, that they are formed by magmatic segregation.

Origin of Shoots or Bonanzas in the Veins of This Metallographic Province.—Light is thrown upon the origin of the shoots, chimneys or bonanzas in this class of veins by the studies of the influence of cross fractures on their formation in Tonopah, and the similarity between these bonanzas and those at Silver City and De Lamar, Idaho, the Comstock and Pachuca

DA, FROM THE MINES.

(see accompanying figures). At De Lamar the shoot or chimney form is evident, some of the bonanzas having been followed downward over a thousand feet, yet the local irregularity of the outline is like that of the typical bonanza. At Tonopah a similar shoot-like form with a definite pitch has been discovered, but the developments thus far made do not show so great a persistency as at De Lamar. At Tonopah the connection of the shoots with cross fractures is evident, and the localization of the ore deposition at intersections of especially fractured zones seems the correct explanation. It is doubtful, however, if, when the bonanzas in the Tonopah veins shall have been worked out, the shoot-like form will always be discernible; in the case of the richer eastward-pitching shoots of the Mizpah vein, for example, the spaces between the shoots would probably be considered together with them, in the larger sense, as parts of one great bonanza, whose eastward pitch and shoot-like form would be less emphasized, or not at all.

In the case of Pachuca the bonanzas are irregular or roughly elliptical and are not shoot-like; yet the fact observed by Ordonez, that the bonanzas on the different veins group themselves into a definite zone running transversely across the strike, is hardly to be accounted for except by the explanation arrived at in the case of Tonopah, that the bonanzas are due to the influence of an intersecting fracture system. At the Comstock the bonanzas are similar to those in Pachuca, although no local evidence has been found explaining their origin.

The above explanation is readily acceptable for bonanzas that are elongated into definite shoots and are actually known to be associated with and dependent upon cross fracturing, as in Tonopah; but it is not so easily acceptable, perhaps, in the case of wholly irregular bodies, such as those of the Comstock. Yet at Tonopah the bonanzas are irregularly cut off and do not continue indefinitely downward on the pitch; and to this limitation the explanation of the controlling effect of cross fractures must unavoidably be extended.

When making concrete do not use cold water nor mix the materials in a freezing atmosphere. Do not mix up more concrete materials than can be put in place within a half hour, and do not undertake to ram or otherwise mould or disturb concrete after it has taken the initial set. Sand and gravel or broken rock are essential to concrete, but cement is also, and enough of the latter must be present to make the concrete durable and give it the necessary strength.

Transportation and Handling of Explosives.

As the result of the explosion of a large quantity of nitro powder while in transit on a railroad in Pennsylvania, some months ago, a commission was appointed to inquire into the dangers attending the handling of explosives. C. B. Dudley, C. E. Munroe, H. S. Drinker and C. F. McKenna comprised this committee, and, being scientific and experienced investigators, their report is of interest and value. The whole matter is published at length in the Engineering News, from which the following from the report of the committee is abstracted. The first portion of the report is a part of that by C. B. Dudley:

The nitro-glycerine powders are all sensitive to shock. It is fair to state, however, that since liquid nitro-glycerine is not transported at all, and since the form in which nitro-glycerine is carried is with the nitro-glycerine absorbed in some absorbent medium, such as sawdust, wood pulp, nitrate of soda, etc., the sensitiveness of the nitro glycerine powders to shock is infinitely less than in the case of liquid nitro-glycerine. If the nitro-glycerine is properly made, and properly absorbed in a well-dried absorbent material and the powder is made up into cartridges and properly packed in good boxes strong enough to prevent rupture of the boxes and consequent leakage of the powder while in transit, there is very little danger in transporting high explosives due to the ordinary shocks of transportation. It is quite possible to throw a box containing fifty pounds of almost any high explosive from a point 50 feet in the air down on rocks without causing an explosion, and individual cartridges can be thrown with full force of a man from any height upon rocks without doing anything more than to rupture the cartridge. Moreover, a properly made nitro-glycerine powder can be hammered on a wooden surface until the hammer head beds itself in the wood without causing an explosion, yet it may frequently be exploded even by a glancing blow of wood on wood. Furthermore, a properly made nitro-glycerine powder is rarely exploded by the first blow when it is laid on an anvil and struck with a hammer. The second blow usually causes explosion. We are clearly of the opinion that if the nitro-glycerine powders are properly made and properly packed in sufficiently strong packages, there is almost no danger due to the ordinary shocks of transportation. It is badly made nitro-glycerine, broken packages and leaky cartridges that usually produce the risk, due to shock, in the transportation of high explosives. Decomposing and deteriorated nitro-glycerine powders are dangerous to transport. Decomposing nitro-glycerine powders give off acrid, irritating fumes. It is difficult to fully describe deteriorated nitro-glycerine powder; but powders which have been stored for six months or more may be regarded as suspicious, especially if the boxes show excessive dampness from storage, or are mouldy. If the boxes show any oily stains, the powder is so deteriorated that it is certainly dangerous to transport.

It may not be amiss also to mention one or two characteristics of nitro-glycerine explosives. It is a well-known fact that if a box of cartridges or a single cartridge of nitro-glycerine powder is detonated within a few feet of another box of cartridges of the same, the firing of the one will fire the other, although there is apparently no contact between them. This is not, as might be supposed, a case of transmission of fire from one cartridge to the other, but it is the shock produced by the firing of one cartridge which fires the other. There are cases on record of the explosion of a magazine in one locality producing an explosion of another magazine some distance away. Such explosions are called "explosions by influence," and this fact has a bearing on the transportation of explosives, in that there is an increased risk in having several cars containing explosives in the same train.

We have mentioned above carelessly made nitro-glycerine. There is a critical point in the manufacture of nitro-glycerine which, if ignored, leads to no end of difficulty. As is well known, nitro-glycerine is made by pouring a stream of glycerine into a mixture of the strongest nitric and sulphuric acids. The whole mass is stirred during the operation, and as heat is generated by the chemical change the material is cooled by artificial means. The eye of the operator is kept on the thermometer which is in the liquid, and it is believed that many explosions which take place in the manufacture of this material are due to its being insufficiently cooled. As much as, and sometimes more than, 1000 pounds are made in a batch. After this operation is completed it becomes essential to remove the remaining acid from the nitro-glycerine, and this is the important part of the whole process, as regards the safety of the finished product. The acids and the nitro-glycerine being of different specific gravities, this fact is made use of to effect their separation. The nitro-glycerine is then washed with water to remove the bulk of the acid adhering to it. It is subsequently treated with soda solution to neutralize any acid which may be left, and finally with another washing of water to remove the soda solution. If, now, this operation be properly performed and all the free acid be removed, the nitro-glycerine may be said to be well made and a safe material to proceed with. On the other hand, if all the acid be not removed, in the course of a short time, possibly a week or two and possibly a shorter time, the nitro-glycerine becomes changed in its properties and becomes infinitely more sensitive to shock. Such badly made nitro-glycerine is very hazardous to transport. To neutralize any possible traces of acid which might still remain after the washing or be produced by decomposition, it was formerly the almost universal custom to add to the absorbent material in nitro-glycerine powders a small amount of some substance called an ant-acid, such as carbonate of magnesia or zinc white. This practice has been abandoned by some, but it is of the highest importance that it should be resumed.

This is the place, perhaps, to mention a modification of nitro-glycerine explosive known as "gelatine dynamite." It has been found that nitro-cotton dissolves in nitro-glycerine, and that when the proper proportions of these two ingredients are mixed together they mutually dissolve each other and a material is formed which is even stronger in its explosive power than nitro-glycerine alone. The material becomes gelatinous and is mixed with absorbent in much the same way as ordinary nitro-glycerine, except that being gelatinous it is possible to use more of the explosive and less of the absorbent, thus making a much stronger powder. With the ordinary nitro-glycerine powders, the safe limits for transportation are sixty parts nitro-glycerine and forty parts absorbent. In the gelatine dynamite as high as eighty parts "gelatine" and twenty parts absorbent material may be used. This material behaves much like the ordinary nitro-glycerine powders, and, although a stronger explosive, is believed, if properly made, to be fully as safe to transport as the ordinary nitro-glycerine powders.

As already explained, the nitro-glycerine in high explosives is absorbed in a mixture called a "dope," such as a mixture of wood pulp and nitrate of soda or other substances already mentioned. If the proportions of liquid nitro-glycerine and of absorbent are what they should be, there will be no danger of leakage of the nitro-glycerine, even during a warm summer day, but, unfortunately, during the last few years a change has taken place in the manufacture of high explosives. Formerly dry sawdust and nitrate of soda were the principal absorbent materials. Within the last few years ground wood pulp has been used, but wood can not be ground after it is seasoned on account of the materials taking fire. Green wood must be used and green wood contains about 18% of water. Some of the manufacturers have not dried their wood pulp previous to mixing, and the moisture of the wood pulp has united with the nitrate of soda, which is a hygroscopic substance, liquefying it, and therefore diminishing the absorbent capacity of the dope. Furthermore, powders as high as 75% nitro-glycerine and 25% absorbent have been made. It will readily be understood that under these conditions the liquid nitro-glycerine may run out of the cartridges and indeed this is a well-known

phenomenon. If, now, the liquid nitro-glycerine does exude from the cartridges and finally reaches the outside of the boxes, and gets between a nail in the box and a nail in the car floor, the ordinary shocks of transportation would fire the nitro-glycerine, with the result of blowing up the car load. The skidding of the boxes over the floor may produce the same result.

INFLUENCE OF THE WEATHER. — Nitro-glycerine freezes at about 40° F. if exposed for some time to this temperature. In the frozen condition it is less liable to explosion from shock, and it has been proposed to transport nitro-glycerine powders in refrigerator cars. This does not seem to be advisable, however, for several reasons. The subsequent artificial thawing of these powders for use would probably increase their danger, as a whole. Moreover, their transportation in the frozen form would not result in entire freedom from accident, since fire following a wreck is the most frequent cause of disaster, and such fire would thaw the material and heat it locally to a sufficient degree to cause explosions. Furthermore, according to Hess, by long continued exposure to high temperatures, both volatilization and decomposition, in a greater or less degree, result. Nitro-glycerine begins to decompose at temperatures between 112° and 122° F. and decomposes quite rapidly at 158° F. Moreover, the tendency to leakage and also the sensitiveness to shock increase with the temperature. The increase in the temperature of a car, owing to exposure to the sun in very hot weather, tends to produce these results. It would seem to be advisable, when transporting these powders in warm weather, to have cars ventilated and to make the transportation in the hottest part of the summer as small as possible, and to have the cars on the road as short a time as may be.

FULMINATES.—Fulminate of mercury is made by reaction taking place between a solution of mercury in nitric acid and grain alcohol. As the reaction goes on the fulminate separates out from the liquid as a gray crystalline solid. This material, when dry, may be fired by fire, heat, friction, concussion or shock, and, however fired, it always undergoes a detonating explosion. It may even be fired when saturated with or submerged in water if some dry fulminate be detonated in contact with it. It should never be transported in the dry condition in quantity, and in transporting wet fulminate extreme care should be taken that no portion of this wet mass, however small, is allowed to become dry. Fulminate of mercury is the characteristic component of detonators, blasting caps or dynamite exploders, and they are essential for use in firing dynamite and other high explosives. Owing to the United States internal revenue tax on grain alcohol, very little fulminate of mercury is manufactured in this country, and consequently this necessary substance must be imported in considerable quantity.

Detonators, blasting caps and dynamite exploders should never be transported or stored in the same car or compartment with other explosives or with inflammables, and they should be carefully protected from fire, heat or shock, or contact with acids. It should be borne in mind that fulminates are the most sensitive of the explosives commonly met with, and the most violent.

PRACTICES OF MANUFACTURERS IN HANDLING EXPLOSIVES TO AVOID ACCIDENTS.—Not very much can be said on the subject that is applicable to transportation matters. The manufacturers, after the explosives are made, only have to handle them from the magazine or shipping house to the freight station or siding, where they are loaded in cars. This carrying is usually done in wagons, and cases are known where blankets were spread on the bottom of the wagons to relieve the shock due to the jolting produced in going over rough roads. This is especially true when materials have been returned to the works to be remade. It is a well-known fact that all explosives deteriorate on standing, and sometimes the railroads are asked to take deteriorated explosives from local magazines distributed throughout the country back to the original works to be remade. Of course, in all establishments manufacturing explosives great care is taken to avoid fire, to avoid high temperatures, and to avoid shocks, these three being the principal causes of accident. It is claimed that only very careful men, who have had experience and are strictly trusty, are ever employed to handle the finished explosive. In putting the cartridges in boxes at the works they are sprinkled over with sawdust after the box is filled and then the boxes are nailed up in the regular way. The parties doing this work seem to have no hesitancy, and do not seem to fear any danger from the nailing, and, as a matter of fact, so far as our studies have gone, the accidents, especially in nitro-glycerine works, are more connected with the manufacture of the nitro-glycerine itself than with the handling of the powder after it is made. It is not rare for a nitro-glycerine house to be blown up. It is rare for a magazine to explode. It is customary to have several at a works that all the product on hand shall not be involved in a single explosion. It should be mentioned, perhaps, that large mounds of earth are often thrown up about the danger buildings at the works in order to limit the extent of damage done in case of an accidental explosion taking place. Moreover, the different operations are separated as much as possible, the buildings being small and widely scattered, so that an accident in one part of the works will not involve the whole.

CHAS. B. DUDLEY.

Altoona, Pa., July 24, 1905.

REPORT OF COMMITTEE OF EXPERTS.—(1) Your committee finds the explosives industry in the United States to be of importance and continually growing in the quantity and value of its output. This is exhibited by the accompanying table, taken from Bulletin No 210 of the United States Census of 1900.

(2) It finds that the important and extensive industries of mining and quarrying, the many industries which employ the products of mines and quarries, and engineering operations, can not be economically or safely carried on without explosives.

(3) It finds that the well-being, comfort and advancement of our modern civilization is to a large extent dependent upon the utilization of explosive substances, and that the raw materials from which explosives are manufactured, the products of the mines and quarries made available through the use of explosives, and the great variety of articles manufactured from these products, constitute a considerable part of the freight carried by railroads, while the various industries that are fundamentally dependent on the use of explosives give employment to an enormous number of persons.

(4) It is of the opinion that the explosives industry is now so well established a feature of our industrial operations that its products must be transported and that the best interests of all will be conserved by their being publicly transported by the ordinary routes of travel under such restrictions and conditions as will protect the traveler and the carrier without unduly hampering the producer, dealer or consumer.

(5) It is of the opinion that a carrier has the right to know the character and the properties of the goods he carries, for without such knowledge he may be unable to protect such goods from injury or to so handle and transport them as to prevent their injuring persons and property. He should, therefore, be definitely informed regarding the composition and properties of all inflammables and explosives or of substances which may, by contact with other substances, form inflammables or explosives which he is called upon to transport. He also has a right to demand a guarantee that any consignment offered of an inflammable or explosive possesses the same or a higher degree of stability, both as regards its composition and its method of packing, as the previously accepted or standard substance of this class or variety possessed.

(6) It is of the opinion that explosives and inflammables should be started on their way as soon as possible, forwarded as speedily as practicable and promptly delivered, since the shorter the time they are in possession of the carrier the less the risk.

(7) To indicate somewhat the magnitude of the risk following the quantity of explosives shipped in a single lot, your committee submits the following table, compiled from a table prepared by H. M. Inspectors of Explosives and adopted by the United States authorities. In the original table, among other data, is given the distance which a magazine or factory containing the given weight of explosive should be separated from a public railway in order to protect the latter. The conditions we are considering here are the reverse of those named by H. M. Inspectors of Explosives, for the explosives are on the railroad and the distance becomes the danger radius about the car for dwellings, churches and other buildings:

Amount of Explosive, Pounds.	Danger Radius, Yards.	Amount of Explosive, Pounds.	Danger Radius, Yards.
3,000	240	30,000	1200
4,000	280	40,000	1525
5,000	320	50,000	1850
10,000	525	100,000	3500
20,000	850		

This danger radius is not the limit of final effect, for glass may be broken, walls cracked and weak structures shaken down at greater distances, depending on the topography and geology of the locus of explosion. On the other hand, these very features last mentioned may operate to materially diminish the danger radius. It should be said also that these data are derived from a discussion of data obtained in accidental explosions in the past and represent extreme conditions.

(8) Your committee is of the opinion that the greatest danger which carriers have to contend with in transporting of explosives is fire and that every effort should be made to protect such shipments from fire.

(9) It recognizes a second and more remote cause of danger in friction, percussion and concussion, and packages containing explosives should be handled and stored in cars with due precaution against these conditions arising. Freight handlers should know that the striking of a corner of a wooden box smeared with nitro-glycerine against the wooden floor of a platform or car might give rise to an explosion.

(10) It recognizes a third cause of danger in high temperatures, which may start or promote decomposition and facilitate leakage. The practical application of this is that it is more hazardous to transport certain explosives in very warm weather, and that they should never be placed near a source of heat.

(11) Holding the above expressed views, your committee calls attention to General Notice No. 174B of the Pennsylvania Railroad Company, dated August 21, 1905, being "Information and Regulations for Shippers and Employes," relative to the "Transportation of Explosives." In our opinion, these regulations are practicable, reasonable and fair, and, if observed, offer a high degree of protection and insurance to safety.

(12) Your committee is of the opinion that the interests of all will be best advanced; that the danger to life and property will be reduced to a minimum; trade will be promoted and industries fostered by the adoption by all railroads of uniform regulations governing the transportation of explosives and inflammables, and we advise that such regulations be in general conformity with and on the lines of those now in force on the Pennsylvania railroad as cited above.

(13) Taking up in greater detail the regulations, your committee recommends:

(a) That, to guard against "so-called spontaneous combustion or explosion," no nitro-glycerine explosive, or an explosive of this class which gives an acid reaction, or which fails in the stability test, or which contains an insufficient amount of ant-acid, be accepted for transportation.

(b) That, as a precaution against leakage, cartridges or sticks of explosives be so packed in boxes that when loaded in cars the cartridges shall always lie upon their sides and never stand upon their ends.

(c) That containers be marked "Explosives—Dangerous" on all sides, and, to admit of the method of stowing recommended in (b), they be so marked that the position in which the cartridges lie is indicated.

(d) That, as a further precaution against leakage from the boxes and to reduce the chance of explosion by shock, cartridges or sticks be packed in dry sawdust or dry infusorial earth.

(e) That, as a precaution against explosion from friction or shock, care be taken in loading explosives that the packages are so stayed or chocked in the car that they can not shift or fall.

(f) That no inflammables, no detonators or blasting caps and no acids be shipped in the same car with explosives.

(g) That cars carrying explosives be strong box cars in good order and fitted with air brakes and, in trains, be placed between cars fitted with air brakes.

(h) That cars carrying explosives be located so far from the engine as to reduce to a minimum the danger from sparks from the engine.

(i) That cars carrying explosives be followed in the train by several cars so as to reduce to a minimum the chances of explosion in case of a rear-end collision.

(j) That cars carrying explosives be widely separated in a train from cars carrying petroleum or naphtha. So far as possible, cars carrying explosives and cars carrying petroleum or naphtha should go by different trains.

(k) That in making up trains no cars carrying pig iron, steel billets, heavy structural metal parts, machinery or other heavy material, which in a collision might crush adjacent cars, be placed adjacent to a car carrying explosives.

(l) That in view of the fact that explosives containing nitro-glycerine or other nitric esters are more liable to decomposition the higher the temperature, the transportation of these explosives should be limited as much as possible during the hottest months of the summer, and when transported in warm weather every available precaution should be taken to keep the temperature of the car as low as possible, such, for example, as wetting the car down at water stations.

(m) That it is essential that the containers should be so made and of such strength that they will not be broken in transit.

(n) That in the transportation of explosives containing a liquid component it is desirable that the containers be lined with a liquid proof lining.

Respectfully submitted,

CHARLES E. MUNROE,
HENRY S. DRINKER,
CHAS. F. MCKENNA.

Philadelphia, Pa., Sept. 15, 1905.

Mine Ladders.

Of all the things about mines, the ladders probably receive the least attention. Originally strongly made and of selected material, they are sent down into the mine and put in place, where they quickly become covered with dust or mud, according to whether the mine is wet or dry. Thousands of feet travel up and down the ladders, slowly wearing away the rounds. Rocks occasionally fall upon them, or strike the ladder from blasts, and in time the ladder becomes a much worn, mutilated and dangerous proposition. Rounds are broken out and remain out; the fastenings become weak and loosened, and no attempt is made to secure them. Ladders are suspended from timbers and strongly tied with iron baling wire. Acid waters wet and rust the wire,

which in a short time loses its strength; but still the miner trusts the ladder, or luck, and continues to use it. Ladders should be made of 2x4 inch scantling, with steps 1x4 inch, not over 10 inches from center to center, which are let into the sides and securely nailed with at least five 12-penny nails. The sides should have at least 14 inches space between them, making the ladder 18 inches wide. The ladder should be securely spiked or secured by large staples to timbers firmly placed, and they should receive inspection often enough to keep them in good repair. Ladders in shafts particularly should be kept in good condition constantly. Ladders with iron pipe for rounds, or even bar iron, are good for sinking. These need not necessarily be so wide as the regular shaft and raise ladders, and the rounds may be placed wider apart—12 inches—making the ladder lighter and easier to handle.

Reduction Plant and Process at the Oroya-Brownhill Mines.*

NUMBER II.—CONCLUDED.

Written by ROBERT ALLEN.

PRECIPITATION AND SMELTING.—The issuing gold-bearing solution from the presses is run into three storage tanks, from which it is pumped to an overhead tank. It gravitates from this through Excelsior clarifying presses to the extractor boxes, the exhausted liquor being run into "weak wash" sumps. The wash solutions from the presses are not passed through the precipitation boxes. The zinc boxes each have eight compartments 36 inches by 18 inches by 22 inches deep, and thus have 66 cubic feet capacity. There are five boxes for raw ore solution and three for concentrates solution. Mercury as well as tellurium is precipitated in the raw ore boxes, the former probably being derived from the mineral coloradoite previously mentioned. The spent solutions from the extractor boxes assay from the concentrates up to 24 grains per ton, and from raw ore from 6 grains to 12 grains per ton. The zinc in the concentrates boxes, on account of the richness of the solutions, is treated before use with lead acetate—zinc about $\frac{1}{300}$ inch is used. The boxes are cleaned up twice a month, the slime filter-pressed and smelted, two central filling cleaning-up presses being used. The cleaning up of the boxes takes five men four hours, while the roasting and smelting takes two men sixteen hours. Coarse zinc from the boxes which does not pass a No. 24 mesh screen is treated with sulphuric acid. The treated precipitate, together with the slimes (the whole containing about 40% of bullion), is then roasted in three muffles, 4 feet by 1 foot 10 inches by 1 foot, when the mercury contents and the bulk of the tellurium are got rid of, and most of the base metals, previously unacted upon, are oxidized.

The roasted precipitate is fluxed as follows: Precipitate 100, borax 50, sand 20, bicarbonate of soda about 8, and the mixture fused in an ordinary tilting furnace, there being about five hours to each cleanup, the retort being poured about every two and a-half hours. The slag is collected in trays and the gold in conical moulds. In case of accidents to the tilting furnace, there are two circular furnaces—each taking one "No. 100" pot—also available for smelting the slime.

A retort holding 6000 ounces is used for retorting the amalgam from the concentrates treatment.

The bullion from the tilting furnace is subject to a refining process, whereby its gold fineness is increased from about 730 to over 900, as follows: It is melted, 900 ounces at a time, in No. 30 graphite pots, and poured in a thin stream from a height of about 2 feet 6 inches into a fairly deep tub of water, which is constantly agitated and stirred. The resultant granulated metal varies in size from coarse sugar to rice. The product, about 900 ounces at a time, is put into earthenware jars, covered with water to a depth of 1 inch, and the necessary commercial nitric acid added. The jar is treated on a sand bath for nine hours, when the acid is drawn off, and the acid treatment repeated twice more, the whole acid treatment taking twenty-four hours. After this the bullion is well washed, and 105 pounds at a time put into an iron tray, which has been previously sprinkled with sand, and evenly spread over it. It is then dusted over with powdered nitre, and the tray heated in a muffle to a dull red heat for one and a-half hours, the contents occasionally rabbled. After this treatment the granules are fluxed as follows: Granules 105 pounds, borax 20 pounds, sand 2 pounds, bicarbonate of soda 1 pound, and black oxide of manganese a few ounces, and then fused in No. 60 graphite pots with clay liners. The cost of this refining of the bullion is a half-penny per fine ounce.

DISPOSAL OF RESIDUES.—The six filter presses, which are in two rows, discharge on to two 18-inch belt conveyors, which discharge on to a cross conveyor, which in turn delivers to an incline conveyor. This last, set upon the side of a large conical residue dump, delivers the residues at the summit by means of another belt, which, supported by a boom and telescoping below the former, is extended upwards as the dump grows. The rate of extension is, of course, being gradually reduced as the dump grows in height.

*Abstract Jour. Cham. Mines, Kalgoorlie, W. A.

The Mill-Hole System in Open Cut, Big Indian Mine, Helena, Mont. (See page 375.)

Open Cut Work in a Flat Ore Body, Black Hills, South Dakota. (See page 375.)

VALUE OF ORE MILLED.—May, June and July, 1905:

	Dwt. Per Ton.	Per Cent Of
Gold extracted by amalgamation of roasted concentrates	4.34	13.9
Gold extracted by cyanide agitation of concentrates	9.15	29.2
Gold extracted by bromo-cyanide agitation of raw slimes	16.13	51.5
Total gold extracted	29.62	94.6
(July, 1905		95.1)
Gold in residues	1.70	5 4
Total value of ore	31.32	100

DISTRIBUTION OF LABOR UPON THE PLANT FOR 24 HOURS.—The following is a list of the labor employed in actually running the plant:

Battery men	6
On Wilfley tables	3
On flint mills	3
On spitzkasten	3
On belts and pumps	3
On solution work	3
On taps, etc	3
On press work	12
Foremen	2
Bromo mixer	1
Belt transport of ore	1
Residues beltmen	3
Roaster men	3
Grinding pans	3
Casuals	2
Rock breaker	3
Aerial tramway	3
Total	57

The following tabulated statement of costs is valuable for the purpose of comparison with milling elsewhere:

SUMMARY OF TREATMENT COSTS FOR THE MONTHS OF APRIL, MAY AND JUNE, 1905.

DEPARTMENT.	Total Tons of 2000 Lbs.	Labor and Salaries.	Power.	Repairs and Mainten'ce.	Supplies and Sundries.	Total Cost.	Cost per Ton Milled.	Cost per Ton Milled.
		£ s. d.	£ s. d.	£ s. d.	£ s. d.	£ s. d.	s. d.	
Rock breaking	26,852	305 2 2	307 0 11	327 11 8	23 16 3	963 11 0	0 8.61	$0.1722

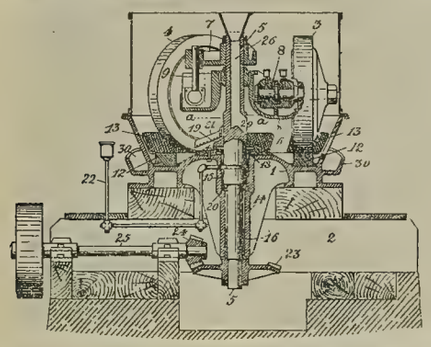
Mining and Metallurgical Patents.

PATENTS ISSUED NOVEMBER 14, 1905.

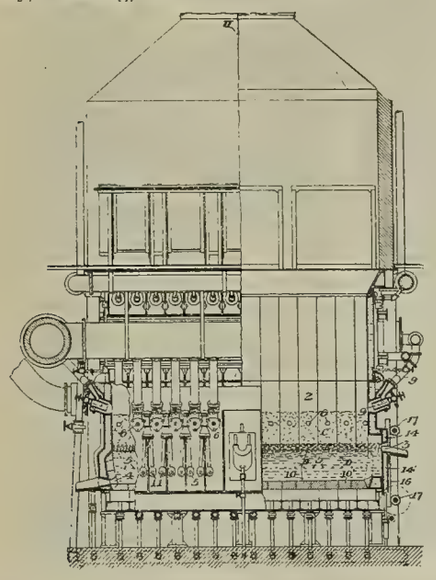
Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

ORE CRUSHING MACHINE.—No. 803,903; G. Johnston, San Francisco, Cal.



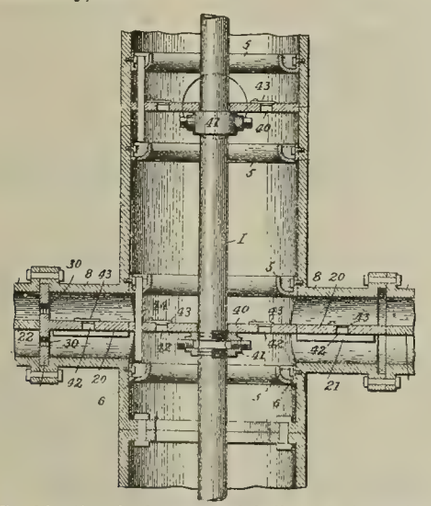
In roller crushing machine of character described, pan, die ring therein, sleeve depending centrally from pan, rotary shaft within and sustained wholly by sleeve, shaft being hollow and provided with lateral passages delivering on fixed conical apron, means for rotating shaft from bottom, and rotary crushing rollers, rolling on die ring and actuated by shaft.

FURNACE FOR SMELTING ORE.—No. 803,737; R. Baggaley, Pittsburg, Pa.



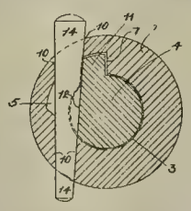
Matte furnace having converting tuyeres near bottom, smelting tuyeres at higher level, connections extending from converting and smelting tuyeres to source of air under pressure, and burner supplying heat above smelting tuyeres.

ROASTING FURNACE.—No. 804,751; A. R. Meyer, Kansas City, Mo.



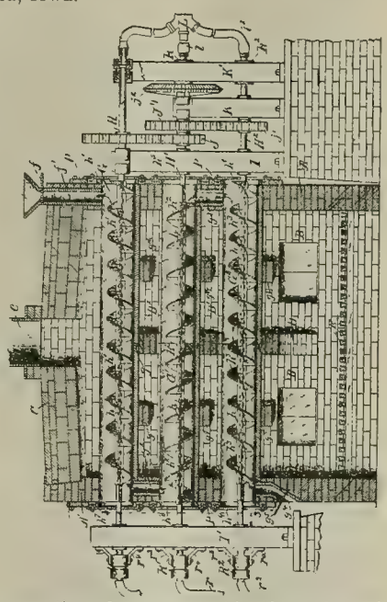
Combination in furnace, of hollow shaft, series of hollow arms extending in pairs from opposite sides of shaft and communicating with latter, rod extending centrally through shaft, and series of partitions extending across shaft between ends and centrally through arms and supported in part by rod.

CHUCK OF ROCK DRILLING MACHINE.—No. 804,686; J. H. Thomas, Johannesburg, Transvaal.



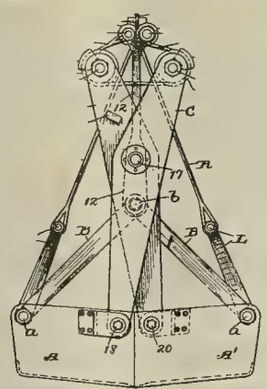
In chucks of rock drills or rock drilling machines and means for fixing bits or boring tools therein, in combination, chuck body constructed with axial bore, longitudinal slot formed in bore, longitudinal recess formed inside chuck in communication with bore, bit or drill shank constructed with lateral projection adapted to be brought into engagement with longitudinal recess inside bore by axial rotation of drill or bit, keyway or tapered slot formed through chuck passing down one side of longitudinal recess, and tapered key or wedge arranged in keyway engaging shank and lateral projection of bit or tool to maintain projection in engagement with recess.

ROASTING FURNACE.—No. 804,379; A. W. Chase, Avoca, Iowa.



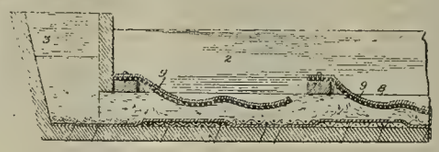
In roasting furnace combination of series of troughs, located one over other and arranged to feed from one to other, conveyors in troughs, means for operating conveyors, means being so proportioned as to drive several conveyors at rates of speed increasing from top to bottom of furnace.

EXCAVATING, HOISTING AND CONVEYING BUCKET.—No. 804,235; R. W. Kaltenbach and J. Griess, Jr., Cleveland, Ohio.



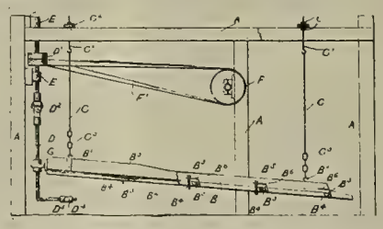
In bucket whose body portion is composed of suitably supported trays arranged to swing outwardly and upwardly or inwardly and downwardly, according as bucket is opened or closed; combination of trays; bail arranged centrally and transversely of bucket; bucket-closing levers operatively attached to trays and fulcrumed to bail with axes of levers coincident and parallel with axes of trays; bars pivotally connected at one end to trays at rear ends and pivotally supported at other end below fulcrums of levers, and means for operating levers.

GOLD SEPARATOR.—No. 804,408; F. M. Johnson, San Francisco, Cal.



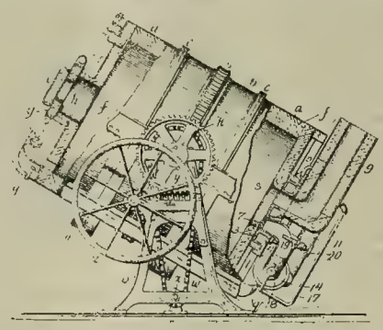
In gold separator, box or sluice having retaining bottom composed of fibrous or textile material, in combination with wire screens, arranged one above other and in contact, and forming two continuous layers, upper layer being, alternately, such wire screen and such fibrous or textile material.

CONCENTRATING AND AMALGAMATING TABLE.—No. 804,466; J. A. Hamilton, St. Peters, South Australia, Australia.



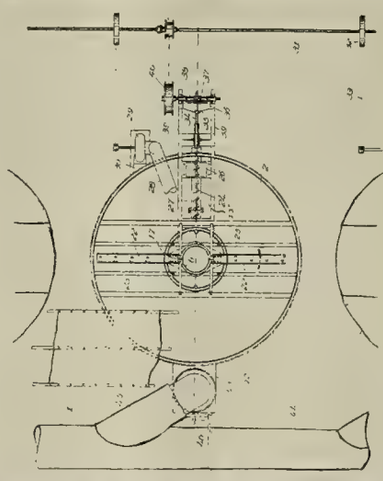
In concentrator, combination with table, and means to freely suspend it, of rotatable shaft, shaft section on end thereof, universal joint connecting shaft and shaft section, weight connected to and eccentric to shaft section, and means fixed to table and through which shaft section can freely move longitudinally, whereby table is moved in elliptical paths when shaft is rotated.

COMBINED SMELTING AND REFINING FURNACE.—No. 804 330; C. C. Medbery, New York, N. Y.



In combination, heating chamber provided with fuel supplying device comprising compressed air and fuel nozzles at one of ends; frame provided with trunnions and in which chamber is longitudinally rotatably supported; means for rotating chamber; means for rocking frame; air pipe extending from one of trunnions of frame to fuel supplying device; slip joint in air pipe in line with axis of trunnions; and another slip joint in pipe adjacent to nozzle, whereby nozzle may be swung away from end of chamber.

MECHANICAL ROASTING OR DESULPHURIZING FURNACE.—No. 804,227; H. Howard, Brookline, Mass.



In furnace of class described, drying chamber mounted thereon to receive and dry material to be treated, manually controlled means to directly introduce waste heat from furnace into drying chamber and subject contents thereof to action of such heat, agitating device within chamber, and means to positively feed dried material from chamber into interior of furnace.

MINING SUMMARY.

Specially Compiled and Reported for the MINING AND SCIENTIFIC PRESS.

The annual report of Director Roberts of the United States mint bureau shows that the domestic coinage for the year amounted to $91,172,729 and to 152,422,302 pieces. The coinage for the Philippine islands was 29,390,526 pieces, for Panama 6,435,000 pieces, for Costa Rica 450,000 pieces and for San Salvador 400,000 pieces. Total coinage, 189,097,828 pieces. The total coinage for the Philippine islands to June 30, 1905, was 116,484,859 pieces, and the total payment by the insular government to reimburse the United States for the cost of the same has been $398,335. The insular government also supplied the metal. The original deposits of gold at the mints and assay office amounted to $143,378,969. The total earnings of the mint, including seigniorage on silver and minor coins, amounted to $5,034,635, and the total expenditures were $1,445,615. The director recommends that the provision of law which requires the mints to pay out subsidiary coins on demand should be repealed and all coin paid out hereafter through the office of the treasury. There is a constant demand on the mints for new coin, although an abundance of coin in good condition, but which is not wanted because it has been in circulation, is in the treasury. The director announces that all silver bullion purchased under the acts of 1878 and 1890 is now gone, the accounts closed, and the coinage of the silver dollar is at an end unless in the future new legislation upon the subject is passed. The report takes up at some length the history of coinage of silver dollars in this country, beginning with 1793, and continues: The total issue of silver dollars from 1793 to the cessation of the dollar coinage has been $578,303,848. The aggregate of all seigniorage on coinage under the acts of 1878 and 1890 was $134,164,986. The average purchase price of silver bought in the fiscal year 1878 was $1.204 per fine ounce, and the average price in the last purchases, made during the fiscal year 1904, was 73.1 cents per ounce. The bullion value of a silver dollar in 1878 was 93.1 cents and in 1894 56.5 cents. The stock of gold in the world on Jan. 1, 1905, in use as money, is estimated at $5,000,000,000. The amount actually in sight in reporting banks and government treasuries was $3,364,600,000.

The report of C. G. Yale, in "Mineral Resources of the United States," states that all the output of borax in the United States continues to come from California, and the larger proportion from the extensive colemanite deposits in San Bernardino county. The total product for the year 1904 amounted to 45,647 tons crude, valued at $698,810. Of this amount 38,000 tons, valued at $508,000, came from San Bernardino county, Cal., the remainder coming from Ventura and Inyo counties. In 1903 the returns gave an aggregate production of crude amounting to 34,430 short tons, valued at $661,400. The production in 1902 was 17,404 short tons of refined borax, valued at $2,447,614, of which 862 short tons, valued at $150,000, were stated to be boric acid, and 2600 tons of crude borax, valued at $91,000—a total of 20,004 short tons, valued at $2,538,614. The refiners of borax in the United States are: Borax Consolidated (Ltd.), Bayonne, N. J.; Pfizer & Co., Brooklyn, N. Y.; Brighton Chemical Co., New Brighton, Pa.; Thos. Thirkelson & Co., Chicago, Ill.; Stauffer Chemical Co., San Francisco, Cal.

ALASKA.

The Golden River Placer M. Co. of Windham bay have shut down their works for the winter.——A. Gefeler, manager for the Helvetia M. Co. at Windham bay, has completed the tram and started the mill.——C. W. Young of Juneau, president of the Windham Bay G. M. Co., has let a contract to R. L. Rowe to run 50 feet of tunnel on the Windham Bay G. M. Co.'s property on Spruce creek.

A. L. Pearse of the Alaska-Perseverance Co. has seventeen lode claims between Juneau and Sheep creek, on Gastineau channel, and the property at the head of the Basin, together with a tunnel site, dumping ground and wharf rights. A tunnel which will eventually be the outlet for the workings of the company 10,000 feet back will be driven 9x9 with a 2 foot drain. An hydraulic drilling machine, similar to the ones used to drive the Simplon tunnel, in Italy, is to be used. The tunnel will on completion tap the Perseverance property about 2500 feet below the apex of the lode and fully 1200 feet below the present working tunnel, which runs from the Basin side of the property.

ARIZONA.

A bulletin issued by the census bureau places the aggregate value of manufactures of Arizona for the last year at $28,083,192, as against $20,438,987 for 1900. Copper refining is the principal industry represented, the production amounting to $22,761,981. The capital employed in 1904 amounted to $14,395,656. There were 4975 wage earners, and wages amounting to $3,963,248.

Cochise County.

Official statements of the Copper Queen M. Co. of Bisbee show that the company has mined since its beginning 3,352,000 tons of ore and is now mining at the rate of 40,000 tons a month. Its average copper saving has been 7½%. The mine began production of ore in 1879 and opened its original small oxide smelter during 1880. The mine is consuming in underground timbering 1,100,000 feet of lumber per month and is burning about 17,000 barrels of oil for fuel.

A connection has been made between the Lowell and the Sacramento shafts in the Copper Queen mine, at Bisbee, a distance of 2200 feet, which furnishes better ventilation and opens up a new territory for exploration. The Copper Queen continues to carry on considerable exploratory work in the several shafts, in addition to the shipments of ore required to feed the Douglas smelter. At the Cuprite, the newest shaft being sunk by the Copper Queen, a depth of 230 feet has been attained.——The Copper Queen Con. M. Co. has three producing shafts, the Czar, Holbrook and Spray, and four developing shafts, the Lowell, Gardner, Sacramento and the Cuprite. The mine is timbered with square sets of 10x10-inch and 12x12-inch timber, mainly Washington fir, and an average of 30 feet of timber, board measure, is required for each ton of ore won. All ore is hand sorted underground after breaking, and culls used for filling in worked-out stopes. The Douglas reduction works of the Copper Queen Co. are 28 miles from the mine and within a mile of the Mexican border. The smelter has five furnaces, each 42x204 inches, with capacity of 400 tons daily, and three furnaces from the Bisbee, smelter each 42x120 inches. There are four stands of converters. The Paradise mining district in the Chiricahua mountains is tributary to Douglas and embraces a territory 4 miles in width by 18 miles in length. The average elevation is 5500 feet.——The Chiricahua Dev. Co. is working 1½ mile west of Paradise. The shaft is three compartment and has been sunk 425 feet. The equipment includes three boilers of 150 H. P. each, one fifteen-drill compressor, one double-drum hoist, etc. The main drift, which runs to a depth of 600 feet, shows white iron with a small percentage of copper.——The Manhattan Dev. Co. has thirty-nine claims joining the Chiricahua on the west.——The Black Queen, owned by Walker & Myers, has ten claims.——The Savage C. Co., with J. A. Lewandowski as superintendent, lies nearer to the railroad point, Rodeo, than any other property in the district. A sixty-ton smelter is on the ground.

The Cochise Gold & Silver Co. has started work on mines near the State of Maine, near Tombstone. J. M. Montgomery of Pittsburg is president. H. T. Fisher is manager at Tombstone.

Gila County.

Work has been started at the Old Dominion smelter, at Globe, upon the fourth unit of the smelter. With the addition of this furnace capacity the plant will be able to handle one-third more ore than it does at the present time. The furnace is doing excellent work, but is still not up to the mining capacity of the plant. The smelter has eight double storage bins holding 1000 tons of ore, limestone, and coke. There are three blast furnaces each 44x180 inches at the tuyeres, arranged tandem, with common settlers between. Furnaces are charged automatically from side-dumping cars, and water for the jackets is brought from the mine. The brick dust chamber is 20x20x250 feet, connecting with a smokestack 200 feet high. Flue dust is briquetted for resmelting. The converter department has three stands. The shells are 7x11 feet, lined with a mixture of clay and quartzite carrying 4.5% copper, the lining carrying 75% silica, and making eighteen tons before burned out. The converter blast is 18,000 feet per minute. The shells are handled by electric crane.

Graham County.

The Detroit Copper M. Co. is arranging poles for an extension of their electric lines to the Santa Rosa group, which they own, near Coronado. It is proposed to put in an electric drill for development work.

Mohave County.

J. W. Guinn, foreman of the Enterprise mine, near Kingman, reports that the shaft has been timbered to the first level and the east drift cleared of debris. The mine is being put in condition to carry the shaft to the 300 as soon as the big sinking pump is put in. The new hoist is in commission.——L. Hoffman, superintendent Chloride G. M. Co. at Chloride, has shipped four carloads of ore from the Samoan mine to the Needles smelter.——Good molybdenum ore has been opened up in the Leviathan and Whale claims near Berkeley.

Pima County.

W. F. Stanton, general manager Imperial C. Co., at Silver Bell, reports that the ore shipments are 100 tons daily. They are 80 feet below the 500-foot level, in high-grade ore, and are still sinking. The management is at work on plans for a smelter and concentrating mill. The capacity of the smelter will be 300 tons per day. The mines are in the Silver Bell mountains, at elevation of 2900 feet.

Yavapai County.

Manager Tyson has put in a boiler and new machinery at his mill near Turkey and is running it.——The 5-stamp mill of S. Parker, near Turkey, is running steadily.——The Rainbow gold and copper group 1½ mile from Turkey is to be developed.——The Lone Star M. Co. is working J. S. Johnson's mines, 7 miles from Turkey creek.——The Fuller mine and mill on Squaw creek, 6 miles east of Goddard, are to be started up.

The Renegade shaft, 3½ miles from Mayor, is being sunk to a depth of 800 feet. G. A. Howe is manager.

The new 50-ton cyanide plant recently completed on the Braganza Gold Mining Co.'s property at Henrietta has been started.

CALIFORNIA.

Reporting on the production of magnesite, Chas. G. Yale says that in Alameda county the King magnesite mine is 22 miles southeast of Livermore, on the Arroyo Mocha road. No product has been hauled to market. There is also a small undeveloped deposit 24 miles southeast of Livermore, in the Arroyo Mocha canyon. In Mendocino county the Vassar claim is 12 miles north of Cloverdale, near the line of the California-Northwestern Railway. This is as yet undeveloped. Napa county has several occurrences. The Mathai mines, North and South, are owned by Frank Mathai of Chiles and have been worked to a small extent within a few years past. The mining was done by means of open cuts. The North mine is in Soda Creek canyon, and the South in Greasy Camp creek. The Prest mine, in Chiles valley, 13 miles from Rutherford, has been opened at several places, but has been idle. The deposit owned by E. T. Russell of Chiles, 15 miles from Rutherford, has produced a small quantity, but is idle. The Snowflake, 11 miles from Rutherford, was worked for about twelve years and was very productive during that period, yielding, in fact, nearly all the magnesite produced in the State. The workings are extensive and mainly in the form of tunnels. The occurrence is in a series of ledges in a serpentine formation. The mine is at present idle. The Stanley and Bartlett mines, 12 miles from Rutherford, are on the property of the Phelan estate, and were productive for ten years, though they are now idle. The White Rock mine, 15 miles from Rutherford, is owned by J. B. Duval of Lidell and the Western Carbonic Acid Gas Co. of San Francisco. The deposit was opened in 1894 and continued to produce for five years. This, like the Fairweather claim adjoining, is unproductive. The deposit owned by J. C. Sullenger of Oakville, Napa county, is in Pope valley, 20 miles by road from Rutherford, but has not produced for several years. In Placer county there are undeveloped deposits in the mountainous regions about Damascus, on the Forest Hill divide. They are too far from a railroad and in too rough a country to be at present of much value. There is also an undeveloped deposit near Walkers Pass, Kern county. Near Winchester, in Riverside county, the Fireproof M., M. & M. Co. has 323 acres of land on which magnesite deposits have been found. The American Magnesite Co. has claims on Red mountain in Santa Clara, Stanislaus and Alameda counties. The mines are 32 miles southeast of Livermore, at an elevation of 3350 feet. The ore is to be hauled by traction engine to Livermore and thence shipped by railroad to Oakland, where the manufacturing plants have been built. The mines and factories are in operation. The A. F. Cochrane mine, near Madrone, in Santa Clara county, is idle, not having been worked since 1897. The Weber Ranch deposit, in the same county, is on the west side of San Felipe Creek valley, and is owned by the Bay Cities Water Co. Sonoma county has numerous deposits of this mineral. The Creon mine, 4 miles northeast of Cloverdale, is owned by J. Kolling of San Francisco and has been opened in three places, but is not being worked. The Cummings deposit, 2½ miles from Cloverdale, is operated by the Sotoyome Magnesite Co. of Healdsburg, Thomas Merchant manager. Operations on the mine were not commenced until the summer of 1905. The Eckert ranch deposit is 2 miles southeast of Cloverdale. The deposit owned by George Madeira of Healdsburg is 11 miles from that place, and is as yet undeveloped. The Sotoyome Magnesite Co. owns a deposit on the Norton ranch on Dry creek, 10 miles northwest of Healdsburg, but it is not productive. Extensive deposits occur 3 miles northeast of Porterville, Tulare county, on the first range of foothills, and it is from these that nearly all the magnesite produced in the United States has come for the last few years. Part of the magnesite mined is carried by chute and tramway to the kiln and shipped as magnesium oxide and part is hauled by wagon to Porterville and shipped as magnesite. The deposits are worked by open cuts and tunnels. The mines are well developed, and Manager W. P. Bartlett states that he could readily ship two or three times as much as he does annually if the consumption warranted it. A considerable portion of the output is shipped to the Western Carbonic Acid Gas Co. of San Francisco, where it is calcined and the gas utilized commercially. Kilns for calcining the magnesite have been erected at Porterville, and began operations in 1905. The calcined material is shipped to the paper mills of California and Oregon.

Amador County.

The Bay State mine, near Plymouth, is being profitably worked by the miners on a co-operative plan.——Work at the Markley mine, northeast of Volcano, has been discontinued by the parties who bonded it recently.——Work has been resumed at the Telegraph placer claim, situated in Upper Rancheria.——At the Mitchell mine, near Pine Grove, twelve men are employed in underground operations and getting the mill in order.

El Dorado County.

It is reported that drill tests near Pacific House have developed gravel under the lava.——The 40-stamp mill at the Union mine, near El Dorado, was recently destroyed by fire. It is to be rebuilt by A. Harpending.

Humboldt County.

(Special Correspondence).—A suit in which J. Salstrom and wife were plaintiffs and the Orleans Bar G. M. Co. defendants was recently on trial in the Superior Court of Humboldt county. Salstrom, as owner of an 80-acre tract at the mouth of Crawford creek, on Klamath river, valuable, as claimed, for the minerals it contains and for agricultural purposes, complained that the dumping of boulders into the creek by the mining company resulted in cutting a new channel through the land, destroying six acres and rendering the remainder comparatively worthless for either mining or agricultural purposes. The original damage claim was $15,000, but since commencement of the suit Salstrom claimed to have discovered that there was more gold in the ground than he had supposed, and the claim was amended so as to increase the amount of demand to $25,000. The case was submitted to a jury. The Orleans Bar Co.'s claim is the most extensive and important placer proposition in Humboldt county.

Eureka, Nov. 22.

(Special Correspondence).—What is believed to be a copper deposit has developed in the claim of George Henderson of Eureka in the Horse mountain region, Willow Creek district, on lower Trinity river.

Willow Creek, Nov. 26.

Inyo County.

The Western Borax Co. owns a deposit near Big Pine, where borax is being produced from marsh dirt or mud containing from 8% to 10% of borax. All the product is the result of concentrating and crystallizing the borax, which is found mixed with large quantities of earth. In Death Valley are large borax deposits controlled by the Borax Con., Ltd.

Kings County.

The Florence Mack M. Co. has ordered new machinery and will commence operations at once on the mines on San Benito creek, near Hanford. G. E. Barton is manager.

Placer County.

A. Weske is running a tunnel to tap the gravel channel of the Dam claim at Centerville.——It is reported Peach & Schmitt will start work at the Kittler mine, near Ophir, and sink the shaft 500 feet.——Rich ore has been found at the 200-foot level of the Bellevue mine, near Ophir, being worked by Buchanan & Sazano.

San Bernardino County.

According to a United States Geological Survey report, the main borax deposit of the Borax Con., Ltd., known as the Calico deposit, is that from which by far the largest portion of the product of the United States is derived. This deposit is not found in well-defined ledges, but in pockets which may develop into very large deposits. The mining has not been carried on to any considerable depth — not more than 500 to 600 feet. The ore found is colemanite, and varies in percentage of boric acid contained, but is seldom shipped unless it averages 35% or more. Any lower grade is calcined at Marion, where it is put through a Holthoff-Wethey furnace. At Daggett the company is running its roaster to full capacity. The American Borax Co.'s works at Daggett are connected by rail with the mine 7 miles distant. The ore is a borate of lime, varying in boric acid contents from 7% to 30%, and is treated by a process invented by Henry Blumenberg, Jr. The resultant material is shipped to the Brighton Chemical Co., New Brighton, Pa., and is there converted into borax and refined boric acid. It is now producing from these low-grade ores a carload of boric acid every week. The Columbus Borax Co. owns a mine 5 miles south of Daggett, but is at present only operating the deposit it owns in Ventura county. The mines of the Palm Borate Co. are 6½ miles from Daggett. The ore is a borate of lime in a clay formation. The boric acid was probably formed in the bed of a lake and tilted up during some upheaval of the earth's surface.

Shasta County.

The shaft in the Clara mine at Keswick is to be changed to two compartments and will be sunk to a depth of 100 feet, when drifting will begin. J. Kahny is manager and W. C. Stanley superintendent at the mine. Electricity is to be put in to run the hoist.

Sierra County.

It is reported that blue gravel has been struck at the Columbia Channel gravel mine near American hill, near Forest City, by J. M. Harper. An 1800-foot tunnel was run.——A gravel channel has been cut in the Forest City mine.——Drifts are being run and breasts opened out in the South Fork mine at Forest City, preparatory to washing gravel when water is plentiful. The main tunnel is being pushed ahead for the other two channels.

Siskiyou County.

R. McDowell, manager of the Oregonian mines, on Tauni mountain, in the Salmon River district, near Sawyer's Bar, has uncovered $84 sulphide ore while drifting on the ledge at a depth of 300 feet. Ground has been broken on the Salmon river, 1¼ mile from the mine, for a 10-stamp mill, which will be put up at once. The ore will be carried to the mill by an aerial tramway.—— Tetherow & Co. have completed their tunnel on the Highland property, having tapped the vein at a depth of 400 feet. Ore bunkers are being built to hold the output during the winter, as the 3-stamp mill on the premises is not able to work it. As soon as spring opens a larger mill will be built below the mine on Salmon river, near Snowden.

Trinity County.

(Special Correspondence).—Placer claims on New river are in readiness for work. At the Trinity mine ten men are at work and three stamps in the mill dropping. The Mountain Boomer is working a crew in the best ore handled for years.

Denny, Nov. 26.

(Special Correspondence).——F. P. Burris, owner of the Bear's Tooth quartz mine, on New river, 15 miles from its confluence with the Trinity, intends to put in an aerial tramway to convey ore from the mine to the mill at the foot of the mountain, a distance of 2800 feet. Buckets must be carried at intervals of 200 feet. The mine, which was discovered last year, will be equipped with a Huntington roller mill, shipped via Humboldt bay. It was so constructed that it could be taken from the end of wagon navigation on Trinity river to the mine on pack mules. It will be used as an adjunct of the triple-discharge stamp mill now in service.

Eureka, Nov. 26.

Tuolumne County.

Work is to be commenced at the Mack mine, near Big Oak Flat, probably working through the Wooten shaft.——The Gold Queen shaft, north of Soulsbyville, is down 275 feet on the vein. Geo. Dean is superintendent.

Ventura County.

A recent Government report says that the Frazier mountain borax deposit is owned by the Frazier Borate M. Co., controlled by the Stauffer Chemical Co. of San Francisco. The colemanite is shipped by traction engine from the mine to the railroad and thence by rail to San Francisco, where it is refined into borax and boric acid. The ore is considered very high in boric acid contents. The Columbia Borax Co. also owns a deposit near Griffin, which began to be productive in 1904. This company does not refine their product.

COLORADO.

According to a recent report of the U. S. Geological Survey, there was an increase of 17,838 barrels in the oil yield of Colorado in 1904 as compared with 1903, and the production was the largest credited to this State since 1894. The average price was $1.15 per barrel and the total valuation was $578,035. The greater portion of the increase came from the deep wells drilled in the Florence field, which in some instances found a fourth pay streak at a depth of 2100 feet, which did not exhaust the Fort Pierre shales of the Cretaceous. The deepest well in the field is 3650 feet, which was dry. The formation was such, however, that there is a probability of finding pay beds at that depth. There were eighty producing wells operated during 1904, and about 120 wells have been abandoned since the field was first opened in 1887. The sands are loose and gritty, resembling shale, and are in lenticular beds deposited in the shale at different depths. One may develop four pays of beds which contain petroleum, and it is possible that another may well miss all of them. There are two wells in this field which have produced over a million barrels each of petroleum. None of the wells are of the gusher character, and the driller is often unaware that he has pierced an oil sand until the oil begins to flow into the well and its presence is shown in the sand pumpings. Small flows of natural gas and some showing of water are found. The Boulder field in 1904 did not produce one-half of its output in 1903, although a number of wells were completed during the year 1904. The uncertainty of production and the failing wells have robbed this field of its prominence, which was given to it about the close of 1902. In northwestern Colorado petroleum has been found in Rio Blanco county, where eight wells have been drilled which produce from one-half to five barrels per day by bailing. The gravity is from 30° to 35° Baume, and, in common with the other Colorado petroleums, the oil has a paraffin base, flashes at 90° F., and burns at 116° F. An analysis showed: Light naphtha, 7%; heavy naphtha, 12%; illuminating petroleum of 45° Baume, 60%; paraffin, 16%; coke and loss, 5%.

Boulder County.

The Coney Island tunnel, near Eldora, is being driven an additional 800 feet from the 200-foot point.——The cyanide mill of the Cash Co. at Magnolia is working on high-grade ore struck in making an upraise from the 250 to the 140-foot level in the Cash mine.——The Cashier M. & M. Co. intend building a 50-ton concentrating plant to handle the silver and lead ores from their mines at Camp Albion. T. L. Wood is manager.

A 50-ton cyanide plant is being put in at the Inter-Ocean mine at Wheelmen, via Boulder, under the direction of F. Weed of Denver.

The Marcasite M. & M. Co. has been formed to work the Old White Crow and Osceola claims on Gold hill, near Sunshine. R. A. Trevarthen is superintendent.

Chaffee County.

It is reported that operations have been resumed at the Mary Murphy mine and that ore shipments are being made to the Pawnee mill at St. Elmo.

Clear Creek County.

The Silver Glance mine, on Democrat mountain, near Georgetown, is being worked by C. Clark.

The Key West and McKinney properties on Leavenworth mountain, near Georgetown, are being developed by E. W. and L. G. Shepard, under bond and lease. Drifting on the McKinney lode has shown high-grade ore. The drift is in 350 feet.——Drifting is to be resumed on the Domino vein by Superintendent H. Cochran of the Domino M. Co. of Georgetown.

Several important strikes have been made at Yankee lately.——B. F. Musgrove, engaged in running the Puritan vein, owned by G. R. Steuart, has exposed over a foot of smelting ore averaging $54 per ton.—— Manager Seeman of the M. M. & T. Co. has proved the practicability of sinking the Lombard shaft by striking 2 feet of smelting ore at the starting of the 100-foot level. Owing to the difficulty in securing fuel, the mine is not in operation at present. —— The Gold Anchor at Yankee is making preparations to sink.

The U. S. Geological Survey has recently published a map of the Georgetown quadrangle on a scale of about 1 mile to the inch. The topography is shown by contour lines of equal elevation, having a vertical interval of 100 feet. The area represented is a high, mountainous region, ranging in altitude from 7500 to 14,260 feet above sea level. In the northern part of the quadrangle are the mining towns of Idaho Springs, Georgetown and Silver Plume. Georgetown is one of the oldest mining towns in Colorado. The central portion of the quadrangle about Mount Evans is very high and generally inaccessible. Having escaped in a measure the forest fires, the area is heavily timbered. A large part of the quadrangle is, however, above timber line. A peculiar feature of the topography of this portion of the quadrangle is the presence of numerous cirques. Formerly the heads of glaciers, they are now occupied by Alpine lakes. This map is printed in three colors, the water in blue, the topography in brown, and the cultural features in black. The triangulation for the map was executed by L. H. Baldwin Jr., the topography by F. Tweedy.

Custer County.

The low grade ores of Custer county are to be treated by the new mill and cyanide plant being built near Silver Cliff by J. W. Northrop. Crushers and rolls, with a capacity of 200 tons per day, have been put in, and four tube mills are being set. W. H. Mest has charge.

Dolores County.

A. B. Roeder, manager of the United Rico Mines Co. at Rico, intends to sink a deep shaft to prospect the lower contacts of Newman hill. Their Gold Tunnel mill is being remodeled and new machinery put in under the direction of C. G. Smith. The Syndicate tunnel, the main entrance to the Rico-Aspen mines, has been retimbered. The Black Hawk group of the company is being worked through the tunnel at the upper terminus of the 3000-foot tram. This tunnel is to be retimbered and used until the new tunnel, 200 feet below, cuts the ore body. The tramway will then be reconstructed and the new tunnel will be used to take out the ore from the mine. Franz Cazin is making plans for remodeling the Atlantic Cable concentrator of the United Rico Co. so as to treat the lead and zinc ores from the Atlantic Cable mine. A tramway is to be built from the Atlantic Cable shaft to the concentrator.——Ore is being stored on the dump as it is taken from the main working tunnel being driven by the Rio Dolores Co. on the C. V. G. claim at Burns, north of Rico. J. W. Burns is superintending work.——The Dunton Con. M. Co. intends to build a mill near Dunton to treat ore from the America group. Nos. 2 and 6 levels are being connected by a 300-foot raise. Tunnel No. 6, the main working adit, is in 1200 feet. V. L. Brown is secretary of the company. ——The Horlick property near Rico is being worked by the Milwaukee G. M. Co., under the management of A. B. Green.

Gilpin County.

The Register-Call reports that a shipment of smelting ores from the Perrin mine in Russell district to the Chamberlain sampling works at Black Hawk brought values of $137.03 per ton. The lot weighed 9780 pounds, and the total returns were $653.35. The ores came from a depth of 240 feet. The property is being worked by Ed. Jones and J. Jones of Russell Gulch under a lease and bond.——Mill machinery is being hauled for the Ann Rutledge G. M. Co. to the millsite in Vermilion district. The new mill is to be equipped with ten rapid-drop stamps. Amalgamation and concentration methods will be used.——Lumber has been hauled from Central City to the Mattie May mine in the Yankee Hill district for a new shaft building 30x40 feet. Machinery is to be put up on the property next spring.——At the Chase mine in Willis gulch operations are being carried on in the 200, 250, 300 and 400 west levels, as well as in the 300 and 400 east levels, and the leasers are doing a large amount of development work. Manager J. A. Gilmour has had the shaft building repaired, the sheave frame has been rebuilt and the collar of the shaft has been retimbered for a depth of 20 feet.——M. Harris, E. R. Fouts, G. Miller and D. Davis have taken a lease and bond on the Willow Gulch and Tyrol lode claims on South Willis gulch, near Central City. The main work is to be carried on at the Willow Gulch, which has a shaft down about 175 feet, and the lessees intend to sink another lift.

Regarding operations in the Nevada district, near Central City, the Gilpin Observer reports that Horning & Williams, lessees on the Kansas Burroughs, are working thirty men in the mine, most of whom are subleasing. They are taking out a good quantity of mill ore, besides getting some fair smelting ore. The smelting ore is shipped in carload lots to the valley smelters. The work is being done mostly around the 500 and 600-foot levels. —— The United Mining & Exploration Co. of Denver have an option on the Modoc mine on Quartz hill and are taking out mill ore in good quantities, the vein being 70 feet wide. The ore is soft and easily mined and the Modoc is capable of working a large number of miners and outputting a heavy tonnage. The ore at present is all milling and is shipped to the Hidden Treasure mill at Black Hawk. John Lyng has charge. —— Ed. Straub & Co. of Denver, who have formed the Goldfield-Homestake M. Co., have taken a lease and bond from Lewis & Murphy on the Gold Retort lode on Quartz hill, near the Modoc. Sinking is being continued from the 70-foot level. A shaft house is to be built and the shaft sunk to a depth of 500 feet. M. Riley is mine superintendent. —— The Pozo mine in Nevada gulch is being operated by Lewis & Son of Denver. This property is being worked principally for its zinc values, although some of the ore gives values of from two to three ounces gold per ton. The tailings net $12 per ton and the zinc values are $25 per ton. The shaft on the Pozo is 165 feet deep. A. W. Rucker is manager.——R. W. Pearce of Nevadaville is operating the Ute mine in Nevada district and is shipping to the mills in Black Hawk. The main shaft on the Ute is 650 feet deep, but operations are being confined to the 300-foot east and west levels. They are also sinking a winze on the 300-foot level for prospecting purposes.——Cody & Co., who are operating the Hawley-Gardner on Quartz hill, are carrying on devevelopment work and opening up the property in a systematic manner.

Gunnison County.

The New York group on Forest hill, near Tin Cup, is being worked by Dilworth & Abbott. Drifting has been commenced from the bottom of the 200-foot shaft.

Lake County.

R. W. Miller has cut the Eureka vein in his crosscut tunnel, near Twin Lakes.——Work is to be resumed on the Miley properties, near Twin Lakes, by V. Anderson.

From their claim in Birdseye gulch, near Leadville, Burkhardt & Sullivan lately shipped twenty-five tons of 5-ounce gold ore. The ore was packed out from the mine on jacks to the Resurrection switch and there loaded on cars for the smelter. The New York, Oliver Twist and Moffat tunnels in the Mosquito section will continue work all winter and the ore taken out will be stacked. The London mine will also work continuously.——The draining of the Leadville mines has resulted in lowering the water level of the Leadville basin so that deep shafts can now be sunk without the necessity of pumping. These pumping operations have been conducted by the Coronado and Penrose. At least ten shafts which have been sunk in the Leadville basin in the last few years at a large expense, some of which have been abandoned owing to the heavy pumping expense, are now dry and can be operated without great expense. One of the immediate effects of the draining of the Leadville basin is the resumption of sinking on the Bohn shaft. Several years ago the ore was worked out of the 500-foot level. Drill-hole exploration revealed the presence of large bodies of mineral below the present workings; but, owing to the heavy expense of sinking the shaft and handling water, the company decided not to do any further work, as it was not at that time financially strong. It is now sinking another lift of 150 feet and no water has been found.——Richard Spensley is preparing to explore the new strike which he recently made in the Silver Nugget, on Breece hill, Leadville, and the shaft is down 130 feet.——The Ida May property, in Lake Park mining district, has recently opened up a fine body of silver ore. The owner is J. Jones.

Mineral County.

The Ridge mine and mill in the King Solomon mining district, near Creede, is to be started under the direction of E. R. Mosher.

Routt County.

A Craig report says that it is proposed to build a smelter to treat the copper and iron ores and also the uranium and vanadium ores in the Blue Mountain country, between White and Bear rivers.

San Miguel County.

A steam hoisting plant has been put in for all the buildings at the Pandora mill by the Smuggler-Union Co. An electric hoist has been substituted for the steam plant at the Union shaft.

The official report of the Tomboy G. M. Co. of Telluride for the year ending June 30, 1905, states that the profit for the year amounted to $186,530, and, adding the carry-over from the previous year, the surplus is $300,235. The percentage of yield has risen from $7.01 per ton in March to $8.82 in September, 1905, while the profits advanced from $1.52 per ton to $4.16. Costs show a satisfactory reduction, having been brought down in the same period from $5.49 per ton to $4.66. Manager Herron reports that the extension of the 1050-foot level into the Red Cloud section has continued in milling ore, while the raise started on the same level at a point which was supposed to be the eastern end of the ore shoot, extending from 123 raise on the west, came into ore a short distance above the 1050-foot level, and at the date of report showed a good width of ore.

Summit County.

(Special Correspondence).—Summit county received the gold medal awarded by the Portland Fair for the finest collection of gold specimens shown at the exposition.——The mill of the Washington-Joliet M. & M. Co. on Nigger hill, near Breckenridge, has been started again. The ore being milled and concentrated is coming chiefly from the Berlin and Cornish tunnel workings.——The mill at the Lucky mine, near Breckenridge, is running during the day and is making a good product of lead concentrates.——The Jessie mill is turning out a good quality of bullion as well as concentrates. In four days the amalgamation plates produced $1000. ——A good streak of ore showing free gold has been cut in the Morning Star mine on Mt. Baldy. This was met with while connections were being made between the tunnel and shaft workings. The owners are preparing to work all winter.——On the Summit Banner placer, near Breckenridge, some rich boulders of gold-bearing quartz have been found which give assay returns of $290 per ton. The manager is prospecting for the ledge.——Ore has been struck in the Novelty mine in driving a crosscut west from the main shaft.——The Wonderful London M. Co. on Hoosier Pass has its main two-compartment shaft down 100 feet. When the 200-foot mark is reached, a crosscut will be run to cut the extension of the iron vein. M. M. Howe of Breckenridge is manager.——The Lucky Fisherman Co.'s mine, near Montezuma, is being worked by manager Charles H. Campbell.——In the Rothchild tunnel, at 3100 feet in the Black Bear shoot, at the base of Coopermountain, a 2-foot vein has been cut.

Breckenridge, Nov. 27.

The Wellington mine on Mineral hill, near Breckenridge, owned by the Colorado & Wyoming Development Co., is shipping zinc-lead ore. The owners are R. W. Foote, G. H. Evans and O. K. Gaymon, all of Breckenridge.

A 60-ton cyanide plant is to be put in by the Carrie M. & M. Co. on Mount Wise, 12 miles east of Breckenridge.

Teller County.

An air compressor has been put on the Gold King claim of the Savage G. M. Co., on Gold hill, by the International M. & L. Co. T. C. Bradford of Cripple Creek is superintendent.——A new hoist is to be put in at the No. 1 shaft of the Portland G. M. Co., on the south slope of Battle mountain, near Victor.——The Jones shaft of the Pharmacist Co. at Cripple Creek is to be sunk from the 650 to the 850-foot level.——The Dillon shaft on Battle mountain is being sunk 200 feet to the 1000-foot level.

Thomas Finnerty, leasing on block 196 of the Stratton estate, on Bull hill, has made a good strike at a depth of 200 feet.

W. Braden, lessee of the Last Dollar mine, near Victor, has made a rich discovery at the 400-foot level in the No. 1 shaft.——Improvements are being made at the Golden Cycle mine, which is partly closed.——Excessive royalties at the Stratton Independence mine are causing a number of leasers to abandon work there.

IDAHO.

Blaine County.

The Alturas M. Co. has closed down its Virginia mine, in Minnie Moore gulch, near Hailey. Superintendent Ruthrauf will work the Bullwhacker mine of the Alturas Co.

The 800-foot drainage tunnel, being driven to tap the old workings of the Nay Aug at a depth of 500 feet, recently cut a vein of lead-silver ore after being run 450 feet. The zinc mill is being remodeled. John Williams of Hailey is manager.——W. T. Riley is working the Wolftone mine, 15 miles north of Hailey.——M. M. Tolle has charge of work on the Alleghany and Pittsburg mines, near Hailey, being worked by the Eclipse M. Co.

Custer County.

The Greyhound mine, in the Sea Foam district, is to be worked all winter. S. M. Smith of Boise is manager. Smelting tests have been made. A rock crusher and a concentrator to increase the lead contents is to be put in. Freight is hauled in from Ketchum.

Idaho County.

The Eagle Mountain M. Co. has bonded the Deer Trail claims, near Orogrande, and plan to develop them and put in a reduction plant. F. E. Bursall is manager.—— The Umatilla mine, near Orogrande, is to be worked all winter by Superintendent W. C. Brower.

W. A. Douglas, manager of the Pearl G. M. Co., has been operating on Divide creek, near Roosevelt. It is closed down for the winter, but it is the intention of the company to resume operations in the spring.——L. E. Moody has bonded the Royal Flush claims, at the head of Indian creek, near Roosevelt, to Eastern parties for $150,000.——A the Dewey mine, at Roosevelt, E. E. Haug is superintendent, with William Proyor as mine foreman and William Paddock as mill foreman. Their ten stamps are dropping steadily and are reducing fifty-five tons of ore daily. Straight amalgamation is used and 85% of the assay value of the ore is said to be saved on the plates. Thirty-five men are employed in the mine and mill.——At the Sunnyside, at Roosevelt, forty-five men are on the payroll.

Owyhee County.

The mill of the Pioneer M. Co. at Silver City is to be started as soon as the electrical equipment is put in. Arthur Buckbee is manager.——Work has been resumed in the Stormy Hill shaft, near Silver City, by C. W. Hill.

Shoshone County.

Work has been started on the Keating property at Wardner that was recently bonded to Portland capitalists, represented by J. F. Watson. Preparations are being made to put up a shaft house, and a shaft will be sunk 200 feet. John Keating is the sole owner.

The Pittsburg Lead Co. has made the final payment on the property it has had under bond on Nine Mile creek, near Wallace. The California mine has resumed shipments. The mill, which was shut down for some time for repairs and improvements, was started up on Nov. 19, and is treating an average of 200 tons of ore a day. The concentrates obtained from this ore will aggregate 600 tons monthly. The mill is operated by both electric and water power, its equipment consists of two waterwheels, a 150 H. P. electric motor, rock crusher, two sets of rolls, a Huntington mill, twelve jigs, four Wilfley tables, two round tables and four vanners. During the shutdown of the mill the work of developing the mine on the No. 3 level was prosecuted and a stope of galena ore has been opened on that level, 200 feet in length and four sets wide. The company employs seventy-one hands at present, most of them on the No. 3 level, where one big machine and three chippy drills are stoping and developing the ore chute.

Manager J. F. Whelan of the Capitol M. & M. Co. states that work has been suspended for the winter at the mine. The property is on Two-mile canyon, near Osburn. The company will start a new tunnel which will cut the vein 500 feet below the present workings. This tunnel will be 2000 feet in length.——The Morning mine of Mullan has on its payroll 300 employes.——The Hunter, at Mullan, is working eighty men.——At the Snow Storm the company and the leasers are working 150 men.——Among the properties near Mullan employing smaller forces are the Leslie M. Co., North Franklin, Ruth group, Bull Pen and San Quentin, Copper King and Heney group.

The Clearwater G. M. Co. has been formed at Wallace to work the Dora and Mabel placer claims, located in an unorganized mining district in Shoshone county. The incorporators are J. P. Rogers, A. E. McLeod, G. T. Johnson, J. A. Wayne and C. Goulding.

Encouraged by the success of the trial run of the concentrating plant established on the creek between Wallace and Mullan, to work the tailings of the mines on the canyon, the owners are planning a mill to be built on the same creek. The home-made plant, consisting of a revolving table and settling tanks, has been run for a month. This plant was built to determine whether the tailings would pay systematic working, and the results of the first month's run have convinced the owners of this fact. The old plant worked only the water carrying lead slimes. A dam was built in the creek, water carrying the mineral was run into settling tanks, and the mineral and slime material collected on the bottom of the tanks. The settlings were then passed onto the revolving tables and the valuable material saved. The new plant will handle all the tailings from the tailings dump. Jigs will be put in to divide the material into tailings, middlings and shipping products.——The Cœur d'Alene Concentrating Co. has been formed, with Joseph Felton as president, I. M. Cornthwaite secretary and treasurer.

MISSOURI.

Jasper County.

A concentrating plant is to be built by the Cuyahoga M. Co., west of Joplin. A. J. Donnan, Jas. Roach and Chas. Glover, all of Joplin, are interested.——The California-Buckeye mill at Cave Springs, 6 miles west of Joplin, has been started.——It is expected that the M., K. & T. mill at Baxter Springs will be started soon. ——A new concentrator is to be put up by the Mary M. Co. on the Cox land, 2 miles north of Joplin.

MONTANA.

Fergus County.

Rich ore has been struck in the Cumberland group at Maiden.

Missoula County.

The work of enlarging and retimbering the Monitor shaft at Saltese has been begun, and when that is completed the shaft will be put down 200 feet more to the 500-foot level and the vein explored by drifts in both directions at that depth.——A. H. Gray, of the Western Montana M. Co. at Saltese, reports that the mine will be worked all winter.——C. Heidenrich has made a strike on the Copper Age, near the Western Montana.

Silver Bow County.

F. A. Heinze and his associates have organized a Copper Securities Co., and it has acquired 2,000,000 shares of the common stock of La France C. Co. The latter owns the Lexington mines in Butte and the concentrating plant at Basin. Mining is done on the upper levels, the lower ones being filled with water. Work at pumping out the water will begin soon.

NEVADA.

Lincoln County.

The Josephine G. M. Co. intends to build a mill to treat the ore from its mines in the Chief district, north of Caliente. J. N. Elston is secretary and treasurer.—— H. Gentry is developing the Advance claim in the Chief district.

Good ore is being milled from the 8th level of the Quartette mine at Searchlight. —— The shaft of the Santa Fe mine at Searchlight is being retimbered and enlarged to 5x8.

Lyon County.

T. B. Gamble and T. Harris of San Jose, who, with other Californians, have purchased the Spragg copper mines, near Wabuska, announce that they will open the property. There are two other mines operating here, the Bluestone, which is owned by Californians, and the Boston mine, which is controlled by Eastern people. Both the latter companies have independent smelters, one of 40 and the other of 80-ton capacity.

Washoe County.

Regarding the White Horse district, the Nevada State Journal reports that operations on the property of the Springfield-Nevada Co. in the White Horse district, near Olinghouse, have been resumed and by the first of the year a full force will be at work. The company's mill is running on rich ore.——J. C. Effrick is milling high-grade ore on the Renegade mine in the White Horse district.——The East End M. Co. is working the Golden Eagle, purchased by H. Lincoln from J. C. Effrick and L. Kearney.——The Keystone-Nevada M. Co. of Olinghouse will put on fifteen men the first of the month. D. M. Harvey has resigned as superintendent, and Mr. Lloyd of Colorado has been appointed.——The Green Hill M. Co., with J. D. Poole as superintendent, is working twenty-five men, blocking out the ore body. ——The Ferncliff Co. will start a new shaft on Dec. 1, which they contemplate sinking to 300 feet.——The crosscut tunnel on the property of the Optimun Co. has been advanced 55 feet and a body of high-grade ore cut. ——The Texas-Nevada Co. is taking out and sacking ore for shipment.——O. M. Pudor, manager of the Texas-Nevada, is laying in a large supply of mining timbers, which will be used in the double-compartment shaft.—— C. P. Clemmons, manager of the Whitehorse-Nevada Co., will put on two shifts at the Jim Blaine.

White Pine County.

P. H. Cannon, the manager of the Imperial mine at Cherry Creek, says that the new railroad branch of the Southern Pacific is built 30 miles from Toano station, on its way to Cherry Creek. The grading is completed to within 10 miles of the camp and will be ready for business shortly after Jan. 1. The Old Imperial will resume shipments.——The Star mine, operated for the Glasgow & Western Exploration Co. by Stamann & Farron, is blocking out ore.——The National Mining Co. has purchased eight mines and is developing them.——The Wild West Co., composed of Boston people, is operating and has a mill running.——The Hartford-Nevada people are developing thirty claims. A hoisting plant is going in and a mill is also being built.——The Gold Canyon people have a new mill under construction.

NEW MEXICO.

Dona Ana County.

(Special Correspondence).—Considerable activity is being shown in the Organ mountains. This district is 15 miles from Las Cruces and 40 miles north of El Paso. Perhaps the largest operator in this locality is the Stephenson-Bennett Con. M. Co. This company has put in a new hoist and compressor and built a 50-ton mill to handle the ore from the mine. A double-compartment shaft is being sunk on the property, which will give them 450 feet of stoping ground on the incline below the lowest level. J. I. McCullough is general manager. This property is on the western slope of the mountains. On the eastern slope the Dona Dora Co. are driving a tunnel which is now in about 400 feet, and also sinking a shaft to connect with the tunnel. This company is putting in a new compressor and drills. The ore carries copper, lead and gold. G. W. Kent is manager. This property, and in fact all of the property on the eastern slope of the mountains, has bad roads and a long haul to the railroad to contend with, but as the mines are developed these obstacles will be overcome.

Organ, Nov. 27.

Socorro County.

The Graphic Co. of Magdalena, in order to reduce the cost of mining, has commenced a 1600-foot tunnel to cut the ore bodies 200 feet below the sixth level. This tunnel has already been driven 600 feet and has cut two bodies of sulphide ore, also encountered a stream of water furnishing 500 gallons per minute, insuring a permanent supply for milling and other purposes.——G. A. Freeman of Pittsburg, Pa., is superintending the erection of a stamp mill and concentrator for the Enterprise M. & M. Co. at Mogollon.

OREGON.

Baker County.

A steam hoist is to be put in at the Pyx mine, near Greenhorn.——The Snow Creek and Psyche mines, near Greenhorn, are closed because of litigation.

Grant County.

The Dame Fortune mine, near Quartzburg, has been sold to S. N. Gallaher.

Josephine County.

The long delayed rains and snows have arrived in southern Oregon, ending one of the most extended drouths ever known in this section of the State. Fears were entertained that this winter would be a repetition of last, with scant rains and slack water supply for hydraulic plants. Most of the large placer mines have increased their capacity and several new ones have been equipped.

On Grave creek, near Leland, the Blalock, Lewis, Goff, Van Brunt, Whitehead-Moore, Vindicator, Harris Flat, Archer and Columbia are to be worked. The Lewis mine, which J. C. Lewis manages, has a 65-foot gravel bank, and uses two No. 4 giants under a head of 250 feet. Water is secured through a 4-mile ditch, with an auxiliary supply from the lower ditch of the Columbia, the next mine above, of which L. A. Lewis is manager. Superintendent C. E. Foss of the Columbia has seventeen men putting the property in order and setting the giants. In four years the Columbia has washed a mile of channel, much of the lower gravel beds having a

depth of 40 and 60 feet. The plant is lighted for night work by 1000 C. P. arc lamps, deriving their energy from the Columbia's electric lighting plant.——Manager J. R. Harvey will operate three giants on the Royal group diggings near Galice. The explosion of 5000 pounds of dynamite, which has been placed at the end of a long tunnel bored under the high gravel banks, will loosen the ground so that it will wash readily. Last season 8000 pounds of No. 2 giant powder were used for this purpose.

At the Greenback mine at Greenback, electric power has been put in and the ten additional stamps finished. The forty stamps are running continuously. The 1400-foot level has been reached and the vein is holding its size and values in a way that is most encouraging to the owner, Mr. Brevoort. R. N. Bishop, the general superintendent of the Greenback mill and mine, has been in New York for some time on business in connection with the mine. He is expected back the last of this week. W. R. Thomas has been succeeded by I. L. Greninger as foreman of the mine.

SOUTH DAKOTA.

Lawrence County.

Statistics of the total gold production of the Black Hills since that region was surrendered by the Sioux Indians and occupied by the whites, contained in the United States assay offices and mints, show that the Black Hills to Dec. 1, 1904, produced gold to the value of $112,163,759. By adding to this the amount which has been produced so far this year, approximately $8,000,000, it gives a total production of $120,163,759.

The Montezuma mill at Rochford has been torn down and moved 1 mile to the mine, where it will be put up to treat ore from the 15-foot vein.——The Esmeralda mine on Blacktail gulch, near Deadwood, has been leased by E. Major of Central City.——Work is to be resumed at the Wauconda mine, near Lead.——The Golden Reward Co. is unwatering the Delaware mine, near Terry.——Work has been commenced on the Ulster and May Queen mines, near Preston, by the Victoria Extension M. Co., of which F. Steele is manager.

Pennington County.

It is reported that a contract has been let for a 100-stamp mill at the Bullion mine, near Keystone. F. H. Long of Chicago is president of the company.——Work is to be resumed at the properties of the Keystone Holy Terror M. Co., near Keystone. M. L. Fox is general manager.——The Grandview mine, near Silver City, has been bought by L. A. Richards. The shaft is to be sunk 300 feet.——The Black Tom M. Co. is putting up a 10-stamp mill on Slate creek, near Keystone.

TENNESSEE.

State Mine Inspector R. A. Shiflett of Tennessee has prepared statistics showing the mineral production of the State during 1904. The production and value of the various minerals are as follows: Coal, 4,847,242 short tons, valued at $5,617,095; coke, 386,875 short tons, valued at $923,120; barytes, 10,565 short tons, valued at $37,132; copper valued at $641,860; iron ore, 539,820 long tons, valued at $613,705; pig iron, 271,659 long tons, valued at $2,692,132; lead, 900 short tons, valued at $7200; zinc, 73 short tons, valued at $1204; phosphate, 468,443 long tons, valued at $1,485,665; marble, 372,560 cubic feet, valued at $523,872.

UTAH.

Juab County.

Work is to be resumed by the Argenta Copper Co. and by the Uma Con. Co. at Eureka.

Salt Lake County.

H. M. Crowther, general manager of the Continental Alta mine, at Alta, reports that the Flagstaff management is considering using the aerial tramway of the Continental to bring their ore over the 3 miles at a saving of $1 per ton.——The Columbus Con. at Alta have finished their ore bin and their bunkhouse.——Superintendent W. Zeigler of the Ohio Copper Co., at Bingham, reports that they are drifting from the 400-foot and 500-foot levels.

Daniel Guggenheim, president of the Guggenheim Exploration Co., makes the official announcement that the purchase of the Utah Copper Co. has been completed, and the latter is now in actual and physical control of the former. The company will develop the property. It will complete the concentrating works which are now being built.

Summit County.

The Creole mine, at Park City, has resumed work.——A new cable has been put in at the Silver King tramway at Park City.

WASHINGTON.

Ferry County.

Sinking is to be started from the 220-foot level of the Ben Hur mine, near Republic.

The 100-foot shaft on the Lone Pine mine near Republic has been completed, and the crew is crosscutting to the ledge. Should values continue to that depth, the company will put in additional machinery and increase the working force.

Snohomish County.

The Ethel Con. mines, near Index, have been sold to the Mineral City Power & Transportation Co.

FOREIGN.

AFRICA.

Transvaal.

The African Concessions Syndicate has been in consultation with the leading American and Continental engineers and experts on the subject of the transmission of power from the Victoria Falls to the Witwatersrand. These authorities have unanimously expressed the opinion that the scheme is not only quite feasible, but would be commercially successful, especially as the climate of South Africa is one of the most suitable in the world for the transmission of power. There is no ice in the rivers to interfere with the working of the turbines, and no snow to break down the transmission lines. The extreme dryness of the climate is also greatly in favor of the project. The experts consider that there is absolutely no difficulty in the way of the scheme so far as the distance of transmission is concerned. With reference to statements that the volume of water in the falls is not sufficient to produce the necessary power, it is pointed out that even in the driest season yet experienced there is sufficient water to produce 500,000 H. P., while at present the Rand only consumes 150,000 H. P. At the falls there is an available head of about 330 feet, and if more than 500,000 H. P. were needed it could easily be obtained by cutting a canal, 15 to 20 miles in length, to a point lower down, where there would be a head of 1000 feet, which would be sufficient to produce 1,000,000 H. P.

AUSTRALIA.

New South Wales

The New South Wales gold yield for October amounted to 37,187 ounces, valued at £130,341, as compared with 15,719 ounces, valued at £59,395, in October, 1904. The yield for the past ten months amounted to 267,066 ounces, valued at £934,384, as compared with 247,495 ounces, valued at £899,512, in the first ten months of last year.

CANADA.

BRITISH COLUMBIA.

Boundary District.

Boundary mines ore shipments for the week ending Nov. 25 were: Granby mines, 15,696 tons; Mother Lode, 3328 tons; Rawhide, 150 tons; Providence, 60 tons. Total for week, 19,234 tons. Total for year to date, 810,324 tons.

Since the entire battery of eight furnaces of the Granby Co. went into commission the smelter is holding to a daily average of 2750 tons. The two large furnaces completed this year are holding up to at least 800 tons. Superintendent Hodges is pressing work rapidly for commencement of the 3-compartment shaft, the headworks for which will be erected this winter. An electric motor of 250 H. P. will actuate the hoist, which will have a depth capacity of 1000 feet.——Work has been resumed on the Sunset in Deadwood camp, with Neil Morrison in charge. The Sunset is owned by the Dominion C. Co.

Nelson District.

At the La Plata mine on Kokane creek, near Nelson, the new concentrator building is completed.

Rossland District.

The tonnage shipped fron Rossland mines for the week ending Nov. 25 and for the year to date was as follows:

Mine.	Week.	Year.
Le Roi	1,350	104,836
Le Roi (milled)	....	3,240
Center Star	1,620	89,530
War Eagle	1,230	61,850
Le Roi Two	270	7,582
Le Roi Two (milled)	....	9,430
Jumbo	100	9,629
White Bear	....	1,100
White Bear (milled)	....	3,220
Cascade-Bonanza	....	120
Crown Point	....	350
Spitzee	....	4,809
Velvet-Portland	....	1,977
Gopher	....	180
Homestake	....	30
Lily May	....	90
Inland Empire	....	30
Totals	4,570	298,003

The station on the 1350-foot level of Le Roi at the head of the winze is finished, and sinking from the 1550-foot level will be inaugurated as soon as the double-drum hoist is in place. No work is at present in progress below the 1350-foot level, pending the starting of the hoist. The crosscut, which is being driven on the 1350-foot level of the Le Roi into the territory of the Le Roi Two, is 90 feet in length. The station on the tenth level of the Center Star has been completed, and the work of deepening the shaft, which is about 120 feet below the level of the tenth level, has been resumed.

On the 1000-foot level of the Le Roi, at Rossland, the Black Bear ore shoot has been found. On the 800-foot level it is 108 feet wide, and on the 900-foot level it is 45 feet wide.——The new ore shoot of Le Roi No. 2 has been prospected with diamond drills.——The White Bear mine and mill at Rossland are to be started soon.

The War Eagle mine at Rossland, B. C., has been purchased by the Center Star M. Co., owning the adjacent property. For years the properties have been controlled by the Gooderham-Blackstock interests and operated under joint management. Recently both passed into the control of Canadian Pacific Railway interests, and now have been entirely merged, the War Eagle Con. losing its identity in the Center Star Co. James Cronin is general manager of the Center Star Co.'s properties at Rossland, and of the St. Eugene mine at Moyie, B. C.

Slocan District.

Attention is being paid to the magnetic separation of zinc by the Kootenay Ore Co. at Kaslo. The plant at Frank will probably handle the largest part of the zinc product of the camp.——The Payne mine, near Sandon, has opened a new shoot of lead and zinc ore below level No. 5, and is expected to supply the mill for a year. The lessee of the property has twenty men working.——John Bow has opened a shoot of galena ore on the Tramp Planet, adjoining the Payne on the south. The Majestic, farther south, operated by Bigney & Little, now has three levels. Stoping is being done between the second and third levels.——The Slocan Star is working three men in stoping ore and twenty men in development work.——The Silversmith has a showing of 2 feet of galena on the fourth level, 250 feet from the surface. Work will be pushed on the fifth level, 225 feet lower, into the new ore body.

West Kootenay District.

The tunnel in the Beatrice mine at the head of Mohawk creek, near Camborne, has reached the main level. The tunnel has been run over 500 feet. A tram has been built to convey the ores from the mine.

MEXICO.

The situation in Mexico resulting from the dynamite famine is rapidly becoming acute. A petition has been sent to President Diaz asking for some relief. There is a prohibitive duty of $210 per ton on dynamite. The Mexican national monopoly, which has the sole right to bring dynamite into the republic free, has entered into an agreement as agent to the American trust. It is pointed out that after allowing wide margins for all possible expenses there is a net profit of $6.65 per case, or $226 per ton, or $5320 per car for the company. The miners feel that this bonus is exorbitant and unjust and ask for immediate relief.

Chihuahua.

It is expected that the mill and cyanide plant of the Galanista G. M. Co. at the Esmeralda mine, southwest of Guadalupe y Calvo, will be finished by February 1. It is reported that a wireless telegraph outfit is to be put in. G. M. Holmes is manager.

NEW ZEALAND.

The Waihi G. M. Co. have applied for water rights on the Waikato river, near Cambridge, to furnish power for new tube mills to be put in at their Waikino and Union batteries. About 60 H. P. is required to drive three mills at their Waihi battery. The Mining Journal reports that two of the tube mills at the Waihi battery have been found equal to grinding the whole of the coarse sands passing through a 20-mesh from ninety stamps. The sinking of the main pumping shaft is proceeding satisfactorily, and a total depth of 101 feet has been reached below the "sill" at No. 7 level. The Royal lode continues strong in both the east and west drifts, and so far the stretch of pay ore being revealed at this No. 7 level is encouraging.

PHILIPPINE ISLANDS.

A recent government report states that old Spanish workings have uncovered large bodies of high-grade copper ore in Lepanto, in the district of Mancayan. About forty claims have been located here by Americans who plan systematic exploration work. In the province of Batangas work has been done in the Loboo mountains on a group of claims containing copper carbonate ores with a trace of gold. Platinum has been discovered in small quantity in the placer sands from Rizal. In Bulacan, in the mountains east of the towns of San Miguel de Mayumo and Angat, important deposits of rich hematite and magnetite have been known and worked by natives in a small way for over a century. Some of them are fully up to Bessemer grade. Correspondence is now in progress with iron works of Japan looking to the profitable shipment of these ores. Excellent coal, suitable for steamer use, is found in Albay Province, in Batan island. In Cebu are important deposits of steaming coal and two known deposits of lead ores. These coals have been proved by practical tests in steamships in Philippine waters to do very well. Petroleum is reported in Tayabas Province, but no wells have yet been driven to prospect this field thoroughly. At Binangonan occurs a limestone which is shown by analysis to be suitable for making cement. As there is available clay in the vicinity and good water transportation to Manila, capitalists are considering the erection here of a modern rotary kiln cement plant, to cost not less than $225,000.

Commercial Paragraphs.

L. S. PIERCE, 1653 Welton St., Denver, Colo., reports sale of a 15-ton set of riffles to the Denver Mint, a 25-ton set for Johannesburg, S. A., and a 25-ton set for Siberia.

THE Sullivan Machinery Co. announce that their St. Louis office, P. F. Jarvis, manager, has moved into larger quarters at rooms 1125A to 1127 Missouri Trust Bldg.

THE School of Mines of the State University of Washington gives a course each winter for prospectors and mining men in general. It is the aim of the institution to make this course thoroughly practical. To that end, the instruction is principally by laboratory methods and visits to smelters and mines in operation.

THE National Wood Pipe Co. has completed a line of 91-inch continuous stave pipe at Pendleton, Or. This pipe is made from 3x6 fir staves banded with ¾-inch round steel rods, which are held in place with malleable iron shoes, and carries the water which operates the Pendleton roller mills. A 54-inch continuous stave pipe line has been completed by them at Dayton, Wash., for the local electric company.

THE city of Alpena, Mich., has contracted with Allis-Chalmers Co. of Milwaukee for the complete electrical and power equipment of a lighting plant, consisting of a 60-cycle Bullock alternating current generator, normal capacity 150 kilowatts, direct connected to a Reynolds-Corliss cross compound heavy duty engine; an exciter unit, jet condenser, switchboards, sub-station apparatus, and equipment for 100 arc lamps connected in series.

CROCKER-WHEELER CO., manufacturers and electrical engineers, announce the establishment of an industrial engineering department, in which is concentrated all their work in the line of industrial engineering as applied to railway shops, machine shops, and industrial plants of every description. J. K. W. Davenport, E. E., has become associated with the company, that its growing activities along these lines may be handled in a satisfactory manner. Mr. Davenport and his staff of assistants are at the present time giving personal attention to several important industrial propositions.

Personal.

H. C. CALLAHAN is in Mexico.

F. J. SPARE is manager Pompeii M. Co., Searchlight, Nev.

J. T. STEVENS is manager Harris mine at Washoe, Nev.

A. E. BRYAN of Seattle, Wash., is examining mines in Mexico.

FRANCIS RULE of Pachuca, Mex., is visiting San Francisco.

MARK B. KERR is in Butte, Mont., en route to San Francisco, Cal.

CHAS. EATON is superintendent Con. Copper Co. of Boulder, Colo.

H. SAVILLE is manager Deep Down M. & M. Co. of Keystone, S. D.

J. W. POWER is superintendent Little Mendah mine at Pioche, Nev.

DANIEL KIRBY is superintendent Monarch mine at Atlanta, Idaho.

C. A. CLAY is superintendent Animas Power Co. at Silverton, Colo.

L. WHEATLEY is superintendent Duplex M. & M. Co., Searchlight, Nev.

R. HALES has been made foreman Kearns-Keith mill at Park City, Utah.

THOMAS JAY has been made superintendent Monitor mine at Saltese, Mont.

O. B. STEEN is superintendent Searchlight C.-G. M. Co. at Searchlight, Nev.

A. P. MAYBERRY has charge U. S. M. Co.'s Richmond properties at Eureka, Nev.

J. C. FOLEY has been appointed manager Shakespeare mine at Webwood, Ontario.

R. G. BAILEY is superintendent Nonpareil M. & D. Co., working near Dixie, Idaho.

J. J. PENDERGAST is general manager Cyrus Noble M. & M. Co. at Searchlight, Nev.

H. H. NICHOLSON has moved from Sumpter, Or., to 701, 135 Adams street, Chicago, Ill.

SAMUEL BRETHOUR has charge of work at the Gold Medal mines, near Idaho Springs, Colo.

S. F. EMMONS recently examined the Arizona Commercial Copper Co.'s mines at Globe, Ariz.

A. H. OLESON of Deadwood, S. D., is manager Homestake South Extension M. Co. at Lead, S. D.

M. O. O'BRIEN of New York has been appointed manager McKinley mines, near Grand Forks, B. C.

J. B. KEATING, general manager Bully Hill S. & R. Co. at De Lamar, Shasta county, Cal., has returned from the East.

F. J. HARRINGTON is superintendent, G. B. Wilson assistant superintendent and J. Luxon foreman Quartette M. Co. at Searchlight, Nev.

JOHN HAYS HAMMOND, general manager Guggenheim Exploration Co., has been made managing director Utah Copper Co. at Bingham, Utah, representing the Guggenheim Exploration Co.

Obituary.

B. J. CATREN, a pioneer mining superintendent of Clear Creek county, died at Silver Plume, Colo., November 18.

G. H. ALLEN, foreman Standard mine at Mace, Idaho, was killed Nov. 23 by being crushed by a cage in the Standard shaft.

WM. ORR, manager of the Glasgow & Western Exploration Co., Ltd., controlling the MacArthur-Forrest cyanide process, died at Denver, Colo., November 22.

W. H. EDGAR, founder and president of the Dearborn Drug & Chemical Works, with offices in the Rialto building, Chicago, Ill., died suddenly November 27 at the Arlington hotel at Hot Springs, Ark.

Trade Treatises.

The National Electric Co. of Milwaukee, Wis., illustrate and describe their polyphase induction motor in Bulletin No. 358, and stationary and portable and motor-driven air compressers in Bulletin No. 363.

Catalogue No. 20 of the Jeffrey Manufacturing Co. illustrates "Coal Handling Machinery for Mines," including tipples, conveyors, crushers, drills, cars, hoists, etc. Pictures of typical installations and of sectional parts constitute the essential of the booklet, as there is but little text.

"Water Lifted by Compressed Air," while listed as catalogue No. 73 of the Ingersoll-Sergeant Drill Co., of 11 Broadway, New York City, is really an excellent treatise on the theory and practice of pumping water with compressed air. Concise text and pertinent illustrations give the details of reason, operation and cost of the "air lift" system. It contains much valuable information for the engineer interested in economical pumping.

Books Received.

As extracts from "Mineral Resources of the United States for 1904," the U. S. Geological Survey has issued "Production of Borax" and "Production of Magnesite."

The annual report of the irrigation and drainage investigations of the Office of Experiment Stations for 1904 has been issued as Office of Experiment Stations Bulletin 158. This contains a review of the irrigation work of the year; a report of the drainage investigations for the year, and a number of reports covering local investigations.

Office of Experiment Stations Bulletin 157, entitled "Water Rights on Interstate Streams—the Platte River and Tributaries," has just been issued by the United States Department of Agriculture. It contains discussions of the water-right systems in Colorado, Wyoming and Nebraska; the rights to the Platte river and tributaries in three States; and the physical conditions which affect water rights within and between the States, including topography, return seepage and underflow—by R. P. Teele; and a general discussion of water-right systems, by Elwood Mead, chief of irrigation and drainage investigations. Only a limited edition of 1000 copies of this bulletin has been printed, a part of which is available for distribution by the department. Copies of the bulletin, as far as available, can be obtained by addressing the Director of the Office of Experiment Stations, United States Department of Agriculture, Washington, D. C.

Latest Market Reports.

SAN FRANCISCO, December 1, 1905.

METALS.

SILVER.—Per oz., Troy: London, 30 5/8d (standard ounce, 925 fine); New York, bar silver, 65⅝c, refined (1000 fine); San Francisco, 65¼c; Mexican dollars, 53c, San Francisco; 50¼c, New York.

Within the week silver has continued to advance, going from 63⅜c last week to 65⅝c to-day. With each small increase in the market value of fine silver the producer of that metal continues to feel correspondingly thankful.

COPPER.—New York: Standard, $17.50; Lake, $17.50 @18.00; Electrolytic, $17.50; Casting, $17.50 @ 17.75. San Francisco: $16.75. Mill copper plates, $18.00; bars, 18@24c. London: £78 10s spot per ton.

The copper market is firm and higher. In the New York market Lake copper can be bought for future delivery at $17.50, but where smaller lots are wanted immediately the price ranges from $17.75 to $18.00. It is now several years since copper touched 18c. It is probable that the upward limit in the price of copper is being, or has already been, reached. When the price of copper becomes so high as to make aluminum an aggressive competitor, the latter metal will find an increasingly wider use, particularly in electrical work, into which it has already entered largely.

LEAD.—New York, $5.75; St. Louis, $5.15; San Francisco, $5.00, carload lots; 5¼c 1000 to 4000 lbs.; pipe 7½c, sheet 8, bar 6¾c. London: £15 16s 1d ℔ long ton.

SPELTER.—New York, $6.25; St. Louis, $6.20; London, £28 15s ℔ ton; San Francisco, ton lots, 7c; 100-lb lots, 7¾c.

TIN.—New York, pig, $33.90@34.25; San Francisco, ton lots, 35c; 500 lbs., 36c; 200 lbs., 37c; less, 38½c; bar tin, ℔ lb., 40c. London, £155 17s 6d.

PLATINUM.—San Francisco, crude, $18.50 ℔ oz.; New York, ingot, $20.50 ℔ Troy oz. Platinum ware, 75@$1.00 ℔ gram.

QUICKSILVER.—New York, $40.00@$40.50, large lots; London, £7 5s 0d; San Francisco, local, $38.00@39.00 ℔ flask of 75 lbs.

BABBITT METAL.—San Francisco, No. 1, 10½c; No. 2, 8c; No. 3, 7½c; extra, 17½c; genuine, 32½c; Eclipse, 35c.

SOLDER.—Half-and-half, 100-lb. lots, 22.00c; San Francisco, Plumbers', 100-lb. lots 19.15c.

NICKEL.—New York, 55@60c ℔ lb.; ton lots, 40@47c.

ZINC.—Metallic, chemically pure, ℔ lb., 50c; dust, ℔ lb., 10c; sulphate, ℔ lb, .04c.

ALUMINUM.—No. 1, 99%, small lots, 37c ℔ lb.; 100 lbs.. 35c; 1000 lbs. 34c; ton lots and over, 33c, Pittsburg. No, 2, 90%, small lots, 34c; ton lots and over, 31c, Pittsburg.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, $17.35; gray forge, $14.60; San Francisco, bar, 3½c ℔ lb., 3¾c in small quantities.

STEEL.—Bessemer billets, Pittsburg, $26.00@$27.00; open hearth billets, $27.00@$28.00; San Francisco, bar, 7c to 13c ℔ lb.

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 7¾c; less than 500 lbs., per lb., 8c; in 25-lb. tin pails, ¼c ℔ lb. above keg price; in 1 and 5-lb. tin cans, 100 lbs. per case, ½c per lb. above keg price. Dry Lead.—In bbls., 1 ton and over, 7½c; do. in kegs, 8c.

LIME.—Santa Cruz, $1.35 country, $1.25 city ℔ bbl.

CEMENT.—Imported, $3.00@4.00 ℔ bbl.; California, carload lots, $1.80 f. o. b. at works; small lots, $2.10 ℔ bbl. in sacks, 4 sacks to bbl., 5c for each sack returned.

LUMBER.—(Retail): Pine, ordinary sizes, $24.00@ 25.00; extra sizes higher; redwood, $28.00@30.00; lath, 4 feet, $4.50@5.00; pickets, $21.00;shingles, $2.50 for No. 1, and $2.25 for No. 2; shakes, $13.50 for split and $15.00 for sawed; rustic, $28.00@35.00.

NAILS.—This week the basic prices are: Wire, $2.77; Cut, $3.25. Meanwhile the nominal quotations per keg (list prices) are: No. 20d to 60d, Wire, $3.35; Cut, $3.55; 10d to 16d, Wire, $3.45; Cut, $3.35; 8d, Wire, $3.50; Cut, $3.50; 6d and 7d, Wire, $3.60; Cut, $3.60; 4d and 5d, Wire, $3.70; Cut, $3.70; 3d, Wire, $3.85; Cut, $3.85; 2d, Wire, $4.10; Cut, $4.10. Special rates for carload lots.

GENERAL SUPPLIES.

ANTIMONY.—New York, Cookson's, 11½c; Hallett's, 12½c; San Francisco, 1000-lb. lots, 14c; 300@500-lbs. 12c; 100-lb. lots, 13c.

BISMUTH.—Subnitrate, ℔ lb., $2.10.

BONE ASH.—Extra No. 1, 5@6c ℔ lb; No. 1, 4@5c.

BORAX.—Concentrated, 7@8c ℔ lb; powdered, 9@10c; fused, 25@30c; crystal, 7c.

CANDLES.—Spear Brand, 16 oz. adamantine, 40s., 11c ℔ set; 14 oz. adamantine, 40s., 10c; 12 oz. adamantine, 40s, 9c; 10 oz. adamantine, 40s, 8c; 16 oz. stearic, 40s, 12½c ℔ set; 14 oz. stearic, 40s, 11½; 12 oz. stearic, 40s, 10½c; 10 oz. stearic, 40s, 9½c. 100-case lots and over, ¼c less. Not less than 50-case lots, ¼c less. Boxes of 20s, price ½c advance.

CAPS.—3x, $5.50@6 per 1000; 4x, $6.50@7; 5x, $8@8.50; Lion, $9@9.50, in lots not less than 1000.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 23@24c ℔ lb.; carloads, 23@23½c; in tins, 30c; soda ash, $2.00 ℔ 100 lbs.; hyposulphite of soda, 3@3½c ℔ lb.; caustic soda, in drums, 3@3½c ℔ lb.; Cal. s. soda, bbls., $1.10@1.20 ℔ 100 lbs.; sks., 90c@$1.00; chlorate of potash, 12@13c; nitrate of potash, 6½@7c; caustic potash, 10c in 40-lb. tins; roll sulphur, 2½@2¾c; powdered sulphur, 2½@2½c; flour sulphur, French, 2¾@—c; alum, $2.00@2.25; California refined, 1¾@2c; sulphide of iron, 8c ℔ lb.; copper sulphate, 5¼@5½c; chloride of lime, spot, $2.50@2.75; sulphuric acid, in carboys, 66° B, 1¾@2c ℔ lb.; nitric acid, carboys, 8c ℔ lb.

CHROMIUM.—90% and over, ℔ lb., 80c.

FIRE BRICK.—Domestic, carloads ℔ 1000, f. o. b., factory square, $25.00; soap and split, $22.50; arch and wedge, $27.50; skewback, $30.00; circle, $32.00.

FIRE CLAY.—Domestic, ℔ ton 2000 lbs. in 125-lb. bags double, and dry ground, f. o. b., factory, $8.50.

FUSE.—Triple tape, $4.00 per 1000 feet; double tape, $3.55; single tape, $3.10; Hemp, $2.85; Cement No. 2, $3.10; Cement No. 1, $2.75, in lots of 3000 and up.

COAL.—San Francisco, coast, yard prices: Wellington, $8.00; Seattle, $6.50; Coos Bay, $5.50; Southfield, $8.00. Cargo lot, Eastern and foreign: Wallsend, $7.50; Brymbo, $7.50; Pennsylvania, hd., $14.00; Scotch, $8.00; Cumberland, $13.00; Cannel, $8.50; Welsh Anthracite, $13.00; Rock Springs, $8.50, long ton; Colorado Anthracite, $14.00. Coke, $11.50 per ton in bulk, $13.00 in sacks; Sunnyside, $8.50, long ton.

OILS.—Linseed, boiled, bbl., 50c; cs., 55c; raw, bbl., 48c; cs., 57c; Lucol oil, boiled, bbl., 48c; cs., 53c; raw-bbl., 46c; cs., 51c. Kerosene—Pearl, per gal., 17½c; Astral, 17½c; Star, 17½c; Extra Star, 20½c; Eocene, 19½c; Elaine, 26c; Water White, in bulk, 11c; Mineral Seal, iron bbls., 18c; wooden bbls., 20½c; cs., 24c; Mineral Sperm, cs., 26½c; Deodorized Stove Gasoline, bulk, 14½c, do., cs., 21c; 86° Gasoline, bulk, 25c; do., cs., 31c; 83° Naphtha or Benzine, deodorized, in bulk, per gal., 12½c; do., in cs., 19c; Lard Oil, E. W. S., bbl., 75c; cs., 80c; Neats-foot Oil, pure, bbl., 63c; cs., 78c; Sperm, crude, 63@68c; Natural White, 68c; Bleached, do., 68@73c; Whale Oil, cs., 52@67c.

LITHARGE.—Pure, in 25-lb. bags, 9½@10½c ℔ lb.

MAGNESIUM.—Pure, N. Y., $1.60.

MANGANESE.—Black oxide, ℔ lb., 2¾@4c.

MERCURY.—Bichloride, ℔ lb., 77c.

MOLYBDENUM.—Best, $2.75 ℔ lb.

PHOSPHORUS.—American, ℔ lb., 70c.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitroglycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1**, 50%, carload lots, 11½c; less than one ton, 13½c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2, 35%, carload lots, 9½c; less than one ton, 11½c. No. 2**, 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2.00 per keg.

RED LEAD.—500 lbs. and over at one purchase, ℔ lb. 7½c; less than 500 lbs., 7¾c.

SILVER.—Chloride, ℔ oz., 90c@$1.00; nitrate, 54c

SODIUM.—Metal, ℔ lb., $1.

TUNGSTEN.—Best, ℔ lb., $1.20.

URANIUM.—Oxide, ℔ lb., $3.40.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS United States and Foreign Patent Agency, the following are worthy of special mention:

ACETYLENE GAS MACHINE.—No. 805,091. Nov. 21, 1905. J. F. Philpott, Windsor, Cal. This invention relates to an apparatus for the production of acetylene gas. It consists in the combination and arrangement of parts whereby a limited amount of calcium carbide is intermittently delivered into a body of water, and the released gas is transferred to a gasometer, thence transmitted to a point of use. It is the object of the invention to provide a compact, portable, gas generating apparatus, comprising a receptacle superposed above a water chamber and in conjunction with an open bottom gasometer movable in circumferential liquid seal, and in conjunction therewith of an automatically operating valve, whereby the dry carbide will be delivered into the water in small quantities and at intervals dependent upon the rapidity with which the gas is consumed

DISH WASHING MACHINE.—No. 805,118. Nov. 21, 1905. C. S. Chamberlain, Emeryville, Cal. This invention relates to an apparatus which is designed for the rapid cleansing of dishes as they are returned to the kitchen after being used. The object of the invention is to provide an improved mechanism for rapidly handling containers within which dishes are placed for washing, means for transferring the containers through a series of washing tanks, means for transferring the washing water from one to the other, means for admitting steam to heat the water and to prevent the vacuum and the noisy operation which usually accompanies such use of the steam.

SHINGLE GAUGES AND CLAMPS.—No. 805,094. Nov. 21, 1905 G. Reed, Fort Bragg, Cal. This invention comprises a gauge and bracket made of a single piece of spring metal bent to provide two arms capable of a limited movement toward and from each other, one arm made flat and straight and adapted to be inserted beneath a shingle, the other having its end bent first outwardly from the first-named arm and then bent inwardly and abruptly and approximately at right angles to the first-named arm, and said inwardly bent end extending across the end of the second-named arm and serrated and forming a jaw member to grip the upper side of the shingle, and means to compress the arms.

The Mining Camp Knocker.

There are probably few mining camps that have not among their residents men who make it their particular mission to look into the business affairs of other people. Not a mining deal is negotiated or consummated into which this insidious individual does not attempt to inject himself in some manner. When he is not "in on it," he, on occasion, manages to meet prospective purchasers or examining engineers and gratuitously offers advice. In a recent instance of this kind the "city knocker" approached several engineers, who were strangers in the town and country and who were engaged in making an examination of a large mine, and said earnestly that he hoped, for their own good, the good of their clients and for the good of the country, that they would not pay too much for the property they were examining, as he was aware that the price asked was far in excess of the value of the mine. He was assured by the engineers that they felt abundantly able to protect themselves against any attempt to take advantage of them in the manner suggested, and plainly indicated that they needed no further advice in the matter. The following day the same fellow approached the engineers again and invited them to dine with him. An excuse being offered—and probably expected—he produced a report on another property, in which he modestly admitted he was somewhat interested, and urged them to look into its merits, as it was far superior to the one they were engaged upon. It seems needless to add that they gave the knocker and his property scant courtesy.

There are ways to invite the attention of engineers and capitalists to mines without condemning other property, whether justly or not; but these methods of doing legitimate business have not seemingly come to the notice of the knocker.

ONE of the vexed questions of the West is the fixing of a proper valuation on mining property for the purpose of taxation. Most of the States have no laws defining how a mine shall be valued. If the valuation be on the improvements, this can usually be arrived at, as far as its cost is concerned; but the equipment of a mine deteriorates rapidly—usually figured at 10% annually; but, in the event of the mine becoming exhausted, the plant is of small value, unless it can be used at once in the operation of another property. If the valuation be fixed by the output, this is manifestly unfair, as the output may cease. Nor is an arbitrary valuation on the entire property more just, safe or satisfactory. The assessment is usually adjusted through conference of the mine officials and the State and county officers at a figure mutually agreeable to all concerned.

Front View of Gold Dredger Near Golden, Colo.

Gold Dredger Cutting Into the Gravel, Near Golden, Colo.

ONE of the most important factors in the transportation problem in the desert regions of the Southwest is the automobile. There are scores of these modern vehicles in the Nevada, Arizona and southern California deserts. It is less than a year since the first long automobile trip was attempted in eastern Nevada, on which occasion the auto broke down. To-day these vehicles are in use as a means of quick, convenient and comfortable travel between camps where the railroad has not been built, and, without doubt, the auto is going to prove of great value in penetrating the undeveloped and unprospected regions of the desert, where heretofore the burro and prospector afoot were the only invaders of the desert silence and solitude.

WHERE constructive work is left to the inexperienced workman, he usually builds strong enough and well enough; but the engineer will build equally well, while not using nearly the amount of material that the other has employed. The result is a saving in first cost, with a probability that, all things considered, the engineer's constructive details are superior and that the whole structure is better adapted to the use to which it is to be put than that designed and built by the ordinary workman. It is much the same in underground work. There are excellent workmen—men who thoroughly understand every branch and detail of the mining work, and who are capable of performing anything that is to be done in a mechanical way in the mine, from mucking to running a machine drill or building a chute—and yet these men are often utterly incapable of initiative. Show him an ore body and give him orders to mine it out, and the work will be performed expeditiously, cheaply and well; but, this exhausted, he knows not which way to turn, and looks helplessly to some one to direct him further. His methods are good, or were considered good in the past, but he is not aware that better methods, possibly, have been devised, as he has never heard of them. The miner, like the superintendent and manager, must keep abreast of the times, and this can only be accomplished by either travel and careful observation, or reading. The former is not generally possible, but the latter always is, and the working miner may learn much to his advantage by the weekly perusal of a good mining journal, in which he will find the latest things in mining and metallurgical practice, and which will keep him in touch with the entire mining world. This is the age of progress and improvement, and when a man, whether miner, merchant or farmer, complacently reaches the conclusion that his methods can not be improved upon and that he knows it all, he has outlived his usefulness.

What Is a Fissure Vein?

Simply described, a fissure vein is a fracture in the crust of the earth, which has been filled by minerals infiltrated into the fracture and deposited along its course, either in open cave-like spaces, or in a mass of crushed debris, derived from the attrition and crushing of the vein walls. A fissure vein presents so many phases as to render its description in all of its characteristics a somewhat complicated matter.

Many geological text books contain sketches of "fissure veins," which show the successive deposition from the walls toward the center of minerals of various kinds, including silica and calcite, with various sulphides of iron, lead, zinc, copper, etc., giving the vein a comb-like structure and a banded appearance. Such veins exist, and in some mining districts are numerous, but ordinarily the fissure vein fails to show this banded structure due to successive deposit of different kinds of minerals.

More commonly the vein is bounded by definite walls, but the vein material is massive, showing little or no evidence of successive deposition, but rather an alteration of the crushed materials derived from the walls by the movements which have fractured a zone of the country rock within the limits of the walls and reduced much of it to a fine granular or pulverulent condition. This crushed rock, being easily attacked by the waters passing through the fissured zone, is decomposed, its soluble portions dissolved out, and the minerals thus removed are replaced by other minerals—usually silica (quartz) and one or more of the sulphides of the base metals, with sometimes gold or silver, or both. Calcite, baryta, fluorite, siderite and other minerals are also occasionally precipitated from these percolating solutions. Not infrequently the character of the fissure is distinctly influenced in its structure by the wall rocks. Thus in a slaty formation, the vein may have a slaty or ribbon structure, and in a massive rock, the vein is more apt to assume a massive structure, or a brecciated appearance, there being many pieces of more or less silicified rock which are clearly portions of the walls which have not been finely crushed, but which have nevertheless been altered by the mineralizing solutions.

How hard, firm rocks can be thus altered so that they no longer bear any physical resemblance to the original rock, can be readily understood by those who have visited geysers and hot springs in volcanic regions. There steam and sulphurous gases may be observed issuing from vents in the rock, and rocks recently fallen from surrounding cliffs within reach of the influences of these vapors and heated waters are found altered to kaolin, or otherwise changed. If similar waters pass upward through a vent in earth's crust—a fissure—the adjoining rocks will be altered in a similar manner, and in time the vein minerals with which we are familiar will be deposited. This is accomplished probably by upward moving waters, but in most instances where mining is now being carried on the process of vein formation has long since ceased, or is on the wane, and the water circulation is downward. This downward circulation produces other changes in the vein, and we find what is termed secondary enrichment, which is so beautifully exemplified in many copper mines, although this process is known to affect other classes of veins as well.

There is much difference of opinion among miners as to the direction of flow of underground waters. Some believe these waters are forced into the workings from below, others think they came from above, but it is fairly safe to assume that in most instances the ascending waters are hot, and that where the water is cold it has no direct connection with the sources of heat found in great depth. Much depends on local conditions. The waters in the deepest mines in California, nearly 3000 feet vertical, are not over 80° F., while in the Comstock Lode, Nevada, water having temperatures varying from 100° to 158° F. are found far above the 3000 level—between 1000 and 2000 feet from the surface, as well as deeper. The surface waters of the Comstock lode are cold. At Steamboat Springs, Nev., the attempts to mine have been futile, because the scalding waters and steam issue at the surface. In Colusa county, California, a quicksilver mine having what would be good payable ore under ordinary conditions cannot be worked owing to the intense heat of the mine workings and the existence of scalding hot waters at numerous places in the mine. In time, doubtless, both this and Steamboat Springs and similar places will become cold, and then the miner of the distant future may find profitable employment in the exploitation of the mineral deposits existing in these and like veins elsewhere.

In shaft sinking water often comes into the workings from below with considerable force, occasionally in such abundance as to temporarily drive the miners from the shaft, when only by vigorous and long-continued pumping can the water be controlled. Later this flood is overcome and the sinking proceeds as before; the "spring" is passed and sometimes completely drained and comparatively little water is encountered, when, without warning, another gushing spring is encountered, and the same process of pumping must again be gone through. This proves conclusively that the water is due to downward flow and is the result of tapping a fissure, seam or crevice which had communicated with a water-saturated zone.

The downward flow of surface water usually changes the physical appearance of the vein to a great extent. Oxides and carbonates abound where were originally sulphides and silica, the change from the oxidized zone to the sulphide being sometimes gradual, but often abrupt.

Veins are also altered greatly by movement of the walls and pressure which took place long after the vein was formed. Solid masses of ore are crushed to the condition of sand, or broken into millions of fragments, large and small, these being generally re-cemented by silica or calcium carbonate, or both, again forming a solid vein, but the evidence of brecciation may generally be plainly seen. Sometimes a gouge forms on one wall, occasionally on both. At one time it was thought that where the gouge occurred on the foot wall only it was due to fine particles of suspended clay, and other mineral matter, settling by gravity on the lower, or foot wall, from the solutions which filled the fissure. This theory contemplated an open crevice, and there may be examples of its occurrence, but ordinarily clay selvage, gouge, etc., at the side of a vein is due wholly to movement of the walls. This selvage may be but a fraction of an inch thick, or it may be many feet. On the Mother Lode of California gouge often occurs up to 40 feet in width—usually a mass of crushed, foliated, lustrous black slate, soft and easily mined, but extremely dangerous, swelling and crushing timbers and filling the excavations completely if not promptly held. Often these great gouges contain rounded masses of quartz, sometimes weighing a ton or more, but usually not over a hundred to two hundred pounds in weight. These are striated and polished, and show every evidence of heavy pressure and attrition. Occasionally these "boulders" are rich in gold and sulphides, and a fruitless search is made for the main vein from which they came, for it is evident that these masses of quartz originally occurred as kidneys, or lenses of ore, in an irregular vein, and that the tremendous movement to which the zone of fracture in which these lenses occurred was afterward subjected, resulted in obliterating the line of original crushing with its walls, if it ever had any, and the lenses become involved in the broad mass of crushed slate in which they occur without regularity or definite relation to each other. This has then become a fissure vein, though originally it may not have been such, but merely a succession of detached lenses formed along a common strike and dip, in a zone of crumpling, but not of clean fracture. The conditions here described are only a few of the many which may be observed in fissure veins, as it is a subject about which volumes have been already written and much still remains to be said, as knowledge is gained of the process of ore formation and alteration.

THE mining States of the West are already summarizing the results of the mining industry within their respective borders during the past year, and it is pleasing to note that there has been a material increase in almost every branch. Labor troubles have been few in the mines the past year, and this has been an important factor, when compared with the conditions of the previous year. At

no time in the past has the mining industry generally been more prosperous than at present, and with every promise of a continuance of the existing industrial conditions throughout the United States and the world, which make such heavy demands on the products of the mines, an increase in mining activity may be anticipated, so that the year 1906 is more than likely to show an important increase over the output of the present year. The market price of all metals used extensively in the industries is high, which naturally gives added stimulus to the efforts at increased production.

The New California Inland Sea.

Since the Colorado river has been steadily pouring its flood into the depression in southern California known as the Salton Basin, there has been much speculation as to the influence which this newly created inland sea may have on the climate of that portion of the Southwest. There are those who believe, and insist, it will entirely change the climate of southern California, and the adjoining portion of Arizona, and that an abundant rainfall will result, with correspondingly increased fertility of the soil and consequent prolific crops; also, that the temperature of the country will be much more bearable, particularly during the heated midsummer.

Such conclusions cannot fail to be pleasing to those dwelling in southern California, and particularly in the desert section, but there is seemingly nothing to warrant such hope of climatic change. That there will be a large and increasing evaporation from the surface of the Salton sea there is no doubt. It already covers several hundred square miles of territory, and as all attempts to turn the Colorado aside have thus far failed, and apparently will continue to fail, the Salton sea will doubtless increase in area, and may in time cover all of the territory lying below the level of the ancient shore line, so sharply defined about a great portion of this desert basin.

The original area of the ancient sea was over 4000 square miles, and its greatest depth was about 260 feet, at Salton. This lowest portion of the basin was, as a matter of course, the first to be covered by the recent flood. The water is, perhaps, 25 feet deep at the deepest place. The statement that the Basin will soon be filled to the level of the ancient shore line is without reason, for it will take several years to accomplish this, even if the entire Colorado river pours steadily into it, uninterruptedly, winter and summer. The river has been flowing into the Basin now for months, and only a comparatively small portion of the area is covered. Each additional foot in height now means a much larger superficial area, and from now on the rate of rise must be comparatively slow.

The evaporation in that arid region is very great, particularly during the summer months, and in time it may be that evaporation will equal the inflow, for as the Basin fills up the sand will again be deposited along the side of the river channel, and eventually build a spit across the breach through which the river now flows as it did before. When this occurs, should the flood continue until then, evaporation would soon begin to exceed the inflow, and the Salton sea would in time become once more dry.

The evaporation from the surface of this great sheet of water is taken up by the dry desert atmosphere and carried over the country in the direction of the air currents. Unless this moisture-laden atmosphere strikes a mountain range of much lower degree of temperature than the moist air itself, or it encounters other and colder currents of air, no precipitation will take place in that part of the country. Should the heavily laden clouds drift toward the snow-crowned San Jacinto or San Bernardino mountain ranges, prompt and heavy precipitation must result, which may be more damaging than helpful in its effects. The desert region is not noted for its gentle showers, but rather famous for violent storms and torrential down-pours, as evidenced in every mountain canyon and boulder-strewn wash of the desert country.

There is no evidence that the shores of the Salton sea, or the region within many miles of it, enjoyed a more salubrious climate when the ancient lake was full than it does now.

The Great Salt Lake in Utah was a much larger sheet of water in former times (Lake Bonneville) than the Salton Basin has ever been, and there is little evidence to show that that section of the Great Basin was more fertile in consequence than under the present conditions.

The anticipated change of climate, due to refilling of the Salton Basin, is without substantial support. Should the Basin continue to fill, the most important change that will occur will be that a hot and absolutely dry depression on the Colorado desert will have become a body of water which may be in part navigable for small and flat-bottomed vessels. The shores will present various conditions. In places there will be broad stretches of shallow water with exposed mud flats, between the higher land and deep water. In other places the water will be deep enough to float large vessels close to the shore. The ancient shore line presents all of the varied and interesting phases of lake shores elsewhere. There are sand spits and dunes and barrier reefs, enclosing shallow lagoons with mud flats; abrupt, rocky shores, and low-sloping flats. Where canyons entered the Basin from the mountains, carrying their torrents of flood water and laden with debris varying from sand to cobbles and boulders, the characteristic results may be plainly seen, and these evidences of nature's forces on the old shore line are still so well preserved as to make it seem that a month had scarcely elapsed since the waves washed the shores of this ancient lake.

There are mines in almost every mountain range and hill in the vicinity of the Salton Basin, particularly on the easterly and northerly side, and the development of these mines may be facilitated by the filling up of the lake. Whether or not the Basin will ever be completely filled yet remains to be seen. It is very far from it at present, at any rate.

Annual Assessment and the Multi-Claim Holder.

There is in some mining districts a very strong prejudice against the relocation of unpatented, but "unrepresented," mining claims, by any one, and those persons having the temerity to act within their legal rights, by relocating claims upon which no assessment work has been done within the past year, or perhaps within several past years, usually are made to feel the displeasure of those who consider the first locator entitled to all he claims without complying with the full requirement of the law, and in many instances with no part of it. It is fortunate that such sentiment can only prevail in those districts where mining activity is at a standstill, or near it, for in those districts where mines are being profitably operated the demand for claims is so great as to overrun the dog-in-the-manger policy, so evident in the stagnant camp. In former years much contention, and not infrequently bloodshed, resulted in the adverse claiming of mining ground. More recently the mining laws are better understood, and the lawless, bulldozing element which was often such a pronounced feature of mining camp life in the early days is much less in evidence. Gun fighting "miners" are seldom seen these days, even in the richest camps. Men understand their legal rights better and the communities which grow up about newly discovered mines insist upon law and order. As a result rich and poor mines alike are developed, and the fortunate owner of a claim that opens up well under development can retain his possessions without employing a small army of armed men of known bad reputation to hold it. The sluggish, or forgotten, camp is the one where the oldest inhabitants usually hang on tenaciously, locating all unclaimed ground, and relocating for themselves all claims abandoned by more wide-awake and progressive men, who have gone elsewhere to seek fortune. These "oldest inhabitants" quietly lay claim to everything in the district, some of them claiming more than a hundred locations, while performing less than a hundred dollars worth of work on the entire lot. They patiently wait for some capitalist to come along and buy them out—an event which rarely, if ever, happens. No policy could be more detrimental to the progress of the district, nothing more suicidal to the best interests of the selfish multi-claim holder. He does nothing to improve or develop his property himself, yet is unwilling to give up a foot of "his ground" without reward to any one else who will. The development of a single paying mine in such a district would enhance the prospective and speculative value of every other claim in it, but so long as these oldest inhabitants continue to claim and hold the principal portion of the district, and they singly and collectively threaten personal violence to any one who presumes to assert his legal rights by relocating claims which have not been properly represented perhaps for years, just so long will such districts remain undeveloped and obscure, and capital will continue to look elsewhere for investment.

There are numerous districts of the character here described, and they are found in most, if not all, of the Western mining States. The lack of large success in any of the mines of the district is probably largely responsible for such a condition, but so long as such conditions prevail there is little likelihood of any mine in the district becoming noted or profitable. It does not follow that there does not exist in such districts mines well worth equipment and development, but the attitude of the selfish claim holders is a great drawback, and the best prospects are likely to remain idle for years, as they have in the past. In such districts as these the claim holders should make an effort to have the possibilities of their section known to the world, and to offer the most liberal terms to capital to induce some one to undertake the development of the best claims. Should one such venture prove a success it would be comparatively easy to dispose of other promising claims at advantageous price and terms.

GOLD mining on the west coast of Africa is beginning to assume a more substantial appearance, and the industry is evidently growing and prospering. In 1880 the output was about $150,000; in 1889 it had increased to $500,000. From that year to 1902 it fluctuated between $100,000 and $500,000, but suddenly increased in 1903 to over $1,250,000, and in 1904 was further increased to about $1,750,000, the latter increase being due chiefly to addition of mill capacity at some of the mines. Gold is obtained by quartz mining and dredging. Both of these branches of the industry are on the increase in the West African territory. The climate is exceedingly bad, and a prolonged life of white men in that portion of Africa is almost impossible. The expenses of management are necessarily high, as competent men are required for the conduct of various branches, and good men will not accept such positions except at a high salary, with frequent vacations. White miners will do well to remain away from the Gold coast, for the opportunities for employment are few, and all engineers go there under contract, yet, in the face of the topographical and climatic disadvantages, mines have been equipped and developed, and railways built, and other engineering work accomplished, but at a great cost of money and human life.

THERE are those who believe geology is of little practical benefit or usefulness in mining. It is needless to say that those entertaining such opinions have no knowledge of geology themselves and represent a class of people whose opportunities have been either limited or neglected. Geology has a most important relationship with mining, as has been evidenced many times. The work of trained scientific geologists in several of the largest and most productive mining districts of the United States has been of distinct and almost incalculable value to miners. Instances of this may be mentioned in the iron mining region of Minnesota and Wisconsin; Leadville, Colo.; Cripple Creek, Colo.; the Comstock Lode, Virginia City, Nev.; and other fields in Nevada; in the bedded ore deposits of South Dakota and in the zinc-lead fields of Arkansas and Missouri. Many more instances of the value of geology to mining might be instanced, but the general and most valuable features have been pointed out by Prof. A. C. Lawson, a distinguished geologist, who read a paper on this subject before the recent convention of the California Miners' Association, at Nevada City, Cal., and which is republished herein in full.

IN working a mine by open-cut method, some note should be taken of probable future requirements and the work performed accordingly, but usually the future is left to care for itself, particularly in the early history of a mine.

CONCENTRATES.

IT is customary to line large steel stacks with bricks to prevent the steel being corroded by the gases passing through the stack.

DIABASE may be either fine or coarse, and ranges in color from almost black to light green shades. It sometimes contains mica and quartz.

THE only method of obtaining the actual capacity of an air compressor is by the use of indicator cards, from which the effective stroke in the air cylinder may be obtained.

THERE is no material advantage of vertical over horizontal engines or compressors for any purpose, except that the vertical type requires much less floor space than the horizontal type.

A VERY small percentage of copper ore in a furnace charge will act as a carrier for all the gold and silver present. Attempts to smelt pyritic ores without some copper, result in a loss of precious metals in the slag.

THE only material difference between compressors built to operate at comparatively low altitudes—5000 feet or less—and those to work at high altitude is a change in the relative diameters of the steam and air cylinders.

ASPHALTUM from different localities varies greatly in mineral composition, as indicated by analysis and by the action of heat, alcohol, naphtha and turpentine on samples. Asphaltum is found in many places and in rocks of no particular age.

REPEATED successful experiments in various parts of the United States have abundantly proven that a weak solution of copper sulphate will clear water polluted with algæ and other organic substances. When applied in proper amount the water is usually clear within four days from the time of application.

CALCINED MAGNESITE is employed largely in lining open hearth furnaces, cement kilns and where a refractory heat-resisting material is required. Magnesite is white or cream colored, unless colored by impurities, such as iron oxides, etc. It is usually hard, dense and brittle, but also occurs white, soft and earthy.

IT is difficult to anticipate the cost of mining by analogy. The fact that mining and milling is accomplished at a cost below $1 per ton at one mine is not a safe indication that these costs may be duplicated at another. On the other hand, under more favorable conditions, the cost per ton may be reduced somewhat.

WHEN it becomes necessary to take samples under the floor of a level, it is generally a good plan to shovel away all overlying debris and to get the floor as clean as possible, and then by a line of block holes blast out a trench across the vein or deposit, thus exposing new ground from which samples may be taken with a minimum chance of being salted.

THERE are scores of patents issued in the United States and other countries of the world for various modifications of the cyanide process. In selecting a process, seek one which will treat the ore by rational and inexpensive methods, and not one full of complex and difficult operations, wherein the profit, if any be possible, is wholly absorbed by the expense of treatment.

THERE still remain twenty-two days in 1905 within which assessment work may be done on unpatented claims for the year 1905. If work is started at any time prior to midnight, December 31, 1905, the claim owner may legally hold his claim against all comers, but he must continue the work so commenced to a completion at once or it will not avail as against the relocator.

THE minerals occurring most commonly in pegmatite dikes, those of unusually coarse crystallization, are: Quartz (white, colorless, pink and bluish); orthoclase (feldspar); microcline (feldspar); muscovite, biotite, phlogophite and lepidolite (micas); tourmaline of various colors; cassiterite, wolframite, beryls, apatite, columbite, spodumene, topaz, and other minerals. The most of these minerals have economic value when separated from each other.

A WINDLASS for a prospect shaft should be made of good, strong material and be so constructed that it may be readily taken down and set up again at another place without injury to the windlass. This can be accomplished by framing the uprights so that they will enter tenons in the cross-sills of the platform, where they may be secured by the use of wedges. This obviates the necessity of spiking the uprights to the frame, to which, however, there is no objection if the windlass is never to be used elsewhere.

MONAZITE is a mineral mined for its value in thoria content, which is used in the manufacture of incandescent gas mantles commonly known as the Welsbach mantle. The mineral monazite is mined chiefly in South Carolina and North Carolina at present, but large amounts are known to exist in the sands of granitic regions elsewhere in the United States. Brazil and Norway also produce monazite in considerable quantity. It was worth in 1903 about $140 per ton. This is from the latest available official report.

THERE are several minerals which resemble molybdenite. That approaching it most nearly in appearance is micaceous hematite, a foliated, mica-like variety of specular iron, but this may be readily distinguished from molybdenite. Micaceous iron has a dark red streak, while the streak of molybdenite is metallic lead gray, with no trace of red. Graphite is also much like molybdenite in appearance. Both leave a trace on paper, but the molybdenite leaves a more bluish trace on paper, and on heating gives off sulphurous fumes, which graphite does not.

HEAVY BINDERS of timbers may be useful in a stamp mill to hold the mortar blocks firmly, if the blocks be made of two or more large timbers, but if the blocks be built up of planks solidly spiked together, the binders may be dispensed with. The battery posts, too, should be given a very firm foundation, and not placed on a timber or sill which is supported by mud sills several feet apart, as this will cause the cam shaft to become very unstable and to vibrate to such an extent as to require the bearings to be capped and held in place by bolts, thus increasing the friction and consumption of power.

A PIECE of silver-plated copper plate placed on the spreader box of a concentrating machine of the belt type, and fixed immediately under the pipe carrying the pulp from the launders down to the spreader box, often collects quite a quantity of amalgam that has escaped from the apron plates. Mercury becomes very finely divided, and concentrating machines do not always save this with the sulphurets. "Concentrates" has known of considerable quicksilver accumulating in the settling boxes underneath the machine, which had apparently floated from the wash box, and finally settled in the still water of these settling boxes.

AN arrangement frequently seen at large shafts for handling skips quickly, when it is necessary to change from one kind to another, for instance, from ore skip to water skip, is a traveler running on a track passing near the shaft, the traveler being provided with a means for attaching to skip. When the skips are to be changed, the hook on the traveler is made fast by chains or other means to the skip and it is swung out from the shaft and pushed to one side, suspended above the floor. The other skip is then made fast to the cable and placed in the shaft. The upper section of guides is so arranged as to swing to one side on a hinge to permit the skip to be readily taken from the shaft, and replaced when necessary.

MICROSCOPES for the examination of rock slides are of special construction, made specially for this purpose. The instrument must not only be fitted with a readily adjustable set of Nicol prisms, but must have a number of other accessories—a wedge-shaped slip of perfectly clear quartz, set in glass, a selenite plate, mica plate, etc., beside which the instrument must be provided with a mechanical stage, by means of which the object to be examined may be shifted forward or backward, or to the right or left, and the entire stage must revolve about a central point, and be accurately graduated into degrees. There are other movements and attachments to the petrographical microscope, but the above mentioned are the most important.

WHERE a quartz mill is situated on an unpatented quartz lode location, any substantial improvements or extension of the mill, or work on the mine roads, flumes, tramways, etc., may be applied to assessment work. In fact, any work, improvements or installation for the betterment of the mine is legitimately applicable to annual assessment account. The placing of movable tools, etc., on the property, or the wages paid a watchman, are not applicable to assessment. The same kind of work and improvements as above mentioned, made on a patented claim, one of a group of which some are unpatented, may apply as assessment on the unpatented claims. In this case the several claims of the group must adjoin, and the work or improvements made must clearly be for the benefit of all the claims constituting the claims of the group. One hundred dollars worth of work must be done or improvements made for each unpatented claim of the group.

THE East Lode of California, as it is generally described, is that mineral belt extending in a northwest direction, and about 8 to 10 miles east of the so-called Mother Lode, and approximately parallel with the latter. The wall rocks of the mines of the Mother Lode are clay slates, amphibolite schist, serpentine, diorite, diabase, and at a few localities gabbro and rocks of granitic type, though south of Placerville, El Dorado county, so far as known, no granite. The slates have been assigned to the Jurassic, and are known as the Mariposa beds. The East Lode occurs in association with clay slates, mica schists, quartzites, limestones, dikes of felsite, diorite and diabase, and much of it in grano-diorite. The metamorphic rocks are much older than the slates of the Mother Lode, and are known in California as the Calaveras formation. This so-called East Lode is not the most easterly lode in California, for there are two or more belts or lodes still east of the East Lode, and between it and the crest of the Sierra Nevada, and other lodes on the east slope of the Sierra. West of the Mother Lode is also a gold belt and a copper belt. The latter is the more sharply defined and extends for many miles, though not continuously, along the low foothills bordering the eastern edge of the San Joaquin and Sacramento valleys.

SOLID iron sulphide in gold-bearing veins is usually but not always auriferous. In some very good mines this mineral occurs in a semi-granular condition with little gangue mineral, and containing very little gold. This is a notable feature of some of the fissure veins of the San Juan country, and it is also known to occur in Yavapai county, Arizona, and elsewhere. Heavy sulphide ore is occasionally crushed in a stamp battery and amalgamated, but it is rarely that over 60% of the values in free gold can be thus extracted at one operation. Occasionally the greater part of the gold in such ore is coarse, when a high percentage of the gold values may be thus saved, but to obtain the fine gold the ore must be crushed very fine and agitated for some time in contact with the quicksilver. Numerous attempts have been made at various places to do this, but usually such efforts are of an experimental nature, and "Concentrates" knows of no place where this is the regular practice. The nearest approach to it is the slow-drop Gilpin county, Colorado, mill method, where the ore is crushed in a mortar with high discharge and the ore given abundant opportunity to come into direct contact with the mercury before it escapes through the screen. In some of these mills no concentrates are made as they are not considered sufficiently high grade to yield a profit.

AS to the discharge capacity of a siphon, the enquirer having neglected to give the length of his siphon, it is impossible to answer his question as to the amount it will discharge. The following information may be of some service: For a straight iron pipe, the formula for head required for a given discharge is

$$H = \frac{v^2(1+54d)}{m^2 d}$$

So

$$v = \sqrt{\frac{H(m^2 d}{(1+54d)}}$$

Where,

H = m and head in feet.
l = length of pipe in feet.
d = diameter of pipe in feet.
v = velocity of flow in feet per second.
m = a constant varying for different diameters of pipe and values of

$$\sqrt{\frac{d\ H}{(1+54d)}}$$

From the above, assuming in this case that the length of the siphon pipe is 100 feet and head 5 feet, the discharge should be approximately 33 cubic feet per minute, or 247½ gallons. By applying the above formula, the probable flow for other heads may be computed, but inasmuch as the constant (m) changes with the condition of head and length, these factors must be known before an accurate determination can be made. One of the points in connection with this matter is of the utmost importance, and that is the fact that any results obtained by the use of such formula as given above apply only to the condition of a siphon in which no air is allowed to collect at its crest, for as soon as such a condition begins to exist the flow is necessarily reduced.

IN the issue of Nov. 25, "Concentrates" stated that "where a vein crosses one end of a location and then swerves and crosses a side line, it is restricted in the extralateral right to that portion of the vein between the crossed end line and the point where the vein crosses the side line where the plane is projected downward in the direction of the dip, and parallel with the crossed end line." This is good law (Argonaut Con. M. Co. v. Turner, 23 Colo., 400; 58 Am. St. Rep., 245; 48 Pac., 685; Beik v. Nickerson, 29 L. D., 662). A locator of a new mine is not always able to trace out definitely the exact strike of his location, and he may mistake its true direction to such an extent that the vein may pass outside of one, or even both, side lines. In such event the extralateral right is limited to that portion of the vein between the points where the vein crosses the side line or lines, and this right is defined by drawing planes parallel with the end lines, downward in the direction of the dip, as stated in the "concentrate" above referred to. Should this claim be designated "A," and another claim "B," through which the vein passed, after leaving the side line of "A," should be located upon this extension of "A's" vein, then the extralateral right would be determined by priority of location, which in this case would be "A." "A" would take his extralateral right as indicated, and "B" would be entitled to all of the vein within his claim and the extralateral right as usual until it reached that section of the vein belonging to "A." "B" would then take up his right beyond "A's" zone and pursue it on its downward course, until he intercepted the right of a second senior location, should any such exist. In the Cœur d'Alene, Idaho, cases there are several such instances of interrupted extralateral rights, due to curving strike and other causes.

The Relation of Geology to the Mining Industry.

At the recent convention of the California Miners' Association, held at Nevada City, Cal., A. C. Lawson, professor of geology at the University of California, delivered the following address on the relation of geology to the mining industry:

Mining is one of the most ancient of the arts. The relics of the most ancient civilization afford abundant evidence of the existence of mining operations.

Long before the gold of Ophir embellished the temple of Solomon, gold and precious stones, silver, copper and other metals were known to the older civilizations of Assyria, Egypt and Mycenæ.

The bricks of Babylon were cemented with asphalt mined on the shores of the Caspian.

The fire worshipers of Persia burned natural gas. The Greeks mined silver-lead ores of Laurium to the extent of 51,000,000 cubic yards 600 years B. C. The tin mines of Cornwall and the copper mines of Spain were well known to the Romans. The mines at Freiberg have been mined continuously since the eleventh century and those at the Hartz mountains since the ninth century.

With this long experience mining has gradually improved its methods of extracting the metals and other useful substances from the rocks of the earth's crust.

Like other arts, its methods and its conclusions are empirical. As an art it has been unconcerned with the genesis of the deposits which it exploited. It sought but rarely to comprehend the laws governing their occurrence, or the conditions which determine their variation of character. It concerned itself with the matter-of-fact search for and exploitation of valuable deposits.

Its most sweeping generalization even to this day is, "gold is where you find it."

In contrast with the antiquity of the art of mining, geology is one of the newest of the sciences, the product of the last century. The sciences of mathematics, astronomy, botany, zoology, physics and chemistry were well advanced before the science of geology came into being.

It is in the nature of things an inexact science. Its data are often vague—its hypotheses shifting. It deals with the genesis and evolution of the earth's crust, of which metalliferous deposits form an exceedingly small part.

It is as to the relationship between this hoary art, extending back into the mists of antiquity with its ages of accumulated experience and this up-start science of the century, juvenile to a degree, tottering along like a child in the maze of world mystery, grasping at stray facts for support, that I am requested to address you this morning.

Whatever may be that relationship, it would be very natural to suppose that geology was founded on mining. The revelation of the rocks, their structures, relationships and history, as afforded by mining operations, might well be supposed to have stimulated that healthy curiosity into the causes of things which is the basis of all science, and thus bring about the beginnings of the science of geology. This assumption, however, would not be true. Geology historically is not an outcome of mining. The rocks which first awakened inquiry were not studied underground. Its first principles were not discovered by candle light, but in the open daylight along the seashores, in the stream gorge, and on the mountain peak.

It was entirely unconcerned with economic questions. The earliest controversies of the sciences were about rocks. You will all recall the famous controversy of the Neptunian hypothesis versus the Plutonic, carried on by Werner and by Hutton, the representatives of two different schools of geology, which arose at the beginning of the science. William Smith of England was concerned with the principles of stratigraphy. With the study of the strata, the discovery of fossils created widespread interest, and the paleontological side of geology has remained to this day one of its most interesting phases. The study of stratigraphy has also led to the recognition in England of the occurrence of coal in the form of strata. Gradually, and incidental to its main purpose, geology took cognizance of metalliferous deposits, their character, form, size, mineralogy, origin, etc., along with other earth phenomena. In later years, particularly in Germany, Scandinavia and the United States, the body of facts and theories arising from these observations became so large that a special branch of geology, known to-day as economic geology, has grown up to care for them. This is particularly seen in Government service. All the nationalities of the earth, and in the case of Germany, for example, the various subdivisions of the nation, have established State survey for the purpose of mapping the geological formations of the countries and so delimiting those formations which are liable to carry valuable ores and other substances from those which are in all probability barren.

In our own country we have a national geological survey maintained by the United States Government at an annual cost of approximately $1,000,000, but besides this the great majority of the States maintain their own individual geological surveys. California alone of the larger States, having rich mineral resources, maintains no geological survey and is making no systematic effort to map its geological formations in the way that other States are doing.

But this activity on the part of economic geology is not confined to State established institutions. There is a growing body of men who are devoting their lives to what may be fairly called the profession of economic geology. They have their own literature and their regular periodicals, dealing solely with economic problems.

During the first forty or fifty years of geology in the United States we followed, as in many other things, British traditions and were engrossed in pure geology, ignoring economic considerations. But with the winning of the West and the opening up of the great mining camps, geology was drawn irresistibly into the study of ore deposits, and we have to-day a literature and a body of men devoted to geological problems of this kind standing second to none.

But these studies, while undertaken primarily for the economic interest that inheres in them, have frequently yielded generalizations of a purely scientific import. In this connection, speaking of the profession of economic geology, it may be well to discriminate between the economic geologists proper and the mining engineer, and both of these from the "expert" whose name is legion. The economic geologist is not concerned with the winning of the precious metals or any other substances from their native deposits. He is concerned primarily with the understanding of their geological relations. It is the function of the mining engineer to see to their economic exploitation.

In any consideration of the relation of geology to mining, the first idea that becomes uppermost is the deep obligation of the science to the art. In this branch of inquiry geology has been very greatly indebted to mining operations. The study of ore deposits was only possible underground. Geology, in itself, could never have undertaken the necessary operations to reveal the relationships necessary for its inductions.

The sequence of ores in depths as illustrated in the copper and tin mines of Cornwall; the relation of ore to wall rock as illustrated in the metasomatic replacement in the Mother Lode; the relation of gossan to original deposits; the general association of ore deposits with igneous rocks; the theories of ascending and descending solutions and of lateral secretions; the distinction of deposits due to dissolution from those due to crustification, and from impregnations so ably discussed by Posepmy; the principle of secondary enrichment now so generally recognized, particularly in our copper deposits; the distinction between aqueous deposits and magmatic segregations illustrated in the nickel mines of Sudbury; all of these valuable ideas, principles and facts are due primarily to the facilities offered to geologists by mine operations, so that they might have access to the underground conditions for the purpose of study. They are not merely contributions to the lore of mining, they are important additions to geological science. I say, therefore, that the most important fact in the relationship of geology to mining is the indebtedness of the former to the latter. But, while geology is deeply indebted to mining, the service has been well repaid. Geology to-day is contributing much to mining in various ways. Let me mention some of these: First, in the matter of prospecting. The mapping of geological formations as conducted by geological surveys is one of the preliminary steps in the systematic prospecting of any region rich in mineral resources. The prospecting for the precious metals by the aid of geological mapping and instruction is well illustrated in the conditions which prevail at Tonopah to-day. There the miners and mine owners are deeply concerned with the results of geological investigation. For, in the greater part of the camp the ore bodies do not outcrop at the surface, but are buried by lava flows and these lava flows must be pierced by shafts to reach the formations in which these lodes occur; and it requires geological skill to determine whether or not the so-called lode bearing porphyry has been reached in such sinking. The prospecting for zinc in the upper Mississippi valley has been greatly benefited by geological guidance. In the Lake Superior region the great iron mining companies concerned in the finding of new iron deposits systematically employ geologists to do their prospecting in new districts on geological lines. Coal is usually prospected for on stratigraphic principles. And you are all familiar with the fact that in search for mineral oil or petroleum the theory of the anticline is now generally recognized, but the recognition of the anticline in the field can be safely made only by the skilled geologist. Another way in which geology subserves the purposes of mining is the substitution of world-wide experience for the local experience of any particular mining camp. In particular camps miners who have been engaged for years in exploitation of mineral substances become keen and expert in the recognition of the indications of ore, and their experience, growing upon them naturally, leads them to apply that experience to new conditions in remote or neighboring districts, where, perhaps, the geological conditions are totally different, and it requires a man who is familiar with mining experience as regards the occurrence of ore deposits, at least, to interpret a new field.

Another way in which geology is of service to mining is in the pursuit of ore bodies already known. Ore bodies are troubled in various ways, particularly by the faulting of the region. Lodes and deposits of all kinds are very commonly interrupted by faults, so that the extension of the ore body may be a matter of grave doubt, and in these cases it is the advice of the skilled geologist which will prove most efficacious in bringing a solution of the problem. The famous Saddle reefs of Bendigo and the similar structures in Nova Scotia and in the Broken Hill region are instances of the occurrence of lodes with structures with which the miner is usually unfamiliar, but with which the field geologist is at home.

Next, as regards the genesis of ore deposits.

It may be urged that theoretical questions as to the genesis of deposits do not concern the practical miner. But I have generally observed that whether or not it is a matter of practical concern, the miner is usually much interested in the inquiry as to what the genesis of his ore may be. Whether they be veins or segregations from igneous magmas, or the products of contact metamorphisms, are questions which fall within the domain of the geologist and not the miner, and he alone can satisfy the very laudable curiosity of the miner in this respect.

As regards the history of deposits, the geologist must be called in. These deposits are often complex, and there are many stages in their deposition, and the interpretation of this complicated history is not a matter which the miner is usually able to deal with.

In litigation, also, geology is very frequently of service to mining. The courts and opposing counsel are generally desirous of knowing the opinion, at least, of geological experts in the matters in dispute.

In the matter of legislation, too, the abundance of geological terms in the statutes governing mining operations shows the large influence which geology has exercised in this direction, and this influence, if I may be pardoned for saying it, might be still farther extended to the simplification of our existing mining laws.

Another way in which the influence of geology in mining is seen is the growing tendency of large mining corporations to employ geological experts, not only in the direction of exploratory work, but in the actual direction of mining operations. This is well exemplified in the great Anaconda mine at Butte, Mont., where the planning of new underground operations is directed from the office of the consulting geologist of the company.

Large concerns, like the Guggenheims, are employing the best geological expert advice that they can get in the advancement of their projects. The Southern Pacific railway maintains on its staff not simply a geologist, but a corps of geologists, to enable them to discriminate valuable mineral lands from agricultural lands. And if a private corporation like the Southern Pacific railway finds it profitable to follow such a policy, it would seem at least expedient for the State of California to follow suit, and to establish and maintain a geological survey for a similar purpose.

But one of the finest illustrations of the co-operative helpfulness of geology towards mining is seen in the investigation which is being conducted at the present time by the United States Geological Survey under the direction of G. K. Gilbert, into the vexed problem of the reconciliation of hydraulic mining and agricultural interests. Mr. Gilbert is one of the most eminent geologists at the present time living. He has been concerned throughout his life in the investigation of problems in pure geology. Yet, at the call of the miners of California, he gives his great talents to the study of this most important problem.

One of the most curious things in the relationship between miners and geologists is the "odium geologicum." The cause of this is difficult to fathom. In many camps geologists are ridiculed, not as experts, but as inexperts. The probable reason for this is two-fold. In the first instance, there are, beside the real geologists who understand their science, a vast number of so-called experts who impose upon mining communities, and who, by their ignorance and mistakes, bring the science of geology into disrepute. The second probable cause of this prejudice against geologists on the part of miners is to be found in the natural and wholesome suspicion of theories, but theories are a symptom of thinking. Some thinking is weak and ineffective, so some theories are pernicious in their tendencies. Science makes headway only by the erecting of hypotheses and their critical examination. Theories are not an evil in scientific hands. There they are understood. The trouble is that many miners take them for gospel. Miners themselves are not wholly free from theories. Such theories as "iron is the mother of all the metals" is a theory which is pretty commonly entertained in Cornwall and among Cornish miners, is a theory which it would be difficult to parallel in the science of geology; the theory that "values always increase with depth" is almost universally entertained by the prospectors. When a miner runs a crosscut tunnel he indulges in a theory. The mine owner in putting up money to develop a mine indulges in a theory. How often his theory is in error I leave you to judge. There are 20,000 mining claims in this State. Every one represents a theory. How true they are I leave you to judge.

From what I have said it is apparent that the chief feature of relationship between geology and mining is one of mutual benefit. This should be the keynote of all efforts in the development of the mining resources of the country. There should be a spirit of co-operative helpfulness on the part of the art of mining and on the part of the science of geology. The miners should not be suspicious of the natural ambition of geology to do as much as it possibly can in its own way to bring about the full development of the country's resources. And geology, on the other hand, should remember its deep obligations to mining, and pursue with still more enthusiasm and with greater energy the problems of economic geology with which the mining industry is concerned.

Measures We Carry About With Us.

Written for the MINING AND SCIENTIFIC PRESS by MATT. W. ALDERSON.

If a mining man were called upon to judge of a distance on the surface of a mining claim he would form a close estimate by pacing it off. Yet, when one has had experience with numbers of estimates made in this way, he will be surprised at the difference in results. Most men will pace off the ground, calling each step a yard. It may, or it may not be. If one takes such a step as he would ordinarily, it is more likely to be 28 or 30 inches. Knowing that his step is less than a yard, he is apt to make a longer step when measuring; and, almost invariably, he will make steps of more than a yard in length.

There are many measures we are accustomed to make by one part or another of the body. Thus we say of a horse he is so many hands high—a hand measuring in this sense 4 inches. But many palms are not so wide. It is probable more would measure 3½ inches than 4. Then we have the cubit—the measure handed down from the pyramids of Gizeh, 3500 B. C., 20.64 English inches, and the Roman cubit of 17.4 English inches. The cubit is the measure from the elbow to the end of the middle finger and its variation in the past was due to the variation in its length in different individuals.

It is oftentimes of very great convenience to make measurements with various parts of the body and with a little intelligent forethought one may make these with accuracy. One should consider those he

might have occasion to use, find out what they are on his body and commit them to memory. First of all we take the pace. This is preferably made in the step one usually makes. Let one pace off a number of steps, measure the distance and strike an average.

Then one may wish to know how far he may reach with his arm outward from the body, how great the distance when his arms are outstretched their full length. One should know his height and it is often well to know the height from the ground to the level of one's eyes. One should make a table similar to the following and commit it to memory:

Pace	28 inches
Thumb joint	1¼ inch
Palm	3½ inches
Thumb and palm	6 inches
Hand span	8½ inches
Forearm	18 inches
Reach of arm	26 inches
Stretch of arms	5 feet 8 inches
Height	5 feet 6 inches
Height of eyes	5 feet 3 inches
Length of foot	11 inches

The Great American Desert.—I.

Written by GEORGE J. BANCROFT.

A very large part of ten States and three Territories is generally known as the Great American Desert. All that region where the rainfall is less than 15 inches per annum may be considered part of the desert.

The word "desert" is such a harsh one and carries to many hearers an idea of such a hopeless waste that it has been customary to speak of this territory as the "arid regions." I prefer to use the word desert because of its brevity, but it must be understood that I use it very broadly and apply it to that territory which is only just a little too dry to raise ordinary crops without irrigation, as well as to that country where conditions are more severe.

Using the word in this way, the desert is one of the most productive areas in the Union in proportion to its population. About 2,300,000 people have found good homes and profitable employment on the desert up to date and the day of the desert is only just beginning. In this wonderful stretch of country, blessed with the finest climate on earth and with uniformly rich soil, with water sufficient to reclaim a large acreage of it, with mineral deposits surpassing the treasures of Solomon, and with grazing potentialities sufficient to feed the herds of a nation, the desert is one of the most valuable and the least generally appreciated possession of the American people. It is an empire within itself.

I have heard sincere but untraveled men say that the United States must soon be looking abroad for additional territory to meet the growing demands of an increasing and ambitious people, while right here within our borders we have the best field imaginable in which to expend our surplus energies for the next two or three generations. The Steppes of Russia, which not only supply the fatherland with grain, but export 400,000,000 bushels yearly, have a climate more arid than two-thirds the land known as the Great American Desert. Vast areas in China and India, which teem with millions of people, are much the same in general characteristics as that which our census report shows have an average of seven-eighths of a man to the square mile.

Our desert differs from the stereotyped impression of a desert, in that the whole area is broken and and beautified by mountain ranges of all sizes, heights and kinds of contour. Many of these ranges are high enough to receive a very generous precipitation of rain and snow on their summits and some of the most beautiful little garden patches in the world are to be found clustered at the bases of such mountains where the little streams run out upon the thirsty land. Near the main ranges and larger streams there are very large areas under cultivation, as, for instance, the beautiful stretch of irrigated farms extending along the eastern slope of the Rockies and extending down the valleys of the Arkansas and Platte rivers.

The desert-grown fruits and melons are among the best known. The combination of damp soil and dry air gives a crispness to peaches, pears and melons which can not be duplicated elsewhere; moreover, the desert gardener is relieved of the eternal fight against worms, moths and disease which besets him who gardens in less isolated localities. The desert is the natural home of the sugar beet. To produce a high percentage of sugar, an abundance of sunshine is necessary, and to produce a large tonnage per acre, rich damp soil is necessary, while the beets are growing. The irrigated desert supplies these conditions. The desert produced $20,000,000 of sugar last year.

The driest country in the United States is the southwest desert surrounding Death Valley, Cal., and it has 2⅛ inches of rainfall per annum. From 2⅛ to 15 inches of precipitation, the land must be irrigated more or less to produce the ordinary crops, but even our driest land is used for grazing, and there are places in Nevada and Utah where the rainfall is only 5½ inches annually, that are so favorable to equine existence that the wild horses are a pest.

The topography of the desert country is admirably adapted to agriculture. It is a country of broad, gentle sloping valleys and picturesque little ranges. The soil of the valleys is deep and rich. The mountains relieve the monotony of the landscape. One can not travel through this vast, arid country in any direction without thinking what a beautiful country it would be if only there were a few more inches of annual rainfall, and one of the tantalizing things about it is that all through the central part of the arid country there is unmistakable evidence that the country was comparatively well watered, and not so many centuries ago either.

To the casual observer, the desert is apt to be uninteresting. The tourist, eager with interest to catch every view from the car window in California, pulls down the shade and reads a novel in Nevada. Yet the desert is as varied in its flora and fauna as any other area of equal size, and in scenic attractions, I think, there are few localities that can surpass it. Certainly, there is nowhere else where such brilliant rock coloring can be seen, and nowhere else where the soft lavender, grays and purples of the desert can be reproduced. I am speaking now of the ordinary every-day sights of the desert, such views as the Colorado canyon, the eastern scarp of the Sierra Nevada, or the view from the Panamint range, where at a glance one may see the lowest national place (Death Valley, 350 feet below sea level) and the highest national place (Mt. Whitney, 14,897 feet above sea level), now recognized as being among the foremost scenic wonders of the world.

Although the flora of the desert presents a gray, barren and uninteresting appearance to the superficial glance, a little closer scrutiny reveals a wonderful variety of species and a great range of utilities. Take the so-called sagebrush country, for instance. There are thirty or forty species of brush which go to make up the gray verdure commonly called sagebrush, and most of them are in no way related to sage at all. Among the commoner varieties may be mentioned the following: Shad scale, which sheep will eat, but which is not very good pasture; white sage, which is the best winter horse feed possible, and which cattle and sheep are also fond of; sheep clover, which, as its name implies, is the finest desert sheep feed; black sage, which is not good for much except that it grows high and strong and is seldom covered by snow; rabbit bush, whose succulent green stalks give nourishment to the jackrabbit when all else is dry and parched, and whose roots contain a gum which is practically the same as the finest South American rubber; greasewood, which makes a good camp fire, and whose roots also contain rubber gum and salt bush, which is an "all around" feed.

As the tourist gazes from the car window he sees a monotonous unchanging sea of grayish green, while the dweller of the desert looking out of the next window sees an ever-shifting panorama, replete with interest to the sheepman or cattleman, horseman or miner, whichever he may be. As a general princi

A Borax Town on the Mojave Desert.

ple, it may be said that stock feed on the desert is far more abundant than water, and that herein lies the great future of the desert as a grazing country. As wells are sunk and reservoirs built, more and more live stock can be profitably raised. It is not that stock die of thirst on the desert, when the range is overstocked, but they eat all the feed close to water, and then as they must walk farther and farther from grass to water and back again, they suffer from thirst and starvation combined. With frequent wells and windmills I venture to say the present number of stock on large parts of the desert could be increased ten times.

The rubber industry mentioned above gives promise of becoming one of importance. There is a practically unlimited supply of raw material and an ever-increasing market. There is one factory already in operation at Buena Vista, Colo., and several others are planned.

Among interesting flora may be mentioned the beautiful everlasting flowers found in the Mohave Desert, and near Death Valley, and probably many other places. They grow in great profusion after an unusually heavy rain, and have the most beautiful colors imaginable. The accompanying picture of flowers is from the Death Valley country.

On the deserts of southern Idaho and Oregon the desert mahogany reaches its maximum growth. The wood resembles the true mahogany in all essential particulars, except that it has a most unfortunate habit of "checking" during the seasoning process. There is an old man near Wells, Nev., who seems to have learned how to season the wood properly, and he makes most beautiful canes, which he sells for a living. These trees make the best firewood I have ever seen, not excepting the ironwood of the Australian desert. One cord of desert mahogany is equal to a ton of good coal.

Another interesting desert tree is the pinon, which produces the most tasty and wholesome nut that grows. The Piute and Gosiute Indians use these nuts as a staple article of diet. In central Nevada they grow to the size of peanuts and could be gathered by hundreds of tons, yet I have never seen any but the small Mexican nut on the Eastern market.

Many parts of the desert are clothed with a heavy growth of timber, and profitable lumber enterprises flourish; in fact there are 120,000,000 acres of woodland on the desert, of which 75,000,000 acres are valuable for lumbering. I only aim to touch here and there on some matter that arrested my attention in traveling through the desert mines, believing that these same subjects may interest others.

One of the noticeable characteristics of the desert flora is, that north of latitude 37° the flora is practically destitute of thorns, except on the eastern slope of the continental divide, while south of latitude 37° thorny plants are in the majority. In southern Arizona and Sonora it is said that there are 400 different varieties of brush, and 399 have thorns, while the remaining one is poisonous to the touch. I cannot vouch for the figures being exact, but the saying gives an impression of the conditions.

The worst of the thorny plants is the Cholla cactus, which is illustrated in an engraving on the front page. These plants have barbed thorns set so closely as to resemble a thistle going to seed. The knowing little desert rats gather pieces of these cacti in great quantities and place them around their burrows. They have tiny secret trails through the mass, and they know full well that no wildcat will follow them nearer than the edge of their abattis, that no coyote will ever undertake to dig them out. One of the most horrible tortures invented by the Apaches was to roll their naked victims in a bed of chollas (pronounced cho-yas).

In this same southern country are found the palo verde, whose bright green trunk and general appearance seem to indicate an abundance of water, yet they grow in the driest places, where the rainfall is only 2 to 5 inches per annum. Then there is the "niggerhead" cactus, whose outer skin is as water-tight as rubber, but whose inner pulp is almost as juicy as a watermelon. The juice is not very pleasant to the taste nor very wholesome, contrary to the popular story, but it beats going dry a whole lot, and I can imagine that one who was about "all in" with thirst might find it sweet and delicious. Some lives have no doubt been saved by the niggerhead cacti, but as a rule the man who knows enough of the desert to pick out a niggerhead knows enough to find the water holes.

One of the oddest, and I presume rarest, bushes I ever noticed on the desert is the screw bean bush, which, so far as I have noticed, grows only in the Saline valley, Inyo county, Cal., and the lower Colorado river. The fruit resembles in form nothing so much as the ordinary carpenter's screw. This valley and the neighboring valleys, such as Death valley, Panamint valley and Racetrack valley, I believe are the hottest places in the United States in summer. They have to shut down the borax works in the Saline valley from July 15 to Sept. 15, because even the Indians cannot work in the heat. For weeks the mercury will stand from 110° to 125° in the shade—and there is no shade.

Of the unusual fauna found on the desert I may mention the Gila monster, the "side winder" rattlesnake, and the hydrophobia skunk. The Gila monster is a hideous spotted lizard about a foot long and stubby in general appearance, which inflicts a poisonous bite. There is a harmless lizard called the chuckawalla, which looks much like the Gila monster and which has a great fondness for living around abandoned mines. It is a startling experience to have one of these hideous lizards poke his head out from between the cribbing just on a level with one's hands or face, when one is climbing down a shaft and can not jump away. The Indians say they are very good to eat, but someone else can have my share.

The hydrophobia skunk lives only in the driest and hottest parts of the desert. It is a pretty little animal, about the size of a kitten, and has a saucy way of coming around camp in broad daylight. I have often wondered how they existed so far from water. I have seen them, during August, 15 miles from any known water. Whether they really impart hydrophobia with their bite or not is a question I can not positively answer, but all the people who live in that section of the country believe they do, and there is no doubt that coyotes, wildcats and dogs occasionally "go mad" in the localities inhabited by the hydrophobia skunk.

I always thought the "side winder" rattlesnake was a good deal like the hoop snake, a creature of the fancy, until I saw one; then I realized that he was simply the result of evolution. For the ordinary snake to travel he must have something to wriggle through, such as grass or brush or rocks. Put a snake on a sidewalk and he can hardly progress at all. In southern Nevada, Arizona and on the Mohave desert of California, there are many areas so barren that the bushes are many feet apart and the intervening ground is a baked claypan as hard and smooth as a sidewalk. It is here that the "side winder" lives. I can not exactly describe his mode of locomotion except that he holds his head up straight, well off the ground, and travels sideways at a good rate. A close inspection of his tracks showed that he lifted first one end and then the other and threw it forward, finally flopping over his middle, but in action his motions were too quick to decipher. The "side winder" is distinguished from the other variety of rattlesnakes on the desert by two horny projections over the eyes. This snake is smaller and more vicious than the so-called Black Diamond rattlesnake (crotalus adamanteus).

It must not be thought that all the denizens of the desert are as disagreeable as the three just mentioned. The commonest creatures on the desert are probably the harmless little lizards, and next the jack rabbit and next the coyote. Among the larger animals, white tail deer are quite plentiful, and antelope and mountain sheep may still be found. Lynx and mountain lions are occasionally found, but bears seem to prefer a moister climate. Wild horses are by far the most numerous of all the larger wild animals.

In Oregon, Idaho, Utah and Nevada one may see wild horses by the thousands. Of late years the packing companies have been buying them and they are getting cleaned up. Five thousand head were shipped from one station on the Central Pacific railroad last year. What the packers do with them is not given out, but rumor has it that they are either converted by mechanical processes into canned corned beef, or are shipped to France and sold as horse meat. Anyway, it is a good thing for the country to clean them up. They sprang originally from small Spanish stock and it seems impractical to breed them up, and, on the other hand, they entice away the gentle horses of the ranchmen. The fact that the desert supports these great

The Cholla—a Desert Cactus.

Greasewood Bush and Desert Flowers.

herds of wild horses, which have no hay or shelter in winter, illustrates the undeveloped grazing resources of the country. The far-famed Arabian horse is a product of the desert, and, I believe, that the desert bred horse of this country is the equal of the Arabian in all respects and will soon be recognized as such.

In the Panamint range there are great droves of wild burros, and anyone who thinks the burro is a stupid, slow-going beast should see those wild jacks bore holes in the atmosphere at the first scent of danger.

Gold Dredging in Colorado.*

Written for the MINING AND SCIENTIFIC PRESS by W. E. THORNE AND E. J. MOORE.

This article is not technical, but is devoted to facts as we know them. Dredging is one of the easiest methods of gravel mining, if all is favorable, but, like all forms of mining, one must use care and business judgment if it is to be a commercial success. A great many investors seem to think all that is required is a lot of gravel, some gold, and water, and then a dredger—and this combination will pay anywhere. This is often found to be not the case. In Colorado six or seven months is the length of the working season. This makes the cost excessive, for the manager and superintendent's salary must be paid for twelve months if you want to keep good men. Also interest, taxes, etc., go on. All fixed charges must be charged up to the short season. The cost sheet would be about as follows for one dredger:

	Cents.
Superintendence, per yard	0.81
General expense, management, etc., per yard	0.62
Taxes, insurance, interest, per yard	0 41
Dredge crew, power and operating supplies, per yard	3.14
Repairs, labor, per yard	1.03
Supplies, repairs, per yard	3 08
Bullion expense, per yard	0.05
Total per yard	9.14

This shows excessive cost for most items on account of this short working season.

In order to run this low, one must be within short distance from Denver.

DREDGING DISTRICTS.—First is Swan river, a branch of the Blue. Here the first dredger was built in Colorado by the North American Dredging Co., who built two Risdon and one Bucyrus dredger. Ground was very tight, some large boulders and rough, hard bedrock. The Bucyrus dredger is of the double-lift type, with continuous bucket, which discharges into a trommel, fines going into a sump and from there raised by a large centrifugal pump into the sluices that are on an auxiliary barge. This makes the cost of operation excessive.

The Lambing plant, 2 miles below Breckenridge, a type of shovel dredger built to work on a track on dry land some years ago, was a failure, as values were too low, with large boulders, etc., which ran the operating expenses so high that it was abandoned.

During 1905 a dredger has been constructed in French gulch, about 1 mile below Breckenridge. This is an up-to-date dredger. It has some new improvements and should be a success. This gulch is not an ideal spot for a dredger by reason of the rough, hard bedrock and spotty distribution of gold. These obstacles have not been successfully overcome as yet by any dredger, and when it is done it will be a decided step in the right direction. Our knowledge of the Blue river points to the opinion that any dredger proposition must be gone into in a very thorough manner, as there is an immense amount of large boulders to contend with; also rough and hard bedrock, with low and spotted values in most places.

On the head of the South Platte, at Fairplay and Alma, is a lot of ground favorable for dredging, but so far as known it is very spotted as to values, also full of large boulders where the best pay lies. In the few places a dredger can be run it will not pay, and the ground is of a cemented nature, with a hard, rough bedrock.

The Tarryall placers furnish some dredging ground, but must first be proven as to values, boulders, etc. The lay of the ground and water supply are favorable.

The Granite placer district is not so favorable for dredging.

In the Durango district on the San Juan river is some ground that may make dredging profitable, but in sampling that district some years ago we could not find anything of high grade.

In northwestern Colorado there has been in operation for a short time a small dredger that has reported pay. Lack of water, shallow ground and low values make this of little worth as a commercial investment. It will be very expensive to obtain a sufficient water supply for even one dredger.

In the sand hills, on the eastern edge of San Luis valley, is a vast quantity of sand that carries small values in gold, reported at 5 cents per cubic yard, but from tests made by us some time back we could not find 1 cent per yard. So this has no commercial value at present.

The most favorable dredging district so far developed is on Clear creek, between Denver and Golden. Here is a large area of gravel suitable for dredgers, if values will warrant. A part has been tested and, although the gold is fine, two dredgers are at work for the National Dredging Co. and report working at a profit. The three engravings appearing on the front page illustrate the style of dredger used there. They are the Bucyrus continuous bucket pattern and are of the latest type. One new feature is the steel head gantry. One engraving shows front struts, etc. This is built of channel and angle iron, showing lowest cross bar in center of gantry to be high. This will allow raising the digging ladder high, so buckets will clear water. This is a good feature, lacking heretofore on some dredgers.

The second engraving shows deck connection. This gives a flexible joint which will allow for expansion and contraction, and also allows stretch of guy cables without any bad results.

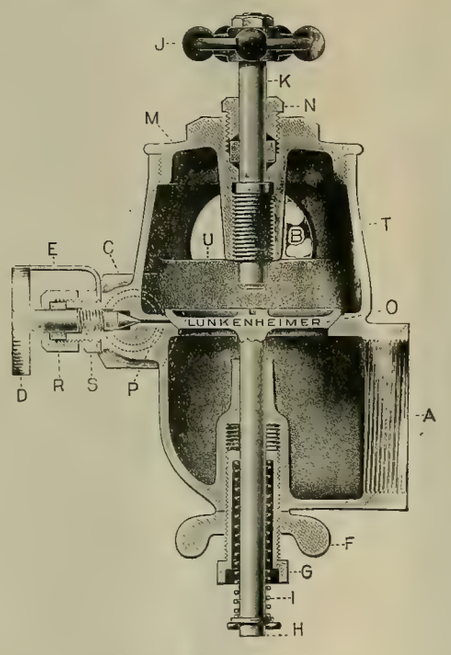
A rear view is shown in the third illustration, which also gives an idea of the size of the gravel. Some new departures in style of gold-saving tables have been tried, but as to their success we do not know. Bedrock here is hard and rough in places, and values in streaks. Up to this year dredging in Colorado has not been a success financially.

There are a few other places in Colorado which possibly may be favorable for dredging, but with these we are not acquainted.

*See illustrations on front page.

An Improved Generator Valve.

An improved form of generator valve has lately been placed on the market, which embodies a number of desirable and important features highly appreciated by users. The sectional view herewith clearly



Improved Generator Valve.

illustrates the construction of the valve. One of its principal features is the easy regulation of the spring which holds the disc to its seat. This regulation can be easily accomplished (while the engine is running), and without in any way interfering with the proper operation of the valve.

It is only necessary to loosen the thumbnut F when the sleeve G can be screwed up or down, to loosen or tighten the tension of the spring, after which the thumbnut F is again tightened.

It has been found that gasoline engines work best with the generator valve disc spring set at some particular tension; but as this particular tension cannot be ascertained except by trial when the engine is in operation, it is necessary that provision be made for the easy adjustment of the spring while the engine is running, which important feature will be found in this improved form of generator valve. The lift of the disc, and consequently the speed of the engine, is regulated by means of the stem K, operated by wheel J.

Another important feature in the design of this valve is the light but strong construction of the disc. One of the troubles experienced in generator valves is the tremendous wear on the seat and the breaking of the disc. To overcome this objection, the seat opening in this improved valve is very large, the area being considerably in excess of that of the inlet A. It is not necessary, therefore, that the disc be raised very far off its seat to permit a full charge of air and gasoline to enter the cylinder. The movement of the disc being but a trifle, the shocks caused by seating are reduced to minimum, and users claim they have had no trouble owing to the valve leaking or discs breaking. The disc can be easily reground when worn, by simply removing the cap M and inserting a screw driver or other flat instrument in the slot in the top of the disc provided therefor.

The valves are made of a very high grade of bronze composition, and the metal is so distributed about the valve that those parts subjected to the greatest strain are made heavier in proportion. Owing to the oxidizing effect of gasoline on iron or steel, these materials are entirely eliminated.

The supply of the gasoline is controlled by the needle valve D, and the end of same is placed as near as possible to the outlet of the gasoline into the valve, very little clearance being allowed. The result is that the gasoline is injected in the form of a spray, thus vaporizing thoroughly with the air admitted through the air inlet A. This needle valve has a long taper bearing and the threads on the stem are of fine pitch, thus very close adjustment can be secured and the amount of gasoline injected can be regulated to a very fine degree.

The wheel handle D is engraved with numbers to show the different degrees of opening. This wheel handle has a flat spot on its periphery with which the spring E engages. The object of this is to enable the operator, after he has properly adjusted the needle valve for the correct mixture, to at any time easily obtain this same adjustment should he close the needle valve or open same beyond the proper setting. No matter where this flat spot may be, after the needle valve has been set, the spring E cannot be brought to bear on same by merely loosening the locknut S, which will permit of the free turning of the spring.

The union C is provided on the gasoline inlet to facilitate its connection.

This improved generator valve is the result of considerable experimenting on the part of the Lunkenheimer Co., the manufacturers. They have recently issued an attractive pamphlet on generator valves, which is sent free to any one requesting a copy.

THE PROSPECTOR.

The metallic mineral from West Tintic district, Utah, is foliated or micaceous iron, a variety of hematite. It may contain gold, and if transportation is cheap would be useful as a flux at the smelters. If finely ground it would also make a good dark red mineral paint.

The single mineral specimen from Wallace, Idaho, marked "T. A. S.," is limonite, brown iron oxide, with some quartz. It may carry gold and silver, as it is apparently derived from oxidation of pyrite.

The rocks from Yale, B. C., are identified as follows: No. 1 is silicified greenstone, carrying iron and copper sulphide and a little hematite. No. 2 is a metamorphic rock, consisting chiefly of amphibole and garnets; epidote and a small amount of pyrrhotite are also present in the specimen. No. 3 is a metamorphic rock. No. 4 is quartz with gray-copper ore. No. 5 is a much decomposed intrusive rock, of granitic type. No. 6 is pyrophyllite. No. 7 is epidote.

The rock specimens from Denver, Colo., marked G. A. D., are: S., mica-diorite; N., a metamorphic rock with slightly schistose structure. It consists principally of quartz grains and small scales of mica.

The samples from Orleans, Cal., are: No. 1, earthy clay; 2, a much decomposed rock, practically clay; 3 and 4 are similar--clay; 5 is a piece of coal.

The white mineral specimen from Baker City, Or., which resembles some varieties of magnesite, is halloysite, and is essentially an aluminous silicate, similar to kaolinite, from which it differs only in having water of hydration. Non-technically it is a species of indurated clay.

The rock samples from Atwater, Cal., are: No. 1. Quartz, showing a small amount of secondary mica. No. 2 is a hornblendic schist with numerous small garnets. No. 3 is a much altered granitic rock, including a small veinlet of quartz. No. 4 is a dark-colored, translucent calcite (calcium carbonate).

The ore from Howe Sound, B. C., is apparently the result of silicification of diorite or amphibolite schist. The larger piece is similar to ores occurring in the gold belt of California in Calaveras, Amador and some other counties of that State. The sulphide is mostly iron with a trace of copper.

The samples from Los Angeles, Cal., are: L. A., "Black," manganese dioxide; L. A., "Green," diopside (calcium magnesium pyroxene).

The mineral from De Lamar, Idaho, marked "W. R. T." is quartz, with manganese and iron oxides.

The mineral from Cleveland, Ohio, marked "C. O. B. & S. Co.," is wolframite, tungstate of iron and manganese. It is slightly magnetic.

The Simplon Tunnel.

The Simplon tunnel, piercing the Alps between Switzerland and Italy, is interesting as the longest of the great Alpine tunnels. It has a total length of about 12½ miles, as against 9¼ miles for the St. Gothard and 8 miles for the Mont Cenis. It is distinguished from the other tunnels in the Alps by the fact that there are really two parallel tunnels, separated by about 55 feet between centers. Each tunnel contains one track. The bore is straight, with a knee at either end, due at the north end to the proximity of the Rhone river at the town of Brigue, and at the southern extremity to the nearness of the Divernia, just below the town of Iselle.

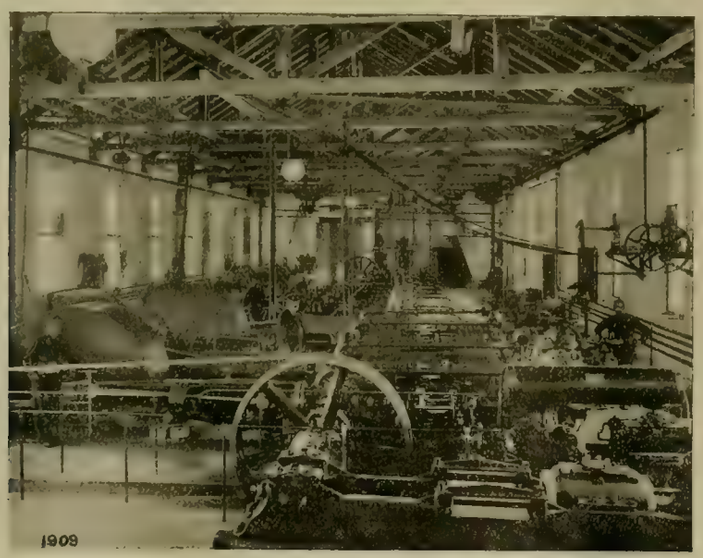
The track at the north portal is about 2250 feet above sea level. From this point the tunnel rises with a 2% grade until the apex is reached, almost exactly beneath the boundary between Swiss and Italian territory. The highest point is about 2325 feet above the sea, and the bore falls thence with a 7% grade to the southern extrance, at an altitude of about 2100 feet. The mountain over the tunnel is 7000 feet in height, and the thickness of the rock above the tunnel at the apex is greater than anything ever before attained.

The method of building provided for the completion of the easterly tunnel as it was driven, while simultaneously only the floor heading of the second or western tunnel was carried along. The two bores are joined at intervals of about 650 feet by cross galleries. When traffic increases so as to demand it, the second bore will be fully completed. An especial advantage of the double tunnel scheme developed in course of construction, in permitting a very effective system of ventilation. A very high temperature was encountered as the work progressed, and, in order to make conditions more tolerable, fresh air was forced in by powerful fans at the rate of about 1250 cubic feet per second, entering heading No. 2, passing through the last traverse and returning outward through heading No. 1. Cross galleries were closed as the work progressed, only the advance opening being kept clear. Even with such a circulation as this, it was found necessary to still further reduce the temperature at the face by sprays of cold water, and for this purpose a great system of refrigeration was installed. The temperature of the rock in the tunnel was 55° C. (132° F.), but the cooling devices maintained the air temperature at from 25° C. to 30° C. (86° F.)

The construction of the tunnel was carried on simultaneously from both ends. The heading starting on the Swiss side at Brigue was pushed beyond the apex to a point on the Italian side about 6½ miles from the Swiss portal. At this time the Italian heading had been advanced to within 800 feet of the other heading, and there remained this thickness of rock to be penetrated before the mountain was pierced. At this point, in September, 1904, unexpected obstacles to further progress were encountered, necessitating the abandonment of work on the Swiss side and seriously impeding operations on the Italian heading. These were springs of hot water at 45° C., opened almost simultaneously in the two headings, those on the Swiss side flowing 489 gallons per minute, those on the Italian side 960 gallons per minute. The volume and temperature of this water in the Swiss heading, together with the destruction of the cooling plant for that section by a landslide, forced complete suspension of operations at that side. The work was completed by driving through the Italian heading, but here, again, operations were seriously impeded and the rate of progress cut down to a mere fraction of that normally maintained. When measurements showed that only a thin wall, which could be removed with one blast, intervened between the two headings, work was suspended until the greater part of the accumulated water on the Swiss side could be pumped out. Then the blast was fired, making an opening through which the remaining water rushed out to the Italian portal. This occurred on February 24, 1905, and this date marks the culmination of the greatest tunneling enterprise ever attempted. The work was started in August, 1898.

Power for the Simplon work has been furnished by two plants of about 2000 H. P. each, driven by water power, one at either end of the tunnel. The method of tunneling was radically different from that familiar to American engineers and so often exemplified in tunnel work in this country. Instead of the compressed air rock drills so common in American practice, the Brandt system of hydraulic rock drills was used. Instead of chipping away the rock by hammer blows, it was ground away by cutters under tremendous pressure. Instead of the familiar air compressor plant, there were immense high pressure pumps driven from water wheels. The ventilating fans also are driven by water power. The tunnel section was enlarged by hand drilling.

But compressed air had its part in the enterprise—in operating the haulage locomotives and handling construction trains in the tunnels. The accompanying illustration shows the interior of the power house at Brigue, Switzerland. In the foreground are seen the two Ingersoll-Sergeant air compressors furnishing air for these motors. One machine is seen complete, as it has been during its successful operation of several years. Its faithful performance led to the installation of its duplicate when the demands grew beyond its capacity. This second compressor is seen in course of erection. Both of these machines are belt driven from water wheels and are of the style known by the makers as "Class BC 3." They are of the three-stage, "straight line" type, with water jackets on the low pressure cylinder, horizontal intercooler, and water box submergence on the high and intermediate pressure cylinders. They deliver air at 1500 pounds pressure and at normal rating of 140 revolutions per minute; each compressor has a free air capacity of 121 cubic feet per minute furnished at this pressure.



Ingersoll-Sergeant Compressors at the Simplon Tunnel

The continuation of this great work under the unexpected difficulties encountered called for the exercise of resource and daring on the part of the engineers in charge. The driving forward of the Italian heading in the steaming, stifling heat from the hot water was in itself a laborious operation without precedent. Much curiosity and apprehension was felt as to the outcome of the piercing of the dividing wall. But this was made without mishap, and since that time efforts have been directed toward enlarging, lining and completion of the tunnel.

While one of the largest and most difficult tunnels, the Simplon was by no means the most expensive. Its cost thus far, exclusive of installation charges, has been about $210 per lineal foot. In driving it 10,000 men were continuously employed—4000 on the Swiss side, 6000 on the Italian section. Its length, as stated, is 12½ miles. The section of the completed tunnel is of horseshoe shape, 13½ feet wide at the bottom, 16½ feet at spring line, and 18 feet high in the clear above the rails. It is lined with concrete and masonry throughout, the enormous pressure in some places calling for a lining 6 feet in thickness. The heading carried forward in the second and uncompleted bore is 6½ feet high and 10 feet wide. Just what power will be used to haul trains through the Simplon tunnel has not yet been made public, but a recent order by the Swiss Government for 160 cars with enclosed platforms would indicate that, for the present at least, steam will be used.

Mine Surveying.—I.*

Written by C. A. S. Andrews.

Instruments.—The instruments actually necessary are a theodolite, steel measuring band with spring balance, prismatic compass, clinometer, 100 feet of metallic box tape, two coils of copper or steel wire, shingling hammer, chisel, one 14-ounce plumb bob for theodolite, two 24-ounce plumb bobs for back and foresight, two 10-pound plumb bobs for weighting the wires, table of sines, cosines, tangents and secants, and a field book.

Theodolite.—The theodolite should be not less than 5 inches diameter, reading to twenty seconds. Both striding level and diagonal eyepiece are essential. The theodolite should admit of being focused to clearly define a plumb line at a distance of 10 feet, as often a longer sight cannot be obtained. A traversing head is absolutely necessary, as without one it is practically impossible to set over a spot with the degree of accuracy required for short sights.

Tripod.—A convenient length for the tripod is 2 feet 8 inches. One leg at least should be telescopic, or, if not, should be jointed about half way. A metal tripod about 3 inches high should also be provided for use in low workings.

Chain.—The steel band or chain should be 500 feet long, divided to feet, with the tens and hundreds numbered. It should be light enough to stretch clear of the ground, and tested with the government standard at the temperature generally ruling underground, say 80°. Any further correction for temperature will not be required. A foot rule divided to tenths and half tenths is required, so that distances may be read to two places of decimals. The handiest way is to have this marked on the tripod leg, as all distances are read at the axis of the theodolite.

Clinometer.—The clinometer should be at least 7 inches in length, the foresight being in such position as to be visible when a light is thrown on the bubble.

Compass.—The prismatic compass should be not less than 4 inches diameter. The use of a mirror for taking bearings up or down slopes is not to be recommended. If used, a cross bubble is necessary on the compass, and to keep this level necessitates the use of a stand. It is preferable to suspend a plumb line a short distance away in line with the next station. The compass can then readily be held precisely in line with the plumb line and the forward station, and the bearing read to a point on the plumb line horizontal with the compass.

Wires.—The coils of copper wire are for lowering down vertical shafts in carrying the surface meridian below. The gauge should be about 20, and the length sufficient to reach to the bottom of the deepest shaft in the district, say 2000 feet.

Surface Meridian.—The first thing necessary in making an underground survey is to pick up the boundaries of the mining property as marked on the surface. Two boundaries should be picked up, and if they agree the original survey may be adopted as correct.

Carrying Surface Meridian Below.—Connections are then to be made to the different shafts on the property in such manner that the surface meridian may be carried below. This can be done either by traverse or triangulation, whichever may be more convenient.

Levels are also to be taken between each shaft and to the shafts on the adjoining mines, so that the vertical depths of all the different workings can be reduced to the same datum.

By Underlie Shaft.—In making a connection to an underlie shaft, a point is chosen at the mouth of the shaft in a convenient position to see down the underlie. A draft mark is made at this point, and is connected to the surface survey.

From this draft mark the survey would be continued down the underlie, in a method to be described later on, thus carrying the surface meridian below. Connections would afterwards be made underground to the vertical shafts, and the survey thus checked.

By Two Vertical Shafts.—If there be no underlie shafts on the mine, and none on any adjoining mine connected with the underground workings, then the meridian must be taken below by the vertical shafts.

If there be more than one vertical shaft, connections are made to one of the winding ropes in each shaft. The direct bearings and distances between the ropes are computed, and form the datum for the underground survey.

Unless for special reasons, it is better to connect to the center compartment rope than to the end ones. Some shafts have been sunk with a twist or wind, which sometimes does not leave room for a bucket to swing clear in an end compartment.

In making the surface connection, the rope should be sighted close to the poppet head, where there is no oscillation.

In the underground survey these two or more ropes are connected by traverse. For this purpose a magnetic or other meridian is adopted, and the direct bearings and distances computed. If the dis-

*Abstract Trans. Queensland Institute of Surveyors.

crepancy between these distances, as computed by the underground and by the surface surveys, be not more than 1 in 500, then the survey may be assumed to be correct. All the bearings of the underground survey are then to be corrected to make the direct bearings between the shafts agree with the surface meridian. If more than two shafts were connected to, the connection in each case should be the same. If the discrepancy be not more than 1 minute per 1000 feet of underground survey, then the mean may be taken.

In connecting to the rope in the underground survey, the rope weighted with a full bucket is lowered into the sump, and the bucket submerged in the water. If cages are used, one cage is to be removed and the rope weighted with a full bucket or other heavy weight. The rope should then be left for an hour or more to settle. Care is to be taken that the bucket is well clear of the sides.

In sighting to the rope, read the bearing at one extreme of the swing and then at the other. There is plenty of time to do this if the shaft be more than 400 feet deep. At this depth the time of oscillation is eleven seconds, while at a depth of 2000 feet the time is twenty-five seconds.

This operation is to be repeated at least three times, and the mean of all the readings taken.

BY ONE VERTICAL SHAFT.—If there be only one shaft on the mine, and that a vertical shaft, and the underground workings be not connected to any other shaft in an adjoining mine, then the meridian must be carried down this one shaft.

For this purpose the two wires are suspended in the shaft, one in each end compartment. They are suspended as far apart as possible, but no closer than 6 inches to the timber, so as to be sure that they do not touch the sides. In lowering the wires small weights are attached to the ends, and the wires kept in the center of the compartment, so as not to catch in splinters, etc. On reaching the bottom the 10-pound plumb-bobs are attached, lowered into the sump and submerged in the water.

The wires at the surface are then moved over to their required position and pressed into saw cuts in two battens nailed across the shaft, and left for an hour or more to settle. The distances between the wires at the surface and at the bottom are measured and if they agree the wires are clear.

The theodolite is then set up on the surface in a convenient position, as nearly in line with the wires as will admit of sighting each wire distinctly. The bearing and distance to each wire is taken and connected to the surface survey.

The length and bearing of the line between the wires is then computed and forms the datum for the underground survey.

The surveyor then proceeds below, traveling by the center compartment, so as not to disturb the wires. If there be less than three compartments, then one of the wires must be fastened into one corner of the shaft to allow the bucket to descend. When this has been done the greatest possible care must be taken that the wire be returned to exactly its original position. For this purpose an assistant must be left at the surface who can be thoroughly trusted.

In connecting the wires below, the procedure is much the same as on the surface. The theodolite is set up as nearly in line with the wires as possible, and as far away as is consistent with obtaining a clear sight of the wires.

One wire is then sighted and followed to the extreme end of its swing, and the bearing read; then to the opposite end of its swing, and the bearing read again. This operation is repeated at least three times, and the means of all the observations is adopted.

He will then take the bearing to the second wire in the same manner.

The horizontal distance from the theodolite to each wire is then measured. This is done by the assistant holding the end of the chain to the wire and following it in its swing. The surveyor reads the distance at each end of the swing and records the mean. This operation is repeated at least three times and the mean of all the measurements taken.

The bearing and length of the datum line is then computed. If the discrepancy between this length as computed and as measured on the surface be not more than .01 foot, then the connection can be taken as satisfactory.

The difference between the magnetic and the surface meridian is thus known, and is to be added or subtracted, as required, by the bearings booked.

This method of carrying the surface meridian below is to be looked upon as approximate, and is only to be used temporarily until another shaft be sunk, or until the workings break through into an adjoining mine, when correct meridian can be obtained by either of the first two methods.

DEPTH OF SHAFT.—In measuring the depth of a vertical shaft, the strain required at the lower end of the chain is the strain used when the chain is wholly supported, less half the weight of the chain used.

When the shaft is more than 500 feet deep, two or more chains may be joined together or the shaft measured in sections.

ASSISTANTS REQUIRED.—The surface meridian having been carried below, the surveyor is ready to proceed with the underground survey. For this work only one regular assistant is required, who should be thoroughly conversant with the surveyor's methods, and if able to check his calculations, so much the better. Any other assistance required can be obtained from the mine. In general cases one other assistant is enough.

CLASS OF MINE TO BE SURVEYED.—In this paper the writer has assumed that the mine to be surveyed is a working lode, dipping more or less, on which underlie shafts have been sunk, either from the outcrop or from some deeper part of the vein, opened up by a vertical shaft. From the underlie shaft levels have been driven each way on the lode, connected by winzes, rises, passes, etc.

The methods of survey described in this paper are applicable to any other class of mine.

DRAFT MARKS.—Assuming that the surface meridian has been carried to the mouth of an underlie shaft, the surveyor will now go below and fix all his draft marks in the shaft before taking the theodolite out of its case.

The draft mark at the mouth of the underlie is probably a nail driven into the ground sill. This should be driven right home to the head, so that it cannot be shifted, and a broad arrow chiseled pointing to it, so that it can be recognized on future occasions.

This draft mark will require an arrow placed plumb behind it to sight on to, but all draft marks underground should be placed in the hanging wall, so that a plumb line may be attached to sight on to. Draft marks are best made by a hole bored at least 3 inches deep into the solid rock. Into this a close-fitting hardwood plug is driven home. Into this plug an inch nail is driven, leaving just sufficient protruding on which to hang a plumb line.

Should the hanging wall be close timbered, the draft marks will have to be put on the timbers. Choose a solid timber, and trim a small vertical face. In this drive the nail, leaving only just sufficient protruding on which to hang the plumb line. All draft marks are to be branded with a distinguishing mark, so as to be always recognizable. A broad arrow chiseled under the nail is the usual way.

Ingenious Mine Timbering.

Timbering underground is familiar to all miners, but the placing of heavy timbers in surface cuts is less usual, and generally calls for ingenuity and a thorough knowledge of timbering—its functions and strength, and also a fairly definite idea of what to anticipate from the rock masses which are supported by the timbers. These masses of rock are subject to changing stresses as the ore is removed from place to place, and the timber boss must so place his system of stulls, posts and braces that they not only support the weight at the time they are placed, but also sustain the ground for some time later when the direction of stresses and pressure changes. The accompanying illustration shows how a caving surface cut was saved in the Mahoney mine at Sutter Creek, Cal., in order that several thousands of tons of payable ore might be extracted before the walls were allowed to collapse. These timbers were placed as shown and the work was attended with extreme danger until it was well advanced, as the walls continued to cave and slip into the cut while the timbers were being placed in position. The work was rendered additionally hazardous owing to the fact that large stopes had been excavated below and the ground was settling over an area 200 by 100 feet, the cut here illustrated being near the center of the subsidence. The caving was stopped and the ore removed, when most of the timber was recovered for use elsewhere about the mine.

Mine Timbering in an Open Cut.

The Little Giant Tape Splice.

This device is intended to aid surveyors and others in making a quick repair of broken measuring tapes without delaying field work and without the aid of extra tools other than the splice itself. The splice is made in the form shown by the above illustration. Should the tape break the ends are inserted in the splice until they are in the proper position as seen through sight hole in middle of the device. The screws are then turned down on the tape with knife blade or any convenient edge, slightly bulging the tape into the holes opposite the screw points, making a tight grip, but not injuring the tape. The splice is small and neatly made and does not catch or obstruct the tape. It may be used for temporary or permanent repair.

The splice is a new and much needed device, often saving engineering parties hours of inconvenient and expensive delay from broken tapes which cannot always be avoided in spite of the greatest care by chainmen. The splice should be of especial value to surveying parties working in out-of-the way locations, and should save the inconvenience of carrying a number of extra tapes in the outfit.

The splice has been adopted for use on United States, Canadian and Australian Government surveys. It is the invention of a civil engineer, Clinton B. Alexander of Clearfield, Pa.

Excavating for the Government.

The United States Reclamation Service has found it advisable to issue a formal letter to prospective bidders on work for that department of the Government, says "The Contractor." This letter is in the nature of a warning to contractors who are about to bid on work, asking them to be careful to imform themselves fully concerning the conditions, terms and details of the work in order that their bid may take all factors into consideration. The letter contains the following:

There seems to be a peculiar fascination about a Government contract and a widespread belief that a person who secures a contract from the Government is certain of large profit and easy work. As a result, there are many inexperienced persons who are continually seeking contracts and who, out of their ignorance, frequently succeed in getting into very embarrassing situations. There is nothing more irritating than the effort of inexperienced persons to try to get a contract, and if by chance it is awarded to them, they seek not to execute the work as required, but to shirk the obligation incurred.

The Reclamation Service, having a new class of work, has been put to much trouble and expense by inexperienced or speculative individuals who have, in some cases, made bids ridicuously low, and have insisted on having the contract awarded to them, in spite of the warning of skilled men that they would incur large losses in carrying out the work specified. These people do not and will not understand that the contracts they enter into are very carefully guarded and that no discretion or leniency is possible after the contract is signed. They seem to forget that an employe of the Government can not modify the contract, no matter how onerous it may be, and that their property and that of their friends who have gone on their bonds must be taken by the Government in default of the work.

There is no desire on the part of any one connected with the Government to let a contract at less than a fair rate, with reasonable profit. It is far better for all concerned that the contractor make fair wages for his men and a small return upon his capital invested The engineers of the Reclamation Service, having spent the best part of their lives in such work, know, as a rule, very nearly what it will cost, and they view with apprehension the incursion into the contracting field of men who have never had experience and who are enamored with the idea of getting a job of this kind.

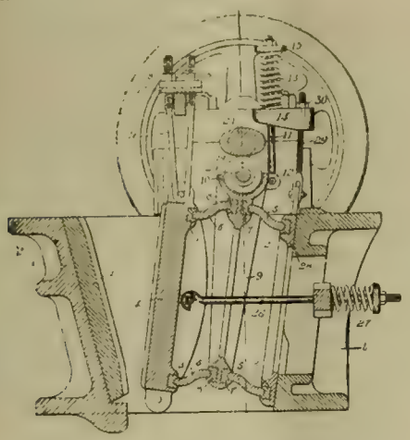
IT is frequently stated that the cause of failure of the cyanide process at some mines is due to absorption of large values by the staves and bottoms of the wooden tanks used, and that the discrepancy between the pulp assay before cyaniding and the bullion recovered by precipitation is represented by this greedy absorption of the gold solution by the wood of the tanks. It would be interesting to know just how much gold is really absorbed by the wood of a cyanide tank.

Mining and Metallurgical Patents.

PATENTS ISSUED NOVEMBER 21, 1905.

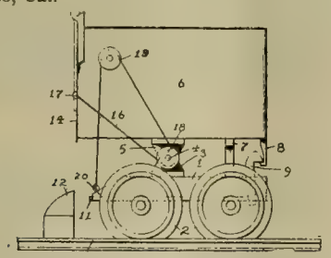
Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

ROCK CRUSHER.—No. 804,201; H. H. Blake, Pittsburg, Pa.



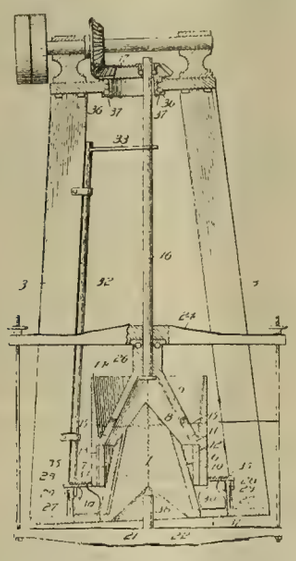
In crusher, combination with machine frame, of movable jaw, operating shaft having cam, vertical having trough or cup, means yieldingly suspending vertical from machine frame, means for operating jaw by vertical, and roller adapted to be moved by cam and slidably mounted on machine frame and received in and bearing against trough or cup.

DUMPING CAR.—No. 804,412; J. H. Kelly, San Francisco, Cal.



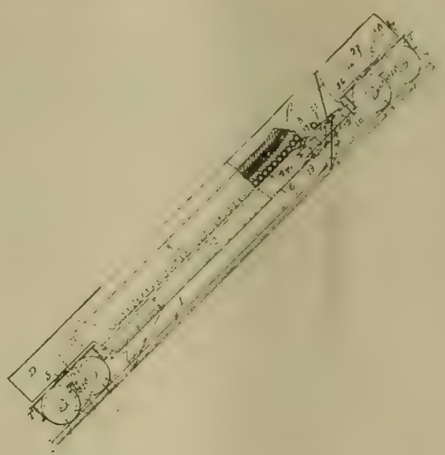
In dumping car, combination of truck, car body tilting thereon, swinging gate closing front end of car body, cable secured at ends to gate and to frame, parts carried by frame and car body around which cable passes, position of parts being such that when car body is tilted cable is relaxed to allow gate to swing open.

ORE CRUSHER AND PULVERIZER MACHINE.—No. 804,780; A. Tetrault, Boulder, Colo.



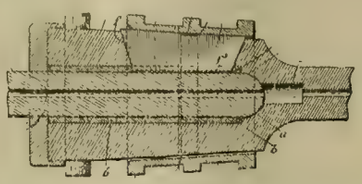
In ore crusher and pulverizer, frame, cone fixed on base thereof and ring shell mounted relatively to cone to cause it to rest with unbroken annular grinding edge contact upon side walls of cone, means for imparting gyrating movements to shell, means for applying pressure upon shell, whereby in gyrating movements grinding edge of shell has uniform pressure at every part of grinding edge upon conical walls, and means for feeding material to crushing surfaces.

ORE DISTRIBUTING CAR.—No. 804,870; R. S. Moore, Portsmouth, Ohio.



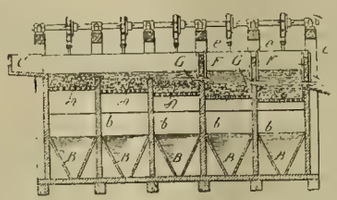
In ore distributing car combination of floor made up of movable segments of sections, and suitable means for automatically separating same, one from other from beneath load, in succession, from one end of floor to other.

CHUCK FOR ROCK DRILLS.—No. 804,904; J. C. H. Vaught, Deadwood, S. D.



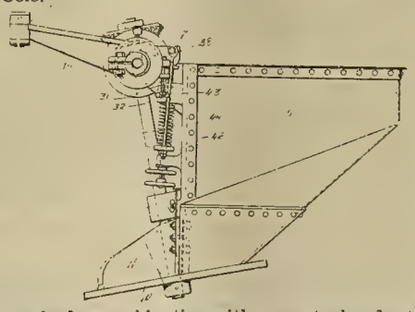
Drill chuck, comprising body having longitudinal socket to receive shank, and longitudinal slot, gib in slot adapted to bear at inner face on shank and having longitudinally tapered outer face projecting beyond face of body and flange projecting from face and sleeve engaging tapered face of gib.

ORE SLIME SEPARATOR.—No. 804,841; E. Hedburg, Joplin, Mo.



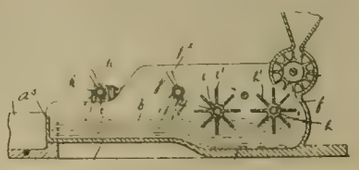
Ore separator provided with plurality of sections, plunger compartment in each section and plunger therein, hutch at bottom of each section, a screen ore bed near top of each of hutches, adjustable deflectors or partitions between sections, walls of sections having grooves in which partitions may slide, partitions adapted to form passages in close proximity to the ore beds, and to deflect the finer ores into the ore beds, whereby said finer ore may work through the screens into hutches.

ORE FEEDER.—No. 805,128.—N. V. Fitts, Denver, Colo.



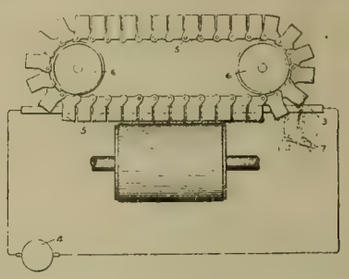
In ore feeder combination with receptacle adapted to hold ore or other material, of feed plate mounted below receptacle, and revoluble shaft connected in operative relation with plate, of two parts mounted on shaft and having wedge-shaped opposing faces capable of independent revoluble movement, one of parts being also axially movable on shaft and having friction face, another friction face connected in operative relation with shaft, and means for imparting rotary movement to one wedge-faced part, whereby opposing part is shifted axially to bring friction faces into operative relation to actuate shaft and feed plate.

AMALGAMATOR.—No. 805,090; C. W. Patten, Lynn, Mass.



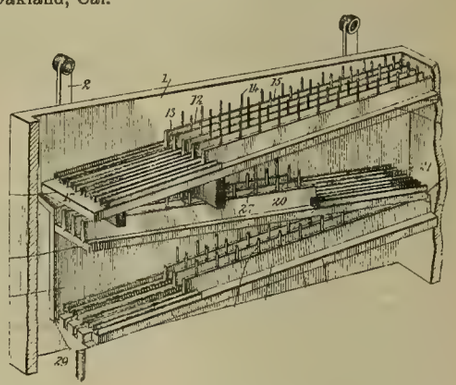
Amalgamator comprising elongated mercury, containing trough having shallow portion of substantially uniform depth, and having weir at discharge end of shallow portion, pit of greater depth at opposite end thereof, one or more submerging drums in pit, and means of discharging series of water jets onto surface of mercury between weir and said drums.

MAGNETIC SEPARATOR.—No. 805,289; H. E. Heath, Windsor, Conn.



In magnetic separator, combination with stationary conductor, of plurality of pole pieces traveling longitudinally thereof and in proximity thereto, and means for conveying material to be treated beneath pole pieces.

ORE CONCENTRATOR.—No. 805,215; M. R. Lyle, Oakland, Cal.



Concentrator of class described, comprising inclined sluice-box having elongated openings at bottom thereof, channels presenting elevated edges at edges of openings, and means for rocking box so as to advance material contained therein progressively by gravitation toward lower extremities of openings.

PROCESS OF CONCENTRATING ORES.—No. 805,382; W. M. Sanders, Iola, Kans.

Method of concentrating ore, which consists in subjecting it to non-acid solution capable of reacting with evolution of gas, and collecting such particles as are sustained by evolved gas.

METALLURGICAL PROCESS.—No. 804,936; W. E. Everette, Tacoma, Wash.

Metallurgical process which consists, first, in preparing suitable preliminary melt and heating it to incandescence; second, in subjecting previously pulverized materials, which are to be treated, to action of liquid oxygen, whereby they are reduced to extremely frigid condition and caused to occlude portion of oxygen; third, forcing frigid mixture into and through incandescent melt whereby metals in mixture are largely freed from sulphur and phosphorus and are rapidly fused; and finally, separately drawing off metal and slag at different levels.

METAL-LEACHING PROCESS.—No. 805,017; T. B. Joseph, San Francisco, Cal.

Herein described process of extracting metals such as gold, silver, copper and nickel from ore containing same when in suitable condition, which consists in subjecting ore to leaching action of solution containing water, sodium cyanide and ammonium carbonate, carbonate being in excess of cyanide, together with compressed air, and precipitating metals from solution by any well known method.

MINING SUMMARY.

Specially Compiled and Reported for the MINING AND SCIENTIFIC PRESS.

ARIZONA.

Cochise County.

At the Copper Queen smelter, in Douglas, is a body of reserve ore worth $2,500,000. The immense ore dump, kept on hand for emergency, in case an accident to the railroad should prevent shipments to the mines, is 2500 feet long, 40 feet wide and 16 feet thick, which equals 1,600,000 cubic feet, or approximately 123,000 tons of ore. This body of ore is all fluxed and prepared for the furnaces.

Maricopa County.

A call has been issued for a miners' convention to be held in Phœnix during the last six days of December. As the call clearly states, it is not proposed to have the organization one for any particular branch of the mining industry.

Mohave County.

J. C. Noble and E. Brannen are opening up the Climax and the Nightingale mines, near Kingman.—— The shaft on the Rattan mine in the San Francisco district, near Kingman, has been retimbered and the mine unwatered by the Gold Giant M. Co.——The West Flores mine, near Cerbat, is to be worked by W. B. Campbell. ——It is reported that an auto ore wagon will be put on between Yucca and the San Francisco mine. The mine will soon be shipping concentrates. The distance is 48 miles.

Pima County.

At the Helvetia mine, in the Santa Ritas, there are 150 miners at work and this force will be doubled during the month. When the smelter starts up 1000 men will be employed. The 200-ton smelter at Helvetia will be blown in as soon as coke arrives. The company has a large amount of ore blocked out, which will be ample to keep the smelter going all winter. There are twenty-five shafts on the claims of the Helvetia Co., but at present only two of them are being worked. One is the Old Dick, which is down to a depth of 800 feet, and another is the A1 Royale, with surface workings.

Yavapai County.

The Storm Cloud mine, 12 miles south of Prescott, has been sold to H. J. Beemer by F. Williams. The mine is to be unwatered and a 20-stamp mill placed on the property.——New concentrators have been put in at his mill on the Santa Maria river, near Hillside, by John Lawler. A road has been built from the mine to the mill.

Near Turkey Creek, William Theising has started up his new mill and is running ten tons of ore through per day.

G. O. Ford, manager of the Catherine Elizabeth group in the Mineral Point district, has his new shaft down 75 feet. The property is a mile from the United Verde railroad.——The Rincon M. Co., operating near Martinez, has stopped sinking at 1100 feet, having reached the limit of the hoist. Superintendent G. D. E. Mortimer says a larger plant will be secured at once.—— C. O. Goddard, of the Goddard M. Co., near Wickenburg, has gone to New York on business. Two shifts are working at the mine.——At the Baumann mine, 2 miles from the Humboldt smelter, a new hoist has been put in. The shaft is down 500 feet, and it is proposed to sink it 200 feet farther before crosscutting.——Rich copper strikes are reported from near Bill Williams mountain.

CALIFORNIA.

California is still the only State producing any chromite, and in 1904 the quantity was 123 long tons of ore, valued at $1845. As compared with the production of 150 long tons, valued at $2250, in 1903, this is a decrease of 27 tons in quantity and of $405 in value.

In California, for the past two months, one mining plant after another has been obliged to cease operations, owing to a shortage of water, until the number of idle mines has become a matter of some concern, as it has necessitated the idleness of a large number of men, both above and below ground. Some managers have taken advantage of this enforced idleness to overhaul and repair their mining and milling plants and others have simply closed up everything. In some instances water is filling the lower workings, and this will cause some delay in restarting work in the bottom of some mines. In others work can be continued in upper workings, which have not or will not be submerged, as soon as sufficient water is again available. There have been some rains, but in the mountains snow has fallen heavily, with comparatively little rain. The temperature continues so low in the snow zone that but little increased water has resulted as yet. The outlook for abundant water a little later is now very encouraging. The large distributing electric power plants, upon which many mines depend for power, have also felt the water shortage, and find it impossible to furnish the full amount of power usually depended upon.

Amador County.

(Special Correspondence).—The Keystone mine and mill are running regularly. The mine is 1575 feet deep, but until recently no extensive work has been done below the 800-foot level, most of the ore coming from the 400 and 600. Ore is now being stoped from the 1000-foot level. C. R. Downs is superintendent.

Amador City, Dec. 5.

The pile of waste from the Kennedy chlorination works has been sold to the Selby Reduction Works.

El Dorado County.

The following account of the work of the Eureka Slate Co., at Slatington, is condensed from a local paper: The Eureka property is north of the South Eork of the American river, west of Kelsey. A tunnel running through the deposit from west to east has developed the fact that the sedimentary slate deposit at this point is 300 feet in width. There are many dikes of a foreign substance traversing these beds from north to south. The slate beds themselves vary in thickness from 2 inches to 2 feet. These beds are separated by a flinty ribbon, having the same course as the beds themselves, and usually standing in the same vertical position as the beds, varying in thickness from ¼ of an inch to 2 inches. In quarrying the slate the gallery system is employed. A sink is made in the quarry 18 feet in depth and extended along the line of the cleavage of the slate beds for the entire distance the quarry is opened. As there are no foot joints in the vertical deposit, it is necessary to drill the entire length of the opening at the bottom of the gallery. The length of the hole is governed by the natural seams, which are readily determined after a loose end has been made in any part of the gallery, and as there are many vertical joints, they usually drill the blast to a vertical joint, black powder only being used, as the object desired is to simply raise and move the mass of slate with as little breakage as possible. After a portion of the gallery is blasted it is taken from the quarry by means of fall block carriers running on cables, which extend from an anchorage on the bank up over a derrick and down to a lower point in the quarry. Blocks are taken out in all sizes, from 300 to 3000 pounds in weight. The waste is hoisted in the same manner in specially constructed steel cars dropping onto tracks in the quarry, and from the derrick onto waste tracks on the bank. The slate blocks are run on block cars from the derrick to the block making yard and splitting shed. After the slate blocks reach the block making yard they are worked by crews of three. First, the block maker cuts the stone as received from the quarry into the most favorable shape for the various sizes of slate made. The blocks are then taken into the splitting shed, where the splitter takes the prepared block and splits it into sheets of the proper thickness with chisel and mallet, passing them on to the trimmer, who, with rotating power machine, trims them into various sizes. The slate is conveyed down the American river canyon from Slatington to Placerville by an aerial tramway, capable of transporting 300 squares, or 180,000 pounds, of slate from the quarry to Placerville every ten hours. The cable crosses the American river at an elevation of 600 feet, and with a 2400-foot span. The track ropes are 1¼ inches on the loaded side, and ⅞-inch on the empty side; the traction or drawing rope is ⅝ inch in diameter, the whole resting on 33 towers, one double tension station, one anchorage and tension station, one curved rail trestle 150 feet long, and the quarry and discharge terminals. The tramway is operated by water applied direct to a 36-inch Pelton wheel running to a countershaft and from countershaft to main shaft of tramway power sheave, requiring a minimum of 15 and a maximum of 25 H. P. to operate it, the difference of elevation from the quarry terminal to the discharge terminal at Placerville being 240 feet. At present the slate shipments from Placerville average a carload a day. C. H. Dunton is superintendent.

Inyo County.

The Great Western Ore Purchasing & Reduction Co. is building a smelter at Keeler to treat ore from the Cerro Gordo mine, in the Swansea district. F. C. Everett is president. The old 10-stamp mill has been remodeled.

Nevada County.

The Yuba Drift M. Co., which owns the Badger Hill, Malakoff and other gravel properties at Badger Hill, near Grass Valley, have put in a new hoist and started a perpendicular shaft to strike bedrock. The shaft is now down about 140 feet and blue gravel has been reached.——The Maryland shaft, near Grass Valley, has been cleaned out and retimbered to the 800 level and the pumps will be started. It is estimated that it has cost over $50 per foot to reopen the shaft.

Operations have been resumed at the Spanish Ridge mine, near Washington, after a shut down of two months due to shortage of water. Superintendent J. H. English is having the new air compressor put in place. The Spanish Ridge has made arrangements for another water ditch and will not again be hung up on account of a shortage of water.

Placer County.

The Eclipse-Morning Star mines, near Ophir, have been sold to C. L. Wilson of San Francisco. Pumping is to commence at once.——The Valley View mine, near Ophir, has been sold, and the new owners are sinking a shaft.——The Bear Valley Smelting Co. has acquired land between Ophir and Lincoln, and propose to build a smelter.

Plumas County.

It is reported that the Ward Creek M. Co. has completed the grading for a 100-stamp mill for the Gruss mine, near Genesee. W. L. Harper is general manager. The shaft is down 400 feet.——The Genesee Con. Copper Co. have run their 3000-foot tunnel 700 feet. This is intended to cut their ledge at a depth of 1500 feet. An air compressor and machine drills are being put in. J. Phelan is manager.

H. Goering has charge of work at the Last Chance gravel mine at Mohawk Valley.

Santa Barbara County.

An entirely new district in the Santa Barbara county oil fields has been opened by the Los Alamos Oil Co. bringing in the first well, a gusher, producing 600 barrels daily of 32 gravity oil, the highest grade yet found in the territory. The well is about 5 miles southwest of Los Alamos and about 6 miles south from the nearest well of the Western Union Co. and the same distance east of the Purisima wells of the Union Oil Co. The well was brought in at a depth of 4290 feet, which is the record of the county.

Siskiyou County.

It is reported that a cyanide plant is to be added to the Jillson mill, near Hornbrook, by the Hazel G. M. Co.

Trinity County.

The Bonanza King mine, near Trinity Center, has been sold to James and John Treadwell. J. H. Porter will remain as manager.——The Brown Bear mill, at Deadwood, has made its last cleanup for the season.—— Three shifts are working on the Lappin at Deadwood. Frank Hollingsworth has succeeded John Bealham as manager. The main ore working tunnel is in 200 feet, and will be pushed ahead 800 feet farther, to tap the ledge at depth.

Yuba County.

L. Pierce, J. R. Chadbourne and T. H. Woods of Suisun are preparing to develop their gravel mine, near Brownsville. J. R. Chadbourne has charge at the mine.

COLORADO.

(Special Correspondence).—While nothing sensational can be reported in connection with mining in this State, the fact is evident to all observant persons that much activity exists and that the outlook is bright. Without exception, mining men predict a good year during 1906. Machinery houses are making estimates on machinery and supplies for next year's delivery and with the advance in the price of lead and silver and the demand for zinc the mines of Colorado will undoubtedly have one of the best years in the history of the State. Attention is being called to the fact that assayers should be compelled to pass an examination and receive a license the same as a U. S. deputy mineral surveyor before they are allowed to commence business. This is considered advisable by many on account of the crooked work being practiced by some of the assayers throughout the State and also to do away with incompetent men in the business.——The case of J. B. Hindry against the Globe smelter, which has been in the courts for several years, and which resulted in a mis-trial last spring, will soon be brought to trial again. Hindry sues the smelter for damages on account of the smoke injuring his ranch land and livestock.——Word has been received in this city that the U. S. Mint will start operations Jan. 5, 1906. The date has been set a number of times, but has been delayed for various reasons.

Denver, Dec. 4.

(Special Correspondence).—The receipts of gold and silver bullion at the United States Mint in Denver for the month of November are 58% higher than they were in the same month last year. The past eleven months show increase over the preceding year. This increase is evidently due to the fact that the Denver Mint is to be used for coinage in future. In the San Juan country the heavy snows are impeding the progress of the new mills that are being erected, but some of them have gotten under cover, so that work can proceed during the cold weather. The railroads handling the material for that section of the State are having their usual difficulties on account of snowslides. The heavy snowfall so early in the season is rather unusual, yet it will be a great benefit, as the snow coming at this season of the year will pack and freeze and will be better for next season's water supply.

Denver, Dec. 6.

Boulder County.

The Cass P. N. O. Co. is working the Grand View mine at Sunshine under the direction of E. Eby. The shaft is down 700 feet and is approaching the level of the El Dorado tunnel, which is in 1200 feet and is being driven to drain and work the White Crow, Grand View and El Dorado properties.——New machinery has been put in at the Boulder Valley, west of the Grand View, under the direction of H. Fuller.——The Osceola shaft of the White Crow has been retimbered and new machinery has been put in. R. Trevarthan is superintendent.——The shaft on the Inter-Ocean, at Sunshine, is to be sunk from the 500 to the 700-foot level. A cyanide plant is to be put in. A. E. Healey is superintendent.——Work is to be resumed at the American mine, at Sunshine, under the direction of W. B. Hays.

The Five Points G. M. & M. Co. has been formed to work near Gold Hill.——A new hoist and boiler have been put in at the St. Joe mine, above the Cash mine, near Gold Hill.——The American Queen G. M. Co. is putting in a 25-ton mill to handle the ore from the Cash mine. A tramway is to be put in between the mine and mill.——The Grand Republic G. M. Co. has been organized to work claims near Sugar Loaf.

Clear Creek County.

The West Griffith, near Empire, operated by the Independence M. Co., is working full force. The management is thinking of putting in a concentrating plant to handle the lead and zinc ores blocked out in their workings.——The East Griffith, on Griffith mountain, is being worked. W. D. Hoover has just taken a trip East, and it is understood that on his return he will let a contract for a concentrating plant to treat the ores of the property.

It is reported that the Manhattan-Union M. Co. intends to put in a concentrating plant to treat the ore from the Kittie Ousley mine in East Argentine district, near Georgetown. Edw. Wing is manager.

Manager B. J. Martelon of the Silver Leaf tunnel, which is being driven into McClellan mountain, near Silver Plume, has temporarily suspended operations pending arrangements for machinery.

The Blue Bird group, on Republican mountain, near Empire, is to be worked during the winter by D. W. Stewart under lease and bond.

Dolores County.

The United Rico Mines Co. has begun work on the fourth level of its Yellow Jacket mines on the slope of Nigger Baby hill, near Rico. The remodeling of the company's Group Tunnel mill has been completed and will handle ore from the stopes on Enterprise verticals. Each stope is to be milled separately to the extent of 500 tons.

Eagle County.

Scott & Reed have taken a lease on the Combined Discoverer, west of Rock creek, near Red Cliff, and have a shipment of ore ready.

Fremont County.

The Rocky Mountain smelter, at Florence, recently bought by the Colorado S. & R. Co., has finally been

freed from litigation. The works were built five years ago and ran for a few months and have been closed since, owing to litigation brought about by quarrels among the stockholders. J. M. Harsh of Creston, Ia., is president of the new company with C. G. McCarthy of Des Moines vice-president and E. L. Whitney of Colorado Springs as secretary. President Harsh says the smelter will be running not later than February. The ore supply is not yet definitely secured, but the company will either buy mines outright or enter into combination with the big mine owners. The plant has a capacity of 500 tons a day. About 150 men will be employed. The plant is south of this city on 160 acres donated by the city government as a bonus for its erection. The plant is in first-class condition after five years' idleness.

Gilpin County.

W. Barrick, superintendent of the Apex Gold M. & M. Co., has bought the Trio and September lodes, in the Pine Creek mining district, near Apex, and will organize a company to work them. M. Whalen has charge of the work.——The Ingram M. Co., operating the Ingram mine in Apex, have sunk the shaft to a depth of 115 feet from the top and are 70 feet from the tunnel level. The company will commence shipping within the next month. I. Pollard is manager and J. Ingram is superintendent.

W. A. Hopkins of Central City, who is leasing on the 555-foot west level of the East Notaway mine in lower Russell district, has received returns from a carload shipment of smelting ores, netting $198.98 per ton. The ores contained the following values: 10.23 ounces gold, 7.32 ounces silver and 3.96% in copper per ton.——A deed has been placed on record conveying from L. C. Beckwith to T. R. Webb of Argentine the Redemption lode claim, situated in the Lake district.——The Hall mine in Russell district has again been started up by its owner, Isaac Hall, and work is to be carried on by its owner in the 100 and the 200-foot levels.——Local operators are working the Eureka mine in Prosser gulch, owned by J. C. Henkins.

The Pozo mine in Nevada gulch, near Central City, is worked principally for its zinc values, although some of the ore gives values of from two to three ounces gold per cord. The shaft on the Pozo is 165 feet deep. A new plant is to be put on the property. A. W. Rucker is manager.——R. W. Pearce of Nevadaville and County Treasurer Trezise are operating the Ute mine in Nevada district and are shipping to the mills in Black Hawk. The main shaft on the Ute is 650 feet deep, but operations are being confined to the 300-foot east and west levels. They are also sinking a winze on the 300-foot level for prospecting and to afford better ventilation.

The O. K. group on German hill in the Gregory district, near Central City, has been sold to Denver and Eastern parties for $50,000 by A. Anderson. The group consists of the Epizootic, Dean and Casco lodes.

Lake County.

At a depth of 700 feet the President shaft at Leadville was still in wash. G. F. Burtch is manager.

F. J. Hoffer will put in new machinery on the Hoffer No. 1 shaft being sunk on the Bob Ingersoll claim, near Leadville.

The ore output from Leadville during November was 77,500 tons, as against 90,000 tons for October. The decrease is due to the fact that many of the smaller operators, especially in the silver iron mines, were unable to work their claims owing to inclement weather. Many of the shafts are exposed to the elements and the cold weather interferes with the work of hoisting.

La Plata County.

(Special Correspondence).—The lower tunnel on the May Day has cut the vein at a depth of 750 feet and it is said to be larger and richer than above. Heretofore an output of twenty-five tons per day has been the limit, but this may now be increased, since ore may be dumped directly from the mine cars to the bins, from which it will soon be taken by railroad cars, for the owners have let a contract for the building of a spur 2 miles in length to connect the R. G. S. Ry. at Cima, 15 miles west of Durango. It is to be completed in thirty days.——The 50-stamp mill of the Bonnie Girl is completed. The tramway is finished and development of the mines is being pushed. Mr. Allen is to have charge of the property.——The Small Hopes tunnel is in 1500 feet, where it is expected to cut the vein; but a careful survey shows that it will still be necessary to run 50 to 200 feet. As the dip is not constant the distance can only be guessed at.——The Chief M. Co. has had buildings in readiness for some time for their compressor plant.——The Old Kentucky, on the East Mancos, has made a shipment of twenty tons to Denver for test, with a view to putting in a reduction plant in the spring. D. H. Franks, of Mancos, is manager.——The first heavy snow fell on Nov. 22, and the prospecting season in the La Platas is over. A number of new prospects have been opened the past season and the camp has made the best progress in its history.

Mancos, Dec. 2.

Ouray County.

It is reported that the Grecian mine, on Mt. Hayden, near Ouray, is to be opened up and a mill built to separate the zinc and lead. R. W. Clinton is the owner.—The Micky Breen mill of the Tempest Ajax Co. at Ouray has been remodeled, and hereafter the concentrates are to be separated into zinc and lead products. F. M. Jackson is manager.

San Juan County.

The mill of the Hercules Con. M. Co., south of Silverton, is being overhauled and gotten into shape for the resumption of operations after a protracted idleness. To accommodate the new machinery and appliances that are being installed, an addition of 30x65 feet has been built. Ten more stamps will be added to the equipment, making 40 in all. The steam power is to be increased to 275 H. P. During the past summer a big force has been employed in developing the mine, and it is stated that there is already enough ore of good quality in sight to keep the mill running double shift all next year.

San Miguel County.

The Adams property, near Telluride, is under lease to George Lee and M. Weiss of Telluride. The 10-stamp mill on Bear creek has been started.——A. A. Clute, manager of the Goldfield-Rex M. Co., which had a contract for extending the Pennsylvania tunnel to the Smuggler-Union vein and which has a long-term lease on a portion of the Smuggler-Union vein, has closed down prospecting and exploitation work on the Contention mines, in Bear Creek basin, near Telluride.——Work on the Vanadium Alloys Co.'s experimental plant at Newmire, on the San Miguel river, 14 miles below Telluride, has been retarded by inability to secure lumber and brick as rapidly as needed. The mill is being built for the treatment of vanadium ore on Bear and Leopard creeks, the former emptying into the river at Newmire, opposite the mill, and the latter at Placerville, 6 miles below. Vanadium ore has been found on both sides of the San Miguel river between the two creeks. W. T. Rynard has charge of work.

L. Neilson, H. H. Hutton, C. Flodman and F. Williams have a lease on the Morning Star claims on Bilk creek, in the Mount Wilson district, near Telluride.——The Keystone placer, on San Miguel river, 5 miles below Telluride, has been closed down for the winter by the Keystone Hydraulic M. Co.——The low-grade ores on the dumps of various properties in the Sawpit district, 17 miles below Telluride, will soon commence to be worked over. Two small custom mills are being built. One of them, containing five stamps, is being built by H. Revelер, W. Pomeroy and Mr. Weeks, while the other is being put in by Denver parties. There never has been a quartz mill at Sawpit, and the ore that has been shipped from there had to carry values sufficient to pay railroad transportation and smelter treatment, consequently the greater portion of the mineral taken from the mines was thrown on the dump as too low grade to ship. There are said to be thousands of tons of this character on the dumps which, if concentrated, will return profits.

Summit County.

(Special Correspondence).—Near Montezuma the Sarsfield and the Wild Irishman mines are being put in shape for continuous work during the winter. The Fisherman is being worked on lease. The El Dorado group on the Snake river, 2 miles from Montezuma, is being worked on lease.

Montezuma, Dec. 2.

(Special Correspondence).—The Beaver Creek M. Co. is making steady shipments of ore and concentrates. The ore is being taken from the Lucky shaft, which has a 4-foot streak of ore and concentrating matter. The same company is working the Carbonate mine on Mount Baldy.—— The Washington mill was closed down for a few days to put in an electric light plant to light up the mine, mill, boarding and bunk houses and offices.—— Condon & Shrack have opened up gold-bearing sulphide ore in a winze sunk 40 feet below the lowest level in the Pacific Gold Dust mine.

Breckenridge, Dec. 4.

The Old Union M. & M. Co.'s mill, near Breckenridge, is running night and day, and the installing of their new screens has proven a success. The mill is taking the crude ore, which runs 17% zinc, 17% to 20% lead and 17% to 20% iron, with gold and silver values, and is making a lead product of 33% to 40%, zinc product from 35% to 40% and a clean iron product. The tailings assay 2% zinc and 1% lead.

Teller County.

The Oro shaft, on Ironclad hill, near Cripple Creek, is down 120 feet and is to be continued to the 150-foot level by the Oro Leasing Co. C. F. Springer is manager.—— It is reported that ore has been struck in a crosscut from the 350-foot level of the Montrose, on Ironclad hill, being worked by Van Fleet and associates.——The shaft on the South Burns block of the Acacia, near Altman, is down 440 feet.——McClary & Co. have struck ore at a depth of 100 feet in Block 3 of the Ajax, on Battle mountain.——Shaft sinking is to be carried from the 200 to the 500-foot level of the Finn lode claim of the Royal Oak G. M. Co., under the direction of C. B. Wider of Cripple Creek.——Work has been resumed on the North Fork claim of the Empire State M. & T. Co., on Ironclad hill. Sinking is to be continued from the 160 to the 300-foot level.

IDAHO.

Blaine County.

(Special Correspondence).—A discovery is reported west of Hailey by P. Deliny and J. Montgomery near the Crœsus mine. The ore is a sulphide, with brilliant silvery luster. Assays show from 60% to 75% of metallic bismuth in concentrates and the sulphide in the quartz is from 3% to 15%. As a little depth is gained, an increase in the bismuth is noted. Preparations are being made to block out ore and for reducing the ore to metallic bismuth on the ground.——Several old mines in the Wood River section are also starting up again.

Hailey, Dec. 4.

The Wood River Zinc Co. of Hailey has 1000 tons of War Dance ore stock piled at its mill at the mouth of War Dance gulch, on Deer creek. The mill is not running, because it is not adapted to the ore. Changes are intended, such as the addition of jigs and of hydraulic sizers.

Shoshone County.

The German-American claims, near Osburn, are being developed.——Supplies have been delivered to the Polaris mine, near Osburn, for all winter work.——A compressor has been put in at the Central group on Idaho gulch by Walker Bros. of Murray. Work is to be started on the lower tunnel.

MISSOURI.

Jasper County.

J. M. Baulby of Iowa, Norman Scurman and Albert Thomas of Webb City, last spring took a lease on six lots of the McCrosky lease north of the old Nevada land in Webb City. They have now completed their mill and made their first turn-in of zinc ore, amounting to 56,880 pounds.——A contract has been let by Webb City people for the building of a mill on the Burch land, north of the Underwriters' Land Co.'s land, north of Webb City. There will be three or four mills built on this land within the next few months.——The Grace M. Co., operating on the Granby M. & S. Co.'s land in the Chitwood district, has made an exceptionally rich drill strike at a depth of 143 feet. The drill has already shown a 20-foot face of ore.

MONTANA.

Granite County.

The Tussle M. Co., which recently took a bond on the Frank Wahlgren property on Little Gold creek, near Princeton, is shipping ore.

Jefferson County.

The Blackwell-Golden Crown claims, including the Blackwell mine and mill, have been absorbed by the Sunset National M. Co. The new company owns 160 acres, representing nine claims, near Homestake. Improvements on the property consist of a 10-stamp gold mill, cyanide plant, concentrating tables and assay office. Two shafts have been sunk, one 117 feet deep and the other 230 feet deep.

Madison County.

Dredgers near Alder are still at work and will continue into the winter. The Conrey Dredging Co. has begun work on an electric plant at Alder.

Silver Bow County.

(Special Correspondence).—The properties under bond to the East Butte M. Co. have been examined by J. W. Neill of San Francisco. Mr. Neill spent several weeks in the mines and his report will soon be in the hands of New York and Boston parties who are interested in the flotation of the mine. He says the property under option is among the best in the Butte district, and it is expected that his report will be favorable. The company has taken a bond on nearly 300 acres more of mineral ground, and will use a portion of it as a site for a concentrator to be built immediately, and a smelter site, should one become necessary in the future. Without any further development or equipment the mines are capable of producing daily about 200 tons of first-class ore and 500 tons of second-class for concentrating. While Mr. Neill was examining the properties a most fortunate development occurred. In the Yankee Boy mine, one of the properties of the group, a new vein 9 feet wide was opened at a depth of 350 feet, and in the Dutton 3 feet of copper glance was cut in a winze from the 300-foot level. The glance runs 60% copper and the vein in the Yankee Boy about 14%. Mr. Neill, who made the examination, was for some time chief engineer and mine director for F. A. Heinze, and is now consulting engineer for the Pittsburg & Montana Co.——Through economies at the Washoe smelter and the discovery of richer ore bodies the Anaconda Co. has reduced the cost of its copper production nearly 1 cent per pound. Copper is costing the company little more than 9 cents per pound now. The company is working eight mines at present. They are, with their shaft depth, as follows: Anaconda, 2450 feet; Never Sweat, 2440 feet; St. Lawrence, 2000 feet; Bell, 1600 feet; Diamond, 2200 feet; Mountain Con., 2200 feet; High Ore, 2200 feet; Wild Bill, 400 feet.—— The North Butte Co. has acquired the Gem mine and has options on half a dozen others, many of which will be taken up. The new hoisting engine, which was due in Butte December 1, has not yet arrived, owing to delay in transportation, but it will be in place in a few weeks. The company continues to mine its properties through the shaft of the High Ore mine and hoists about 550 tons of ore a day. Only the very highest grade of ore is being mined and it yields from 150 to 155 pounds of copper per ton.—— Development work is still going on in the Raven mine and some good ore has been found in the crosscut at 1200 feet from the Buffalo shaft.

Butte, Dec. 5.

The annual report of the Deputy State Mining Inspector shows the number of men employed by the principal Butte companies, above and below ground, and the present depth of shafts:

	Underground Men.	Top Men.	Shaft, Feet.
Amalgamated—			
Anaconda mine	580	146	2,450
Never Sweat	440	66	2,440
St. Lawrence	420	56	2,600

West Stewart	280	20	1,900
Pittsburg & Montana Co	111	87	1,200
Totals	8,884	1,436	

The shaft of the Pennsylvania mine was sunk 300 feet during the past year, that of the West Colusa 200 feet, Never Sweat 406 feet, St. Lawrence 122 feet, Original 200 feet, West Stewart 200 feet. The Pittsburg & Montana Co. has two shafts of 1200 feet each.

The Hanson, Kennedy & Bryant Co., on Silver Bow

creek, near Butte, have put in a copper precipitating plant. The plant is composed of a tower 56 feet long, 16 feet high and 6 feet wide, and is divided into nine floors, which are made of 2x4 lumber, allowing 2-inch spaces for water to fall through onto the next floor below, and so on to the bottom. The bottom floor is made tight, and adjoining this floor are four settling tanks, all in connection with each other, and by such arrangement the water is held until it deposits the precipitates carried from the iron in the tower into the tanks. The tanks are so arranged that during cleanup time one or more can be disconnected from the others. Each floor is covered with scrap iron, requiring about 150 tons for the first filling. The water is obtained from Silver Bow creek by means of a dam with a headgate so arranged that any amount of water desired can be taken into the ponds. The banks of the ponds are made up of tailings washed on the flat from the old Parrot smelter. These tailings carry about 3% copper. When the ponds are filled with water a great amount seeps through these banks, which makes the water valuable for its copper contents.

The Amalgamated Co. has begun sinking the shaft of the J. I. C. mine in the East Butte district, and will put it to a depth of 2000 feet. The J. I. C. has been worked for some years. The J. I. C. adjoins the properties of the East Butte Co. They have started to prospect mines east of Butte and are sinking a shaft on the Greenleaf, owned by the Boston & Montana Co.——The shaft of the North Butte has been reconstructed and the output of the mines will be increased one-third. Next March the new hoist will be put in.——In a suit of F. A. Heinze and the Johnstown Mining Co. against the Boston & Montana Mining Co., known as the Gambetta-Piccolo case, the district court has denied the defendant permission to do some development work in the Minnie Healey mine, one of the Heinze properties, for the purpose of demonstrating the truth or falsity of the plaintiffs' contentions. Heinze claims that the veins of the Minnie Healey dip to the north and under the Piccolo and Gambetta mines of the Boston & Montana, and that the ore the Boston & Montana has taken out in years past really belonged to the Minnie Healey. Heinze obtained an injunction several years ago by which the Boston & Montana has been prevented from mining in that particular portion of the property. The Boston & Montana Co. has always maintained that the claim of the Heinze interests was not sincere, but that the action was brought as a gamble when Heinze had friendly judges on the district bench. The Boston & Montana therefore asked permission to go into the Minnie Healey mine and open the ground to such an extent that it could be determined whether the Minnie Healey veins dip to the north at that point or not. The application, however, was resisted by the Heinze lawyers and Judge Bourquin sustained their objection because the petition as to the necessity of the work was held not to be sufficient. The company was, however, given permission to renew the application.

NEVADA.

Esmeralda County.

The Tonopah-Goldfield Railroad has issued a tariff sheet which probably will result in moving low-grade ore that could not be handled under the old tariff. These rates are in effect Dec. 5, between Goldfield and Tonopah and Mina only, as this is the terminus of that road, although most of the ore has been shipped to Salt Lake, Utah, or Vallejo, Cal. The tariff for 2000 pounds or less follows: From Tonopah to Mina—Ore value not over $30, $1.50; between $30 and $40, $2; $40 and $50, $3; $50 and $60, $3.25; $60 and $70, $3.50; $70 and $80, $3.75; $80 and $90, $4; $90 and $100, $4.25. From Goldfield to Mina—Ore value not over $30, $2.10; between $30 and $40, $2.80; $40 and $50, $4.20; $50 and $60, $4.55; $60 and $70, $4.90; $70 and $80, $5.25; $80 and $90, $5.60; $90 and $100, $5.95.

NEW MEXICO.

In addition to an address upon the mineral resources of New Mexico at the American Mining Congress at El Paso, F. A. Jones of Albuquerque gave out the following resume of mining conditions in a number of active New Mexico mining camps: About Elizabethtown, in Colfax county, the operations of the placers are greater than formerly. The Oro Dredging Co., operating with a dredger at Elizabethtown, will take out $100,000 this season. The season here is seven months long, on account of freezing up in winter. This company has been operating for five years. Several small hydraulic concerns are operating here also with considerable success. ——About Red River, in Taos county, there was recently made a rich strike of petzite ore which is rich in gold and silver.——In the Bromide district, in Rio Arriba county, the 6000-foot tunnel on the Bromide mine is in about 600 feet. It will tap a number of deposits. The Dillon Dev. Co., which is working the Tampa mine, has some machinery on the ground for a 50-ton concentrating plant. The ores are sulphides of copper, carrying gold and silver, and some of the ores are said to carry platinum values. The property is owned by the Tusas Peak M. Co.——Northwest of Bromide is the Headstone district about Hopewell, where the King William M. Co. is operating. The lower flat placers are worked by the hydraulic method. The season is just closed, as the ground is freezing up. The company is building storage reservoirs, and expects to have enough water to run through all next summer.————In Lincoln county about White Oaks the present shaft of the Old Abe gold mine, 1375 feet deep, is to be sunk 250 feet deeper. This is the deepest shaft in New Mexico. The Old Abe coal mine, belonging to the same company, is being operated to supply the local trade.——At Parsons, in Eagle mountains, the Eagle M. Co., J. M. Rice general manager, is putting in new milling machinery. The processes are amalgamating and cyanide, and Huntington mills are used.——In the Jicarilla mountains, in Lincoln county, W. A. McIvers is building a 50-ton concentrating plant to do custom work.

OREGON.

Baker County.

The Valley Queen mine, near Cable Cove, has been consolidated with the adjoining claims of the Ophir Co. T. C. Gray will continue as manager. Work will be continued throughout the winter.——Manager E. I. Field, of the United Elkhorn mines, near Baker City, has removed his air compressor from the camp at the 2000 level, where it has been in operation by water power, to the mine on top of the hill, where he has put a 75 H. P. electric motor. He is also putting in a new movable electric hoist, to be used on the third and fourth levels.

The Gold Coin mine, near Durkee, owned principally by Pendleton capitalists, is to open this winter. It is 20 miles southeast of Baker City.

Jackson County.

Manager H. Foster is adding ten stamps to the Opp mill, near Jacksonville, making a total of twenty.

Josephine County.

A. C. Hoofer of the Mount Pitt mine, near Grants Pass, says that he intends to put in a three-drill compressor.——The Black Channel M. Co. has sold its placer properties on Foots creek, near Grants Pass, to W. P. Bailey, who is getting it ready for a winter run.

The bedrock flume on the Galice Con. Mines Co.'s property has been completed from the mouth of Galice creek to Mill bar, which the company expect to work this winter. There are 15 acres in this bar, bedrock varying from 6 to 10 feet. Four giants are operated and twenty men employed during the working season. The ancient channel, which crosses the Galice country at an elevation of 800 feet above Rogue river, is to be worked under lease by J. R. Harvey. Water is brought 5 miles from the Galice and three giants are used.——The Rand and Almeda properties, 3 miles below Galice, on the opposite side of Rogue river, are to be consolidated.——The Black Jack group on Quartz creek, a tributary of Galice, is being opened up by R. Jackson.

UTAH.

Juab County.

The output from the mines of Tintic for the week ending November 30 was the largest of any week during the present year, amounting to 160 carloads. Ridge Valley, 3 cars; Bullion-Beck, 8; Gemini, 19; Eureka Hill lease, 9; Centennial Eureka, 46; Swansea, 8; Eagle & Blue Bell, 8; Uncle Sam Con., 6; Yankee Con., 7; May Day, 2; Brooklyn Con., 3; Dragon Iron, 6; Carisa, 5; Mammoth, 14; Victoria, 5; Grand Central, 9; Ajax, 2; total, 160 cars.

T. Manion, superintendent of the New Utah property, near Eureka, reports that the new hoist is working well and the sinking of the incline shaft is in progress.——Work has begun on the Logan claims, south of the Bullion-Beck mine, at Eureka.——M. M. Kellogg of Provo has made arrangements to have work commenced on the Ralph and Lilly claims in East Tintic. ——The machinery from the old Martha Washington mine at Silver City has been removed to the Copper Jack mine in West Tintic and installed and development work on that property will be begun immediately by C. C. Griggs, J. C. Jensen, G. Hanson, et al.

Salt Lake County.

The mill of the Shawmut Con. C. Co. at Bingham is to be run on custom ore. A deep tunnel is to be driven to cut the vein. F. A. Darrenougue has charge of work.

Utah County.

P. Adamson of American Fork has stopped work for the winter at the Scotchman mine.——It is reported that good ore has been struck in the Copper King mine of the Silver Flat M. & M. Co. in American Fork canyon. Work is to be continued during the winter.——The Goodsell mine is to be worked during the winter. J. H. Wooten of American Fork is manager.

WASHINGTON.

Ferry County.

A new hoist has been put on the Defender mine, near Orient, and the shaft is to be continued to a depth of 300 feet. J. T. Dolan has charge.

Okanogan County.

The Prize M. Co. has struck a new ore shoot on Mount Elemeham, near Nighthawk.

Stevens County.

It is reported that a concentrator is to be put in at the Daisy mine, south of Kettle Falls.——Work is to be resumed on the Acme mine, near Kettle Falls.

WYOMING.

Natrona County.

J. H. Bury and A. E. Minium, owners of the asbestos deposits southeast of Casper, are making preparations to develop their mines and begin shipping.

FOREIGN.

AFRICA.

Gold Coast.

In a Governor's recent report it is stated that the climate is malarious and not suitable for the prolonged residence of Europeans. European employes, belonging to mining and mercantile communities, are engaged in England. There is little hope of obtaining employment, and Europeans should not come to the Colony on the chance of obtaining employment, where the openings for white labor are few. The rates of wages are high, and the cost of living has considerably increased in recent years, particularly in the Western Province, which is the center of the mining industry. The rate paid by the Government for carriers has been reduced from 1s a day and 3d a day subsistence, to 25s a month with the same amount for subsistence; short journeys to and from the principal coast towns are at a fixed rate. Contractors at Accra and Cape Coast supply the Government with carriers. Native carpenters and masons can earn 1s 6d to 3s a day; bricklayers 1s 6d; to 2s 9d; coopers and painters, 1s to 1s 9d a day. The rates of wages paid to native miners vary from 1s 3d to 1s 6d a day for surface laborers, and 1s 9d for underground work. The Government Transport Department have done valuable work in organizing and regulating the employment of labor for the mines in the Western Province, and it is mainly by the efforts made by this Department that the rate of labor has been reduced to the present figure. The laborers sent to the mines by the Transport Department are hired on contract for six months or a year, and, with the exception of occasional advances, do not drawn their pay until their contract is completed. Laborers receive subsistence money, whether they work or not, until their contract is finished. While there is no doubt as to their being a sufficiency of labor on the Gold Coast, supplemented as it is at present from other Colonies, complaints are made as to its quality. The value of a gang of laborers usually varies with the ability of the European in charge. One overseer will condemn as worthless a gang out of which another will get excellent results. Under efficient supervision, or working on a fair system of daily task work, a fair day's work is generally obtained.

CANADA.

BRITISH COLUMBIA.

Boundary District.

Boundary Falls smelter has been blown in by W. C. Thomas, smelter superintendent for the Dominion Copper Co. One furnace is now in commission, reducing about 350 tons daily from the company's Brooklyn, Stemwinder and Rawhide mines. The second furnace will be blown in later. This makes a total of over 3000 tons of ore daily now being shipped from the mines of Phœnix camp, the Granby output being 2700 tons a day.

Boundary ore shipments for the week ending December 2 were as follows: Granby mines to Granby smelter, 17,633 tons; Mother Lode to British Columbia Copper Co.'s smelter, 3717 tons; Brooklyn and Stemwinder to Dominion Copper Co.'s smelter, 1170 tons; Rawhide to Dominion Copper Co.'s smelter, 480 tons; Sunset to Dominion Copper Co.'s smelter, 360 tons; Providence to Trail smelter, 30 tons; Skylark to Granby smelter, 30 tons. Total for week, 23,420 tons. Total for year to date, 833,744 tons. Boundary's three smelters treated ore as follows this week: Granby smelter, 17,960 tons; British Columbia Copper Co.'s smelter, 3717 tons; Dominion Copper Co.'s smelter, 2010 tons; total for week, 23,687 tons. Total for year to date, 857,184 tons.

Cassiar District.

In a recent report of the Provincial Bureau of Mines, W. F. Robertson reports on mining conditions on Windy Arm, a branch of Tagish lake, the claims being near the boundary line between British Columbia and Yukon Territory. The district is reached from southern British Columbia by steamer to Skagway, Alaska, thence over the White Pass & Yukon railway to Carcross. Steamers from Victoria and Vancouver to Skagway run every week, with additional steamers from Puget Sound ports, on which the first-class fare is $30. From Skagway to Carcross the White Pass railway runs a passenger train every day, except Sunday, the year round. The railway fare is $12.25. From Carcross to Conrad City, the terminus on Windy Arm of the aerial tramway from the Conrad Consolidated mines, is 14 miles by navigable water. During the summer season transportation is provided by the steamer Gleaner, which makes two trips a week, or by rowboat, while after the ice forms travel is by sleigh over the ice. The White Pass railway has made two surveys for a branch to Conrad City. The older mineral locations, together with all the development at present accomplished, is in the Yukon Territory, and, consequently, outside the jurisdiction of the Province of British Columbia. From the shore of Windy Arm the hills rise rapidly, their lower levels being so covered with wash and slide as to have confined all prospecting to the upper levels—that is from 1500 to 4000 feet above lake level. Timber line in this part of the country is found to be at an altitude of from 4500 to 5000 feet above sea level, or about 2500 feet above the lake. The Conrad Consolidated mines, of which J. H. Conrad is president, holds ten claims, at an elevation of from 3000 to 4000 feet above the lake, in a level basin among the higher peaks, 4 miles from the Arm. The surface is covered with heavy wash or slide, in which rich float was found in such a well-defined line as to induce pits and cross-trenches to be dug until the vein was eventually struck in the solid formation upon the Montana, one of the central claims of the group. On this lead a drift has been driven for from 200 to 300 feet, giving a depth of 100 feet. From this level stoping had been carried up in places for about 30 feet. The vein is a quartz fissure vein between distinct walls. The hanging wall is the general country rock, a fine-grained, basic, intrusive rock, and the foot wall is a decomposed, rusty, coarsely crystalline, igneous rock, probably a diabase. The vein, as exposed, had a thickness of from 2 to 5 feet, averaging 3 feet. The strike of the vein was northwest and southeast, with a dip to the southwest into the hill, averaging 25°. On the footwall was found a layer from 3 to 12 inches thick of galena embedded in "carbonates," or iron oxides. Above this is the quartz proper, from 12 to 30 inches thick, mineralized with iron pyrite and silver and antimony sulphides. The manager estimated the entire vein to run $25 to the ton in gold and silver. On the strike of the vein as indicated by the Montana workings, a tunnel was driven on the Mountain Hero, the adjoining claim, through wash for 80 feet, when the solid formation was struck, in which a 50-foot raise was made, when the vein was found containing similar quartz ore. The company has a Riblet aerial tramway, 3¾ miles long, from the Montana group to the shore of Windy Arm at Conrad City, and will continue work all winter. The J. H. Conrad Bonanza has the Venus vein and the Uranus claims. From both of these properties tram lines have been surveyed and the right of way cleared to Windy Arm, at a point 2⅜ miles to the south of Conrad City. There are probably 100 more claims located on this slope, on which slight surface development has been done.

East Kootenay District.

C. A. Mackey, of Nelson, has been granted a permit

by the gold commissioner to prospect for a lode or vein of mineral under Lake Moyie, between the Lake Shore and Aurora mineral claims. The permit granted is for a shaft or tunnel site, and is for three months. A shaft is to be sunk on the Lake Shore ground near high water mark, to a depth of 200 feet and drift run in search of the vein which is supposed to extend below Lake Moyie.

Nelson District.

The Supreme Court of Canada has delivered judgment in the mining case of Docksteader vs. Clark. The highest Canadian tribunal practically decides that in deciding mine lo ation cases technicalities will not prevail. Specifically the court finds in location cases: 1. That 70° is too great a variation to allow as an approximation, though no exact limit was fixed. Ninety-seven degrees was the point involved. 2. That a location may be wholly on one side of location line. 3. That a location line may traverse any number of claims. 4. That a discovery post may be located even upon a crown granted claim. The decision is clear that such ground as may be lawfully covered by the location is to be allowed. From a mining standpoint the finding is one of the most important ever given in the Dominion. By consent the decision governs thirteen other pending actions.

Rossland District.

A reduction of 5 cents a ton has been made by the Canadian Pacific Railroad in the transportation rate on ore from Rossland to Trail. The price was 35 cents a ton and this has been cut to 30 cents. This will make a saving of about $16,000 a year for the mines of the camp. The White Bear at Rossland will resume on December 15 provided the new 400 H. P. electrical motor is ready. Shipments for week ending December 2 were: Le Roi, 2310 tons; Center Star, 1400; War Eagle, 1000; Jumbo, 200; total for week, 5180, and for the year, 303,-183 tons.

Slocan District.

After a trial which has lasted nearly two years, Chief Justice Hunter has given judgment in the suit of the Star M. & M. Co., owned by J. M. Harris of Sandon and others, against the Slocan Star M. Co., owned by Byron N. White of Spokane, Wash., and others. Judgment is in favor of defendants. The Slocan Star M. Co.'s claims are the Slocan Star and Silversmith, south of the Star M. Co.'s properties, the Heber and the Rabbit Paw. All the claims were located under the old mineral law, now abolished, which permitted the pursuit of a vein having its apex on the property into any adjacent lateral property. On the fifth level of the Slocan Star a vein which had its apex on that property was pursued northward into the Heber and followed through a curve which bent to the west and then to the south through a corner of the Heber and of the Rabbit Paw, back into the ground of the Slocan Star M. Co., in the Silversmith claim. It was contended by W. J. Elmendorf of Spokane, Wash., on behalf of the Slocan Star, that the vein pursued was continuous, and that, therefore, the company has a right to all the ore they could extract from it, whether in their ground or in that belonging to the Harrises. To the contrary, John Sizer of Butte, Mont., for J. M. Harris, maintained that a black fissure vein in the Heber cut off the vein, and that the vein pursued on the other side of that alleged fissure through the Rabbit Paw was not the vein originating on the Slocan Star. On the first hearing of the case there was this direct conflict of evidence, and an adjournment was taken for the execution of further work to prove the theory of either party. This was supposed to be done under the direction of S. F. Parrish, then manager of Le Roi mine. Mr. Parrish was taken ill and delay supervened. Finally Chief Justice Hunter, with the rival mining engineers, surveyed the property. On the hearing of the evidence then tendered the owners of the Heber and Rabbit Paw wanted yet more work done, as that already accomplished did not convincingly demonstrate the correctness of the theory advanced by Mr. Sizer. This the chief justice refused. The judgment, therefore, is that the vein is continuous, and that its contents belong to Byron N. White and the other shareholders of the Slocan Star Co.

West Kootenay District.

In a recent bulletin of the Provincial Bureau of Mines H. Carmichael says that Big Bend district is that portion of British Columbia north of the Canadian Pacific Railway and enclosed by the Big Bend of the Columbia river, having an area of approximately 2300 square miles. Crossing the Canadian Pacific Railway at Beaver Mouth, the Columbia river flows northwest for 60 miles, when it takes a sharp turn to the left and flows south, again crossing the railway at Revelstoke, 76 miles south of the Bend. With the exception of a few rapids, the river is navigable for boats or canoes for the entire distance, and the only bar to steamer navigation is at La Porte, 40 miles above Revelstoke, to which point a stern wheel steamer now ascends twice a week from Revelstoke, the return journey being made in one day. The entire region is rugged, the mountains rising rapidly from the Columbia river. The lower hills and benches are covered with a heavy growth of timber, consisting of Douglas fir, cedar and white pine, timber line being reached at an altitude of 6000 feet above the river, or 7500 feet above sea level. Prospecting in the region above timber line is easy, compared with the densely wooded portions of the Province. Communication will undoubtedly be better in the future, so that this section appears to offer a favorable field for the prospector. The J. & L. group is on Goat mountain, at the head of the east fork of Cairns creek. The group consists of five claims—the Eli and J. & L., owned by L. T. George and J. P. Kelly; the Badger, owned by J. P. Kelly, and the Annie M., owned by E. McBean and J. P. Kelly. The foot of Goat mountain is reached by a trail from Cairns creek to the forks, thence following up the east fork to the mine cabin at the base of the mountain, where it is 1050 feet above the Columbia river, the length of the trail being 9 miles. The work done on this property shows that there is a vein or impregnated zone in the schist country rock and along a contact with limestone extending from high up the mountain to the creek below, varying in width and mineralization. In places the ore is solid, carrying good values; in others, concentration would be required. The work which has been already done amply justifies further development. The values are in zinc, copper, gold and silver. The Standard group embraces eleven claims, and is owned by the Prince M. & D. Co. of Revelstoke. The property is on a small divide between two forks of the headwaters of one of the southeast branches of Downie creek, flowing into the Columbia river. The claims are reached from the Columbia river by a trail 12 miles long, following up Five-Mile creek and crossing over the divide into Downie creek. The altitude of the divide is 6000 feet above the Columbia, about 7500 feet above sea level, and is just above timber line. The summit is clear of timber. The country rock is a well marked schist, interbanded with limestone, and outcrops of quartz, often carrying minerals, are numerous. The lowest tunnel crosscuts the formation and was run 315 feet. At 275 feet a mineralized zone was struck and was estimated to be about 45 feet thick. Drifts were run 140 feet. A second tunnel, run at an elevation of 184 feet above the lower tunnel, struck the zone referred to at 140 feet, when drifts were run, parallel with those below, a total distance of 166 feet. At a further elevation of 120 feet above this a third tunnel was driven, cutting this zone at 150 feet, when drifts of 70 feet were run north and south. The last two levels have been connected by an upraise driven on the zone, drifts 70 feet long being run from the upraise midway between the two levels. The mineralization consists largely of arsenical iron and copper pyrites, with a little bornite. Assays of selected samples gave gold, silver and copper. Difficulties of transportation at present militate against the claims, but there is good ground for hoping that further work will prove up a property which, by offering a large tonnage of ore, will overcome this difficulty.

MEXICO.

Jalisco.

D. P. Richardson, president of the Cacoma M. & S. Co., near Autlan, states that the steam pump and steam hoist have been put in at the Vulcancias mine. Work on a 500-foot shaft has reached a depth of 125 feet. It is proposed to run a crosscut tunnel to cut this shaft. A 50-ton concentrating plant is to be put in. —— The Altamira M. Co. is cleaning out three old tunnels on its property near Ahualulco. Thirty men are working under the direction of R. R. Landrum. An air compressor and several drills will be put in and new development work taken up. W. W. Mathews of Etzatlan is president.

Mexico.

The Mexican Government has introduced as a circulating medium a new copper coin with an intermediate value between the 1-centavo copper piece and the 5-centavo nickel piece. On this subject Consul-General Parsons furnishes a synopsis of an address recently delivered by Finance Minister Limantour before the Chamber of Deputies. The Minister, in reviewing the monetary situation, in part said: "In the issue of new coins the proportion of alloy has been altered, putting them on a par in purity with the silver coins of other countries of the world. As under the new regulations the silver 5-centavo piece would have been smaller even than heretofore, a coin of nickel has been substituted, and as the new silver pieces coined—10, 20 and 50 centavos—bear to each other the proportion of 1 to 2 and 2 to 5, it was deemed desirable that a copper piece should be coined intermediate in value between the 1-centavo copper piece and the 5-centavo nickel piece, which would bear to these pieces the same relation. Consequently a 2-centavo copper piece has been coined, which will be of much use in transactions with coins of the smaller denominations. The peso remains, of course, the standard of value, equivalent now, however, to the fixed value of $0.498 gold, such value having been arrived at on the basis of the contents of the peso, 24.4388 grams of pure silver, equal to 75 centigrams of pure gold. The President, according to Mr. Limantour's statement, wishes to retain certain powers, such as the power to demonetize coins which it is desirable to withdraw from circulation, and to change, if found desirable, the design of the silver peso and to make foreign gold coins legal tender for a limited period. Mr. Limantour estimates the loss to the treasury in the reduction of mining taxes at $3,600,000 Mexican currency annually, such reduction being based on an annual production of $105,000,000 Mexican currency of gold and silver. He feels that this reduction, together with the steps taken by the Government to expedite the sale of silver bars, will compensate the miners for losses due to the curtailment of the free coinage of silver. The means through which Mexico is given a stable currency mark the most important step in advance in many years. Their enactment has greatly encouraged the investment of foreign capital in Mexican enterprises."

Sonora.

A. W. Jenks, superintendent of the Transvaal Copper Co. at Cumpas, expects to have the new smelter running within a month.

Obituary.

T. A. BENNETT, a mining engineer of high reputation, died at Lima, Peru, on November 23. It is probable that the cause of death was heart disease, from which he had lately suffered. Mr. Bennett had many friends in the profession and was associated with the Exploration Co. (London) in a copper mining enterprise in Peru.

Dividends.

December 5th the Bunker Hill & Sullivan Mining & Concentrating Co. paid dividend No. 99 of $300,000. This makes total paid since January 1, 1905, $3,255,000, and total to date $5,526,000.

Personal.

H. W. TURNER is in Alaska.

CHARLES JANIN is in Mexico.

JOHN B. FARISH is in London.

WILLIAM S. NOYES is at Chicago.

F. W. BRADLEY has returned from New York.

F. C. ROBERTS is in Mexico, with Charles Butters.

A. S. HOLLY is in Denver, Colo., from Mexico City.

G. E. ALEXANDER is in Denver, Colo., from California.

E. M. HAMILTON is at Copala, near Mazatlan, in Mexico.

PHILIP ARGALL has returned from British Columbia to Denver.

R. K. HUMPHREY has returned to Denver, Colo., from Chicago, Ill.

WILLIAM R. BARBOUR of New York is at the St. Francis Hotel.

MARTIN J. HELLER has returned to San Francisco, Cal., from Nevada.

HOWARD D. SMITH has returned from examining mines at Nevada City, Cal.

J. LINDSTROM has charge Dover & Brighton mill, Idaho Springs, Colo.

M. M. JOHNSON has returned to Salt Lake, Utah, from Greenwood, B. C.

H. L. DAY has been made manager Humming Bird M. Co. at Burke, Idaho.

CHARLES W. ABBOTT has arrived in San Francisco, from Blueridge, Oregon.

WM. BALL has resigned as superintendent Lower Mammoth mine, Eureka, Utah.

W. G. PAGE has resigned as superintendent of the Alturas M. Co., of Hailey, Idaho.

FRANK W. OLDFIELD is at Dresden, Germany. He will be in New York about Dec. 16.

J. LARSEN has been made manager X-Ray Gold & Silver M. Co. at Idaho Springs, Colo.

F. R. LYON, manager United States M. Co., at Kennett, Cal., has been in San Francisco.

C. W. MERRILL has returned to Lead, South Dakota, from a business trip to New York City.

G. W. MYERS, representing Chrome Steel Co., has returned to San Francisco from Australasia.

JOHN C. MONTGOMERY has been appointed manager in America for the Venture Corporation, Ltd.

J. M. HARPER has returned to San Francisco from the Columbia gravel mine at Forest City, Cal.

GEORGE J. MCCARTY, manager of the Creston-Colorado mine, at Torres, Mexico, is visiting San Francisco.

M. J. LIDSTONE has gone to Searchlight, Nev., to construct a 10-stamp mill for the Searchlight M. & M. Co.

F. C. GREGORY has returned to Denver, Colo., from Old Mexico, where he has been examining mining property.

REES C. VIDLER, manager Transcontinental Transportation & Tunnel Co., has returned to Georgetown, Colo., from Europe.

A. D. GASSAWAY, superintendent Union Blue gravel mine at North Bloomfield, Cal., has returned from a visit to New Mexico.

F. C. CARSTARPHEN has returned to Denver, Colo., from an examination of the power plants at Fort Collins and Boulder, Colo.

HOMER WILSON, of San Francisco, Cal., and president Wildman Syndicate mines of Sutter Creek, Cal., has gone to New York City.

D. H. LAWRANCE of Breckenridge, Colo., has been appointed consulting engineer to the Square Deal M. & D. Co., operating at Frisco, Colo.

F. M. TAYLOR is in San Francisco, Cal. The firm of Taylor & Brunton has established a branch of their ore sampling business at Tonopah, Nev.

C. F. GODDARD of the Goddard M. Co. of Wickenburg, Ariz., is in New York City. D. E. Huncsinger has charge of the mine during his absence.

A. F. HEWITT of the firm of Hewitt, Carstarphen & Co., mining and construction engineers, Denver, Colo., has returned there from Kansas City, Mo.

L. L. HUBBARD is at the Palace Hotel, San Francisco, Cal. Dr. Hubbard has been appointed consulting geologist to the Tamarack and Osceola mines, Michigan.

WM. FLICK of Garden Valley, Idaho, is superintendent in charge of Ox Bow tunnel of the Golden Treasure M. Co., on the Payette river, 20 miles north of Idaho City.

EDWIN O. DANE has severed his connection with the Imperial Copper Co. of Bell, Arizona, and is now with Cia Metalurgica Nacional, Matehuala, San Luis Potosi, Mexico.

GEO. RUGGLES has been made superintendent of all mills of the Federal S. & M. Co. He will continue to have personal charge of Standard-Mammoth mills at Wallace, Idaho.

O. Q. BECKWORTH, for several years with Fairbanks, Morse & Co., Denver, Colo., has resigned to accept a position with Cary & Fielding, at 1711 Tremont street, Denver, to have charge of the machinery department.

Commercial Paragraphs.

THE Hewitt-Carstarphen Co., 221 McPhee Building, Denver, Colo., announce that they are equipped to manage all classes of engineering. They call attention to metallurgical and mill construction, mine management, civil and hydraulic engineering and electrical installations.

THE Blake M. & M. Co., W. G. Swart superintendent, 1936 Curtis street, Denver, Colo., manufacturers of the Blake-Mosher electric separator, have been obliged to enlarge their plant on account of increasing business. The testing plant will be retained at the old place, 1936 Curtis street.

THE Union Gas Engine Co. is building eight Union engines on an order from the United States Navy Department: One 30 H. P., 3 cylinder; two 20 H. P., 2 cylinder; three 10 H. P., 2 cylinder; two 8 H. P., 2 cylinder. These engines will be direct connected to generators for wireless telegraphy stations.

THE Bedford Quarries Co. of Bedford, Ind., and the Ohio Quarries Co. of North Amherst, Ohio, have ordered eighteen Sullivan stone channeling machines of the class "Y" rigid head type, with boiler. This channeler has been developed especially for the needs of the building stone districts, and for several years has been the standard machine in use.

JOHN A. ROEBLING'S SONS CO., the wire and iron manufacturers, will build at Kinkora, 10 miles south of Trenton, N. J., a private city for the housing of its employes. Arrangements were completed recently for the erection of three workingmen's hotels and nearly a hundred private dwellings, in addition to the big hotel and the half hundred houses already erected. The building of the mill and the completion of the city will represent an outlay of more than a million dollars. All of the work is to be done in less than a year. Provision will be made within the limits of the Roeblings' city for the housing of 1000 workingmen and their families at the start, and more houses and additional hotels will be erected as the demands of the place may require. For the married men of the bosses and skilled mechanics class model homes of various sizes will be erected. These houses will be substantially built of brick and stone. They will be equipped with all modern improvements. The hotels and other public buildings will be lighted by electricity, which will also be used on the streets. Electricity will be produced on the place and gas may be manufactured there. Each of the streets will be 100 feet in width, with ample sidewalks. All houses will be erected well back from the curb lines, with grass plots in front. Trees will be planted on each side of every street and each house will have its own flower beds and shrubbery. Each house will stand alone, with plenty of air space all around it. The new town will be provided with a complete system of fire protection, including pressure mains, water to be supplied from a stand pipe 80 feet high. This is already built and is in the very center of the city. Another important feature of the town will be a street cleaning department. Great care will be taken in the sewering of the place, and no mosquito and malaria breeding pools will be allowed to exist. The whole city will be governed by a code of rules yet to be formulated by the corporation, and persons who refuse to abide by them will be excluded.

Books Received.

"Proceedings of the American Institute of Electrical Engineers" for November, 1905, contains a paper on "Performance of Lightning Arresters on Transmission Lines," by N. J. Neall, and a discussion on "Air Gap Flux in Induction Motors."

As Water Supply and Irrigation Papers 137, 138 and 139, the U. S. Geological Survey has issued bulletins by W. C. Mendenhall on "The Development of Underground Waters on the Coastal Plain Region of Southern California." Each is largely made up of a list of wells, together with details as to their condition.

"Bi-Monthly Bulletin of the American Institute of Mining Engineers" for November, 1905, contains the following technical papers: "Genesis of the Ore Deposits at Bingham, Utah," J. M. Boutwell; "The Constitution of Mattes Produced in Copper Smelting," A. Gibb and R. C. Philp; "The Origin of Vein-Filled Openings in Southeastern Alaska," A. C. Spencer; "The Limestone-Granite Contact Deposits of Washington Camp, Arizona," W. O Crosby; "The Electrolytic Assay of Lead and Copper," G. A. Guess; "The Origin of Clinton Red Fossil Ore in Lookout Mountain, Alabama," W. M. Bowron; "Anthracite Washeries," G. W. Harris; "Notes on Southern Nevada and Inyo County, Cal.," H. H. Taft; "Cost Accounts of Gold Mining Operations," T. H. Sheldon; "Manufacture of Coke in North China," Y. T. Woo; "Proceedings of the British Columbia Meeting, July, 1905, Including a Description of the Yukon Excursion," R. W. Raymond.

Trade Treatises.

The Southern Pacific Co. has issued an attractive and profusely illustrated booklet on the Yosemite Valley.

The Allis-Chalmers Co. of Milwaukee, Wis., devote Catalogue No. 128 to a detailed description of their crushing rolls. The catalogue is profusely illustrated.

The G. W. Price Pump Co. of San Francisco, Cal., have just issued an attractive catalogue entitled "Centrifugal Pumps," which describes their high-duty pumping machinery.

Latest Market Reports.

SAN FRANCISCO, December 8, 1905.

METALS.

SILVER.—Per oz., Troy: London, 29 5/8d (standard ounce, 925 fine); New York, bar silver, 64c, refined (1000 fine); San Francisco, 64c; Mexican dollars, 53c, San Francisco; 50½c, New York.

COPPER.—New York: Standard, $17.87½; Lake and Electrolytic, $17.87½ @ 18.00; Casting, $17.62½@17.87½; San Francisco: $17.75; Mill copper plates, $20.00; bars, 20@24c. London: £77 17s 6d spot per ton.

Copper remains at about the same price as that quoted last week. Lake and Electrolytic are selling at $17.87½ to $18.00 in the New York market. There are indications that this price will be maintained for a time at least, but those who anticipate a higher price will probably be disappointed.

LEAD.—New York, $5.85; St. Louis, $5.15; San Francisco, $5.00, carload lots; 5½c 1000 to 4000 lbs.; pipe 7½c, sheet 8, bar 6¾c. London: £17 ℔ long ton.

SPELTER.—New York, $6.50; St. Louis, $6.20; London, £28 12s 6d ℔ ton; San Francisco, ton lots, 7c; 100-lb lots, 7¾c.

TIN.—New York, pig, $35.02½@35.15; San Francisco, ton lots, 37c; 500 lbs., 38c; 200 lbs., 40c; less, 41½c; bar tin, ℔ lb., 42c. London, £160 15s.

PLATINUM.—San Francisco, crude, $18.50 ℔ oz.; New York, ingot, $20.50 ℔ Troy oz. Platinum ware, 75@$1.00 ℔ gram.

QUICKSILVER.—New York, $40.00@$40.50, large lots; London, £7 5s 0d; San Francisco, local, $38.00@39.00 ℔ flask of 75 lbs.

BABBITT METAL.—San Francisco, No. 1, 10½c; No. 2, 8c; No. 3, 7½c; extra, 17½c; genuine, 32½c; Eclipse, 35c.

SOLDER.—Half-and-half, 100-lb. lots, 22.00c; San Francisco, Plumbers', 100-lb. lots 19.15c.

NICKEL.—New York, 55@60c ℔ lb.; ton lots, 40@47c.

ZINC.—Metallic, chemically pure, ℔ lb., 50c; dust, ℔ lb., 10c; sulphate, ℔ lb, .04c.

ALUMINUM.—No. 1, 99%, small lots, 37c ℔ lb.; 100 lbs.. 35c; 1000 lbs. 34c; ton lots and over, 33c, Pittsburg. No, 2, 90%, small lots, 34c; ton lots and over, 31c, Pittsburg.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, $17.35; gray forge, $14.60; San Francisco, bar, 3½c ℔ lb., 3¾c in small quantities.

STEEL.—Bessemer billets, Pittsburg, $26.00@$27.00; open hearth billets, $27.00@$28.00; San Francisco, bar, 7c to 13c ℔ lb.

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 7¾c; less than 500 lbs., per lb., 8c; in 25-lb. tin pails, ½c ℔ lb. above keg price; in 1 and 5-lb. tin cans, 100 lbs. per case, ½c per lb. above keg price. Dry Lead.—In bbls., 1 ton and over, 7½c; do. in kegs, 8c.

LIME.—Santa Cruz, $1.35 country, $1.25 city ℔ bbl.

CEMENT.—Imported, $3.00@4.00 ℔ bbl.; California, carload lots, $1.80 f. o. b. at works; small lots, $2.10 ℔ bbl. in sacks, 4 sacks to bbl., 5c for each sack returned.

LUMBER.—(Retail): Pine, ordinary sizes, $24.00@25.00; extra sizes higher; redwood, $28.00@30.00; lath, 4 feet, $4.50@5.00; pickets, $21.00;shingles, $2.50 for No. 1, and $2.25 for No. 2; shakes, $13.50 for split and $15.00 for sawed; rustic, $28.00@35.00.

NAILS.—This week the basic prices are: Wire, $2.77; Cut, $3.25. Meanwhile the nominal quotations per keg (list prices) are: No. 20d to 60d, Wire, $3.35; Cut, $3.55; 10d to 16d, Wire, $3.45; Cut, $3.35; 8d, Wire, $3.50; Cut, $3.50; 6d and 7d, Wire, $3.60; Cut, $3.60; 4d and 5d, Wire, $3.70; Cut, $3.70; 3d, Wire, $3.85; Cut, $3.85; 2d, Wire, $4.10; Cut, $4.10. Special rates for carload lots.

GENERAL SUPPLIES.

ANTIMONY.—New York, Cookson's, 11½c; Hallett's, 12½c; San Francisco, 1000-lb. lots, 14c; 300@500-lbs. 12c; 100-lb. lots, 13c.

BISMUTH.—Subnitrate, ℔ lb., $2.10.

BONE ASH.—Extra No. 1, 5@6c ℔ lb; No. 1, 4@5c.

BORAX.—Concentrated, 7@8c ℔ lb; powdered, 9@10c; fused, 25@30c; crystal, 7c.

CANDLES.—Spear Brand, 16 oz. adamantine, 40s., 11c ℔ set; 14 oz. adamantine, 40s., 10c; 12 oz. adamantine, 40s, 9c; 10 oz. adamantine, 40s, 8c; 16 oz. stearic, 40s, 12½c ℔ set; 14 oz. stearic, 40s, 11½; 12 oz. stearic, 40s, 10½c; 10 oz. stearic, 40s, 9½c. 100-case lots and over, ½c less. Not less than 50-case lots, ¼c less. Boxes of 20s, price ½c advance.

CAPS.—3x, $5.50@6 per 1000; 4x, $6.50@7; 5x, $8@8.50; Lion, $9@9.50, in lots not less than 1000.

CHEMICALS.—Cyanide of potassium, 98%-99%, jobbing, 23@24c ℔ lb.; carloads, 23@23½c; in tins, 30c; soda ash, $2.00 ℔ 100 lbs.; hyposulphite of soda, 3@3½c ℔ lb.; caustic soda, in drums, 3@3½c ℔ lb.; Cal. s. soda, bbls., $1.10@1.20 ℔ 100 lbs.; sks., 90c@$1.00; chlorate of potash, 12@13c; nitrate of potash, 6¾@7c; caustic potash, 10c in 40-lb. tins; roll sulphur, 2¼@2½c; powdered sulphur, 2¼@2½c; flour sulphur, French, 2¾@—c; alum, $2.00@2.25; California refined, 1¾@2c; sulphide of iron, 8c ℔ lb.; copper sulphate, 5¼@5½c; chloride of lime, spot, $2.50@2.75; sulphuric acid, in carboys, 66% B, 1¾@2c ℔ lb.; nitric acid, carboys, 8c ℔ lb.

CHROMIUM.—90% and over, ℔ lb., 80c.

FIRE BRICK.—Domestic, carloads ℔ 1000, f. o. b., factory square, $25.00; soap and split, $22.50; arch and wedge, $27.50; skewback, $30.00; circle, $32.00.

FIRE CLAY.—Domestic, ℔ ton 2000 lbs. in 125-lb. bags double, and dry ground, f. o. b., factory, $8.50.

FUSE.—Triple tape, $4.00 per 1000 feet; double tape, $3.55; single tape, $3.10; Hemp, $2.85; Cement No. 2, $3.10; Cement No. 1, $2.75, in lots of 3000 and up.

COAL.—San Francisco, coast, yard prices: Wellington, $8.00; Seattle, $6.50; Coos Bay, $5.50; Southfield, $8.00. Cargo lot, Eastern and foreign: Wallsend, $7.50; Brymbo, $7.50; Pennsylvania, hd., $14.00; Scotch, $8.00; Cumberland, $13.00; Cannel, $8.50; Welsh Anthracite, $13.00; Rock Springs, $8.50, long ton; Colorado Anthracite, $14.00. Coke, $11.50 per ton in bulk, $13.00 in sacks; Sunnyside, $8.50, long ton.

OILS.—Linseed, boiled, bbl., 50c; cs., 55c; raw, bbl., 48c; cs., 57c; Lucol oil, boiled, bbl., 48c; cs., 53c; raw-bbl., 46c; cs., 51c. Kerosene—Pearl, per gal., 17½c; Astral, 17½c; Star, 17½c; Extra Star, 20½c; Eocene, 19½c; Elaine, 26c; Water White, in bulk, 11c; Mineral Seal, iron bbls., 18c; wooden bbls., 20½c; cs., 24c; Mineral Sperm, cs., 26½c; Deodorized Stove Gasoline, bulk, 14½c, do., cs., 21c; 86° Gasoline, bulk, 25c; do., cs., 31c; 83° Naphtha or Benzine, deodorized, in bulk, per gal., 12½c; do., in cs., 19c; Lard Oil, E. W. S., bbl., 75c; cs., 80c; Neats-foot Oil, pure, bbl., 63c; cs., 78c; Sperm, crude, 63@68c; Natural White, 68c; Bleached, do., 68@73c; Whale Oil, cs., 52@67c.

LITHARGE.—Pure, in 25-lb. bags, 9½@10½c ℔ lb.

MAGNESIUM.—Pure, N. Y., $1.60.

MANGANESE.—Black oxide, ℔ lb., 2¾@4c.

MERCURY.—Bichloride, ℔ lb., 77c.

MOLYBDENUM.—Best, $2.75 ℔ lb.

PHOSPHORUS.—American, ℔ lb., 70c.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitroglycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1**, 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2, 35%, carload lots, 9½c; less than one ton, 11½c. No. 2**, 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2.00 per keg.

RED LEAD.—500 lbs. and over at one purchase, ℔ lb. 7½c; less than 500 lbs., 7¾c.

SILVER.—Chloride, ℔ oz., 90c@$1.00; nitrate, 54c

SODIUM.—Metal, ℔ lb., $1.

TUNGSTEN.—Best, ℔ lb., $1.20.

URANIUM.—Oxide, ℔ lb., $3.40.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 339 Market street, San Francisco, has official reports of the following United States patents issued to Pacific Coast inventors:

FOR THE WEEK ENDING NOV. 21, 1905.

805,406.—WRENCH—Bolsinger & Bowen, Brockway, Or.
805,116.—DISTILLATION—G. H. Bradford, Stockton, Cal.
805,118.—DISH WASHER—C. S. Chamberlain, Emeryville, Cal.
805,008.—ROCK DRILL—W. J. Ertle, Knowles, Cal.
804,956.—PROCESS—W. E. Everette, Tacoma, Wash.
805,009.—PROCESS—W. E. Everette, Tacoma, Wash.
804,939.—RETAINING WALL—W. H. Ferguson, San Francisco.
805,419.—RAILROAD BLOCK SYSTEM—Gallagher & Gillett, San Francisco.
804,840.—GATE—C. Harris, Lower Lake, Cal.
805,015.—INSECT TRAP—Rosa Haselrigg, Eureka, Cal.
805,017.—LEACHING—T. B. Joseph, San Francisco.
805,201.—BICYCLE LOCK—E. F. Kaiser, Fresno, Cal.
804,865.—BASIN CLEANER—J. E. Keyt, San Francisco.
805,080.—FLY TRAP—J. Kress, Bisbee, Ariz.
805,019.—PUMP—F. W. Krogh, San Francisco.
805,215.—CONCENTRATOR—M. R. Lyle, Oakland, Cal.
805,216.—SQUARE—D. R. Lynch, Reno, Nev.
805,023.—HOSE SUPPORT—J. McBoyle, Oakland, Cal.
805,313.—PUMP—C. W. McGonigle, Walla Walla, Wash.
805,218.—WATCH GUARD—F. E. Mead, Represa, Cal.
805,091.—GAS MACHINE—J. F. Philpott, Windsor, Cal.
804,974.—FRUIT HARVESTER—M. E. Porter, Redding, Cal.
805,028.—ADVERTISING DEVICE—H. C. Quick, Los Angeles, Cal.
805,094.—SHINGLE GAUGE—G. Reed, Fort Bragg, Cal.
805,164.—ROTARY ENGINE—N. R. Smith, Seattle, Wash.
805,162.—ROTARY ENGINE—N. R. Smith, Seattle, Wash.
805,163.—ROTARY ENGINE—N. R. Smith, Seattle, Wash.
805 033.—OAR—Smyth & Goodwin, San Francisco.
805,327.—CLOCK—G. F. A. Sturts, San Francisco.
805,171.—FOOD—E. I. Townsend, Los Angeles, Cal.
805,106.—BRIQUET MACHINE—J. Treadwell, San Francisco.
805,398.—OIL CAN—T. B. Wilkinson, Rivera, Cal.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS United States and Foreign Patent Agency the following are worthy of special mention:

WINDOW SHADE AND CURTAIN POLE ROLLER.—No. 805,676. Nov 28, 1905. F. Shoo, Oakland, Cal. The object of this invention is to provide a device for the convenient adjustment of curtain shades and their retention at any point between the top and the bottom of the window, so that light may be admitted from above or below the shade to any desired degree, and in conjunction with this device is shown a means for supporting curtain poles in proper relation with the above named devices. With this device it is also possible to open the window from either top or bottom, and to allow an unobstructed movement of air for ventilating purposes. The device comprises the various and necessary details of construction adapted to bring about the desired result.

CRACKER CONVEYOR AND DISTRIBUTER.—No. 805,625. Nov. 28, 1905. C. C. Blank, San Francisco, Cal. This invention relates to an apparatus which is designed for the distributing of crackers so as to be convenient to the packers. It comprises in a conveying and distributing apparatus, an endless belt traveling in one direction, a superposed chain belt having its contiguous surface traveling in the opposite direction, a diagonally disposed plow or scraper whereby articles carried by the lower belt are successively brushed off at one side of said belt, said plow having a flexible brush upon its lower edge; and other details of construction making a new and useful machine for the purpose required.

ADVERTISING AND DISPLAY APPARATUS.—No. 805,682. Nov. 28, 1905. Karl Stencil, San Francisco, Cal. The object of this invention is to provide an apparatus for the display of pictures, cards, advertising, or any desired matter in such form that it may be employed in places where ordinary display apparatus would be out of place or objectionable. It consists in a book-shaped casing having a display aperture formed vertically in one side of the casing, vertically journaled rollers having an endless display band fitted thereto, pulleys and an endless cord and means exterior to the casing by which the parts may be turned to advance the band, a hinged door forming one side of the casing and to allow access to the interior, said door having a trough or conductor in line with and below the joint of closure substantially as described.

BALANCED FLOOR FOR SHIPS' CABINS.—No. 805,718. Nov. 28, 1905. R. P. Dewey, San Francisco, Cal. This invention relates to improvements in ship building construction, and especially in a means for balancing the floors of saloons, cabins and state rooms so that they will be maintained substantially level irrespective of the rolling of the vessel. The invention consists in the combination of a movable floor or deck section, a shaft to which the floor section is fixed, a weighted pendulum detached from the floor so as to be independent thereof, and a crosshead or bearing on the shaft and extending beyond opposite sides thereof, said pendulum engaging the crosshead to effect the oscillation of the shaft and floor section and thereby maintain the floor section in horizontal position irrespective of the movements of the ship, and other details of construction.

MINING AND SCIENTIFIC PRESS.

Whole No. 2369.— VOLUME XCI. Number 25. SAN FRANCISCO, CAL., SATURDAY, DECEMBER 16, 1905. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

Virginia City, Nevada.

At one time—in the early '70s—Virginia City, Nev., was the leading mining town of the West. The "Big Bonanza" had recently been found and was being developed as rapidly as money and skill could accomplish so large a task under the most adverse conditions—high temperature and floods of scalding hot water. Never in the history of the West were scenes enacted in connection with mines such as were witnessed in Virginia City. During the '70s this great activity continued, but the tremendous energy resultant upon the discovery, development and extraction of that phenomenal ore body known as the "Big Bonanza," found in the Consolidated Virginia & California mines, began to spend itself, and the early '80s saw Virginia City on the wane. It continued to attract less and less attention, as the fall in the price of silver sent the miners into other regions, until the lower levels were abandoned, the pumps were withdrawn, and for years Virginia City was almost deserted, only a few mines in the town and at Gold Hill, joining it on the south, making any pretense of working. In 1899, however, it was decided to attempt the unwatering of the long flooded levels by improved methods. The attempt was a success, and since then a vast amount of work has been accomplished, and, although it has created comparatively little stir, several millions have been produced by the Comstock mines within the past five years. The accompanying illustration is a new picture of Virginia City, showing the famous "Point A," on the east slope of Mount Davidson, the datum of all scientific and other responsible measurements on the Comstock Lode. "Point A" is shown in the central foreground, and is a mass of siliceous rock—the outcrop of the Comstock lode at that point. The light colored spots beyond the buildings of the town are the great dumps of the Ophir and Consolidated Virginia mines. Those familiar with the city and its surroundings will distinguish many other interesting features in the picture. Virginia City of to-day is a very different city from that of the '70s, notwithstanding that there is at present more activity on the lode than at any time since the decadence of mining after the exhaustion of the bonanzas, which made the lode and the city world-famous.

On every side may be seen the evidences of former greatness. One of the interesting things which attract the attention of a stranger is the huge cast-iron shells formerly used in retorting the bullion from the mills, which, having outlived their usefulness, are now found half buried, and standing erect on the street corners, as fenders to protect sidewalks and other structures from the too close encroachment of careless teamsters who were inclined to make short turns. Another interesting and perhaps more impressive feature is found in the huge walls of masonry and the ponderous pumping machinery of the early days on the lode. The early engineers certainly built for endurance and regardless of expense.

THAT all of the oil bearing territory has not been developed, and probably not discovered, in California, is evidenced by the striking of profitable flows in new wells situated in various portions of the State, particularly in Santa Barbara county, where several good wells have recently been proven.

THE ingenuity of men who are unfamiliar with the dangers of nitro powder in thawing that explosive is worthy a better fate. The latest novelty in this direction was the disastrous experiment of a man in Fresno county, Cal., a few days since, who undertook to thaw out nitro powder by digging a hole in the ground, placing the powder therein and covering it with hot earth and a few coals. He was instantly killed by the explosion which followed. From now on accidents from powder thawing, occurring in various ways, may be anticipated.

A CORRESPONDENT elsewhere herein makes a plea for the discussion of methods of accomplishing fine grinding at minimum cost. This subject is a live one and is of increasing importance. Thus far the principal machines for accomplishing the fine comminution of ores are the grinding pans of various types and the tube or pebble mills of several designs. Chile mills are also employed as well as several other styles of rotary mills. It is desired to ascertain the best device that can be employed for the purpose, and without doubt a discussion along the line, suggested by the correspondent, would result in much valuable information, both from a recitation of facts and from suggestions.

The Western Empire.

The reclamation of desert lands by irrigation is one of the most important matters now attracting the attention of the Government. The making of millions of acres of these arid lands fruitful will mean much to the West in the coming years, and, without doubt, large areas, which in years gone by have been given over to solitude and desolation, will become the home of a numerous and prosperous people. The impression that prevails among a large class, unfamiliar with the desert, its peculiar topographical and climatic conditions, imagine it to be a vast, nearly level plain, trackless and sand-strewn, with nothing to invite the interest, or rest the weary eye of the traveler. In fact, no land shows greater diversity of landscape—changing every hour with the passage of the sun across the heavens, and with every drifting clouds. The almost limitless distances appear shortened, the rock coloring is amazing, and whether by contrast or not, the stream valleys usually present pictures of beauty seldom excelled elsewhere.

The mineral wealth of this vast domain—the Great American Desert—has never been called into question, for hundreds of millions of dollars worth of gold, silver, copper, lead, zinc, iron and salines have already been drawn from its mountains and plains. Such districts as Virginia City, White Pine, Pioche, Tonopah, Tuscarora, De Lamar, Eureka, Austin and Goldfield, in Nevada; Bingham Canyon, Frisco, Park City, Eureka, Little Cottonwood, and numerous others in Utah; Congress, Tombstone, Bisbee and Globe, Arizona; Calico, Randsburg, Cargo Muchacho, Ivanpah and Vanderbilt, in California—all these, and others, are on the desert, and it is known that there remain possibilities in mineral development in these desert regions almost unequaled. There are copper, lead, gold, silver and iron mines to be developed. Salt, and soda, and borax marshes to explore and exploit, beside many other mineral substances, at present attracting little attention by reason of their remoteness from transportation. This latter difficulty is being rapidly solved by the building of railroads in various directions across the desert valleys and around and through its mountains. The Great American Desert is a vast empire, still in its infancy, so far as the development of its material resources goes, and the next decade will witness an output from that region of which the present gives forth only a suggestion. In the last and present issue of the MINING AND SCIENTIFIC PRESS appears an article by Geo. Bancroft on the Great American Desert, in which are given facts of much interest to mining men, and to others as well. This illustrated description of the desert of the great Southwest will give those unfamiliar with it a very fair idea of what the desert region is really like. As compared with the desert region of northern Africa, it possesses many advantages, in climate, transportation facilities and water supply, and in accessibility and richness of its mineral resources.

The Unplausible Promoter.

A short time since a report was in circulation in a Western city which purported to state the conditions obtaining at a gold mine, the name of which was given in this report, written by a person signing "E. M." after his name. The "report" was chiefly noticeable for poor spelling and misapplication of geological and other terms, which clearly indicated also the misuse of the "E. M.;" but, aside from this, the several statements contained in the report were somewhat singular, as one would expect a mine possessing the advantages, and particularly the ore, stated to exist on this property to be in operation. It was a matter of constant surprise that so evidently valuable a mine should remain so long idle. Among other statements was one to the effect that there were several thousand tons—two or three thousand—which would mill $18 per ton in free gold, lying on the dump, with a 10-stamp mill standing on the ground near at hand, and a 4-foot vein of $30 rock standing in the mine ready for stoping. Ostensibly money was wanted for development and the building of a larger mill. A miner would naturally inquire why the several thousand tons of $18 rock lying on the dump was not run through the mill to secure the needed funds for further development and extension of plant. To the experienced this prospectus was plainly a tissue of deliberate lies—to many of the uninitiated and unsophisticated it seemed a magnificent opportunity to make large profit from moderate investment. It is almost useless to speak of these frauds in technical journals, as the people whom it is intended to protect against such imposition seldom see that class of papers. It is almost needless to say that this alleged report was not being circulated in the region where the mine was said to be located, but in a distant State, where a smooth-voiced grafter was successfully obtaining money on the presentation of his palpable fraud.

Had any man such a property as was described in this circular, he need go no farther than the nearest merchant and prove that he possessed what he claimed, and he would be provided with all the necessary funds for turning all this wealth into bullion bars.

Prompt Assay Returns.

Most mine superintendents realize the necessity of accurate and prompt assaying of samples, but methods employed are often such that there is much delay in arriving at the desired results. There is an evident tendency to simplify methods and to make determinations more quickly than has been done heretofore. Students in chemical laboratories have done a great deal in this direction, and some of the newly devised methods are an improvement over former schemes, and usually sufficiently accurate for all practical purposes. As there has been improvement in the past, further improvement in the future may be anticipated. In most instances where absolutely accurate results—and not approximate results—are required a quick determination is less reliable than one involving more work and a greater length of time for its complete accomplishment. Naturally, it is to the wet methods that one turns for prompt results in analysis, for all methods requiring the fusion of the charge necessarily take considerable time.

In stamp mills treating gold and silver ores it is the ordinary practice to take daily samples of headings, tailings, sulphurets, etc., at various stages of the reduction operations. In many mills the first samples of the day are taken during the morning shift, after the plates have been dressed, and these samples taken to the assayer, who is sometimes employed in assaying the samples taken by the night shift. In other instances—the more common ones—the samples of both night and day shift, and those of the previous afternoon, are assayed at one time. Several hours are taken in the preparation of the samples, crushing, bucking, mixing, etc., and finally, after noon, the fusion and cupellation is completed and the weighing done, so that by 3 or 4 o'clock the results of the previous day's work, and up to the early morning, are available. The latest information is obtainable about seven to eight hours after the samples are taken, when it is practically impossible to correct any losses from defective amalgamation or concentration. If the samples could be turned over to the assay department promptly after they were taken, and the assays made as quickly as consistent with safely approximate results, then the sampling would have a value which, under the conditions previously outlined, they cannot possess.

STOCKHOLDERS of mining companies, corporate or otherwise, look to the directors of the companies for a proper conduct of the affairs of the concern, and while the directors may be held responsible for misappropriation of funds, whether these be derived from assessments on the stock or from the operation of the property is not material. It would be impossible, however, to hold them for neglect to pursue the development of the mine, or for failure to carry it on at all, the ultimate result of which might be the loss of the property through relocation by another, because of non-performance of assessment work. The relocator might develop a very valuable property; but this would be the misfortune of the stockholders, for the directors might claim a lack of funds to carry on development, or any one of a number of excuses, through which the property was lost to the company. Ordinarily directors of mining companies are blamed for doing too much, rather than too little, in their official capacity.

CONCENTRATES.

ONLY fifteen days remain within which to do annual assessment work on unpatented claims.

MINING and other corporation stock organized under the laws of California is not unassessable.

NO SURVEY is required of placer locations which conform to the legal subdivisions of the Government land survey.

TAILINGS which are permitted to accumulate on the land of another become the property of the land owner should he choose to claim them.

PETZITE is a telluride of silver, occasionally associated with gold. It is found in a number of pocket mines in Tuolumne county, Cal.

IT is safer to secure guides in shafts with two lag screws in place of a single one, as is sometimes done where the ends of the guides overlap.

ONE of the highest mines in America is at Garland, 14,400 feet above sea level, in the Sierra Blanca of Colorado. It is about a mile above timber line.

THE "right of eminent domain" is not recognized in mining for the reason that mining is not a public utility, but generally conducted as a private or corporate enterprise.

THE peculiar crackling noise made by a bar of tin when bent, or when bitten by the teeth, is known as the "cry of tin," and is a property possessed by no other metal.

WHAT are sometimes referred to as "chicken ladders" in mines are notched poles used in Mexican and other Spanish-American mines in the same manner as ladders.

IT is always a good idea to have at least one 5-stamp battery in a mill so arranged that it may be operated independently of the others, for the purpose of making experiments.

THE flinty concretions (chert) often found in limestones occasionally contain gold. The occurrence in Ragged Top district, in the Black Hills, South Dakota, is a notable instance.

ARSENICAL gold ores have been successfully treated at several places by roasting and then leaching with a solution of bromo-cyanide. A notable instance is at the Del Oro mine, Ontario, Canada.

VERY little pyrrhotite is used in America in the manufacture of sulphuric acid, pyrite or sulphur being employed almost exclusively for that purpose. Pyrrhotite is too low grade in sulphur contents.

WATER may be appropriated from a stream by the owner of a tract of land through which it flows, if he can make such appropriation without interfering with the previously acquired rights of others.

ORE bins at shaft stations may always be provided, either in the hanging or foot wall or at the ends of the shaft, although the latter practice is unusual. In inclined shafts they are usually cut in the hanging wall.

WHEN a new shaft is to be sunk near old, flooded mine workings, the water should be removed from such workings, for safety, as the working in proximity of a large body of water, particularly if under high head, is usually extremely dangerous.

IT is often difficult to distinguish between pyrite and marcasite. This may be done, however, by treating the two samples with dilute hydrochloric acid, and examining at once with a strong magnifying glass. The pyrite is brass yellow and the marcasite tin white.

HYDRAULICKING as practiced in gravel mining is also employed for other purposes, such as grading for mills or other structures, moving filling for dams or railway embankments, etc., and also in washing out manganese, iron and other ores from superficial deposits where they occur.

WHERE there are a large number of men at work in a mine and a great quantity of powder is daily handled, it is the best plan to have as few men to handle it as possible—one or two on each level—and not each man for himself. This latter leads to carelessness and often to disaster.

WHEN the presence of calcium sulphate is suspected in water, it may be tested by filling a test tube about one-third full of the water and then adding a few drops of barium chloride. If calcium sulphate (gypsum) is present, a white precipitate will be formed—barium sulphate.

DYNAMITE usually burns quietly when it comes in contact with flames, but it occasionally explodes while thus burning. It is dangerous to set sticks of dynamite up against a board before an open fire for the purpose of thawing. The warm water thawer is the safest method of thawing dynamite known.

THE term "rawhiding" as used in British Columbia refers to the transportation of ore wrapped in large rawhides and drawn by horses on the snow along the mountain trails. The mountains are steep and the trails narrow and rawhiding is the least expensive method of handling the ore under existing conditions.

CYANIDE OF POTASSIUM is a powerful reducing and desulphurizing agent, and as such is useful in the assay office and laboratory. It is used as a flux in the reduction of tin ores, and also of lead. The use of cyanide is always attended with danger to the operator, who must take precautions to avoid fumes from the charge.

ORE dressing or concentrating consists of two steps—first, crushing the ore to a fineness sufficient to separate the valuable ore particles from the waste material to which it is attached; second, the separation of the ore from the waste particles by some one of the various devices for concentration.

INQUIRIES continue to be made regarding the "miner's inch." Formerly this term signified different quantities of water in different mining districts, but California and Montana have each passed legislation defining a miner's inch as a flow of 1½ cubic foot of water per minute. This definition of the miner's inch has been generally adopted.

WHEN making application for a mineral patent the applicant must furnish specific proof that at least $500 worth of work has been done or improvements made for each claim sought to be patented. This $500 worth of work or improvements may have all been made within a month of the date of location. A patent may cover both a quartz and placer claim jointly.

THE argument that a rock is not of igneous origin because it contains pyrite is not sound. Nearly all igneous intrusive rocks, and even some volcanic rocks, contain pyrite, which has been deposited in the mass after it has become cold. Very few rocks contain pyrite as an original constituent, but almost all rocks are found to contain it subsequently, as a mineral of infiltration.

FULLER'S EARTH resembles clay, but is not plastic when moistened with water. The water test is one of the best for this mineral. A quantity of the dry earth is placed in a saucer and a little water added. If the mineral cracks, crumbles and falls into a loose, incoherent mass, it is, in all probability, fuller's earth. Analysis should also be made.

THE United States now produces a large number of gem stones and semi-precious stones, among them being a few small diamonds, sapphires, tourmalines, beryls, chrysoprase, opal, turquoise, quartz (such as rock crystal, rose quartz, gold quartz and crystals containing rutile and chlorite, copper, etc.), moss agate, petrified and agatized wood, garnets, amazon stone, and a few others of less importance.

GRANITE has been determined by the United States Supreme Court to be mineral—technically as well as actually. This decision was rendered in the case of the Northern Pacific Railroad v. J. A. Soderberg. The defendant had quarried granite from a tract of land claimed by the railroad as non-mineral. This the court denied, holding that granite was mineral within the meaning of the law.

THE principal gold deposits of the world occur in connection with diabase, diorite, granite, andesite, clay slate, and hornblende schist. The gold deposits of the Rand, in the Transvaal, S. A., occur in conglomerate. Gold is found in other rocks, but the above are the most noted. Copper ores occur most abundantly in granite, greenstone and limestone, and lead-silver ores in limestone and quartzite.

THE rare element gallium was discovered by a French chemist in a sample of zinc blende. The discovery was made by means of spectroscopic examination. It is a hard and tough metal of bluish-white color, but melts at a very low temperature as compared with other metals—31° C. or about 87° F., hence it will melt from the heat of the hand. It occurs most commonly in the black varieties of zinc blende.

WHERE the gouge occurs on one side of a vein for some distance and then crosses to the opposite side, this may be due to the fact that the walls have had a sort of axial movement in that vicinity, the wall on one side of the point of crossing moving upward, for instance, while the same wall on the opposite side of the crossing moved downward. Or possibly this condition may be due to a pre-existing fracture, or plane of movement.

THE geological structure of a hill has usually an important influence on the slope angle of the hill. Few hillside slopes exceed 30° to 35°. Where the rock strata dip into the hill, the hillside may be steeper than this, but where the rocks dip in the direction of the hill slope it is usually less than 30°, as at higher angles landslides usually occur until the slope is reduced to about this angle, or even less. The steepest hills are usually in the region of rocks, the stratification or cleavage of which is nearly vertical.

ON a ridge extending northward from the Black Hawk mountains, in San Bernardino county, Cal., are found gray, white and blue limestones which in spots are rich in chloride and bromide of silver, and in some places, where slightly silicified, gold occurs also. Some of this ore will assay $250 per ton in gold and silver. There are no known eruptive or intrusive dikes in these limestones—at least, not in the vicinity of the richer ores.

PURE zinc blende contains zinc 67%, sulphur 33%. Most zinc ore contains other substances beside these which reduces the zinc contents proportionally. It is sometimes rich in gold and silver. It presents more physical differences than almost any other sulphide ore. In color it ranges from white through shades of yellow and brown to black, and is occasionally green or red; luster bright metallic to dull, adamantine to resinous.

THERE are numerous causes for the flouring of quicksilver. It may be due to some mineral in the ore, such as arsenic, graphite, molybdenite, etc., or it may be caused by some mineral in solution in the battery water. Too high a discharge, resulting in sliming, may also cause "quick" to become so finely divided as to make it difficult for the globules to reunite. Sodium amalgam usually will effect a reunion of finely divided mercury.

AN ore shoot appearing at the surface and at some distance from an end line of the claim, and which in depth passes beyond this end line into the adjoining claim, cannot be followed by the owner of the apex beyond his end line. The ore shoot then passes to the owner of this adjoining claim, even though the apex of the vein is unknown at the surface in his claim. The end line bounds and terminates all rights in that direction.

MINERS indiscriminately call many kinds of yellow, buff and gray rocks, in more or less decomposed state, porphyry. With them any intrusive rock which has been altered by weathering is "porphyry." Sometimes altered sedimentary rocks are also called "porphyry." Under such circumstances the term is chiefly valuable as distinguishing between two kinds of rock—"porphyry" and another kind—possibly limestone or quartzite, slate, etc.

COAL and metal mining differs principally in the different conditions in the two classes of mines and in the great difference in the material produced. Moreover, coal mines are rendered additionally dangerous by reason of the occurrence of explosive gases and dust, which most metal mines are free from. An explosion of dust in a metal mine is unknown to "Concentrates," while only a few metal mines have explosive gases, having more commonly the "choke damp" (carbonic acid gas) of the coal mines.

TO ETCH on steel or other metals, cover the portion to be etched with melted beeswax, and then sketch with a needle or other suitable tool the design required, being careful that the lines pass entirely through the coating of wax to the metal beneath. Then mix one part nitric acid with two parts muriatic acid and apply to the prepared surface. Allow it to remain for five or ten minutes, according to the depth of etching desired, then wash with water. The wax may then be removed, either by scraping or by hot water.

A NUMBER of minerals possess the property of magnetism—that is, are attractable by the magnet. The most notable of these are magnetite, some pyrrhotite, some nickel ores (particularly josephinite); wolframite (slightly magnetic); some varieties of native platinum; and franklinite. Some minerals having slight magnetism are supposed to owe this property to the presence of a small amount of magnetite. Many minerals, particularly those containing iron, become magnetic upon heating. Among these latter are zinc blende, iron carbonate, etc.

WHEN it is desired to secure a uniform temper of a number of pieces of the working parts of a machine, as of a rock drill, the various pieces—nuts, bolts, etc.—are placed in bone ash in a steel box provided with a cover which is carefully luted on, and the box with its contents is placed in a furnace, where it is brought to a bright red heat. After being subjected to this heat the proper length of time, the box is removed from the furnace, the cover taken off and the several pieces of steel thrown into a tank of cold water as rapidly as they can be taken from the box, which gives the several pieces a uniform temper.

THE mines of Olancho, Honduras, are mostly placer, as far as developed, though quartz veins, which contain gold, are known to exist in a number of localities. The Department of Olancho is several hundred miles inland and there are only trails—no roads—from the sea ports into the interior. There is abundant water for power and milling purposes when properly applied. The altitude in the gold region varies from 2500 feet in the valleys to 8000 feet in the Guymaca range. There is an abundance of fine pine timber, but a scarcity of labor of any kind, and no skilled labor at all. There are extensive beds of conglomerate in Olancho, in the gold district, which may be auriferous.

Some Types of Head Frames.

Head frame construction is always an interesting feature of mining equipment. Various sections have different ideas of how head frames should be built, so that frames of the several types come to be known as representative of certain districts or States. Thus the two-post frame was largely employed in Montana before it became popular elsewhere, because of its simplicity and economy of construction. It can be adapted to either vertical or inclined shaft. The two types are shown in the accompanying illustrations. Another engraving shows the four-post head frame so commonly seen. It is built for strength, and has few engineering features to recommend it. Frames of this type are very often seen in California, though the one illustrated is at Leadville, Colo. Another illustration is that of a two-post frame built on scientific lines. It is at an inclined shaft and built of timber. Loads of four tons are hoisted 1500 feet with this frame.

The unusual construction shown in the high and narrow rectangular frame is interesting. It will be noticed that this frame is guyed by cables reaching from the top to "deadmen" set in the ground. An improved type of California four-post frame is shown, wherein the main back braces, being a portion of the four-post frame, are set just without the resultant line of compression. This frame is of wood and scientifically designed. The steel frame built at a Rhodesian mine shows that topographical difficulties may be ingeniously overcome. This frame is at an inclined shaft, where the skips dump automatically into the bin in the head frame.

The wooden frame at the Empire mine, Grass Valley, Cal., also illustrated, is very similar to the Rhodesian frame, but owing to better surface situation is able to dispense with the long back braces, the resultant strain falling within the structure.

The steel frame at a French mine is of scientific design and built of a minimum of materials. Frames of this class are known as the "A" type, and are becoming common throughout the mining regions of the West where engineering skill is employed, and it has resulted in giving us better frames at lower cost.

GARNETS embrace a group of minerals which are closely related in chemical and physical properties. They are complex silicates of alumina, with varying amounts of lime, iron, magnesia, manganese and other oxides of the metals, the presence of which gives to the mineral its various colors and tints. Garnets of every description crystallize in the isometric (cubic) system. When of good color and transparent they form semi-precious stones, which have a certain but not great value. The garnets used for gem stones are the varieties known as almandine, Bohemian garnet or pyrope, and manganese garnet or spessartite. The two former kinds have beautiful, deep crimson shades, and the latter orange-red or light brown-red color. The most of the garnets mined in the United States are from Arizona, New Mexico and North Carolina. The latter State produces a fine light purple-red garnet, known as rhodolite.

Fine Grinding in Metallurgy.

TO THE EDITOR:—During a long and somewhat varied experience in the mining and reduction of ores (gold, silver, copper and lead), I have been one of those whose motto is "Stick to the things you know are good," and who, in all matters pertaining to their particular line of business, never even consider the advisability of adopting improved methods or new ideas until after they have been fully indorsed by those whom we have accustomed ourselves to look up to as authorities on the subject. It has begun to dawn on my mind, however, that I have been worshipping "idols of clay," for, as my hairs begin to whiten, I discover I am fast gravitating toward the tail end of the procession, and, though it may be too late in the day for me to even expect to regain the lost ground, altogether, I still have the ambition to try, and to do so in a way that may be instrumental in bringing about the solution of a question that has become paramount with all owners and handlers of low grade gold ores, viz., a cheaper and better method to treat finely pulverized ores, or slimes. And it has occurred to me that the quickest and easiest settlement of this vexed question might come from its discussion, by the best thought engaged in the business of ore reduction by milling process, through a reputable mining journal.

There is a rapidly growing conviction among many of the best gold mill managers that the old idea of endeavoring to prevent the production of slimes by the crushing machinery is fundamentally wrong, and

that, only by reducing, so far as practicable, every particle of ore to a size equalling that of the most minute particle of gold contained, can the highest possible extraction be made.

In theory, this seems plain enough if one will but give it serious thought, but is it susceptible of proof in a practical, commercial sense, and applicable to the most, if not all, cases? I think so, and, although I am still a follower, and not a leader, in such matters, my past experience in them has taught me to accept good evidence in support of a statement or a condition in default of better to the contrary.

As is well known, some gold ores do not respond at all to the amalgamation treatment, but do to the cyanide. Why is this so? Is the gold chemically held in the ore? Who knows this to be so? Is it not possible that the particles of gold, in such a case, are coated simply, by some other metal, mineral or

An Unusual Type of Head Frame—Two Posts with Back Braces, and Sheaves at the Top of Frame.

The term "free milling" used to apply only to those ores from which a fair percentage (60% to 80%) of the gold or silver content was extractable by amalgamation with quicksilver, but within quite recent years, and since the introduction of cyanide leaching, a gold ore is called free milling even when it requires both the amalgamation and cyanide processes to extract the values.

chemical combination, or that those particles are so finely divided (floured) as to reject quicksilver?

While the questions are asked for information on these points, they simply lead up to the main point, with which, as will appear further on, they have no relation worth consideration in the discussion of the subject at hand.

Lixiviation or leaching, particularly that of the cyanide persuasion, seems to have become the final arbiter—the court of last resort—in the treatment of low grade or the milling grade of gold ores the world over, and, as the ores from no two gold mines can be said to be identical in every respect, many difficulties are encountered in the adaptation of the leaching process to all conditions. With rare exceptions, the most serious difficulty heretofore, leaving aside the question of desulphurization and the preliminary wash to free the pulp from all objectionable mineral salts that are soluble in warm water, has been that experienced in nearly every attempt, thus far made, to render the most finely pulverized portion of the ore, called "slimes," as quickly,

cheaply and profitably treated by the leaching process as is the coarser portion.

In most instances the ore to be leached is dumped into the vats or tanks just as it comes from the battery or roll screens—coarsest and finest, altogether. In others, the pulp or crushed ore is classified—that is, the very finest, or slimes, is separated by hydraulic or other classifying devices from the mass and leached by itself. And I have heard that it is the practice of some to separate into three or four classes.

In either case, however, the slimes are a trouble maker and an "unruly member."

Generally speaking, ores that are to be subjected to a leaching treatment are, usually, so low in grade (values) that a large tonnage must be handled in order to make it a profitable operation, and to do this expeditiously and at the least cost, the tank must be charged with as much pulp as it will hold, in addition to the necessary quantity of leaching solution and, at the same time, permit what is called "free percolation" of the solvent through the mass of ore and the filter mat underneath the ore.

In present practice this free percolation is only possible through the coarser portion of the ore. If the coarse and fine go into the tank together the finer particles run together and become so closely imbedded in strata, layers or bunches as to be almost impenetrable by the solvent, despite all the stirring or agitating devices resorted to, thus necessitating a greater length of time than is required to leach the coarser stuff, and a consequent greater cost to be charged to operating expenses.

A recent improvement or innovation in cyanide leaching is that of forcing percolation of the solvent through slimes by both air pressure and by utilizing the precipitate filter press idea. Aside from the results from the experiments of Mr. C. W. Merrill at the Homestake mills in South Dakota, I have heard of no remarkable achievements with either device.

Probably, the longest stride yet made toward a fuller understanding of the still undeveloped possibilities of the milling treatment of gold ores, with special reference to the combined process of amalgamating and cyaniding, resulted from the extensive experiments made in Australia, during the past year and a half, to determine to what degree of fineness their ores (gold bearing, and carrying both coarse and fine gold) should be crushed (maximum size) in order to yield, by the combined process, the highest possible extraction with the least possible cost. Those experiments demonstrated, beyond any possible doubt, that, with their ores, fine grinding (pulverization) to a maximum screen size of 150 meshes to 1 lineal inch renders them susceptible of a much higher per cent of extraction than is at all possible with coarser sized material. The principal increase in saving occurs in the amalgamating department and is, no doubt, due to the finer separation of the metal from the gangue and more thoroughly freeing the metallic particles from any coating it may have had, by attrition in the grinding process.

An increased saving is also made in the cyanide department, for, it goes without saying, that any solvent will dissolve a metal that is finely pulverized in less time than is required when not so finely pulverized, but the leaching difficulties have increased in the same ratio as the screen sizing has been changed from forty or fifty meshes to the lineal inch to 150 meshes, because the proportion of slimes has increased in like ratio. In fact, the crushed product from ore sized through a 150 mesh screen may all, reasonably, be called slimes, as its average is many times finer than the average of a product from a thirty, forty, or even fifty mesh screen, so, if the experiments quoted have any significance whatever, they have sounded the death knell to all amalgamating and leaching methods or systems based on coarse crushing—and the avoidance of slimes.

From the statements published concerning those experiments, and the description of the ores experimented with, there is no apparent reason why the average character of gold ores of any country, if amalgamable or leachable at all, is not amenable to the same laws which have defined the proper standard of ore sizing in West Australia, to wit: to reduce the average size of the metallic particles to as fine a condition as practicable and consistent with the most profitable results. Consequently, I insist that fine pulverization sliming has come to stay; and that just what we and our predecessors have fought against for fifty years—the production of slimes—is what we need most in milling ores, viz., complete freedom of metal from gangue or waste, so that either quicksilver or leaching solvent can have proper contact with the metallic particle.

Fine grinding has become an essential feature of the best mill practice of the present day, as is evidenced by the efforts being made toward the development of a better fine-grinding machine (regrinding) than either the tube or pebble mill or the old-fashioned amalgamating and grinding pan, which are the present standards of excellence in that line, as well as toward the development of a better plan to accelerate the percolation of a leaching solution through fine slimes.

Briefly put, the situation is this: Fine grinding having been proven a pre-requisite for the highest extraction by amalgamation and cyanide leaching of gold ores, it behooves all interested in that method of ore reduction to contribute from their knowledge, or opinions, that some of us may be able to pick a morsel that will form the basis for (1) a plan to successfully, i. e., quickly and economically, leach the large quantity of slimes that are the inevitable result of re-grinding or fine sizing; (2) a plan for the construction of a re-grinding device, superior in all respects, to those mentioned as being the highest types at present, and it is for the purpose of inviting concerted action, by discussion of these questions through and by aid of the MINING AND SCIENTIFIC PRESS, that this article is written.

In any event, nothing but good could result from such an expression of knowledge or opinions.

There being neither chemical nor metallurgical points involved in the subject—only mechanical ones—there is no reason why anybody, who has some knowledge of this branch of ore reduction, whether gained by practical experience or observation, either in the laboratory, or in the mill, should not contribute his ideas and participate in the discussion. The subject is too big to permit any "grand stand plays" in technical phraseology. A good idea expressed in a sentence of plain, every-day English conveys more information than a chapter of the other kind. It is the meat that is wanted—not the skin.

I hope there will be a general and ready response to this invitation and that those who do respond will speak freely regardless of what so-called "authorities" may think of their opinions. The real "authority" is the man who "does" things.

San Francisco, Cal., Nov. 27. E. E. WANN.

The Great American Desert.—II.*

Written by GEORGE J. BANCROFT.

In my foregoing remarks I have confined myself to that part of the desert which has not as yet been brought under cultivation. The passing of the Reclamation Act has renewed public interest in the cultivation of the desert. The recent government publications for the first time permit a fairly accurate estimate to be made as to what may ultimately be accomplished by the Reclamation Service, acting together with private enterprise.

The Reclamation Act was passed June 17, 1902. Within a very few months the desert began to blossom with the tri-cornered monuments of the hydrographic survey and the hill tops to twinkle with their little white flags. From Yuma, Ariz., to Rapid City, S. D., parties of strong-limbed, khaki-clad, young men might be met on any trail, carrying about the queer looking instruments of their calling and going about Uncle Sam's investigations in the accurate, painstaking, scientific way that has characterized all the operations of the Geological Survey department. The sub-department that has this work in charge is called the hydrographic survey, and recent bulletins issued by this department permit one who knows something of the desert to figure out a few general conclusions which are reasonably accurate.

In the first place, it is necessary to emphasize the fact that only a very small percentage of the arid territory is reclaimable by direct irrigation. I think this is a matter that is not generally understood; but indirectly the whole arid region will be benefited by increased irrigation, and I will try to show, later on, what the indirect possibilities are.

Viewing the subject in a broad way, there are six main drainage systems in which additional irrigation is possible by the expenditure of large sums of money. Practically all the "cheap water" has already been used.

By this I mean that where a man or group of men can build a ditch of reasonable length without overcoming any serious obstacles it has been done. The Reclamation Act will make possible the utilization of water in those localities where large areas of good land can be brought under irrigation only by the expenditure of large sums of money. Most of the main opportunities may be divided into two classes, viz., the diversion of large streams, which, of course, requires the construction of expensive diversion dams, and the construction of large reservoirs. Such undertakings require large capital and, in the past, few of them have been undertaken.

The main drainage areas where irrigation schemes are practical are the Columbia river basin, the Colorado river basin, the Rio Grande river basin, the western part of the Mississippi river basin, a little of the southern part of the basin of the Red River of the North, and the drainage area of the western slope of the Sierras. In these six main drainage areas there is a total "map area" of 892,000,000 acres.

The following table gives the total acreage already under irrigation in the several States and Territories of the arid region, together with the cost of the irrigation works. In the States given in this list there is a total map area of 749,000,000 acres, so it will be noticed that only about 1% of the land is now under irrigation:

	Acres.	Cost.
Arizona	185,396	$4,438,352
California	1,445,872	19,181,610
Colorado	1,611,271	11,758,703
Idaho	602,568	5,120,399
Montana	951,154	4,683,073
Nevada	504,168	1,537,559
New Mexico	203,893	4,165,312
Oregon	388,310	1,843,757
Utah	629,293	5,865,302
Washington	135,470	1,722,369
Wyoming	605,878	3,973,165
Totals	7,263,273	$64,289,601

It will be noticed from the above table that the total cost of putting all the present irrigated ground under water has been on the average $8.85 per acre. Nearly all the schemes that the Reclamation Service is considering will cost about $28 per acre. These figures illustrate what I mentioned above, that the energetic Western farmer has got all the cheap water already.

Orators at the irrigation congresses have figured all the way from 60,000,000 acres to 100,000,000 acres as the amount of ground that will eventually be reclaimed by the Reclamation Act. It is, of course, absolutely impossible to make an estimate that will be at all accurate until each stream in the irrigable region has been considered separately and the possible chances for diverting and storing water carefully considered and measured, but from the stream measurements of the hydrographic survey it can be computed that in the six main drainage areas mentioned above, there is water sufficient to irrigate 78,000,000 acres, and this agrees very closely with the estimate made in 1902 by F. H. Newell, the chief of the division of hydrography of the United States Geological Survey. Mr. Newell's estimate was 74,000,000 acres in practically the same area. Both estimates are based on the assumption that some way will be found to use all the available water. This is not likely, but it would seem reasonable that 75% of the available water might be used, particularly when it is considered that owing to the return of part of the water to the stream beds by seepage there will be a certain amount available several times. Figured in this way,

An Irrigated Farm in the Desert.

* See illustrations on front page.

we may reasonably expect 58,000,000 acres to be reclaimed.

The United States withdrew 40,000,000 acres from entry in view of proposed reclamation schemes, but after completing a large number of surveys all but about 1,045,000 acres was restored to entry and the following schemes undertaken:

State.	Name of Scheme.	Number of Acres Reclaimed.	Available Cash.
Arizona	Salt River	160,000	$240,849 25
California	Yuma	85,000	2,186,127 19
Colorado	Gunnison	100,000	1,921,218 00
Idaho	Minidoka	130 000	2,021,750 68
Kansas			139,929 14
Montana	Huntley	35,000	2,147,189 00
Nebraska	North Platte	100,000	550,500 00
Nevada	Truckee	200,000	65,919 35
New Mexico	Hondo	10,000	473,708 31
North Dakota	Fort Buford	60,000	4,503,089 47
Oklahoma			3,209 507 13
South Dakota	Bellefourche	60,000	979,932 75
Utah	Utah Lake	60 000	335,130 40
*Washington	Palouse River	100,000	3,121,863 15
Wyoming	Shoshone	160,000	1,231,718 87
Total		1,045,000	

*Construction postponed.

PROJECTS APPROVED BY SECRETARY OF INTERIOR.

State	Projects.	Estimated Cost.	Acres Irrigable.
Oregon & California	Klamath Falls	$1,000,000	236,000
Oregon	Malheur	2,250,000	100,000
Montana	Milk River	1,000,000	200,000
N. Dakota, pumping.	Bismark	55,000	33,000
	Buford-Trenton		
Idaho	Payette-Boise	1,300,000	250,000

The reason that Kansas and Oklahoma have cash on hand for irrigation projects, but no projects under way, is because the country is so flat and the fall of the streams so slight that as yet the Reclamation Department has found no feasible way to get water out of the streams. The idea of installing pumping plants is now being considered.

In addition to the schemes mentioned in the above table there have been several large private schemes completed within the last year or so, and there are several others in process of construction. Prominent among the completed ones may be mentioned the Imperial Land Co. scheme, which has put 50,000 acres of land suitable for semi-tropical fruits in southern California under cultivation with water taken from the Colorado river, and the Twin Falls scheme of Idaho, which places under cultivation 270,000 acres of fine fruit and grain land.

We can see from what has already been done, and what it is possible yet to do, that some 7% or 8% of the Great American Desert may be put under cultivation, that only 1% was under cultivation before the passage of the Reclamation Act, and that the first series of enterprises will increase the irrigable land by 1,045,000 acres.

POSSIBLE CHANGE OF CLIMATE ON THE GREAT AMERICAN DESERT.—I wish now to call attention to that most interesting question: "Will the reclamation work change the climate of the desert?" Of course, this question can not be definitely answered, or it would not be a question; but my travels on that part of the desert embraced by Inyo county, Cal., and southern Nevada have shown me that comparatively rapid changes have taken place in the climate of that locality; and if a climate may suddenly change for the worse, owing to evident causes, I see no reason why it should not change for the better if original conditions are restored. For instance, there are countless lake beds, some entirely dry and some with a little salt water in the bottom, and all of them showing successive beach marks in the perishable soil of the basin sides, registering the gradual drying up of the country. On one of the beach marks in the Salton Basin, San Diego county, Cal., may be seen stone fish traps, showing that the Salton desert was a fish-bearing lake within the time of human occupation of this continent. Near Osceola, Nev., one can see a crescent-shaped dike across the lower end of a large basin. This was evidently a reservoir built by the ancients. Faint traces of the old ditches may also be distinguished below the dam. There is no water to reserve nowadays.

Walker lake, in Esmeralda county, Nev., is fresh water at the upper end and brackish water at the lower end. Successive beach marks show that at one time it had an outlet to the south. and the fact that it is part salt and part fresh would indicate that the process of the concentration of the small amounts of salt, which all water contains, through the medium of evaporation, has not been in operation for a very great length of time.

One can not help picturing in one's imagination what a beautiful section of country this must have been when all these dry lake beds were filled with clear blue water and running streams, connected one with another. Then the hills were covered with tall cedars and the valleys with waving grass, and the elk, deer and buffalo wandered in herds through a land blessed with the finest climate imaginable, rich in verdure and beautiful with sparkling waters. I venture to say that if this wide area could be returned to its former state by the hand of man, it would be the greatest deed ever done by the human race. The accomplishments of the world's greatest conquerors are not to be compared to an achievement of this kind. It is comparatively easy to kill, destroy and conquer. It is very hard to originate, vivify and create. The greatest engineering feats of the past sink into utter insignificance in comparison. What do the pyramids of Egypt, the bridge of Brooklyn or the tower of Paris amount to in comparison with reclaiming an empire from the desert?

That this stupendous achievement may result from the work which the Reclamation Service has already started seems to me to be well within the realms of the possible, and, strange to relate, the first man to advance the theory and explain the conditions to me was an old Nevada prospector. If I could do so without betraying his confidence, I would like to give his name, for he is an unusual character and his brother was a prominent United States Senator, and his clear-cut features and bright, searching eye show that it was not lack of brains that drove him to adopt the life of a recluse and a placer miner.

I was sitting at "Uncle John's" camp fire, discussing gold veins and things, when he showed me a bit of pottery he had washed out that day from the gravel 20 feet below the surface. I remarked that there must have been people living in that section for a long time.

"Yes, sir," he replied, "and lots of them. There are places where the ground seems like it is half made of fragments of pottery and things. This country used to be a very fertile country and lots of people lived here.

"Why I know a place down towards the Colorado river where there was an ancient city. The houses were adobe, and nothing is left of them, but they had the streets paved with flagstones and you can follow out miles of streets. There ain't water enough in that country nowadays to keep a pair of jackrabbits. There ain't a man that has prospected this country that ain't seen them signs of ancient peoples and lots of them." "How do you account for the country drying up, Uncle?" said I. "Well I'll tell you," and he put a greasewood coal in his pipe to keep it lit awhile, "you probably have noticed that every day you've been in this country the wind has blown from the west or southwest." I recalled that I had. "Well," he said, "if you was ever down in the Altar district near the Gulf of California or along the coast by San Diego, you probably have noted that the prevalent wind is a land breeze. Once in a while we do get a sea' breeze here, but the Sierras suck it dry before it gets here." I had to take his word for that, never having investigated. "Well," he continued, "'taint but a short time ago that the Colorado river used to flow into the Salton desert, and the water backed up into the Death valley and parts of the Mojave desert. There is a whole lot of that country below sea level and it is all on the east side of the Sierras. At that time there was quite a chain of large inland fresh water lakes." I knew the Colorado river does, even nowadays, sometimes flood the Salton desert (it is doing it now), and I knew the basins he mentioned were all below sea level. "You see there is a change in the winds between here and the sea coast, but when them inland lakes was spread out in the hot southern sun, our southwest winds picked up a lot of moisture, and when they got up here on this high, cool ground, they could not hold it all and it come down in rain. But the river flowed into the lake and out again at almost the same place and finally the current cut a channel down so deep that the river and the lakes became separated, and about that time some eruptions came along and made 'malapai' ridges between some of the lakes so they all dried up, and the country dried up, too."

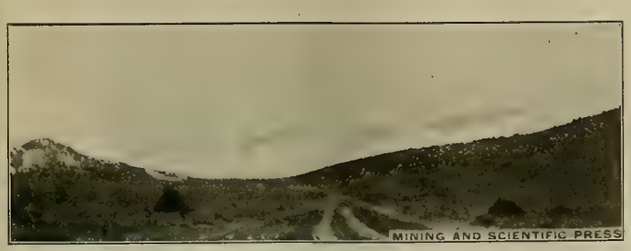
I have never been over the country that "Uncle John" mentioned, bu the had, with his burro and his gold pan and his bright keen eyes, noting many things besides gold veins. As I said above, the old prospector's theory appeals to me. No one who has traveled on the Nevada desert can doubt that only a few centuries ago the country was a great deal more fertile than it is to-day. I saw a cedar butt 2½ feet in diameter in a well in the Saline basin, Inyo county, California, myself. There are no such cedars in the country nowadays, and while cedar is a very durable wood, I doubt if it had lain buried over 500 years. The slow climatic changes which result from the gradual tilting of the poles of the earth or from the rise or subsidence of large areas of the earth's crust, are altogether too slow to account for the comparatively sudden change that is recorded in the soils and rocks of Nevada. That the conditions that once prevailed in that section may be eventually reinstated by the reclamation work that has already been started, seems to me well within the limits of the possible.

Near Denver, Colo., we have had an unquestionable demonstration of the effect of irrigation on the rainfall. Around Denver there are about 200,000 acres of irrigated land. During the heat of the summer the evaporation is very great from this area and one can see the clouds form over the irrigated section. If the wind carries the clouds away from the mountains there is no result, but if they are carried over the mountains into cooler air, heavy showers almost always result. Of course there always were summer showers in the mountains, but that these showers have been heavier since irrigation began is proven by the fact that nearly every mountain meadow close to Denver has been badly cut to pieces by summer cloudbursts since irrigation became general.

It took thousands of years for the silt of these meadows to accumulate, and in twenty years a large part of it has gone; but while the mountain ranches have suffered the prairie ranches have had more water.

To return to the Colorado river basin, I believe that using the water to irrigate the deserts of Arizona and southern California will mean more rain higher up the river, and more rain will mean more

Transportation in Death Valley, Cal.



The Ruby Range, Nevada.

water for irrigation, and this again will mean increased evaporation, so that by a constantly increasing yearly increment the climatic conditions will improve.

I think the same thing will take place wherever topographic and eolian conditions are right for precipitating from the air the moisture freshly acquired from the irrigated fields so that in time to come the 7% or 8% of land which it is possible to reclaim from the district may be the "little leaven that leaveneth the whole loaf."

Water Supply in Mountain Regions.

The mining regions of the West are mostly in mountainous or hilly regions, and the streams in these mountains are mostly of torrential character. The run-off is very large during the spring months and often destructive in its effects. The mines depend upon the mountain streams for their water supply, both for power (with a few exceptions) and for metallurgical operations. To insure permanency of water supply, large reservoirs have been built in favorable places and large amounts of water conserved for summer use. The permanency of the summer supply, however, depends largely upon a heavy snowfall in the early winter. The late snows vanish quickly under warm winds and rains, but the early snows are compacted to beds of ice and endure long into the summer. Among other and more lasting sources of water supply in the mountains are the numerous natural lakes found scattered through the high Sierra region.

There are no more beautiful lakes in any lacustrine region of the world than those of the high Sierra Nevada mountains, which are part of the American-Cosumnes water courses now being discussed as a probable source from which to secure the domestic water supply of San Francisco, Cal. These lakes lie among the highest peaks of the range, being from 5000 to upwards of 7000 feet above the sea. They are practically the meltings of snows descending from snow fields upon the bare and often polished granite, and caught on their way out of the range in receptacles naturally excavated in the same granite. The basins or bowls in which these waters lie have been cleansed by the scourings of untold ages and the waters are as pure as the skies, and the higher reaching mountains from which they are drawn. The water when held in a goblet presents a beautiful crystalline clearness; its color in the lakes varies from a light green, where shallow, to a dark rich cobalt where depth is attained. This marvelous blue setting is like a sapphire in a surrounding band of terra cotta, with here and there patches of white marking the fields of "old snow" among the rugged points of the high mountains. The magnificent distances, the massiveness, silence, solitude and purity of it all are enduring memories with one who has visited the locality.

The most interesting of the lakes are the Echoes, Big and Little, which are connected by a narrow channel in the solid granite, their combined length being about 3 miles and their area about 480 acres. This beauteous pair lie at an elevation of 7450 feet above the sea, close to the very summit of the range; indeed, Lake Tahoe, which can be plainly seen from their banks, lies 1224 feet below them on the eastern slope of the range. In the clear, cold atmosphere which rests upon these lakes the voice reverberates from hill to hill of the surrounding wall and dies away in the distance, rebounding and re-echoing as the sound recedes. The stroke of the oars in the locks, the splash of the blades in the water, will in the silence and the still air find their counterpart amongst the ravines of the shore and come back to the oarsman like messages by wireless telegraph. It is from this phenomenon that the lakes are named.

Farther over to the north and at an elevation even higher than the Echo lakes, lies Lake Harry, presenting its beautiful breast of water so clear and deep that it looks like a lake of indigo fringed with a border of tamaracks. Above and about it is the wildest of alpine scenery; bare rocks, glaciated and glistening, strewn with innumerable flints, with sides so steep that a goat could scarce find footing. Occasionally there rises from some break or crevice a stunted juniper, gnarled and twisted, bereft of foliage on its north and west, where the sharp boreal hurricanes have cut away its limbs, every fiber of its form displaying a terrible struggle for life amidst warring elements. It is a picture not alone of desolation, but abounding in evidences of intense atmospheric action; a region of maximum storms, where the wild gales blow with the utmost velocity.

Advancing farther to the north extends a district most remarkable; it is a vast field of granite-bedded lakes connected one with another, but spreading over many square miles. From an eminence above Lake George the field breaks in sight, and suddenly a great basin of naked rocks interlaced with water presents itself to view. Beyond, the reddish ochre of the bare hills splotched with snow, and to the left, the broad lake of dark blue, surrounded by tamaracks, presents a picture to which the brush of the artist or the camera alone can pay a proper tribute. Farther west is Lake Marguerite, and then there is an array of nameless lakes and mountain pools with splashing cataracts between. This is the "Devil's Basin," "Desolation Valley" or the "Medleys," as it is sometimes called—a wonderful network of water, threading the rocks, leaping from pool to pool, and finally passing out of the region through a great fall which drops in foaming mass more than 150 feet.

The State highway between Lake Tahoe and Placerville traverses the Echo Lakes country, and on past the basin of Lake Audrain. This, too, is almost at the summit and is a typical alpine lake. If, as proposed, these beautiful lakes should become the property of San Francisco, and are utilized for a system of water supply, a dam at Audrain will raise the water to a considerable height, and it will become the peer of the most beautiful of them all.

The waters from this great chain of mountain lakes now flow into the South Fork of the American, from which, some miles below, a canal conducts them, clea

Little Echo Lake, One Thousand Feet Higher Than Lake Tahoe.

and pure, to users farther down. But the proposed San Francisco, Cal., system provides that the water shall be carried by a tunnel through a range of mountains into the watershed of the Cosumnes; dams will be built in deep, rocky gorges and broad valleys transformed into still other great lakes of pure mountain water; and the whole region, now so little known, will become famous, not alone for its beauty, but, also, because of the vast quantities of pure mountain waters available to promote the health and prosperity of the metropolis of the Pacific.

Mine Surveying.—II.*

Written by C. A. S. Andrews.

Surveying Underlie Shaft.—In fixing the position for the draft marks in an underlie shaft, one assistant is left at the surface draft mark, and the surveyor descends to No. 1 level, if he can see that far. The other assistant is sent down to No. 2 level, and the surveyor picks the best place on No. 1 plat, so that he can see both to the surface and to No. 2 level, and also see into the levels on each side. A draft mark is made at this point, and also one in each level, so that all the required bearings can be taken at the one setting up. This operation is repeated to the bottom of the shaft.

The surveyor then returns to the surface, sets up over the draft mark at the mouth of the underlie, and picks up the meridian of the surface survey.

The forward assistant hangs the plumb-line on station (2) and gets it steady. At a point on the string that can be seen from the theodolite he attaches a small ball of clay, about the size of a pea. The surveyor sights to the line immediately above the clay, and reads the bearing and dip. Reversing the instrument he reads them again, and books the mean of the two observations.

To enable the surveyor to see the plumb-line, the assistant holds with one hand two candles, one on either side of the line and about 2 inches in front of it. The other hand is held behind the line as a shield for the candles and a background for the line. If only one candle is used, the line is illuminated on one side more than the other, and the center of the illuminated portion is sighted to instead of the center of the line.

As soon as the bearings and dips are booked the back assistant takes the end of the chain forward to the forward assistant and returns to the instrument, seeing that the chain is clear on his way back. The forward assistant holds the end of the chain to the plumb-line immediately above the clay, and the surveyor puts on the necessary strain, using the spring balance, and reads the distance, at the axis of the theodolite, to two places of decimals.

The height of the axis of the instrument above the ground sill, and of the clay above the plat, are then read and booked. The vertical depth measured plus or minus the difference between these heights is the vertical depth of No. 1 level.

Should the dip of the underlie shaft exceed 65°, the plate of the theodolite will prevent the forward draft mark being sighted. In this case, before the bearing can be taken, a point must be laid off in line with station (2) with a dip of less than 65°. To do this the theodolite is tilted with the leveling screws until the forward draft mark can be sighted. It may be necessary to remove the brass button on the standard to allow the striding level to be kept plumb.

A temporary mark in line with the forward station is then made, either on the surface or on the hanging wall of the shaft, which can be sighted when the theodolite is level.

During the operation the plumb-bob attached to the spindle of the theodolite is kept over the draft mark. The axis has been tipped forward out of plumb, but the line of sight is still in the same vertical plane as the two draft marks. The temporary mark is therefore in the true line with the stations. The theodolite is then leveled, and the bearing taken to the temporary mark.

The dip and distance are left to be measured upward from station No. 2, when the dip can be read with the diagonal eyepiece. If the theodolite has a bubble attached to the telescope the dip can be read from the top station when the instrument is tilted.

The bearing, dip and distance having been booked, the theodolite is put back in its case, the chain rolled up, and the surveyor proceeds to station No. 2, leaving the back assistant at station No 1.

While the surveyor has been coming forward from station No. 1, the forward assistant has lifted the plat-sheet, placed a plank across the opening, and has marked on the plank a spot, plumb under the draft mark. This is most conveniently done by placing a small clay daub on the plank, and pressing the point of the plumb-bob into the clay at the correct point. The surveyor examines this spot, and, if he is satisfied, the plumb-line is removed.

The forward assistant stays with the surveyor until the theodolite is set up, holding the candle or otherwise helping. One or two more planks are now put across the opening in the plat for the tripod legs to rest upon.

If at any time the theodolite is set up on the plat-sheet, two planks are to be put across the plat and supported at each end so as to be clear of the plat-sheet. The surveyor stands on these when taking his sights.

After sighting and chaining to the next station in the shaft, the bearings and distances are taken to the first station in each of the levels. This operation is repeated at each level to the bottom of the shaft.

The dips of the sights along levels are not taken, as the chain can always be held horizontal. Should the exact rise of the level be required, it is more readily measured at another time by using the theodolite as a level and the metallic tape as a staff, or else by using a level and staff brought down for that purpose.

Survey of Levels.—The surveyor having completed the survey of the underlie shaft, now proceeds with the survey of the different levels.

As in the shaft, he will fix all his draft marks before taking the theodolite out of its case.

The level is then traversed in the usual manner, the bearing and total length of lines only being booked for the present. If the level has been driven to the boundary, plugs are to be put in parallel to and about 2 feet inside the boundary. The approximate position of the boundary will be known from the distance given to drive at the last survey.

The surveyor will compute at his leisure the distance these plugs are off the boundary and will embody same in his report.

Should any rises or winzes be approaching a boundary, or should it be desired to break through from them into any particular point in the next level, or in a rise or winze from the next level, or should the surveyor wish to connect his survey of two levels for a check, it will be necessary to survey such rises or winzes with the theodolite. In ordinary cases they will be surveyed by compass and clinometer with the rest of the detail work.

Where levels are more than 500 feet long, the surveys should be connected from level to level, via rises or winzes, as a check.

If any rises, winzes or passes are to be surveyed, a draft mark is fixed at a suitable point at the foot of the rise or top of the winze, as the case may be, and connected with the survey of the level from one of the draft marks. Generally it is better to keep these draft marks separate from the survey of the level, as it may necessitate a short shot, or in any case will increase the number of shots in the level.

The theodolite work in this level being finished, the instrument is put away in its case until wanted for the next level.

Survey of Detail.—The detail work is then proceeded with. This is done with the compass, clinometer and metallic tape. While doing this the surveyor must be accompanied by the underground manager, so that nothing may be omitted.

The usual details to fill in are: Rises, winzes, passes, stopes, cross reefs, faults, changes of country, flow of water, etc.

It is not necessary to take offsets to the sides of levels, underlies, rises or winzes. They may be sketched in on the plan an even width, so as to include the traverse lines.

Starting from the shaft, the distance is measured to the first pass and booked to the nearest foot. The bearing, dip and length of pass to the top of the stope is booked, and also the distance up the underlie to the top of the stope.

In succeeding surveys only the distance up the passes are taken, as the direction and dip remain practically the same.

The distance is then taken from the first to the second pass, and so on to the next draft mark. The distance between the draft marks is thus checked, and any grave error, say of 10 feet, would be disclosed.

The face of the stope is sketched in from top of pass to top of pass, it not being necessary to traverse the intermediate irregularities.

Any rises or winzes not surveyed with the theodolite are taken in the same way.

The tops of the passes broken through from the level below are not noted, only the end of the worked ground being booked.

All solid blocks left in the stopes as too poor to work are to be noted. The habit of showing all unpayable blocks as worked ground is bad. These blocks at some future time, under improved treatment, may become payable, and knowledge of their

Big Echo Lake, Amid the Summits of the Sierra Nevada.

Audrain Lake, Amid the Alpine Summits of the Sierra.

*Abstract Trans. Queensland Institute of Surveyors.

position and metallic contents will then be of value.

The position, strike and dips of all faults should be noted, and also the direction and extent of downthrow, if it can be ascertained.

The strike and dip of any reef, leader or formation branching off either in the level or stopes should be noted, as also any change of country, increase in the water or any other detail which will assist the surveyor in drawing up his report.

FIELD NOTES.—The field notes should be kept with a hard pencil, so that no amount of wetting will obliterate the writing.

The notes of every level and underlie shaft should be kept separate, sufficient blank leaves being left at the first survey, so that the notes may be continued at each successive survey until the level reaches the boundary.

Levels being driven each way from the underlie are to be treated as separate levels, being called Level No. 1 North and Level No. 1 South, or any other suitable names.

An index is to be kept at the end of the field book, giving reference to every level, underlie shaft, surface notes or any other survey noted separately in the field book.

Stations are all to be numbered. A good system is to number all stations in underlies 1, 2, 3, etc., and in each level or crosscut, a, b, c, etc. Start afresh in each case for every new underlie, level or crosscut.

PLAN.—The working plan is generally on a scale of 40 feet to an inch, any section being on the same scale both vertical and horizontal.

A tracing of this plan is used by the underground manager and is plotted up with the main plan at each survey.

The adjacent workings on all adjoining mines are to be shown and plotted up to date at each survey, the vertical depths reduced to the datum of the survey being shown on each level.

Levels on the same reef should be colored alike, another color being used for rises, underlies or winzes and another for crosscuts.

Each level or crosscut is to have its name and number printed on it with its vertical depth. Underlies, rises and winzes are to be numbered.

It is a good custom to give all straight shafts, underlies and main winzes or rises a distinguishing name. Names are more readily remembered than numbers and save endless reference to the plan when reports are being read.

The stopes on the main reef may be washed in with a light wash of India ink, the stopes on other reefs being shaded with parallel bars of the distinguishing colors of the levels on the same reef.

In giving distances to drive, rise or sink to connect from any one point to another, the surveyor should always quote from a draft mark, the approximate amount of solid ground between being also given.

TRAVERSE BOOKS.—Traverse tables should be kept in an exercise book, one for each mine. The traverse of each level and underlie is kept separate, and at each survey is added to, and the reduced latitude and departure of each station shown. A surround of the boundaries is also made, showing the reduced latitude and departure of each course.

By subtracting the reduced latitude and departure of any underground station from the reduced latitude and departure of the nearest corner, the bearing and length of the connecting horizontal line can be readily computed and from this the distance from the station to the boundary is known.

DISCREPANCY BETWEEN SURVEYS OF ADJOINING MINES.—As soon as the workings break through into an adjoining mine, a connection should be made at once to the survey of the latter. If the discrepancy in chainage be less than decimal one (.1) per 500, and in the bearings less than one minute (1′) per 1000 feet of underground survey, the mean may be adopted and the boundary lines adjusted to agree.

When an adjustment has been made between the survey of adjoining mines, the reduced latitude and departure of the last station in the level from which the connection was made is altered in the traverse book to agree. The last station in the other levels approaching the same boundary should be corrected, but those approaching other boundaries are better left till another connection is made.

Where connections are made to the surveys of the three or four adjoining mines, the surveyor may find the discrepancies between his survey and other surveys on the same boundary of his mine are in different directions. In this case the adjustment he makes for each connection will necessitate him having to lay off his boundary slightly different on the frontage of each of the adjoining mines.

There are many other difficulties, too numerous to enumerate in this paper, that the surveyor will meet with; but with thought and patience they can all be overcome. Should the surveyor not feel confident of any part of his survey, made under adverse conditions, he should take the first opportunity of checking his work by a different route. His mind will then be at ease and he will enjoy his work.

THE latest fake gold saving machine is an electrically connected, non-mechanical affair which, it is claimed, saves $10 where by ordinary and well-tried methods only 10 cents can be saved.

Mining and Metallurgical Patents.

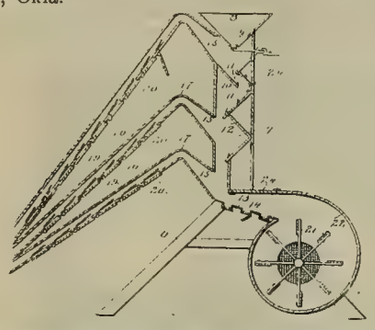
PATENTS ISSUED NOVEMBER 28, 1905.

Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

TREATMENT OF ORES AND THE LIKE.—No. 805,577; J. Nicholas, Waterloo, England.

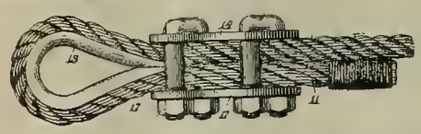
Treatment of materials containing zinc, lead and precious metal, by mixing pulverized materials with water, and with chloride, and then heating mixture, leaching this so-treated mixture with water, reducing metallic compounds contained in leached residue to metallic state, agitating molten lead and precious metal with aluminum, cooling, then separating alloy of precious metal with aluminum from lead.

ORE SEPARATOR.—No. 805,599; L. J. Vandervoort, Guthrie, Okla.



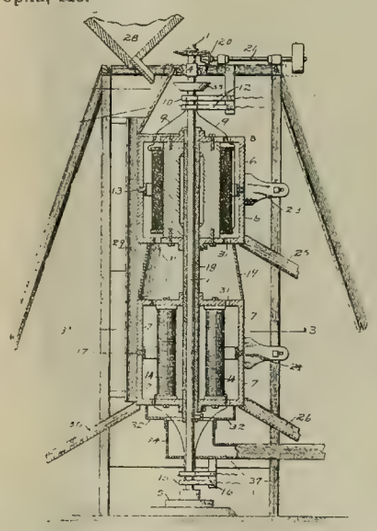
In ore separator, in combination, upright chute down through which ore is fed, series of riffle boards therein, over which ore flows, collecting pan under lower end of chute, upwardly inclined pipes leading from one side of chute.

WIRE ROPE CLAMP.—No. 805,705; C. H. Billman, Boston, Mass.



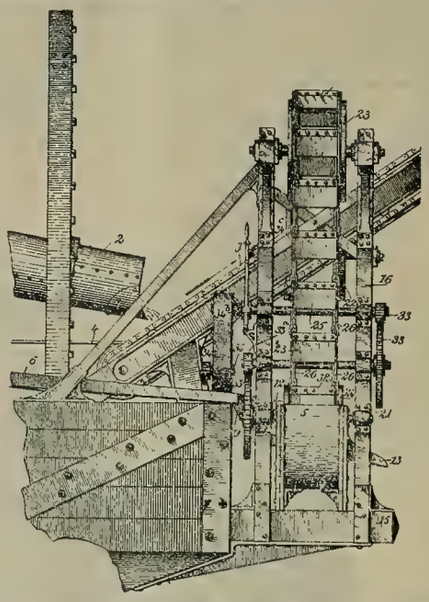
Clamp for wire ropes consisting of two plates, each provided with plurality of openings in two lines, distance apart equal to diameter of rope to be clamped, openings in lines being staggered, plurality of bails adapted to pass through plates and straddle rope, and clamping means therefor.

MAGNETIC ORE SEPARATOR.—No. 805,854; E. Hedburg, Joplin, Mo.



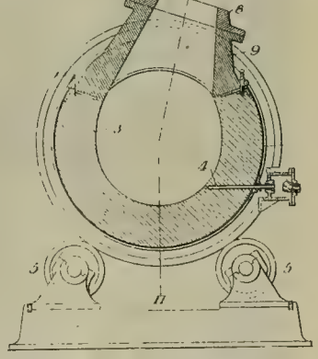
In compound magnetic ore separator, and in combination vertical shaft, upper electromagnet mounted axially thereon, magnet including two pole pieces forming shell which incloses windings of magnet, ring of non-magnetic material separating proximate edges of pole pieces, spreader apron above upper electromagnet, lower electromagnet mounted axially on shaft, lower magnet having two pole pieces which inclose its windings, non-magnetic ring separating proximate edges of pole pieces, outer surfaces of respective rings being in line with and forming continuations of outer surfaces of pole pieces, means for rotating magnets, and flat-surfaced scraper arranged adjacent to outer surface of magnets and overlapping contiguous portions of pole pieces for removing adhering ores from rotating pole pieces.

ATTACHMENT FOR DREDGERS.—No. 805,906; H. P. Francis, Oroville, Cal.



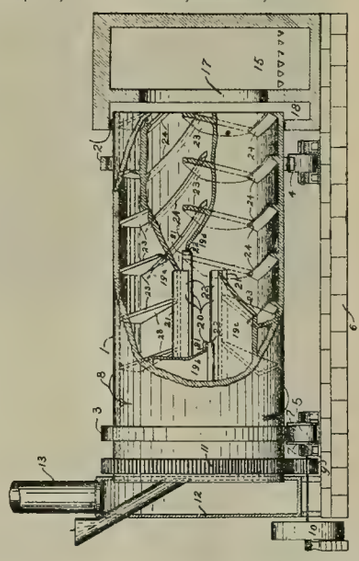
In dredging machine, combination of stacker, means for supplying material thereto, sand box, sluice emptying into sand box, endless conveyor for removing sand and water from sand box and discharging same, means for directing sand from conveyor to stacker, and means for directing water from conveyor away from stacker.

FINISHING CONVERTER.—No. 805,896; C. M. Allen, Lolo, Mont.



Converter having refractory lining and top composed of thick metal of sufficient bulk to withstand heat produced by converting process.

RABBLING DEVICE FOR ORE ROASTING FURNACES.—No. 805,939; C. C. Wilson, Denver, Colo.



In ore roasting furnace or like, longitudinally revoluble cylinder provided upon interior surface with longitudinal shelves projecting inwardly tangential to imaginary cylinder whose axis coincides with that of cylinder and whose diameter is less than that of cylinder, and equally distant apart, and partition plates extending from lifting surface of shelves having longitudinal inclination forward in direction of travel of ore from circumference of cylinder to projecting edge of shelves.

Mining in Trinity County, Cal.

TO THE EDITOR:—In some respects this has been a good year in discovery and development in Trinity county—one of the earliest placer mining fields in the State, but one which can not be assigned a place in the "petered out" class.

Trinity has always been a "pocket" county in both placer and quartz mining. In the early history of New river, in the northwest corner of this county, a bedrock pocket near the source of that stream produced nearly five pounds of gold, chiefly in nuggets almost free from quartz. A similar find was made in a mountain-top mine at what was known as Kellogg Diggings, in upper Hay Fork valley.

Less than twenty years ago the Mountain Boomer mine, on New river, was a large producer for a time and then pinched out next to nothing. At various times the Brown Bear mine, at Deadwood, has produced very rich ore and then dwindled down. In the northeast portion of the county, in the '90s, a host of people flocked to the headwaters of Trinity river, among them many who did not expect to fill their pockets with surface nuggets, but who were bent on research, and went hopefully at work to satisfy themselves whether golden wealth was hidden in the gravel deposits and rocks bordering Trinity valley, and some found what they sought.

The mining world is aware that many valuable placer and quartz properties are being operated in Trinity county. I am one of the few old-timers who believe that as rich gravel and quartz deposits yet remain as those being operated to-day.

The greatest need of Trinity county now is a showing of the energy that characterized the fortune hunters of forty or fifty years ago, when, almost moneyless and creditless, ditch, flume and water wheel enterprises were carried to success at much greater expense than would be required now.

Trinity is yet an open field for the placer or quartz prospector. The output of Digger creek and East Fork placers in the early days warrants the belief that a nest-egg remains, and that the Fairview mine may be a pointer that leads to it. Some day Buckeye mountain will be prospected and the sequel to the old-time placer yield of the creek so named and of Bolt's hill will be manifest. I believe that in years to come the Lappin mine will prove a good property and that there are more of the same sort on the north slope of the Trinity-French Gulch divide, and also that there are duplicates of the Yellow Rose and Dorleska and a half dozen other promising mines yet hidden in the western Trinity river watershed, from Scott mountain to the headwaters of Swift creek. Mineral marks the Trinity summit's course thence to Dedrick, lower East Fork, Rattlesnake and New river. But all can not be said in a single chapter.

OLD TOM.

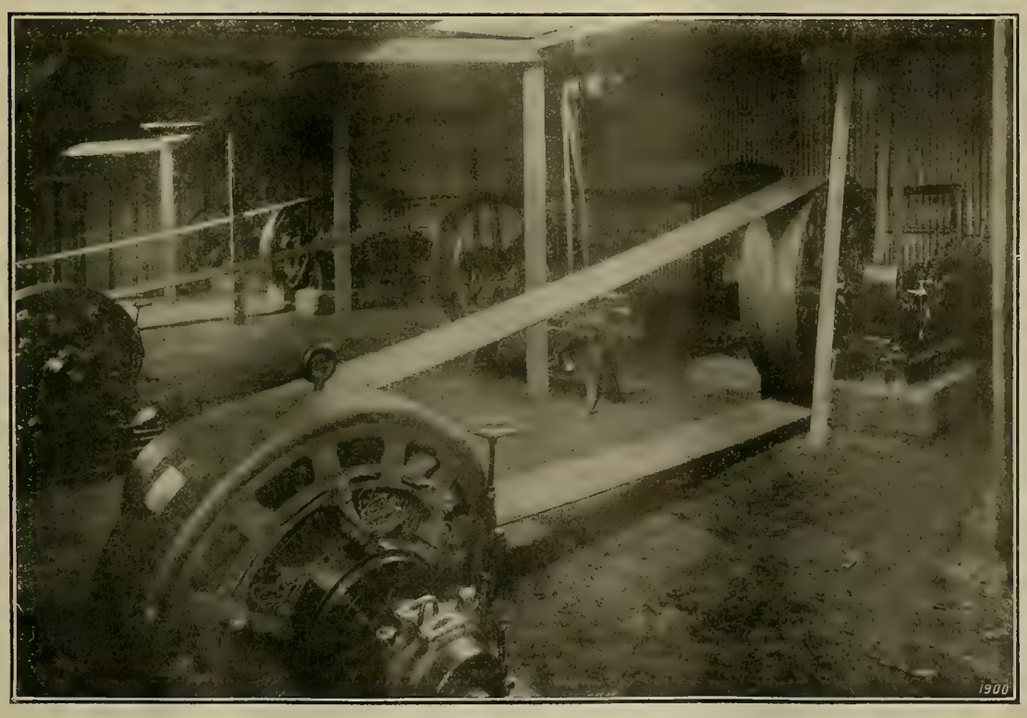
Trinity Center, Dec. 2.

Air Power Plant for Pneumatic Tool Service.

There were 100 steel cars to be built for the London Metropolitan railway when it was decided to convert the system to electric power. The contract for these cars was secured by the American Car & Foundry Co., under conditions demanding almost immediate construction, and called for a great number of pneumatic tools; and since the contract covered only a short period, the plant installed was necessarily temporary in character. The order for the pneumatic equipment was placed with the Ingersoll-Sergeant Drill Co. The tool equipment included eighteen 8-inch and twenty-five 5-inch Haeseler riveting hammers, and sixteen No. 7 and twenty-four No. 12 Haeseler rotary drills—eighty-three in all.

The illustration shows the four air compressors which furnish power for these tools. They are of the builders' "class 'JC'" duplex two-stage machines of balanced type, with a heavy inside fly-wheel, solid sub-base, and semi-tangye frames. The air cylinders are water-jacketed on heads and barrels; an intercooler in the sub base beneath the cylinders provides inter-stage cooling at high efficiency. The Sergeant piston inlet air valve is applied on both cylinders and discharge valves are of vertical lift direct-discharge pattern. At rated speed of 150 R. P. M., each compressor is stated to have a displacement of 526 cubic feet, which would give a total free air capacity to the plant of 2104 cubic feet per minute, delivered at a pressure of 80 pounds. Each unit is belted to a direct current British Westinghouse motor, rated at 110 H. P. on 550 R. P. M.

The picture shows the temporary nature of the plant—a cheap, shell-like building, unfinished foundations, rough earth floors. But it is stated that every detail has been provided for in the machinery equipment which would assure economy of operation and reliability in service.

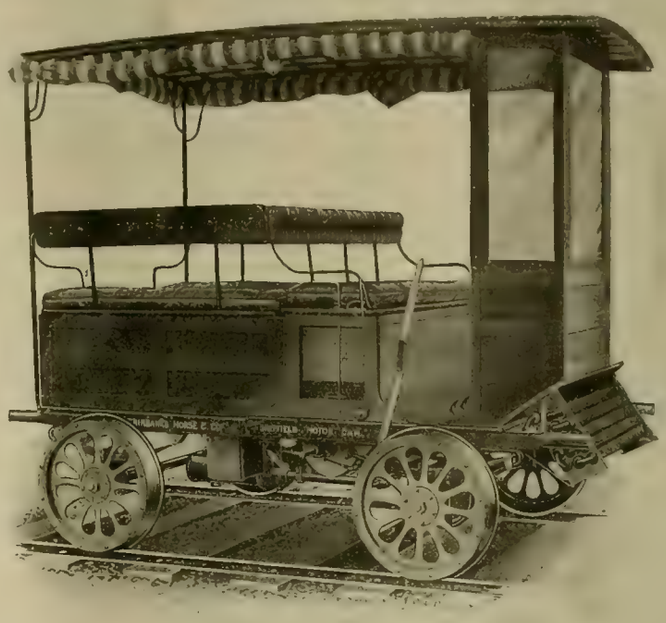


Ingersoll-Sergeant Compressors Run by Electric Motors, and Driving Machine Tools.

New Gasoline Motor Car.

The accompanying cut shows a No. 16 gasoline motor car manufactured by Fairbanks, Morse & Co., Chicago, Ill., and is one of several different styles of cars of this class they are at present building.

Early in the summer of this year George H. Webb, chief engineer Michigan Central R. R., made an inspection trip over the system with one of these cars. The total distance traveled by the car was 4347 miles and the total amount of gasoline used was 231 gallons, or an average of 19.7 miles per gallon of gasoline. The records show that on the run from Jackson to Allegan, a distance of 175 miles round trip, only 7½ gallons of gasoline were used, or 23.3 miles per gallon. The total cost per mile, including lubricating oil, battery cells and everything excepting wages of man in charge, was $\frac{9}{10}$ of a cent. Most any railroad man can figure out that this is quite a saving, as compared with a steam locomotive pulling a private car.



New Gasoline Motor Car.

This gasoline car has its advantages, also, because of its ability to attain a high rate of speed and maintain it on a long run. From Marshall to Allegan, 66.4 miles distance, was made in one hour and forty minutes, or at the rate of 40 miles per hour, and they report they never stopped the engine once. The distance from Tekonsha to Harris—29 miles—was made in forty-five minutes, and the best run of the entire trip was made from South Haven to Kalamazoo, a distance of 39.6 miles, in forty-five minutes, or at the rate of 52.94 miles per hour.

The manufacturers report that there is a large demand for cars of this class, now that they have demonstrated that they are a complete success, and their factory, with the present facilities, is not able to keep up with the orders which are received from all sections of the country.

THERE are few mining camps in the world where water has been more troublesome and expensive in carrying on mining operations than in that group of mines at Leadville, Colorado, situated on the west slope of Carbonate hill, and in these mines lying under the city itself. The deepest mines and those farthest out from the hill have found an increasingly greater amount of water as they have continued to work westward and outward from the hill. The Penrose has had its share of trouble of this sort, but is now equipped with a pumping plant which will easily control the heavy flow of water. The lowest mines drain those opened at higher levels, so that the lowest operators always get the worst of it. The mines are so deep that they cannot be drained by adits. This is a great disadvantage, as it increases the cost of drainage very materially. Although the altitude of Leadville is about 10,200 feet above sea level, and most of the mines are from 100 to nearly 1000 feet higher, comparatively few of the mines of the old lead-silver district can be effectually drained by tunnel. The most extensive tunnel enterprise in the district is the Yak, starting in California gulch and running easterly over 2 miles under Iron and Breece hills. For a time a tunnel starting at Malta, 4 miles distant, in Arkansas valley, was talked of, but the deep mines of Leadville are now below that point.

Notes on Southern Nevada and Inyo County, California.—I.*

Written by H. H. TAFT.

It has long been known that the volcanic area south of Belmont, Nye county, Nev., had mining possibilities. Some of the old time prospectors knew that gold existed there. Its remoteness from any source of supplies, its long distances from any water, the absence of game, and more, perhaps, the lack of grass for animals to subsist upon, have made this an unattractive region in which to search for mines.

The decline of the Comstock mines, the exhaustion of sundry large and rich ore bodies, the high cost of mining, marketing, and particularly the ruinously high freight charges upon refractory ore that had to be shipped to distant smelters, have kept investors out of Nevada for the last few years, and mining people have hardly yet awakened to the importance of Tonopah, Goldfield and perhaps the newer and less developed districts.

The discovery of Tonopah by J. L. Butler, who located the Mizpah claim in May, 1900, and the fortunes soon realized there, attracted many people. As the boom declined many people went away, some scattering out into the surrounding country, and the population is now about 7000. In the fall of 1902 a discovery of gold was made 23 miles south, in what is now known as the Sandstorm group, 4 miles northwest of Goldfield. In the winter of 1903–4 the Combination, January and Florence mines were discovered, and shipments of high-grade ore soon followed.

In January, 1905, there were 10,000 people in Goldfield. In June, 1904, rich gold ore was found 85 miles southeast, at the foot of the south end of the Kawich mountains, but this discovery was kept quiet until a relocation could be made.

On August 10, 1904, the Bullfrog claims, and a month later the Ladd mountain and neighboring claims, were located. The Shoshone group was located September 24. This district is from 60 to 80 miles southeast of Goldfield. In September, 1904, there was a stampede for Bullfrog and Gold Crater —the latter a small area 21 miles east of Goldfield. Two mining districts, called Beatty and Bullfrog, were organized under the laws of Nevada. Later, overflow migrations poured in the old and abandoned districts of Lida (or Allida), Tule Canyon, State Line and Silver Peak, and others more remote.

During the winter of 1904–5 the desert seemed full of people. All sorts of outfits traversed unfrequented roads—men afoot and alone, "burro men," carriages, wagons and automobiles. The inevitable reaction of such furore is no doubt deplorable, yet the rapid development of any new mining region depends upon the excited "tenderfoot" rather than the conservative mine operator. At Goldfield it was "a sight to see." There were hundreds of people walking over the hills, many with a canteen of water slung over one shoulder, while a small iron mortar hung to the other, and a pestle, a pick and a 5-inch frying pan constituted the equipment for sampling, grinding and testing. The rock is soft and the gold at the surface is free.

There is no good map of this region. The best is that of the United States Geological Survey; but this and the Land Office map are incorrect, particularly in the topography between the northwest arm of Death valley ("Lost valley") and Owens lake. A correct map of Inyo county, Cal., has been made by the county surveyor. A very useful map, particularly of the country farther south, is issued by Mr. Crowell of Vegas, Nev.

The high Panamint range is usually mapped with about twice its actual length. It ends at latitude 36° 30′ north. A wagon road from Furnace creek in Death valley to Ballarat in the Panamint valley follows around this mountain at its base. The geological maps would be far more useful to prospectors if the older Tertiary volcanics were separated from the recent ones. A good map showing the potable waters would save much suffering, and perhaps some lives, this summer. The springs should be marked by the Government. So far this year about thirty lives have been lost on account of thirst in that desert region.

Tonopah is 6000, Goldfield 5500, and the Bullfrog region from 3500 to 4000 feet above sea level. The climate at Goldfield is much the same as that at Pueblo, Colo., except that the rainfall is less than half. The topographical variation is not great in Nevada. The summits of the mountain ranges are rarely more than 2000 or 3000 feet above the surrounding deserts. Inyo county, Cal., is different, being remarkable for deep valleys and high, precipitous mountains. The altitude of Owens lake is 3575 feet, and the Sierra Nevada, a few miles west, reaches an elevation of 14,500 feet above sea level. The Panamint peaks rise to 11,000 feet, while Death valley, opposite these peaks, and but a few miles east, is below sea level. On the west the Panamint valley is 1100 feet above tide, while Saline and Butte valleys are not far from sea level. Roughly speaking, 600 feet in elevation is equivalent to 1° in latitude; moreover, a deep valley has not the circulation of air that prevails on the tablelands. Hence this is a region of extremes of wind and calm, heat and cold, both diurnal and annual. The storms of winter seem to blow through one and to take all warmth away; yet on a summer day, without any shade, down in one of these deep valleys, protected by high mountains from the prevailing winds, it is hotter than any other part of the American continent. The maximum temperature at Furnace Creek ranch, in Death valley, is said by those who live there to be 127° F. The extraordinary amount of detritus brought down through every little mountain gulch indicates terrific cloudbursts.

Life would not be so intolerable in these valleys in the summer season if our people would learn more of the Mexicans. Americans even go across the border into Mexico and farther south with their light board houses, low ceilings and thin roofs. Thick stone or adobe buildings, with high ceilings and thick or double roofs, are always comfortable. The good climate of the whole year in Tonopah and Goldfield is much appreciated by the mining men who have come from the tropics, from Alaska, British Columbia, and from the higher altitudes of Colorado.

Montezuma mountain, 8 miles west of Goldfield (altitude 8000 feet), is ever green with pinon and scrubby pine, with a little cedar and juniper around the edges. (It is remarkable how closely one can estimate the elevation through the entire Rocky mountain region by noting the vegetation.) The Montezuma mountain timber belt extends southwest to the White mountains and to the Fish Lake range. The north end of the Grapevine range is also covered with timber. Cordwood sells in Tonopah and Goldfield at $16 per cord; at Bullfrog the price is $25. Below the timber there is considerable sagebrush, with a few cacti and some yucca palms, locally known as Joshua trees. The desert is often green with several varieties of desert brush having different local names—a short, stunted growth of no value, which gives the valleys the appearance of being more fertile than they really are. A strange feature is the almost entire absence of grass. At the head of the Amargosa and southward, "creosote" brush and other desert growths are the same as one sees in northern Chihuahua, western Texas, and in New Mexico, which is good grazing country. Old timers say that this was not so once, but that several years ago a drouth killed all vegetation that could be used as fodder. Along the water courses, such as the Oasis valley, at Ash meadows, in the Death valley, Panamint, and others where there is water, salt and wire grass present a meadow-like appearance, but will barely keep cattle from starving. Along the water courses willows, cottonwood and, to the south, screw bean and mesquite grow. The latter, which is an excellent fuel, is by common consent left to the Indians. Sometimes there are in the valleys large areas devoid of vegetation, with the ground so hard that a wagon leaves but a slight track. Along the low ridges the wind has blown away the soil and arranged the pebbles so as to appear like a mosaic.

The traveler usually takes the "Overland Limited" to Reno, Nev., then the Virginia City & Truckee Railroad 41 miles to Mound House, the Carson & Colorado 137 miles to Sodaville, and the Tonopah Railroad 66 miles to Tonopah. The Carson & Colorado is a narrow gauge road, with light rails and limited equipment. It was completed to Keeler, Inyo county, Cal., in 1881, and was a barren investment until lately, when the Southern Pacific Co. obtained control of it, just in time to reap the benefits of the Tonopah rush. During the past winter this road has been swamped with freight. For six months there were from 500 to 1000 cars awaiting trans-shipment in the various yards near Reno. From Sodaville to Tonopah is also narrow gauge. From Tonopah to Goldfield there both stages and automobiles are running—the latter making the distance of 27 miles in two hours. All this will soon be changed, and the traveler will be able to leave the main line of the Central Pacific in a broad gauge car that will take him through to Goldfield.

Surveys have been made and there is much talk of railroads from the south. A factor in this situation is furnished by the large deposits of colemanite (calcium borate) between Amargosa and Death valleys. A railroad route presenting no special difficulty runs from Vegas on the "Clark" road to Goldfield, via Beatty. The distance to Ash Meadows is 90 miles; thence it is 45 miles up the valley to the Bullfrog district and 35 miles diagonally across (south) to the most developed borax mines.

The outfit for a trip through this section requires, as a usual rule, 1 pound each of vegetable and animal food per day per man, and 14 pounds of hay and 12 pounds of grain per horse per day. A larger amount of alfalfa, with a smaller amount of barley, can be fed. Mules are preferable to horses, because they are more hardy and eat and drink less. In a country where evaporation is so great (an acre of tanks will evaporate 1700 gallons per day), a team of horses will require 15 gallons (say 120 pounds) of water per day; in the heat of the summer more. Where there is running water in the winter there is nothing but a dry "arroyo" in the summer. Indeed, in a channel where there is a stream of running water in the morning sufficient for stock, it may be dry and even dusty at sundown.

A good assaying equipment sufficient for 1000 assays will weigh 500 pounds and require five cases of gasoline. A portable balance, sensitive to 0.005 milligram, can be had, and is best, in that it enables one to reach a desired degree of accuracy with less fluxes and smaller weight of crucibles.

The people are very kind about giving information as to water and roads, but such information is often inaccurate. Nye county, Nev., has had signboards put up at crossroads, and some of the freighters, also, are thoughtful enough to leave some mark or sign.

Personal.

T. S. MATHIS is at Yerington, Nevada.

THOS. H. LEGGETT is at El Oro, Mexico.

MARSHALL BOND is at Phœnix, Arizona.

F. L. BOSQUI has gone to Parral, Mexico.

W. P. BONBRIGHT is at Colorado Springs.

POPE YEATMAN is at Guanajuato, Mexico.

EMILE R. ABADIE is now in San Francisco.

HENRY C. CALLAHAN has returned from Mexico.

L. L. HUBBARD has gone to Salt Lake City, Utah.

H. H. CLARK of Bullfrog, Nev., is in San Francisco.

J. M. MCGEE of Oroville, Cal., has been in San Francisco.

FORBES RICKARD is examining mines at Silverton, Colorado.

N. A. ROBINSON has left Mariposa and is now in San Francisco.

R. G. KIRKLAND has returned to Mexico from San Francisco.

WALTER P. JENNEY of Salt Lake City is at the Palace Hotel.

W. B. FISHER is visiting Spokane, Wash., and Wardner, Idaho.

D. P. PULLINGER of London is in New York on his way to Mexico.

MARK B. KERR has returned to San Francisco, from New York City.

E. D. MCDERMOTT has left El Oro, Mex., to proceed to Johannesburg.

H. I. KEEN of the Allis-Chalmers Company is visiting San Francisco.

F. P. SHERWOOD has returned to Parral, Mexico, from San Francisco.

O. F. POSEY AND CHAS. WEIR, both of Los Angeles, are in San Francisco.

J. H. ELSPASS, patentee of the Elspass mill, Denver, is at Toronto, Canada.

GEORGE H. EVANS has returned to Breckenridge, Colo., by way of Denver.

H. H. LANG, superintendent Kendall mine, Kendall, Mont., is in San Francisco.

FRANK ICKES has been appointed manager Globe M. Co. of Lead, South Dakota.

ARTHUR HOULE is superintendent Calumet & Arizona smelter at Douglas, Arizona.

ARTHUR GOODALL, manager Fremont mine, Amador county, Cal., is in San Francisco.

FRANK E. SHEPARD, president of the Denver Engineering Works Co., is at Boston.

S. B. SALISBURY has been appointed manager Dakota M. Co. at Virginia City, Montana.

W. H. BAKER has been made superintendent Gold Pan mine at Breckenridge, Colorado.

C. M. YEOMANS is visiting San Francisco, from El Oro, Mexico, on his way to Australia.

O. BERGSTROM is consulting metallurgist for the United Verde smelter at Jerome, Arizona.

THEO. F. VAN WAGENEN is examining copper mines on the Isthmus of Tehuantepec, Mexico.

A. F. KENSINGER has been appointed superintendent Chicago-Mexican M. Co. of Chihuahua, Mexico.

GEORGE A. PACKARD has gone to Baker City, Ore., after examining mines in Inyo county, California.

ROBT. H. ANDERSON has been made manager Sullivan Group M. Co. at Kimberley, East Kootenay, B. C.

DAVID MIEKLEJOHN has been appointed manager Buena Vista mine in the La Yesca district of Tepic, Mexico.

H. E. CRAWFORD, consulting engineer Hermosa M. Co., Hanover, New Mexico, has returned there from Denver.

H. H. NICHOLSON has resigned as manager Standard Con. Mines Co. in Grant county, Or., but will act as consulting engineer.

JOHN S. GEORGE AND W. J. MACCONNELL of the Snowstorm Hydraulic Co., Fairplay, Colo., have returned to Milwaukee.

ROBT. K. PAINTER has accepted the superintendency of the mines of the Newfoundland Syndicate at Pilley's Island, Newfoundland.

E. S. GRAHAM of Graham, Texas, has been appointed superintendent Aquila mine, of the Mazeppa Co.'s G. M. Co., near Hostotipaquillo, Jalisco, Mexico.

C. D. ROOKLIDGE has resigned as manager Nevada-Superior Mines Co., working near Humboldt, Nev. F. W. Correll has been appointed his successor.

WILLIAM C. POTTER, manager of mines for Mexico, in the interest of the American Smelters Securities Co., has moved his office from Mexico City to Aguascalientes.

MINING SUMMARY.

Specially Compiled and Reported for the MINING AND SCIENTIFIC PRESS.

ALASKA.

The first smelter to be built in Alaska was blown in Dec. 5 at Hadley, on Prince of Wales island, 400 tons of ore being treated. It will be known as the Brown Alaska smelter, its owner being B. D. Brown. The smelter has a daily capacity of 750 tons, and will treat both copper and gold ores. The mines of Prince of Wales island and surrounding districts will furnish all the ores it can handle.

ARIZONA.

The question of the increase of the assessment of mines in Arizona has gone over until January, at which time the supreme court will hand down a decision in the certiorari proceedings instituted by the Copper Queen and other mining companies of the territory, setting up the contention that the territorial board of equalization exceeded its authority when it raised assessments of the mining companies. In the meantime the county treasurers in the several counties have been instructed by the Attorney General to accept from the mine owners the amount of taxes due on the assessment as turned in by the county assessors, pending the decision of the supreme court which will be on January 17.

Cochise County.

At the Pittsburg & Arizona Co.'s group, near Charleston, a double-compartment shaft has been started on the Manila mine and will be sunk to a depth of 400 feet. ——J. L Bachelder has bonded his copper claims in the Dos Cabezas district to the Western M. Co.

It is reported that J. L. Bachelder has bonded his copper claims, near Dos Cabezas, to the Western M. Co. ——December will see five producers credited to the Western district—Copper Queen, Calumet & Arizona, Lake Superior & Pittsburg, Pittsburg & Duluth, and Shattuck & Arizona. The above named companies will be producers in the order they are named, the Shattuck & Arizona being the last, which will commence shipping from its stock pile on the dump to the Copper Queen smelters some time during the present month.

Gila County.

The Copper Hill mine of the Arizona-Commercial Co. has twelve stopes of sulphide ore from which to make shipments and is shipping 100 tons per day to the Old Dominion smelter and 1000 tons per month of siliceous ores to the Douglas smelter. Superintendent W. S. Sultan is preparing to sink the Copper Hill shaft 200 feet deeper, to a total of 800 feet. An auxiliary hoist will be put underground. The Blackhawk shaft, now domn 260 feet, is to be sunk to a depth of 600 feet before a level is run. A steam hoist will be put in and power drills used.

Mohave County.

The Aztec Turquoise Co. is working at Mineral Park, 9 miles from Chloride, under the direction of Superintendent McNulty.——High-grade ore is reported from the West Flores mine, near Cerbat, owned by W. B. Campbell.——The P. K. and K. P. mines, in IXL Basin, near Kingman, are being unwatered and may be worked by E. M. Carson.——Superintendent Nadeau has opened up rich silver ore in the Windy Point mine, near Mineral Park. New machinery is to be put in.——The Arizona-Mexican M. & S. Co. is putting in a 40-ton mill at the Infallible mine, at Stockton Hill, near Kingman. A road is being made from the mill site to the Alta mine.——A mill is to be put in by the Union Pass G. M. Co. in the Union Pass district, near Kingman. J. D. Jordan has charge.

Santa Cruz County.

The Gold Bullion mine, near Old Glory, has been sold by W. S. Wilde to Clay Peters of San Francisco, Cal. J. M. Drennon of Los Angeles, Cal., will be in charge of the development work. A 10-stamp mill and a concentrator will be built at the mine as soon as the wagon road is completed.

Yavapai County.

A hoist and mill are to be put in at the Pittsburg-Jerome property, near Jerome. A wagon road has been built from Yaeger. The company has fifteen claims, formerly known as the Larson-Avery group, between the United Verde and Equator mines. D. S. Cochran is superintendent.——The Jerome Mines Development Co. is testing a new diamond drill.

The Bradshaw mountains of Arizona have been mapped by the United States Geological Survey. A folio descriptive of this quadrangle has recently been prepared by J. A. Jaggar Jr. and Charles Palache. It includes one topographic map of the quadrangle, one map illustrating the areal geology and one illustrating the economic geology, a page of structure sections and a page of photographic views. The quadrangle is in the southeastern part of Yavapai county and includes a small part of Maricopa county in its extreme southeast corner. A portion of the Prescott Forest Reserve occupies the western half—a mountainous region including all the higher summits of the Bradshaw range. The city of Prescott is 2 miles north of the northwest corner of the quadrangle, and Jerome is 17 miles north of the northeast corner. The only settlements in the quadrangle at the time of the survey were small mining camps and scattered ranches. On the north the Prescott & Eastern Railroad enters the quadrangle near Valverde smelter and terminates at Mayer station. The eastern third of the quadrangle consists largely of low-lying desert land and basaltic mesas. The mineral resources include gold, silver, copper and iron ore deposits, building and ornamental stones, and undeveloped bodies of volcanic ash. No definite statement of the output of precious metals from this region is possible, but an estimate based on scattered contemporary statistics and on the Mint reports gives an approximate value of $9,500,000, equally divided between gold and silver. At the time of the survey (1901) only two or three large mines were actually producing, and the output of the district, chiefly gold, was probably less than $200,000. A number of other mines, recently active and of demonstrated value, were closed down by reason of litigation or other adverse circumstances. The ore deposits of the quadrangle, with few exceptions, are fissure veins of simple structure. The veins may be classed, according to the dominant value of their contents, into gold, silver and copper deposits. The important mines in the quadrangle are in its northern and western parts, and occur in groups associated in a striking manner with the four intrusive stocks of quartz-diorite which occupy the basins of Groom and Hassayampa creeks, of Lynx creek, of Bigbug creek and its branches near McCabe, and of Poland creek near Crown King. Rich placer deposits formerly existed along most of the streams of the quadrangle. The only stone quarried in the quadrangle for building purposes is the green rhyolite tuff found abundantly in the valley of Castle creek. The stone was said to be soft and easily worked when quarried. It hardens on exposure and presents a handsome appearance. Near Mayer, on the left bank of Bigbug creek, is a considerable deposit of onyx marble, small portions of which are of a quality that renders it suitable for a decorative stone.

CALIFORNIA.

Calaveras County.

The Eastland-Gray Development Co , under the management of D. P. Gray, has found a rich gravel at the Hageman ranch, near San Andreas.——It is reported that rich ore has been struck at the 2400-foot level of the Gwin mine.

A promising quartz vein has been opened up in the Red Gold mine near Murphys.——The Beatrice M. Co. is working west of Murphys.

El Dorado County.

The North Weber Land & M. Co. has bonded the Golden Hatchet drift gravel mine, near Placerville, to T. G. Patton. Work will be commenced at once.

Kern County.

(Special Correspondence).—The Zenda mine, on Caliente creek, is putting up a 10-stamp mill.——Mr. Blood of San Francisco is putting up a 10-stamp mill near Caliente creek, on the Gold Peak M. Co.'s property.——A. D. C. McKay is working the Jeannette claim on Piute mountain and taking out good ore.——The Barbarosa mine, recently bonded to a French syndicate, is working seven men developing their ore bodies on the lower level. ——The Atlas mine, owned by A. W. McRae, has started up again.——The Minnehaha M. & M. Co. have completed a 3-stamp mill and are concentrating their low-grade tungsten and crushing and sacking high-grade tungsten. They intend to start tunnel No. 6 to tap the main ledge at a depth of 850 feet, having to run 900 feet. M. D. Hamilton is general manager; H. B. Ward, superintendent; and H. Wischmeyer, foreman. H. Wischmeyer has bought the Bear claim from Theo. Crees.——E. F. Evans has bought one-half interest in the Golden Rule from James Rayme. Active work will be commenced by E. F. Evans and Judge Dearborn soon, sinking 200 feet on the ledge. This ledge carries $10 per ton free. ——The Initial claims, owned by H. C. Jones, have been bonded to San Francisco parties.

Paris, Dec. 12.

(Special Correspondence).—The Phœnix mine, near Johannesburg, has been closed down, on account of lack of water, by Superintendent Gender.——The Yellow Aster has found water 15 miles from the mine after sinking 1600 feet.——Sulphide ore has been struck at the 550-foot level of the Butte mine, near Randsburg. ——Rich ore has been found at the 300-foot level of the Orphan Girl mine, 3 miles from Randsburg.

Randsburg, Dec. 13.

The Francis M. & M. Co. is preparing to start development on the Francis mine, 40 miles north of Mojave. The 700-foot shaft is being unwatered. Besides the cyanide plant, the Francis company has two 2-stamp mills. J. C. Meadows of Kansas City is president.

Mariposa County.

The Three Trees mine, on the Merck estate, near Hornitos, is being developed by a Los Angeles company. A mill operated by electric power is to be put on the property.

Nevada County.

It is stated that work is not to be resumed at the Mountaineer mine, near Nevada City, until next spring, and the pumps have been stopped in the shaft. This is due to the shortage of water, with poor prospects of receiving a sufficient amount shortly. The pumps have been placed in condition, so that when they are needed in the spring they will be ready. The shaft will be allowed to fill up, but the water can not go above the 400 level, as it will drain elsewhere. It is the company's intention to drive ahead the tunnel on the opposite side of the creek, which is headed toward the Summit mine. This tunnel is in 400 feet.——The new company which is reopening the Idaho-Maryland mine, at Grass Valley, has reached the 800-foot level, having cleaned out and retimbered the shaft. From the 1000 level, which will be reached by February, a new shaft will continue on the perpendicular for 1200 feet.

The Birchville mine, near Graniteville, has been closed down for the winter on account of water shortage. J. McKelvey is superintendent.

All is in readiness at the Central Con. mine, near Banner mountain, near Nevada City, to start up the 20-stamp mill which has been put in by W. S. May. Until the slime plant is constructed the mill will remain idle. The tunnel is in 1300 feet, striking the old shaft at a distance of 900 feet and continuing beyond. At the mouth of the shaft a chamber is being cut in the rock for a 30 H. P. electric hoist. Electricity will operate the entire plant.

San Diego County.

It is reported that work is to be resumed at the Stonewall mine, near Cuyamaca. The shaft has been pumped out and retimbered to below the 600-foot level. E. B Tustin is owner and G. H. Clarke is manager at the mine. Machinery is to be put in so that the shaft can be sunk to the 1000-foot level.

Santa Clara County.

It is reported that the New Almaden quicksilver mines may be closed down. For a year past men have been laid off at the mines, until at present there are less than 75 men employed. The mines are owned by the Quicksilver M. Co. of New York. The reason assigned for closing the mines is that the property has been developed enough.

Shasta County.

(Special Correspondence.)—The Middle Creek G. M. Co., who have been developing the Dobrowsky mine, near Shasta, have just started their new stamp mill. The shaft is down 260 feet and three levels have been run. No ore has been stoped, and what ore not sent to the Keswick and Mammoth smelters during the shaft and drift work is piled up on the dump. H. O. Cummins is manager.

Shasta, Dec. 12.

The Bullychoop G. M. Co. has sixty men at work at its mines near Ono under the superintendence of Lester Greenwell. There is a 10-stamp mill and a 2700-foot aerial tramway on the property. It is reported that Manager Beall intends to put in an electric power plant and increase the number of stamps.

Sierra County.

(Special Correspondence.)—The Sierra Buttes mine, at Sierra City, has been closed temporarily because of trouble with the new tramway.——Ed. Westall, manager of the Marguerite, near Downieville, expects to have the mine unwatered soon.——R. Phelan of Sierra City has his power plant ready to run, and will start the Butte Saddle and the Roman.——The electric plant at the Telegraph mine, near Downieville, has been finished. ——The Eureka quartz ledge, on the Balsam Flat ridge, has been sold to the Alleghany M. Co. by A. M. Bixby.

Downieville, Dec. 12.

Sonoma County.

The dam for the Socrates Con. M. Co., near Cloverdale, has been completed. Water power sufficient to run the plant seven months in the year may be considered a certainty. The output each month during the last quarter averaged fifty flasks of mercury.——The Culver-Baer Co., near Cloverdale, is driving its main tunnel to cut the ore body formerly worked by the managers of the Oakland mine.——The Cinnabar King, near Cloverdale, is having its roadways improved and its buildings repaired, so as to be ready for future development work.

Tehama County.

(Special Correspondence).—The main ledge at the Basler copper mine, near Lowrey, is said to have been struck after running the tunnel 200 feet. The ore is stated to be chalcopyrite and bornite.

Lowrey, Dec. 12.

Tuolumne County.

The Moody mine at Big Oak Flat has been leased to Connally & Conde. The mill is to be started soon.—— A 5-stamp mill has been put in at the North Star mine, 7 miles southeast of Groveland. H. Argall is superintendent.

Yolo County.

It is reported that drills will be put to work on the Albert Bemmerly place in the tule, 7 miles northeast of Woodland, to prospect for gold.

COLORADO.

(Special Correspondence). — Several of the mining camps throughout the State are complaining of the shortage of cars to handle the product from their mines, as well as shipments to the mines. This is due to the increased output of the various properties and to the climatic conditions existing in the higher altitudes of Colorado. The traffic at Silverton is congested on account of the large amount of mining and milling machinery now being sent into that district; besides, the railroads entering the camp have been blockaded on account of the heavy snowfall.——The Telluride mill at Colorado City and the Homestake mills at Cripple Creek are reported sold to the Golden Cycle Co. and the Stratton estate, respectively, for the treatment of the ores from the various properties of the two companies.—— The forestry question is attracting considerable attention in this State at present, and a school of forestry in connection with the Colorado college at Colorado Springs is to be established. In some sections of the State timber for mine use is becoming serious and the preservation of the forest is being agitated. A large tract of land has been donated for the use of the school as a field for experimenting, and it is believed that students of forestry will attend the school from the entire arid region as well as from Colorado.

Denver, Dec. 12.

Boulder County.

(Special Correspondence).—The American Tungsten M. Co. report they have opened up tungsten ore which will concentrate twenty tons into one. The company has a lease on ground near Nederland.——The Jenny Creek G. M. Co. is operating on vein No. 1, and has a mineralized streak 4 feet in width which they claim averages $30 per ton. The company expects to put up a mill this year.

Frantz, Dec. 11.

The Inter Ocean mine on Gold hill, near Boulder, has been sold to the Inter Ocean M. Co., with main offices in Chicago, for $100,000. A 100-ton per day mill is to be erected near the mine. Development of the property is under way.

It is reported that a cyanide plant is to be added to the Struggler mill at Ward.——Sinking is to be continued during the winter by Manager G. M. Mitchell. ——The Myrtle mill has been closed down until spring.

Chaffee County.

Announcement was made Dec. 12 that a controlling

interest in the Ohio & Colorado smelter at Salida had been sold and that the purchasers would extend the business of the company by constructing new plants at Salt Lake and Denver. Timothy Goodwin of Denver, one of the former owners of the stock transferred, is authority for the announcement.

The Independence mine at Turret is being reopened under the direction of John Harrison.

Clear Creek County.

It is reported that work is to be resumed on the Atlantic tunnel near Georgetown. C. H. Morris of Georgetown is resident agent.——The work of putting in a switch and station on the Silver Queen vein in the Newhouse tunnel, near Idaho Springs, has been completed. This claim is held under a bond and lease by the Jackson M., L. & Dev. Co.——A Pennsylvania syndicate has secured the Gold Medal group of four patented claims near Idaho Springs. Work has been started by the new company.——Rich silver-lead ore has been struck in the Muscovite property on Democrat mountain, near Georgetown, in sinking the shaft from the tunnel level and at a depth of 35 feet. This property was secured recently by S. H. Clift and associates of Denver. Superintendent Hennengben has put fifteen men blocking out the reserves and knocking down the ore.——The United Light & Power Co. of Georgetown will double the capacity of its plant.——A rich strike of native and ruby silver and gray copper ore has been made in sinking the shaft on the Bellman mine in Gilson gulch, near Idaho Springs. The Bellman is owned and operated by the Memphis & Idaho Springs G. M. Co. C. A. King is manager.

Work has been resumed on the Vidler tunnel through Argentine pass in to Summit county, with machine drills. The present heading is between 700 and 800 feet from the portal. With the new drilling power it is expected that 200 feet per month will be made. It will be continued as a mining tunnel of present dimensions until the heading is advanced far enough to justify the beginning of its enlargement for railway purposes to connect with the Montezuma and points beyond on the western slope of Summit county. Next summer machinery is to be put on the opposite side of the pass to push the tunnel to a junction with the heading from the east side. Within 1200 feet of the present breast they expect to cut the Red Light lode. The men are cutting an upraise to the surface from the 600-foot point in the tunnel to afford ventilation and provide a convenient exit for employes in case of need. The distance yet to be run is about 6300 feet.

Gilpin County.

The Pewabic Consolidated Gold M. Co. in Russell district is shipping an average of five cords per day to the mill in Black Hawk and keeping forty stamps busy. This is mill ore taken from the Pewabic shaft. The Iron shaft has been finished and hoisting of water has been started.——The Old Town mine in Russell district is employing 125 men. The shaft is down 1500 feet.——James McMillan, superintendent of the Ann Rutledge M. Co., who own the North Star mining property, near Yankee Hill, is putting up a new mill to be built on the property designed to handle thirty tons per day.——Wenzel & Eilmann, who have a lease and bond on the Susan Mary mine, near Lake gulch, are working in a new 70-foot shaft, drifting east and west, using a windlass for hoisting the ore to surface.——J. Walters, superintendent of the Evergreen mine at Apex, states that the shaft has been straightened and retimbered and is down 75 feet.

At the Brooklyn mill on North Clear creek, above Black Hawk, the Colorado Chemical Amalgamating Co. is treating a large tonnage of ore. The ore is first put through the Blake crusher, and then fed to a Wild pulverizer, which reduces it to 20 mesh. It is then automatically carried to the grinding pans, where it is ground to 150-mesh fineness, and during grinding chemicals are added to the pulp, which oxidizes it during the four hours that it is being stirred and agitated, after which the pulp is thinned and diluted and put through the amalgamator. The present capacity of the chemical plant is twenty-five tons daily, and the ore is obtained from the Cashier lode of the Brooklyn mines, south of Central City. S. C. Arnold of Denver is manager.——The Brooklyn management is preparing to run the compressor to drive the north and south crosscuts from the sixth level. R. St. John Cleary of Denver is manager of the Brooklyn G. M. & M. Co.——Glanville & Peeck of Central City will rebuild the new shaft building of the Fairfield G. M. Co., which was blown down and destroyed by the recent heavy winds. The new machinery has been put in.——Sinking has been started at the Aduddell mine in Willis gulch on a contract calling for a lift of 100 feet, the shaft being down 450 feet.——The Taawasa Gold Mining & Cyaniding Co. intend to connect with the lateral from the Newhouse tunnel, at a depth of 1700 feet.——Work is to be resumed on the Hillhouse mine, near Russell Gulch. The main shaft is down 400 feet.'——The Old Town mine employs 125 men, forty on company account, the balance being leasers.——The new extension of the Gilpin tramway lines from South Willis gulch to the property of the Pleasant Valley M. & M. Co. at the bottom of Elkhorn gulch is almost completed.——The Mineral Hill G. M., M. & T. Co. is operating the Southworth property in Moon gulch. Sinking is to be resumed. W. H. Knowles and associates of Denver are interested. It is reported that the company will put in an air compressor.

Gunnison County.

C. F. Wahl, superintendent of the Gold Vein M. Co., operating on Cross mountain, near Tincup, is sinking on the recent strike, being down 60 feet.——The Gold Cup Co., of Tincup, is pushing their tunnel on Middle Willow creek. This tunnel will cut the Gold Cup contact at greater depth than has been reached at any other point.——The Brunswick concentrator, at Tincup, is running on ore from the Jimmy Mack dump. A. Lejune, superintendent of the Blistered Horn tunnel, is advertising for bids to run the main crosscut tunnel 200 feet. The tunnel is in nearly 1600 feet.

The Cleveland Mine Operating Co., recently organized to lease and operate mines at White Pine, has secured the Victor mine. The shaft is down 385 feet. The mine is to be worked for the silver, lead and zinc values. W. S. Rogers of Cleveland, Ohio, is president of the company and W. S. Barker of White Pine vice-president and general manager.

Lake County.

In Little Evans, at Leadville, the New Era Leasing Co. will resume work on Hoffer's claims north of the Coronado. Farther up Little Evans a leasing company, under the management of W. F. Page, is working claims partly developed by the Progressive M. Co.——Bohn's Mammoth placer shaft near Evansville is approaching the ore zone proven by drill holes.——On Big Evans, H. K. Whyte has resumed work on the Josie shaft and a new shaft is being put down on one of the claims of the Josie Consolidation, west of the Josie.——On the Bohn shaft, in Leadville, Manager Newell has recently sunk 150 feet, cut two stations and commenced two drifts from the bottom.

The Iron Silver M. Co. reports that during November it hoisted 500 tons more of zinc ore from the Moyer, Tucson and Dome shafts than in October. There was also an increase in the shipment of carbonate ore from these properties to the smelters. About the same quantities of copper and iron sulphide were shipped last month as the month before. The figures as given out by Manager William O'Brien are as follows: Zinc, 10,500 tons; iron sulphide, 1500 tons; carbonate, 500 tons; copper, 500 tons. The entire ore output of Leadville camp was slightly less during November than October, owing to the weather preventing the smaller operators from working their properties. The zinc tonnage also fell off somewhat, according to the local representative of the zinc trust, Patrick O'Dwyer. The amount of zinc ore taken by the trust is about 15,000 tons, while a month ago it was 16,000 tons. The total output of all grades of ore during November was 77,500 tons, as against 79,000 tons for October.

Judge Owers of Leadville has rendered a decision making permanent the injunction restraining the Mine Owners' Association from forcing miners to take out working cards.

The machinery at the Coronado shaft in Leadville has been overhauled and new tramways constructed.——The Fortune shaft, on Little Ellen hill, Leadville, is shipping good ore.

Mineral County.

A lease upon the Commodore mine, near Creede, has been given to A. L. Wilson, H. Van Horn, W. Dwiggans, J. Wilson, and C. Withrow, all of Creede.

Ouray County.

The Evening Star vein has been cut 430 feet from the bottom of the 500-foot shaft at the Imogene G. M. Co. workings, near Ouray.——The Grecian mine, adjoining the Sultan group, near Ouray, and owned by R. W. Clinton, is said to have opened up an ore body 100 feet long and in the breast there is a body of lead-zinc ore 2 feet in width. It is the intention to equip the property with a mill soon.

Park County.

(Special Correspondence).—The Snow Storm Hydraulic Co. recently held their annual meeting in Denver and intend to consolidate development work. The company owns the placer ground extending from near Fairplay to the head of the Platte river, above Alma. J. S. George of Milwaukee, Wis., is president, W. J. MacConnell general agent and W. E. Thorne general manager.

Fairplay, Dec. 10.

San Juan County.

The capacity of the Hamlet mill, near Silverton, is to be increased to treat rock from recent strikes. The lower crosscut tunnel is in over 400 feet.

At the concentrating plant of the Hercules Con. M. Co., at the foot of Sultan mountain, south of Silverton, ten new stamps will be added to the equipment, making forty stamps in all. An addition to the mill, 30x65 feet, has been completed. The present power plant of 125 H. P. will be increased to 275 H. P. by the installation of additional steam boilers. Development and the blocking out of ore in the mine has been in steady progress all summer.

San Miguel County.

The Menona M. & M. Co. has leased the Columbia-Menona mines and 30-stamp mill, in Savage basin, 5 miles from Telluride, to John P. and John B. Olson. Operations have been started.

The work on the Butterfly-Terrible mines at Ophir Loop, 14 miles from Telluride, consists largely of that performed by lessees who are working on the ore shoot between the second and the third levels, and taking out enough ore to keep from ten to twenty stamps of the Butterfly-Terrible 30-stamp mill dropping part of the time. The officers of the company are driving the tunnel to tap the ore shoot 750 feet below the third level. The tunnel is in 1000 feet and is being pushed with machine drills.——Development has been resumed on the Congress group, above Blue lake, at the head of Bridal Veil basin, near Telluride. The group is owned by L. W. White, E. M. Arthur, J. W. Hanson and Peter Hansen.——The Blue Lake group, owned by J. A. Adams, C. F. Hilgenhaus, D. Smith and others, is being developed.

Summit County.

(Special Correspondence).—Foote & Hight, who have been working the Bullion King mine on Gibson hill, near Breckenridge, shipped five cars of zinc ore recently.——The Lanyon Zinc Co. of Denver has taken a bond and lease on the Country Boy vein on Nigger hill. This is a portion of the Juniata mine, owned by the Lincoln Gold Mines Co. Carroll Clark is in charge.——C. C. Acton has struck gold ore on the Acton-Lyman property in Summit gulch.——The King Solomon Tunnel & Development Co. at Frisco has cut two ore bodies in its main tunnel. A contract has been let to drift on this vein.——The management of the Mint M. Co. has let a contract to extend their main tunnel into Ophir mountain.

Breckenridge, Dec. 10.

Teller County.

C. F. Springer of Colorado Springs has taken a bond and lease on the Louisiana claim of the Ore-or-no-go Co. on Raven hill, near Cripple Creek. A hoist is to be put in and the shaft sunk from the 143-foot to the 200-foot level.——J. K. Miller and associates of Colorado Springs have taken a two-year lease on the north end of the Oro claim, Cripple Creek. The shaft is to be sunk to a depth of 200 feet from the 60-foot level. New machinery is to be put in.——The Rose Nicol shaft on Battle mountain, near Cripple Creek, is being sunk from the 600-foot to the 700-foot level.——The Scranton shaft on Little Bull mountain, south of Victor, is being sunk from the 90-foot to the 200-foot level.——The Duncan & Cain shaft on the Teutonic, on Ironclad hill, Cripple Creek, is to be continued to the 650-foot from the 350-foot level.——Selbach & Johnson, operating the Pride of Cripple Creek, on Ironclad hill, under lease, are working on the 300-foot level to cut the extension of the ore shoot opened on the Mt. Rose, adjoining.

IDAHO.

Idaho County.

C. C. Vancy and M. B. Merritt have returned to Roosevelt from Ramey ridge, where they have been developing the Florence A. group of claims, which they own in conjunction with V. Welch and O. Hayberg. About 200 feet of tunnels and open cuts were made.——On the Mildred group, which adjoins the Florence and has a parallel vein, considerable work has been done by Hussey & Wakefield of Spokane. Lynch, Stephenson & Mahon, the discoverers of this district, have done considerable work on their Little Gem and Gold Bug groups, which show well defined veins of good size and character. A 55-foot shaft has been sunk on the Little Gem.——One of the biggest strikes of the year has been made on the Butch, owned by Butcher & Gassett.

Lemhi County.

In a report to W. A. Beyers of Salt Lake, general manager of the Virginia M. Co. of Baker, it is stated that the property consists of twelve claims and has been opened up by 3000 feet of development work. The last work done was by a tunnel 700 feet below the upper workings. This tunnel is in 200 feet. There are nine tunnels on the property, averaging from 35 to 400 feet in length. The mine is equipped with a 3-stamp mill. The company will build a big concentrating mill and start breaking ore.

Nez Perces County.

The gold dredge at Delta has been dismantled and is being moved to the Gaffney land below Pierce City.——The Gateway M. & M. Co. are working the Wild Rose and Hutch claims, near Pierce City.

Owyhee County.

Work has been discontinued for the winter at the Standard M. Co.'s properties on South mountain, near Silver City, by Manager F. T. Clemmens.

Shoshone County.

The Monarch Mining Co. of Murray is opening up the ore bodies on the 1400-foot adit level. A long crosscut tunnel was run some time ago, cutting two distinct veins 1000 feet apart. The first of these had been explored for 500 feet, opening up a shoot of concentrating ore. The second vein ahead, called the Monarch, will be drifted on east and west from the point of intersection. The property has a 150-ton concentrator. E. P Spaulding is manager.

MICHIGAN.

Keweenaw County.

(Special Correspondence).—The control of the Keweenaw Copper Co. and the Keweenaw Central Railroad has been taken over by Thomas F. Cole and associates. The Keweenaw Copper Co. was organized by C. A. Wright of Hancock. The Keweenaw Copper Co. has begun explorations on the Medora and Mandan, and it has there cut the Montreal River lode. The Keweenaw Central Railroad is graded to Mohawk, 5 miles from Calumet, and expects to finish this last stretch of grading in the spring. It also has part of the road from Lac Labelle finished.

Houghton, Dec. 11.

MONTANA.

The annual report of B. H. Tatem, assayer in charge of the United States assay office in Helena, on the mineral production of Montana during 1904, states that the aggregate value of the precious metals won by the mills, smelters and other reduction works from the ore mined and treated, together with the gold obtained from placers, shows an increase over the yield of the preceding year. The quantity and value of each is shown below, the gold and silver being computed at the coinage rate and the copper and lead at the average market price for the year: Gold, fine ounces, 246,605.374, $5,097,785.50; silver, fine ounces, 14,608,089.91, $18,887,227.36; copper, fine pounds, 283,945,330, $36,410,309.67, and lead, fine pounds, 4,537,598, $195,525.10. Total value, $60,590,847.63. The above shows a gain of 17% in the value of the production over the preceding year. In 1903 the entire output shown by corresponding statistics was $50,276,355. The principal increases have been as follows: In gold, $507,270; in silver, $1,789,525, and in copper, $8,209,618. On the other hand, the amount of lead produced shows a decrease of $191,920. This increase in the amount of gold arose principally in ores reduced by the cyanide process. An increase is also to be noted from the tonnage shipped to and treated at the custom smelters. The increase in silver resulted from the greatest reduction of the Butte ores ever accomplished. Smelting ores from other districts also show a gain in silver nearly equal to that noted from the copper ores of Butte. As has been noted in reviews of the production for Montana in recent years, the most important features of the output of gold and silver were furnished by the mining of the copper ores in the Butte district and in the results achieved by the development and perfection of the cyanide process. For many years the fluctuations in the amounts of gold and silver won from

the copper ores were most important, but since the advent of the cyanide process into the mining industry of Montana, whereby gold is successfully extracted from tailings and low grade ores, the annual returns from this source have increased yearly. More than 64% of the total values won from Montana's mines in 1904 consisted of the gold, silver and copper contained in the ores mined at Butte. The principal lead districts are those of Cascade, Meagher and Flathead counties. The production of gold, silver, copper and lead for the State from 1862 until the close of 1904 is shown to have been as follows: Gold, $291,228,136; silver, $404,403,578; copper, $450,327,758; lead, $13,651,075; a grand total of $1,159,610,547.

Broadwater County

The Custer Con. M. Co. at Winston is preparing to do development work. The old Custer shaft, which was 400 feet in depth, has been enlarged and retimbered and will be sunk 200 feet deeper. The second hoist is intended for sinking a new 300-foot shaft on ground belonging to the Custer group. C. S. Muffly of Helena has charge.

Cascade County.

O. C. Mortson and C. A. Martin of Monarch are said to have found tin in the Baldy range, 7 miles from Neihart.

Fergus County.

The Kendall Extension G. M. Co. has been organized by H. H. Lang, superintendent of the Kendall, and R. K. Neill of Spokane, Wash., to explore ground near the Kendall mine.

Rich ore has been recently struck in the Cumberland group at Maiden, owned by O. Stephens, R. F. Calkins of Chicago and P. Rosso of Maiden. A mill may be built in the spring.

Silver Bow County.

(Special Correspondence.)—The leading mining companies of the Butte district in 1905 yielded ore in quantities as follows, December being estimated: Anaconda, 1,600,000 tons; Boston & Montana, 1,200,000; Butte & Boston, 192,000; Trenton Co., 230,000; Washoe, 150,000; Parrot, 135,000; United Copper, 548,000; Clark mines, 350,000; North Butte, 255,000; Pittsburg, 50,000; all others, 500,000; total, 5,110,000 tons. The first six companies named are amalgamated. From this total tonnage of ore in excess of 338,000.000 pounds of copper were produced. Of that amount the Amalgamated Co. is credited with 264,000,000 pounds; United Copper, 30,000,000; Clark, 20,000,000; North Butte, 20,000,000. The Amalgamated also obtained, as by-products, 9,000,000 ounces of silver and 60,000 ounces of gold; United Copper, 2,000,000 ounces of silver and 6000 ounces of gold; Clark, 1,000,000 ounces of silver and 1600 ounces of gold; North Butte, 1,500,000 ounces of silver and 1800 ounces of gold. The output of the Washoe smelter of the Amalgamated Co. was 14,000,000 pounds of copper a month, and the Boston & Montana smelter 8,000,000 pounds a month. Ninety-two per cent of all Amalgamated ore yielded 4% copper, and 8% of it went 8½% in copper. During the last six months the Anaconda ore averaged better than 3%. The monthly payroll for miners in Butte is $1,125,000. There are employed 10,593 men in the mines, as follows: Amalgamated, 6326; United Copper, 1400; Clark, 1100; North Butte, 467; Pittsburg, 300; other companies, 1593. The State Mining Inspector, in his annual report to the Governor for the year ending November 30th, says the mineral production of the Butte district was worth $12,000,000 more than the year previous, and that since the district began producing copper it contributed $600.000,000 worth to the world's supply, or about 40% of the world's product. In the whole of the Butte district there are 26,600 acres, while the principal mines are within a radius of 1 mile square. Of the 26,600 acres of mineral ground the Amalgamated Co. owns 1981 acres, Senator Clark 181 acres, United Copper 167 acres, North Butte 72 acres, Pittsburg & Montana Co. 290 acres, East Butte 18 acres and the Raven Co. 16 acres, the remainder owned by individuals and small companies.

Butte, Dec. 10.

NEVADA.

Esmeralda County.

Ore from the January mine is being treated at the Frank mill at Goldfield. H. T. Bragdon is manager.——Considerable high grade ore has been sacked at the Red Top mine at Goldfield.——High grade ore has been struck between the 100 and the 150-foot levels of the Florence mine at Goldfield. Frank Oliver is manager.——During November 914 tons of ore from the Combination mine at Goldfield were treated in the Combination mill. An electric hoist is being put in at the shaft.

Lincoln County.

(Special Correspondence).—The Quartette M. Co. will sink a working shaft on the Hidden Treasure claim at Searchlight, where $12 ore was opened. The vein has been exposed by trenching for a width of 50 feet on the surface. Superintendent F. J. Harrington expects to get water in this vein, which will be utilized to run ten additional stamps from the old Colorado river mill, now being dismantled.——On the Azusa claim, north of Searchlight, high-grade copper ore has been struck. The gold values are slight.——It is reported that the Santa Fe will build a broad gauge line from Ibex to Searchlight, to compete with the proposed Salt Lake feeder from Nipton.——The tailings dump at the mill of the Southern Nevada M. Co. has been exhausted, and the cyanide work will cease. Crosscutting the lead is in progress on the 430-foot level of the Blossom claim, belonging to the same company.——At El Dorado Canyon the Black Hawk M. Co. is sinking a 2-compartment shaft on the Rand claim. It will be put down to the 500-foot level. On the Honest Miner claim, belonging to the same company, ore has been struck 5 feet in width.——The Venus M. Co. at El Dorado Canyon is sinking a 5x7 shaft on a 5-foot vein, in which free gold is visible. C. E. L. Gresh is manager and E. P. Jeans superintendent.——At the Techaticup at El Dorado Canyon a station is being cut at the 550-foot level. Drifting east and west will follow. At the rate the water has been coming into the shaft of late a pump will soon be a necessity.——The El Dorado Nevada M. Co., E. J. Roberts manager, is sinking on the Silver Legion group at Knob hill. Shipping ore is being taken out at 70 feet depth.

Searchlight, Dec. 11.

(Special Correspondence).—In the Good Hope mine, between the Quartette and the Duplex, in the south crossout on the 300-foot level, 12 feet of milling ore has been exposed. A mill may be put in. Station cutting is in progress at the 500-foot level. When this is completed, sinking will be resumed for the 600.——A new strike at Lewis Springs, 15 miles southwest of Searchlight, on the Blake road, has created considerable excitement.——Work will commence on a 500-foot shaft on the Eddy group, which adjoins the property of the Searchlight-Parallel, and Santa Fe M. Cos. The property has been in litigation for the past two years, but a decision was recently rendered in the lower court in favor of the defendants. The plaintiffs have appealed to the Supreme Court, but in the meantime work will be carried on by the defendants.——The Majestic Goldfrog M. & M. Co. of Denver has acquired the Searchlight-Bonanza claims. Development will be commenced at once.——Retimbering the Santa Fe shaft is going forward. A new Cornish pump has been set up.——Construction of the new gallows frame at the Boulder mine has been delayed by shortage of carpenters. The management hopes to resume sinking by the first of the year.——Operations at the Pompeii mine have been limited to drifting on the 264-foot level, owing to delay in receiving the new pumping plant.——About 30 men are employed at the Excelsior mine, in the New York mountains, 26 miles west of Searchlight, and across the California line. The Excelsior is a copper proposition, carrying also gold and silver values. About $20,000 have been expended during the last four months for equipment and development, and other improvements are planned, including a branch railroad to Leastalk.

Searchlight, Dec. 13.

A 300-foot shaft is to be started in the Oom Paul vein of the Searchlight Copper Gold property at Dupont camp, near Searchlight.——Good ore is said to have been found at the 175-foot level of the New Era mine, near Searchlight.

It is reported that the Josephine M. Co. will build a mill in the Chief district, north of Caliente, to treat ore from the Josephine and Advance mines.——Chas. Culverwell is developing claims at Caliente.——McLain & Dorsey have sold the Bald Eagle mines, on Virgin river, south of Caliente, to Laughlin, Blake & Co. of New York City, who intend to build a mill in the spring.

NEW MEXICO.

Colfax County.

It is reported that electric drills and power plant are to be put in by the Gold & Copper Deep Tunnel M. & M. Co., near Elizabethtown. The tunnel on Mt. Baldy is in 1800 feet. A. T. McIntyre is president and W. P. McIntyre superintendent.

Luna County.

Tres Hermanos camp is at the northwest end of the Tres Hermanos mountains, 25 miles south of Deming, and 7 miles south of Tourmerlin station, on the El Paso & Southwestern Railroad. It is an old lead camp, having been worked twenty years ago. Frank Thurmond and others have resumed work on the old lead claims and have developed valuable deposits of zinc carbonate.

Sierra County.

It is expected that the concentration mill of the Southwestern L. & G. Co., southwest of Engle, will be completed by the first of the year. Electric power is to be used throughout.

OREGON.

Baker County.

At Cornucopia, Manager G. W. Boggs has a large force at work in the tunnels, and is putting up a 20-stamp mill.——In the Greenhorn district most of the properties have closed down for the winter.——The Pyx mine, near Greenhorn, is being worked. The Black Eye vein, in the same district, has been cut at a depth of 250 feet, the crosscut tunnel being 500 feet long.

Grant County.

C. C. Ames, who has the Morning mine, near Granite, under lease, has cut the ledge in the lower tunnel.

Josephine County.

The placer mines near Waldo have started up. The indications are that there will be plenty of water for a long mining season.

The Booth copper mines, at Pickett creek, which were recently bonded by Haviland & Co. of Ohio for $100,000, have been taken over by the new owners. They will develop the property by tunnel and shaft. The wagon road from Merlin, the nearest railway point to the mine, will be rebuilt and improved to allow of heavy hauling at all seasons.

Lake County.

The Pine Creek mining district is south of Lakeview, where Oregon, Nevada and California join. Recent discoveries of gold and copper are expected to cause an influx of prospectors in the spring. The snow is deep in winter, as the elevation is from 5000 to 8000 feet. Claims have been located by J. Reeves, J. Sanger, C. Jeter, W. I. Fleck and D. V. Snowgoose.

Wallowa County.

H. D. Akins of the Tenderfoot mine, 15 miles southeast of Joseph, says there are twelve men sinking a shaft which will open the main vein at a depth of 200 feet. In the spring the management intends to put up a 20-stamp mill. There are about thirty locations in this district which will be worked in the spring.

WASHINGTON.

Snohomish County.

J. Meindal, foreman in charge of the Conservative M. & M. Co., near Index, says that he has suspended underground work for the winter. The tunnel is in 110 feet.

Stevens County.

Molybdenite claims 12 miles east of Bossburg are being worked by V. P. Adams and Frank O'Boyle.

UTAH.

B. H. Tatem, assayer in charge United States Assay office, Helena, Mont., reports that the values of gold, silver, copper and lead won from the mines of Utah during 1904 were the largest in its history:

	Quantity.	Value.
Gold, fine ounces	202,475.703	$4,185,544 22
Silver, fine ounces (coining rate)	12,210,527 20	15,787,348 30
Copper, fine pounds, at $12 823 per hundredweight	44,012,203 00	5,643,684 79
Lead, fine pounds, at $4.309 per hundredweight	116,350,974.00	5,013,563 47
Total		$30,630.140 78

According to counties the gold output for 1904 was:

Counties.	Fine Ozs.	Value.
Beaver, Millard, Piute and Sevier	19,314 747	$399,271 24
Box Elder, Grand and Washington	3,564.325	73,681 13
Juab and Utah	72,404 441	1,496,732 62
Salt Lake	56,472 048	1,167,380 84
Summit	13,601 991	281,178 11
Tooele	36,756 772	759,829 91
Impossible to classify	361.370	7,470 37
Totals	202,475 703	$4,185.544 22

The source is classified:

	Fine Ozs.	Value.
In quartz and dry ores	5,805 945	$120,019 53
In cyanide mill, bullion	53,518.608	1,106,329 06
In lead ores	29,909 253	618,279 10
In copper ores	100,303 582	2,073,458 44
In milling ores	12,938 285	267,458 09
Totals	202,475 703	$4,185,544 22

The amounts and value of the silver in the several counties of the State during the year 1904 were:

	Fine Ozs.	Coining Value.
Beaver, Millard, Piute, Sevier	186,992 52	$241,768 11
Box Elder, Grand, Washington	27,715 77	35,824 52
Juab and Utah	4,022,649.09	5,201,000 84
Salt Lake	1,548,617 03	2,002,252 32
Summit	5,912,936 87	7,645,009 28
Tooele	418,503.13	541,094 88
Impossible to classify	93,112 79	120,388 25
Totals	12,210,527.20	$15,787,348 30

The amount of silver won from copper and lead ores, from cyanide and milling plants and that contained in dry ores and concentrates during the year was:

Classed as	Fine Ozs.	Coining Value.
In quartz and dry ores	153,293.94	$198,198 23
In cyanide mill, bullion	55,280.52	71,473 80
In lead ores	7,904,431.94	10,219,871 60
In copper ores	3,928,328 60	5,079,051 12
In milling ores	169,192.20	218,753 55
Totals	12,210,527.20	$15,787,348 30

Box Elder County.

A cyanide plant is to be put in by the Susie M. Co., working on Dove creek, near Park Valley, to treat talc ores recently opened up. Owen Bailey is manager.

Juab County.

It is expected that the Godiva mill at Eureka will be completed by March 1, 1906.

FOREIGN.

AFRICA.

Transvaal.

Heavier stamps are being used on the Rand; those at the Simmer & Jack are to be 1415 pounds, in place of 1250 pounds, and on the East Rand Proprietary mines and the new Wolhuter mine the mills are to be built with 1350 pound stamps. This is, again, being followed by finer grinding, and a tendency to slime everything, the adoption of filter presses, and other Australian methods, the technical advisers of the General Mining & Finance Corporation taking a prominent part in all experiments tending in the direction of a higher extraction. At several of the mines under the control of the General Mining & Finance Corporation radical alterations in the method of treatment are being tried. It is suggested to dispense with stamps and substitute grinding pans, on the ground of the heavy cost of the former; and with greater application of automatic appliances the cost of treatment would be lower, while the carrying out of fine grinding in different stages would result in a higher extraction.

AUSTRALIA.

New South Wales.

The British Broken Hill has followed the example of the other companies in disposing of its accumulations of tailings, a contract having been concluded for the sale of its surface residues of tailings, and slimes from the concentrating mill, amounting to 375,000 tons. The company has also sold its current output of tailings to the same purchaser for three years. Operations are to be commenced at Broken Hill, where the metal contents of the tailings are valued at £25,000,000. It is not known what process of treatment will be adopted. Satisfactory arrangements have been made with the proprietors of the chief tailing treatments yet tried at Broken Hill, under which the corporation will have the right to test the various systems and adopt the one or more deemed most suitable. Proposals are also under consideration for starting zinc smelting works to treat concentrates instead of sending them to other parts of the world, as is done at present.

CANADA.

BRITISH COLUMBIA.

Boundary District.

J. McPhee has purchased a half interest in the Huron mine, in Franklin camp, from Thomas Donan.——Frank Fritz, the original locator of the Thunder Hill camp, has sold the Agnew property to H. W. Warrington, superintendent of the Kettle Valley Railway.——G. A. McLeod of the McKinley mine has sold an interest in the Yellow Jacket claim, in Franklin camp, to D. Whiteside of Grand Forks.——Development work on the Seattle mine, owned by Robert Clark, has been suspended for the winter.

The ore shipments from Boundary mines for the week

ending December 9, were the greatest made in seven days. Granby mines to Granby smelter, 17,473 tons; Brooklyn, Stemwinder, to Dominion Copper smelter, 1786 tons; Rawhide to Dominion Copper smelter, 480 tons; Sunset to Dominion Copper smelter, 480 tons; Emma to Nelson smelter, 90 tons; Providence to Trail smelter, 30 tons; Skylark to Granby smelter, 20 tons. Total for week, 24,163 tons; total for year to date, 857,907 tons. Boundary smelters treated as follows: Granby smelter, 18,259 tons; British Columbia Copper Co. smelter, 269 tons; Dominion Copper Co. smelter, 2746 tons. Total treatment for week, 23,614 tons; total for year to date, 874,389 tons.

At Long Lake camp the Jewel mine is being developed.——Development work has been discontinued at the Hesperus & Betts on July creek in the Grand Forks division. The tunnel is in over 850 feet. Development will be resumed when diamond drilling has been finished.

Nelson District.

The Ark Group M. & M. Co. is working claims at the head of Sixteen Mile and Clearwater creeks, 4 miles from Ymir. A 350-foot tunnel is said to be in progress to tap the ore shoot at the 200-foot level. Work will be continued all winter and a stamp mill is planned for next spring.

Rossland District.

The tonnage of ore shipped from and crushed at the Rossland mines for the week ending December 9, and for the year to date, was as follows:

Le Roi	1,740	108,886
Le Roi (milled)	....	3,240

A station is being cut at the eleventh level of the Center Star, which is 1530 feet below the collar of the shaft.——The winze of Le Roi is being deepened from the 1550 to the 1750-foot level. Should the territory between the 1550 and the 1750 prove as good as that between the 1350 and the 1550-foot levels the intention is to deepen the five compartment main shaft from the 1350, its present lower terminal, down to the 1750-foot level. The crosscut which is being driven from the 1350-foot level into the ground of the Le Roi Two has progressed 180 feet. J. A. Trevarrow has charge of work in the mine.——The shaft of the Island Empire at Rossland is being deepened by F. S. Griswold.

West Kootenay District.

G. W. Odell of Spokane, Wash., has purchased the interest of W. S. Rugh of Rossland, B. C., in the Wagner mining claims in the Trout Lake district. C. T. Porter, one of the owners, reports that the greatest amount of work done on the group is on the Duncan claim, where 250 feet of tunnel and winze work has been done. This work has opened up a body of silver-lead ore 100 feet long and 12 feet wide. The greatest depth on the claim is 140 feet. Next year a concentrator is to be put in. The Trout Lake district has been going ahead. Adjoining the Wagner is the Abbott group, owned by the C. P. R. Considerable work has been done on it, but it is now idle for the winter.

MEXICO.

The Diario Official recently published the following decree: The metallurgical establishments of the republic which refine silver to the point of obtaining malleable bars of that metal possessing the requisites for coinage and of a fineness of at least .996 will pay, by way of interior stamp tax, 1½% only on the value of the metal thus refined. The refinement of gold and silver in the form mentioned in the foregoing and in the second article, requiring that the gold bars be malleable and .994 fine, in regard to the coinage of gold will entitle metallurgical establishments effecting such refinement to have returned to them, in the form to be fixed by the rules of practice, three-fourths of the value of the stamps due on the metals in question, and which shall have been canceled on the invoices made out in connection with the purchase of the ores or bars by such metallurgical establishments subsequently to January 1, 1906, for reduction and refinement. There will be no claim for the return of stamp duties after the lapse of six months from the date of the cancellation of the stamps. There are hereby abrogated Article 4 of the law of March 25, 1905, in regard to taxes on and franchises to mining, and the decree of June 19, 1905, in regard to the reduction of the stamp tax on metallurgical establishments.

Chihuahua.

The plans for the Chihuahua smelter of the American Smelting & Refining Co. have been approved by Governor Creel, and the erection of the smelter on the site purchased a short time ago will be commenced at an early date. The initial capacity of the smelter will be 750 tons daily. The Compania Fundidora y Afinadora has been organized in Chihuahua to build a custom smelter at Jimenez under the concession granted by Governor Creel early this year. Leopold Iwonsky, manager of the House of Stallforth, is president of the company, and the other officers are J. F. Flynn, J. F. Johnson and Antonio Ortiz. It is stated that the construction of the plant will be started at once. The Jimenez smelter will have an initial capacity of 250 tons.

Jalisco.

The Cuale Mining Syndicate, which was organized a year ago to take over the old Las Bolas silver mine, in the Cuale district, has surrendered the option under which the mine was being worked. The property reverts to the owner, Mrs. F. Orozco of Guadalajara.

It is reported that a concentrating plant is to be constructed at the Agua Blanca mine in the Autlan district. William Oliver is superintendent. The boilers that furnish the power for the pumps and hoist at the Agua Blanca are undergoing repairs, and work in the lower levels has been temporarily suspended.

NEW ZEALAND.

The annual report of the Minister of Mines states that the quantity of gold entered for exportation through the custom for the year 1904 was as follows: Auckland, 223,010 ounces; Marlborough, 473 ounces; Nelson, 5049 ounces; West Coast, 122,310 ounces; Otago and Southland, 169,478 ounces; total, 520,320 ounces, valued at £1,987,501. The winning of gold from quartz reefs is carried on in various parts of the colony, the chief centers of this branch of the mining industry being the Ohinemuri, Thames and Coromandel counties in the North Island, and the Inangahua county in the Middle Island. In the Northern Goldfields, the production of gold is greatest in the Ohinemuri county, in which are the mines of the Waihi G. M. Co. The output from the Waihi G. M. Co.'s mines for 1904 was 259,978 tons of quartz, from which bullion to the value of £673,101 18s 4d was obtained. The several mills are provided with modern plants for the extraction of gold and silver from the ore, there being 330 stamps. Over 1200 persons are employed, and dividends amounting to £297,544 4s were paid during the year. The ore bodies continue to maintain their characteristic sizes at the lowest levels. The Waihi Grand Junction G. M. Co. has made preparations for the output and treatment of quartz, a modern mill comprising a 40-stamp battery with cyanide plant being in course of erection. For treating tailings in the bed of the Ohinemuri river, a plant has been erected near Waihi. For some time operations were necessarily of an experimental character, and have, it is understood, been so satisfactory as to warrant the extension of the present plant, and the proposal to erect one of much larger capacity lower down the river.——Mining at Karangahake is carried on by the New Zealand Crown Mines, Ltd., and the Talisman Con., Ltd., the latter company having taken over the Woodstock mine, at which active operations by the former proprietary ceased last year. Bullion to the value of £137,468 was obtained during the year.——In the Thames county the principal new work has been at the Golden Belt mine, Neavesville, where a battery of forty stamps with cyanide plant has been put up. The Tairua-Broken Hills mine has not maintained the steady output which characterized previous operations.——In the Coromandel county during 1904, work was conducted on a small scale at the Royal Oak of Hauraki mine, at Tokatea. A somewhat serious drawback to the mining industry exists in connection with the drainage of mines near the lower township, work at levels below that at which natural drainage can be effected having been suspended in consequence of owners of adjacent properties failing to agree as the proportionate costs of pumping which each should bear. A proposal has been made to the department relative to prospecting the Tokatea Big Reef, and a subsidy at the rate of pound for pound up to £300 promised for this purpose. At Kuaotunu the Waitaia mine is the principal producer. In the Middle Island quartz mining has been successfully carried on in the West Coast Inspection District. The hydraulic and alluvial mining branch of the gold mining industry is carried on in the several goldfields of the Middle Island, and is well established. There have not been any new developments during the year, but the work gives employment to a considerable section of the mining community. The yield of alluvial gold must gradually decrease unless other areas of gold-bearing country are discovered and opened up. In some known instances payably auriferous ground exists, but so far has not been systematically worked owing to the scarcity of water locally for sluicing purposes, although supplies are feasible by the expenditure of capital in the construction of water races, dams, etc. During the last few years the extension of hydraulic mining methods has been somewhat neglected in consequence of the adaptability of dredgers for working on alluvial flats. Experience has, however, proved that under certain conditions the hydraulic system of mining is preferable to dredging, and in a few cases it has been found necessary to revert to the former method. The number of dredgers at work at the end of the year 1904 was 186, a decrease of about 15 as compared with the preceding year. The experiment of tree planting in Southland on a river flat area which has been dredged appears to have been very successful, and a suggestion has been made that where swamp lands have been turned over by dredgers the cultivation of native flax might be adopted. The royalty obtained by Government in respect to the purchase rights of the cyanide process now amounts to £9356, or practically 93½% of the sum originally paid. The balance will, in the natural course of events, be received during 1903 and thereupon all further royalty charges for the use of the cyanide process in New Zealand will cease.

Commercial Paragraphs.

THE Model Gas Engine Works, Auburn, Ind., now under the management of J. W. White, will be removed to Peru, Ind. The company manufactures gas and gasoline engines and automobiles, and at the present time has large orders booked for shipment to California, Mexico, Cuba and Java.

THE Westinghouse Electric and Manufacturing Co. of Pittsburg, Pa., are equipping mines with electric locomotives, to replace the older forms of haulage. The Newport M. Co. will equip their mines at Ironton, Mich., with surface and underground electric haulage, and have ordered six 4-ton Westinghouse mine locomotives. Electrical apparatus for the equipment of the necessary power station will also be provided by the Westinghouse Co., consisting of a 150 kw., 250 volt generator, direct connected to a Corliss engine of 130 r. p. m., and a three panel switchboard.

Books Received.

In a series of word pictures the reader may see the scenic wonders of this west half of America in "The Western United States," by H. W. Fairbanks. Here this experienced geologist presents the results of years of personal investigation of the geology of this region in a form that is delightfully readable. He has a style of description and of exposition that portrays the subject so that any one can understand it. At the same time the geological and physiographical description is accurate. The "reason why" is told. Mountains, valleys, deserts and coasts are each described and explained in an interesting yet instructive manner. The book is published by D. C. Heath & Co. of Boston, Mass., and will be sent postpaid by the MINING AND SCIENTIFIC PRESS for 75 cents.

Trade Treatises.

"Ideal Power," published by the Chicago Pneumatic Tool Co. of Chicago, Ill., has appeared for November.

Latest Market Reports.

SAN FRANCISCO, December 15, 1905.

METALS.

SILVER.—Per oz., Troy: London, 30⅛d (standard ounce, 925 fine); New York, bar silver, 65¼c, refined (1000 fine); San Francisco, 65¼c; Mexican dollars, 53c, San Francisco; 50c, New York.

COPPER.—New York: Lake and Electrolytic, $18 37½@18.87½; Casting, $18.00@18.50; San Francisco: $18.75; Mill copper plates, $21.00; bars, 21@24c. London: £80 5s 6d spot per ton.

Copper has made another decided advance during the week, each day seeing a small fractional advance. The quotations to-day are the highest since 1882. Small lots have been sold in New York within the week at $19.00. It seems improbable that the price can advance still higher. The present price should and probably will prove a strong stimulus to increased endeavor in production, and in the development and equipment of new deposits of this metal.

LEAD.—New York, $5.85; St. Louis, $5.15; San Francisco, $5.00, carload lots; 5½c 1000 to 4000 lbs.; pipe 7½c, sheet 8, bar 6½c. London: £17 6s 3d ℔ long ton.

SPELTER.—New York, $6.55; St. Louis, $6.20; London, £28 15s ℔ ton; San Francisco, ton lots, 7c; 100-lb lots, 7¾c.

TIN.—New York, pig, $37.75@38.00; San Francisco, ton lots, 37c; 500 lbs., 38c; 200 lbs., 40c; less, 41½c; bar tin, ℔ lb., 42c. London, £164 2s 6d.

Tin is higher than in years. The present price—$37.75@38 00—will prove interesting to the new tin districts of the world as well as a boon to the old deep mines, where increased expenses will now find this substantial advance in price most agreeable.

PLATINUM.—San Francisco, crude, $18.50 ℔ oz.; New York, ingot, $20.50 ℔ Troy oz. Platinum ware, 75@$1.00 ℔ gram.

QUICKSILVER.—New York, $40.00@$40.50, large lots; London, £7 5s 0d; San Francisco, local, $38.00@39.00 ℔ flask of 75 lbs.

BABBITT METAL.—San Francisco, No. 1, 10½c; No. 2, 8c; No. 3, 7½c; extra, 17½c; genuine, 32½c; Eclipse, 35c.

SOLDER.—Half-and-half, 100-lb. lots, 23.50c; San Francisco, Plumbers', 100-lb. lots 19.75c.

NICKEL.—New York, 55@60c ℔ lb.; ton lots, 40@47c.

ZINC.—Metallic, chemically pure, ℔ lb., 50c; dust, ℔ lb., 10c; sulphate, ℔ lb, .04c.

ALUMINUM.—No. 1, 99%, small lots, 37c ℔ lb.; 100 lbs., 35c; 1000 lbs. 34c; ton lots and over, 33c, Pittsburg. No. 2, 90%, small lots, 34c; ton lots and over, 31c, Pittsburg.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, $18.35@18.85; gray forge, $14.60; San Francisco, bar, 3½c ℔ lb., 3¾c in small quantities.

STEEL.—Bessemer billets, Pittsburg, $26.00@$27.00; open hearth billets, $27.00@$28.00; San Francisco, bar, 7c to 13c ℔ lb.

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 7¾c; less than 500 lbs., per lb., 8c; in 25-lb. tin pails, ¼c ℔ lb. above keg price; in 1 and 5-lb. tin cans, 100 lbs. per case, ½c per lb. above keg price. Dry Lead.—In bbls., 1 ton and over, 7½c; do. in kegs, 8c.

LIME.—Santa Cruz, $1.35 country, $1.25 city ℔ bbl.

CEMENT.—Imported, $3.00@4.00 ℔ bbl.; California, carload lots, $1.80 f. o. b. at works; small lots, $2.10 ℔ bbl. in sacks, 4 sacks to bbl., 5c for each sack returned.

LUMBER.—(Retail): Pine, ordinary sizes, $24.00@25.00; extra sizes higher; redwood, $28.00@30.00; lath, 4 feet, $4.50@5.00; pickets, $21.00; shingles, $2.50 for No. 1, and $2.25 for No. 2; shakes, $13.50 for split and $15.00 for sawed; rustic, $28.00@35.00,

NAILS.—This week the basic prices are: Wire, $2.77; Cut, $3.25. Meanwhile the nominal quotations per keg (list prices) are: No. 20d to 60d, Wire, $3.35; Cut, $3.55; 10d to 16d, Wire, $3.45; Cut, $3.35; 8d, Wire, $3.50; Cut, $3.50; 6d and 7d, Wire, $3.60; Cut, $3.60; 4d and 5d, Wire, $3.70; Cut, $3.70; 3d, Wire, $3.85; Cut, $3.85; 2d, Wire, $4.10; Cut, $4.10. Special rates for carload lots.

GENERAL SUPPLIES.

ANTIMONY.—New York, Cookson's, 11½c; Hallett's, 12½c; San Francisco, 1000-lb. lots, 14c; 300@500-lbs. 12c; 100-lb. lots, 13c.

MINING AND SCIENTIFIC PRESS.

Whole No. 2370.—VOLUME XCI. Number 26. SAN FRANCISCO, CAL., SATURDAY, DECEMBER 23, 1905. THREE DOLLARS PER ANNUM. Single Copies, Ten Cents.

Auxiliary Mining Plants.

In any country where mines depend upon water for power—either directly applied or through hydro-electrical installations built for power purposes by large distributing companies, or owned individually by the mining companies—and where the water supply is not sufficiently abundant to be continuous throughout the year, individual mining companies would save much annoyance and expense by the installation of auxiliary steam plants. California mines, in the east central part of the State, have had the usual annual experience of a long hang-up the past fall, and even now a number of the most important mines are still idle owing to shortage of water. Unfortunately this is not the first time this state of affairs has occurred; indeed, it is almost an annual occurrence. The cause for this lies in the fact that the mountain reservoirs are neither large enough nor numerous enough to afford a continuous supply throughout the summer and fall months, during which there is generally little or no rain. The past summer has been unusually dry, and the greater part of the snows melted long before the recent rains began. During the past six weeks, it is true, there has been a series of snowfalls in the mountains, and a little rain in the lower mountains, but the cold weather in the higher altitudes has kept the snow from thawing. These early snows will be a valuable source of water supply next summer, but that does not relieve the present situation, which is unfortunate, as it, in some cases, at least, means increased expense in starting up again, unwatering flooded levels and repairing damages due to caving, flooding and other causes, and a large number of men are temporarily unemployed—a loss of time they can ill afford.

The Old Dominion Mine and Smelter, Globe, Arizona. (See Page 427).

Another View of the Old Dominion Mine and Smelter. (See Page 427).

If it were something out of the ordinary, the matter would, perhaps, be less serious, but it has occurred so frequently that the mining companies appear to look upon the situation as a matter of course. The large electrical companies have become an important power factor in California only within the past five or six years, although electricity has been used for power in California mines in some localities for twelve to fifteen years past. Those mines which formerly were operated by steam and lately installed electric power have, in some instances, kept their steam plants in good repair, and these simply fire up and continue operations as before. Others, which were, previous to the installation of electricity, run by water power direct were practically helpless, as the water is no longer available, the greater portion being required for the generation of electric power at the main power plants. This leaves them in a position where they cannot operate at all, until sufficient water is again available for power at the electric generating stations. Under existing conditions the companies which are thus annually embarrassed by shortage of power would find it economical and satisfactory to put in plants run by steam or by gas engines of some type, that the annual summer hang-up may be a thing of the past. In some situations mines may remain idle for months without sustaining great loss or damage, particularly in the case of dry mines, but on the gold belt of California there are many mines where flooding means a certain and heavy loss, owing to the peculiar geological conditions. In some of these mines are great gouge-like masses, which, so long as they are kept dry, give no greater trouble than that caused by swelling—bad enough in itself, truly—but once allow this sort of material to become wet and it is almost impossible to control it, as it will run and cause the expense of thousands of dollars until a normal condition can be re-established.

In view of these facts, it can easily be understood why an auxiliary steam plant is a good investment for a mine operated by electric power, or by water, in a country where the water supply cannot be depended upon throughout the year. The initial cost may, in some cases, be heavy, but the resulting economy will ultimately, in most cases, prove it to be a very good investment for the mining company making it.

THOMAS W. LAWSON, early in the present week, prophesied an immediate and heavy drop in the price of copper—a drop which would carry everything before it. Up to the present time no very noticeable change has taken place in copper prices. It will be remembered that several months ago Mr. Lawson made a similar prediction, which failed to materialize, and in the present instance, as then, he was at least mistaken or perhaps premature in his announcement. Such bear tactics may have a temporarily depressing effect on the price of copper shares, while the price of the metal remains unchanged. So long as present industrial conditions continue, the demand for copper will be heavy, and, as has already been clearly demonstrated, the output of the copper mines of the world is scarcely able to keep pace with this industrial requirement, therefore, it is unreasonable to expect copper to go much below the present price. A recent reliable report showed that the total visible supply of copper in the world was about 13,690 tons, and this amount was about 2354 tons less than the supply a year ago, while it was from 2000 to nearly 3000 tons less than it had been on the first of October and November, respectively, of the present year. The visible supply of copper has been steadily decreasing lately. Mr. Lawson's pessimistic predictions may have a marked effect on the price of copper shares in the New York and Boston markets, but he does not yet control the industries of the world nor all of the copper mines.

Inclined Shaft or Vertical?

This is a question which the directors of mining companies are not infrequently called upon to decide. The engineer for the company should be able to determine this matter, but at times there seems difficulty in making a choice between the two. Generally speaking, it is good business in an undeveloped mine to sink the shaft on the vein, following it in its various changes of dip. Ordinarily, the vein has at least one good wall, foot or hanging, and this, whichever it may be, is the one to be followed.

In a certain instance a shaft was started on the vein, which was several feet in width and composed of solid quartz with a well defined hanging wall, accompanied by gouge, and the usual characteristics of a strong and continuous vein. About 200 feet from the surface the quartz became mixed somewhat with the greenstone of the footwall, and a few feet deeper the quartz left the gouge and dropped back into the foot wall. The miners, under the direction of a foreman who had, at least, the qualification of being a good miner and timberman, left the gouge and stayed with the quartz until it disappeared entirely, being mixed with and finally replaced by greenstone. A crosscut was run into the foot wall for some distance, when, no vein being found, a crosscut was run into the hanging, which soon encountered a beautifully banded vein 5 feet wide, with the gouge, as above, on the hanging wall side. This was a case of mistaken judgment, and is not an argument against sinking on the vein.

By this practice, knowledge is gained of the size, value and dip of the vein—conditions which may have an important bearing on the location of the main working shaft, to be sunk later. In the prospecting shaft, with its irregularities of dip, and changing width and value of the vein, the distribution of payable ore shoots is demonstrated, and the main shaft should be sunk with reference to the practical extraction of this known ore, and its situation also chosen with some regard to the location of reduction works.

As between the vertical and inclined shafts, the dip of the vein would naturally be an important factor in determining this question. In many cases where the vein has a dip exceeding 50°, the vertical shaft is preferred by some, and at much steeper angles, a vertical shaft would without doubt have advantages over an incline. The vertical shaft necessitates crosscuts at every level, except that at which the shaft intersects the vein. This means increased expense in driving crosscuts, and increased expense in transportation of ore from the chutes in the vein to the ore pockets below the levels at the shaft stations. Where the vein is comparatively small, this cost of transportation would manifestly be less in the aggregate than where the vein is large, as the tonnage handled in the latter would exceed that of the former in proportion to the relative size of the vein or deposit.

The inclined shaft possesses the advantage of less crosscutting, and if the shaft can be sunk on the vein or very near it (and kept at uniform angle), the transportation cost on the levels is reduced to a minimum, but the inclined shaft must be longer to reach a given depth vertically than the vertical shaft, and this, in a country where the rocks are hard and shaft sinking expensive, may in itself be the deciding factor.

As an example, take a vertical shaft 3000 feet deep as compared with a 60° incline to reach the same vertical depth (supposing the collars of both to be at approximately the same level), the incline will be 462 feet longer than the vertical shaft, which, at $60 per foot, gives an increased cost of over $27,000 for the inclined shaft. In some instances the rock may be so firm as to make full sets unnecessary in the incline, when a saving of $10 per set might be made by omitting hanging wall timbers, but the difference between vertical and incline would still be more than $20,000 in favor of the vertical shaft. In the vertical shaft the average length of crosscuts would be about 350 feet.

If twenty-eight levels were opened in the 3000 feet of depth, this would require the driving of about 10,000 feet of crosscuts, which, at as low a cost as $5 per foot, would make a charge against the vertical shaft development of $50,000—a very material item, to which must be added the cost of underground transportation through these crosscuts, which would amount to from $10,000 to $20,000, or possibly more, depending on the amount of ore which must be trammed through them to the shaft. Here is a matter of $60,000 to $70,000 to be considered in the vertical shaft, as against about one-half this amount on account of sinking the incline. In case of the incline, if it were sunk in the foot wall near the vein, a short crosscut would be necessary at each station—say 40 feet, but as a large part of this would be covered by the necessary station and ore pocket at each level, it need not be considered, unless the vein departs considerably from the line of the inclined shaft.

The principal advantage in a vertical shaft lies in the facility with which large tonnages can be speedily handled, and in less wear and tear on hoisting cables, skips and equipment generally.

When the angle of dip of a vein exceeds 65°, it would probably be the better plan to sink a vertical in preference to an inclined shaft.

Steel by Electric Process.

The smelting of iron ores by electrical methods is beginning to attract considerable attention, particularly in those countries where there are no iron blast furnaces, and where it is thought the new process may afford the long-desired opportunity to make available the iron ores of those regions. Principally is this the case in the western United States. Canada is also taking an active interest in the progress of this new metallurgical proposition. In connection with this subject the report of Dr. David T. Day, of the United States Geological Survey, which will be found elsewhere herein, is of interest. This report gives in absolute terms the results achieved in recent experiments made with magnetic iron sands in the electrical furnace at Portland, Or. While the results must be gratifying to those connected with these experimental operations, it still remains to be seen whether or not they will be of immediate commercial value. The making of steel direct from iron ore, by this process, is still in its infancy, and while encouraging results have been obtained in an experimental way both in the United States and abroad, it is still too early to look upon these experiments as anything else than an illustration of the possibilities of the future in this direction.

As an outcome of the success attending these efforts, numerous electrical smelting companies—"which promise to revolutionize the iron industry"—have recently came into existence, and capital is being solicited to engage in electric smelting with every assurance by the promoters of success. A few months ago the radium promoter had the field, but that fad, failing in the production of promised immediate results, has dwindled and almost disappeared, and the commercial world goes on its way undisturbed by the promised vast production of radium which never materialized.

With electric smelting, however, it is somewhat different. A very high grade of steel has been successfully produced by this method, and when the process and its limitations are better understood, its value commercially can be more fully estimated.

At present, at any rate, it can only be hoped that the manufacture of steel in the electric furnace may become a commercial as well as a technical success, where transportation of steel, made by the usual methods, is such an important factor that the electrically produced steel will become a successful competitor.

IN order to escape paying taxes in two States, the Portland G. M. Co. of Victor, Colo., in the Cripple Creek district, which is incorporated under the laws of the State of Iowa, will surrender its charter in that State and reorganize under the laws of Wyoming, which are more liberal in this respect. The company pays taxes in Teller county, Colo., on the improvements on the property, and they naturally object to paying an additional tax on the capital stock in the State of Iowa, which claims $400,000 as its due.

A BILL to create a Department of Mines and Mining has again been introduced in Congress, and considerable influential effort will be directed toward securing the passage of the bill. What its fate may be remains to be seen.

Value of Bore-Hole Tests, in Dredging Ground.

Prior to installation of a dredging plant on gold-bearing gravel it is desirable, and even necessary, to know the amount of gold which may be contained in a stated amount of the gravel. The unit of measurement is usually the cubic yard, following the old practice of the hydraulic miners. This is in contradistinction to the "car" of the drift miner and the "ton" of the quartz miner. There are two methods by means of which the dredge operator may form an approximation of the value of the ground he wishes to investigate with a view to possible dredging. These are sinking shafts to bedrock and boring holes with a drilling machine, and testing the materials thus made accessible. In many situations the latter is the only feasible method without going to great expense in sinking the shaft, particularly in loose and wet ground. In such ground a shaft can often only be sunk either by freezing the ground or driving sheet piling, prior to sinking operations, or, at least, driving sheet piling some distance in advance of sinking—an operation similar to what the miner knows as forepoling.

In view of these facts, the drill-hole method of sampling is generally employed, and, without doubt, this practice affords an approximate idea of the gold contents of the ground, provided the essential factors for safety be given the necessary consideration. In driving a bore hole through dry gravel of fairly even character, a very close estimate of the gold values may be obtained from results, but in wet ground such is not always the case, and where the gravel is mixed with numerous cobbles and boulders, as well as layers of sand and the entire ground is saturated with water, the results are often far from reliable. Under such conditions the driller is almost certain to get from 20% to 100% more material than the size of the bore hole calls for, owing to the fact that where the ground is loose and inclined to run it will almost invariably force itself upward into the casing.

The natural result is that from a hole 30 feet deep and 6 inches in diameter, which should produce about 5.88 cubic feet of material, there may be pumped out 7 to 10 cubic feet, or even more.

If the necessary deductions be not made the result must be a large overestimate of the value of the gravel sampled, and what may be a losing proposition might be mistaken for a most promising one until the true condition of the ground is ascertained by the results of dredging—an expensive way to get at the facts.

In addition to this excess of gravel obtained from a bore hole, the volume of boulders present must be considered and the necessary factor for safe calculation allowed.

After all, perhaps, the most important factor is the personal equation, which varies with different individuals. Moreover, it is apparent, the greater the number of holes sunk in a given area, the nearer may we expect to arrive at approximately correct results.

IN the development of mines a great deal of work is often done without regard to geological conditions, to system or to anything else in particular—haphazard tunnels, crosscuts, shafts and other excavations. Where this erratic "method" of mine development is pursued, as a usual thing there is little development on the vein, if there is a vein. In this way large amounts of money are expended and practically wasted, for, while it may be worth something to know where there is no ore, it is generally the wiser plan to develop the ore that actually exists. In one instance, a mine having a large surface outcrop has been opened by tunnel driven across the formation in the foot wall. In this crosscut tunnel are several drifts, with crosscuts extending from them, none of which are on ore, and with no sign of ore. At another place a tunnel has been driven through hard rock more than 1000 feet and then stopped short of the vein which it was started to cut and explore. The machinery at the mouth of the tunnel has been removed, and unless the tunnel is driven to completion, this work also is wasted, costing many thousands of dollars. At other points on this property are numerous cuts, shallow shafts and drifts of greater or less length. There is ore of good grade at many places, but there has been neither system nor sense in the manner that work has been done. That the mine is idle is not strange. In the development of a new property it is always good mining to "stay with the vein" and to do deadwork crosscutting and exploring the unknown region on either side of the vein later, when the vein system is better understood.

IN the Black Hills of South Dakota, famed for its forests of timber, there are thousands of acres of pine, spruce and fir being destroyed by the ravages of an insect or worm which bores into the bark, and sap of the trees, which within two years from the time of attack causes the foliage of the tree to turn from the evergreen to the well-known russet red of the dead conifer. Within another two years, if the tree is not cut down and utilized, its value for timber or fuel is practically at an end, as the wood becomes rotten and useless for any purpose. Unless something can be done to stop the inroads of this destructive parasite, the entire timber growth of the hills may be destroyed. There were found by the pioneers in the Black Hills, in the early days of its settlement, large tracts of dead timber, which it was generally supposed had been killed by fire, but the fact that thousands of the trees in these so-called "deadenings" stood stripped of bark—gray and phantom-like—unblackened by fires, indicates that in all probability this is not the first time that these forests have been visited by the destructive insect that is to-day making such serious havoc there. The Government forestry experts have here a problem well worthy their attention, for unless some way be found to stop this wholesale destruction of valuable timber, the Black Hills are likely to become entirely denuded of its magnificent forests within the next decade.

THERE is a growing tendency to employ continuous-hoisting machinery in underground ore handling. Conveying belts and bucket elevators of various types are in successful use in all parts of the mining world for handling ores, coal, etc., on the surface, but recently there have been a number of installations for underground use which are in successful operation. At the New Gooch mine, on the Rand, S. A., a belt conveyor delivers ore to the bin from which the skips are loaded at the foot of the main shaft; small buckets running on light, suspended cables are employed to handle ore in some of the stopes on the Rand; in Missouri, a bucket conveyor is in successful operation hoisting ore from a zinc mine through an incline shaft, and still other instances may be cited. There is such an evident disposition to try to find some less expensive method of hoisting ore from mines than that usually employed that these efforts are not unlikely to meet with some success. Mechanical appliances of the character above referred to will undoubtedly operate as satisfactorily in a mine shaft as they will on the surface, when the conditions are otherwise equal, but the deterioration of such a plant underground will be likely to limit the application of this class of ore hoisting machinery to comparatively shallow depths.

THE announcement that this or the other machine has been thrown out at a certain mine is not proof positive of its unfitness for the work at that place, but often, rather, indicates the peculiar personal prejudice of the superintendent or other person in charge. There are a number of types of mills, concentrators, sizers, etc., that are recognized throughout the mining world as superior, and these various machines are doing good work in many places. Notwithstanding this, machines of these various kinds may occasionally be observed lying unused and rusting on the dump and condemned as useless, while thousands of other machines of the same kind are in daily and successful operation elsewhere. It is more often the case that under these circumstances the condemnation should be placed rather on the user than on the machine.

SILVER continues to be quoted at a price which must be satisfactory to miners. It has been sold during the past week at about 65¾ cents per ounce in New York, and at 30¼ pence in London. The price is due entirely to an unusual demand for the metal, and not to speculation.

Butte's Good Fortune.

Although the Butte district of Montana is accustomed to rich strikes and unusual things, generally, in the great mines which underlie that city, the recent strike of a large and rich ore body, reported to have been made in the Anaconda mine at the 2200 level, is creating much enthusiasm among mine owners there, for the uncovering of a 50-foot body of 15% ore at a depth of 2200 feet—a depth at which the process of secondary enrichment was supposed to have had little effect on the normally low-grade ores of that section—is very gratifying, as it indicates the future possibilities for the other mines of that already noted district, in great depth. At one time it was thought that little or no rich ore would be found below 1000 feet. When very rich ore—rich in both copper and silver—was found on the 1500 level of the Anaconda, a hope was created that other rich accumulations would be found at lower levels. Occasional strikes have since been reported at greater depth, but this recently found mass, which is stated to occur at the junction of two veins, is said to surpass previous strikes both in magnitude and in average richness. The copper output of the Butte district has steadily grown year after year until it now is the largest of any single district in the world, the present output exceeding 300,000,000 pounds annually.

A CREDITABLE engineering feat has recently been accomplished in one of the shafts of the Federal Mining Co. at Mace, Idaho. The shaft had been slowly shifting for a long time, owing to the character of the ground in which it was sunk, but finally it got so badly out of line that repairs became necessary. This was accomplished without interfering with the daily work of mining and hoisting through the shaft. The method employed is familiar to many miners on the Mother Lode of California—that of cutting out around the original shaft and surrounding the old sets with new ones of larger dimensions placed entirely outside of the old sets. These new sets were firmly blocked and wedged between the old shaft and the shaft walls, and the shaft brought back into alignment. In some of the California mines the ground has been found so bad that the double-set method here referred to has been found of great value and utility in keeping the shifting timbers lined up—in fact, it is the only way in which this can be done while mining operations continue and the shaft is in daily and almost constant use. The workmen are entirely outside the main shaft sets and perform their work in safety. The swelling or shifting ground is cut away in small sections and the main sets readjusted by relieving or driving wedges from point to point, as may be required.

A COLORADO district court recently issued an injunction restraining the Mine Managers' Association from compelling applicants for work to produce a card signed by officials of the Association before they could secure employment. This has the appearance of being a purely perfunctory process, as there is no law compelling the mine operators to employ all, or any, of those who make application for work, whether they have the cards of the Association or not. The card system has been in operation in Leadville ever since the serious labor troubles in Cripple Creek district, early in 1904. It is not probable that this order of the court will have a material effect in the selection of the character of men given employment in Leadville mines, as the mine operators will not cease to exercise discrimination and judgment in the employment of first-class workmen, whose past records are not such as to make their presence in the mines undesirable.

ONE of the latest evidences of the energy and industrial progressiveness in South Africa is the establishment of an iron and steel mill by Americans at Zuurfontein, in the Transvaal. It is the intention of these pioneers in the iron industry in that country to make much of the structural steel and iron and other things used in the industries in South Africa. What the outcome of this venture may be remains to be seen. Naturally the transportation problem will have an important influence as between the product of this new local enterprise and those in America or Europe.

CONCENTRATES.

THE next meeting of the American Institute of Mining Engineers will be held February 21, 1906, at South Bethlehem, Pa.

THERE are large deposits of rock salt known in San Bernardino county, Cal., in a desert dry lake about 35 miles southwest of Danby station.

FOR the purpose of avoiding future possible legal complications it is the part of wisdom to place a mining bond or lease on record with the county recorder in the county where the property is situated.

ANY work which may be properly charged to annual assessment work on an unpatented mining claim may be considered as a part of the $500 worth of work or improvements necessary before making application for patent.

A ZINC mine at Carthage, Mo., has in successful operation a continuous bucket elevator, hoisting ore from an inclined shaft, from a depth of nearly 200 feet, vertically, or on the incline—45°—a total distance of 300 feet between the centers of the drums.

THE voids occurring in concrete may be dimnished by employing broken stone of mixed sizes, the smaller pieces filling to some extent the open spaces between the larger rocks. If this be carried too far, however, it will have the effect of weakening the concrete.

THERE are still large areas in the Leadville, Colo., mining district about which little is known. Recently some of this territory, where the ore bodies lie deep, has been prospected with diamond drill with satisfactory results. Shafts sunk on or near the drill holes have proven the records made by the drills to be reliable.

WHERE the ground in a drift swells badly, it is not good practice to put sills beneath the posts, for the sills will either be broken or bent, and the set thrown out of line, or the posts will be thrust into the drift over the shoulder cut in the sill. Swelling ground can only be controlled by cutting it away as fast as it encroaches upon the drift.

THE coal mined by dredgers from rivers in Pennsylvania is the fine material carried by water from the coal washing plants into the rivers where it settles to the bottom or is deposited on the low lands along the banks by high waters, in the same way that tailings from metal mines are deposited in and along streams in the rivers of the western States.

THE principal copper ores, which result from oxidation of the normal iron-copper sulphide (chalcopyrite) in the Butte district, are malachite and azurite (carbonates); cuprite and melaconite (oxides); bornite and chalcocite (sulphides); chalcostilbite and some other rare and complex antimonial and arsenical sulphides of copper. The latter ores are usually rich in silver also.

A LARGE blast furnace requires a great deal of water, though the amount varies considerably with changing conditions and at different places. Peters says a water-jacketed blast furnace having 36 square feet hearth area requires 7000 gallons per hour while blowing in and out, and about 2200 gallons per hour when in normal running condition. A furnace then having 60 square feet hearth area would require about 3600 gallons per hour, for jackets alone.

PETROLEUM OIL is usually found most productive in sandstones and shales, particularly where the ore-bearing strata are open and porous. Dense, hard rocks do not afford suitable conditions for the reception of large amounts of oil. As the rock strata are flexed and more open at the crest of the anticlines, the anticline is usually expected to produce more oil than strata which lie in an even plane, either flat or tilted, while the rocks in the synclinal trough are compressed and dense, and little oil is usually found in them.

AMBLYGONITE is a fluo-phosphate of aluminum and lithium. It is a brittle mineral, a little heavier than quartz, with a greasy to pearly luster. In color it is white to pale greenish-blue, yellowish or grayish or brownish white, with a white streak. It is subtranslucent to transparent. It occurs in compact masses, but is usually columnar in structure, with cleavage. It fuses easily with intumescence. This is one of the more uncommon minerals recently found in the pegmatite dikes of southern California, associated with other lithium minerals.

REPLYING to the question from Colombia, S. A., it appears, without question, that the best plan is hand labor. If scarce, he will have to endure the delay. The work is too small for a steam shovel—too many roots for any of the mechanical ditchers, and the suggested hydraulic method is wholly impracticable, especially in view of the steepness of the slopes. Aside from this, he would lose all benefit of the lower bank that would be secured by dry excavation. It is better practice to have the entire depth of ditch in excavation, but the downhill bank is a really valuable safeguard, and its retention is worth while.

THE removal of water from extensive mine workings which have been flooded does not always result in the drainage of other workings in the vicinity, but which are not immediately connected. This is sometimes due to the fact that any existing fissures, cracks or channels, through which the water might naturally be expected to pass, become "silted up" with fine sediment impervious to the passage of water, consequently no drainage results.

THE best way to take samples of gravel to ascertain their gold content, in a running stream, is by building a wing dam, where possible, and then remove the water impounded by the dam by means of a pump. Where the fall is sufficiently heavy, the gravel may be uncovered by the deflection of the water resulting from the construction of the dam. Samples may also be taken by sinking holes with a portable well-boring machine, the gravel being brought to the surface by the sand pump employed for this purpose.

IN the Golden Queen mine at Hedges in San Diego county, Cal., gold is known to occur in a silicified hornblende, schist, in epidote, hornblende without free quartz that may be seen; in an aggregation of scales of biotite, in pegmatite dikes that cut the country; and in a very siliceous rock containing much epidote and garnets. Gold is known to occur in the interior of quartz crystals, at Algerine, in Tuolumne county, Cal., in galena, zinc blende, copper sulphide and carbonate, and in mispickel in many places.

WHERE a sinking pump is in use in a shaft the handling of the pump can be greatly facilitated by putting a slip joint on both the water column and the steam line which connects with the pump. These slip joints are made of various lengths, but in pumps of the smaller sizes, a 20-foot telescoping section on each pipe line will be found a great convenience. The pump may by its use be lowered about four sets without uncoupling, which will save much time. A full length of pipe may then be put in above the slip joint and the same operation repeated.

WHEN sinking a large working shaft, employing temporarily a small hoisting plant, it is good practice to locate this temporary hoist opposite the end of the shaft in order that the foundations for setting the larger permanent plant may be prepared and the plant installed without interfering materially with the smaller hoist. When the large plant is about completed and ready to place the hoisting cables in position, the temporary head frame may be removed. By this procedure there need necessarily be a loss of only a day or two in changing from the small to the permanent hoisting plant.

WHEN ground is very bad it may usually be held in place by means of concrete placed in the form of an arch or oval, as in the Simplon tunnel. The practice of employing masonry and concrete in German mines is an old one, and thus far appears to have been satisfactory. Whether concrete would hold the "swelling ground" often encountered in the Mother Lode of California is not known, as it has never been tried there. Thus far only heavy timber sets have been used, with open spaced lagging, between which the soft swelling mass may press and be cut away so as to relieve the main members of the set.

IF the ore is to be crushed to only 40 mesh it is probable that the crushing can be done more cheaply with stamps than in a tube mill. The latter is used in some districts where it is necessary to reduce the ore to a fineness which will permit its passing a 150 to 200 mesh screen—that is, 22,500 to 40,000 meshes per square inch. A great deal depends upon the character of the ore, what the cost of fine crushing will be. Some of the flinty ores of New Zealand, breaking with a long, splintery fracture, cost more to reduce than granular quartz ore. The Homestake ore, which slimes so readily, contains comparatively little quartz, being mostly hornblende schist.

IT is improbable that all coal originated in identically the same manner, though there was, without doubt, much similarity in the formation of coal beds everywhere. In some instances the coal has been, without doubt, formed, in part, at least, from trees, as thin sections of some coal show the fibers of the original wood. In other instances the coal apparently originated from beds of peat or similar growth. Those who have been in some tropical jungles where the entire soil in the forest consists of the decayed trunks of trees, their branches and leaves—the accumulation of centuries of luxuriant vegetation—can understand most readily the possibility of a bed of coal being formed from this growth.

THE relative merit of inside and outside amalgamation in the gold mill must depend largely upon the character and grade of the ore. Where the efforts are constantly directed toward high stamp capacity, it often follows that satisfactory amalgamation cannot be accomplished inside the battery, unless the gold is peculiarly free milling, and not always then. An ore in which the gold does not amalgamate readily should be treated in such a manner as to insure an opportunity for longer contact of the gold with the quicksilver, which may be accomplished by raising the height of discharge, or employing a finer screen. Sometimes the latter is objectionable, as it is responsible for the creation of a larger amount of slimes which may be objectionable. Most mill men prefer to save gold inside the battery if possible, and as often and as soon thereafter on the outside plates as possible.

A RESERVOIR may be built on level or slightly sloping land as well as on a hill top, or where there is a valley which may be converted into a reservoir by constructing a dam across it. In the dry mining regions it is often desirable to construct a reservoir, and this may be done by leveling a piece of land of the desired area of the reservoir and building around it a square or circular wall of concrete to the desired height. The circular form is advisable, as it requires about one-seventh less material than the square wall of equal cross section. When the wall is completed, the bottom must either be laid with concrete or puddled with clay and the inside of the concrete wall should be finished with a coating of neat cement—what is known as "sidewalk finish." The reservoir may be built partly or wholly below the level of the ground, if desired; but it is usually less expensive to build the upper portion in molds above ground.

WHERE three unpatented mining claims lie side by side, and veins outcrop on each claim, and a main working shaft is sunk on the middle claim with crosscuts started in either direction toward the claims lying on each side of the center claim, work may be done in the main shaft on the center claim for the benefit of each of the three claims. An announcement to this effect should be plainly posted at the shaft on the central claim, in which it is clearly stated that the assessment work for each of the three claims was done in the shaft and a copy of this notice placed on record. It would also be well to post a notice at discovery on each of the side claims, stating that assessment work for each of these claims has been done in the main shaft on the central claim. The law provides that work may be done on one of a group of claims for the benefit of each of the claims of the group, and this is clearly a case within the meaning and intent of the law.

ALTHOUGH there are large intrusions of serpentine and other peridot (olivine) bearing rocks in California, which resemble somewhat the diamond-bearing peridotites of South Africa, none of the diamonds thus far discovered in California come apparently from the region where rocks of this description abound. Serpentine rocks are abundant in the Coast Range of California, but no diamonds have been reported found in that portion of the State. Serpentine is also abundant in the lower tier of foothills of the Sierra Nevada, bordering the great interior valley of the State; but the diamonds found have, without exception, been secured in the sluices of mines working on the ancient rivers which have their sources in the Sierra region, and far east of most, if not all, of the known important serpentine areas. In some of these old channels where diamonds have been found, a micaceous sandstone, white and slightly flexible (itacolumite), has been found; but whether this rock has any connection with the diamonds discovered is not known.

WHERE a company owns a group of mines they may take up adjoining ground as mining claims, provided the necessary discovery can be made on each claim. Then, if they perform work on the previously consolidated claims which is manifestly for the benefit of all the claims of the group, both old and new, $100 worth of work may be credited to each of the new claims, provided these join the claims of the old group. In such cases the several claims of a group must lie in a compact body—they cannot be scattered about. They may also cut timber on the claims for use in any one of them. A superintendent of a mine may locate mining claims in the vicinity and he may permit the company to cut timber growing on his claims, and allow them to use the same in the company's mine. This is on the theory that the company may itself cut timber on unoccupied mineral lands, and after location, if the locator sees fit to allow others to use his timber, it becomes a personal matter, in which the Government has no interest.

WHEN it is desired to sink a shaft deeper than the lowest working level of a mine, one compartment of the shaft can be securely bulkheaded a few sets above the lowest level and a small auxiliary hoist, operated by compressed air or electricity, placed over this compartment beneath the bulkhead, and sinking continued. The remaining compartments of the shaft should be bulkheaded at the lowest level, or a set or two beneath the loading chutes, to protect workmen below from danger from falling rocks. This method of deepening a shaft in a working mine has been successfully employed at a large number of deep mines, and is the only way that a shaft may be deepened with safety while mining operations continue above. At some mines, if the rock broken in shaft sinking is waste, arrangements are made to hoist this to some point above the lowest level where it is dumped into a bin and from there loaded into cars which deliver it to a level where the rock can be utilized in filling stopes. The economy of this is evident, as it saves the cost of a long hoist and supplies the necessary filling for worked-out ground.

Globe, Arizona.*

TO THE EDITOR:—Globe is one of the oldest mining camps in Arizona, having had a checkered history of 25 or 30 years, and perhaps more. It started first as a silver district, in the now almost forgotten days, when the Apaches owned the region, and when it was very unhealthy for the white man who could be caught afield by them. But in spite of this and other drawbacks almost as serious, it has flourished and grown, until now it is one of the best business points in the Southwest, with a railroad of its own, a prosperous and steadily producing copper mining industry, and an environment in the way of numerous undeveloped and partially developed prospects that are just beginning to be appreciated by its own citizens and those of other parts of the country that are looking for promising deposits of the red metal. Unlike Jerome, where there is little more than one big mine, or Bisbee, where the mineral field, though immensely rich, is concentrated within a small area, there is copper to the north, west and southwest of Globe, for 20 miles or more in each direction, as well as in the great mineral zone upon which the Old Dominion Co. is conducting its extensive and highly profitable operations.

The camp is situated near the head of Pinal creek, which flows northward to the Salt river. When one writes of creeks and rivers in Arizona, one should not be taken too literally or seriously. These features of the landscape possess, invariably, channels and banks, but not always visible water, though there is abundance of the element a few feet below the surface of the sand and gravel in their beds, and Globe has never suffered for lack of it, and never will. The region is hilly but not mountainous, and the geology is a complex of eruptives to which each visiting expert gives such new names as pleases his exuberant fancy, and serves to keep the plain people of the district, who are busily engaged in taking out ore, pleasantly interested and amused.

The following geological description of the ore occurrence in Globe district is from Professional Paper No. 12, "Geology of the Globe Copper District of Arizona," by F. L Ransome:"

The ore bodies of the Globe quadrangle exhibit various forms, and, as is usual in such cases, these are not sharply distinguishable from one another. For purposes of description, however, they may be classed as (1) lodes, (2) masses in limestone, and (3) irregular mineralizations of shattered or permeable rocks.

The lodes, for the most part simple fissure veins, are mineralized postdiabase fault fissures. Of the hundreds of dislocations dissecting the region, only a very small portion contain ore, and these are often structurally unimportant as faults. The cause of the mineralization of certain fissures and its absence from others is unknown. It has been impossible to discover any particular distinction, other than the presence of ore, possessed in common by the mineralized faults and not also found in some of the barren fissures of the region, although the postdacite faults, as far as known, are unmineralized. The greater number of the lodes have approximately northeast-southwest strikes and dips ranging from 40° to 90°.

As examples of lode deposits may be cited the Summit, Cole & Goodwin, and Bobtail lodes, carrying sulphide ores in Pinal schist, the Keystone vein of chrysocolla in Schultze granite, the Big Johnnie vein carrying cuprite, chrysocolla and malachite in quartzite, the Josh Billings, containing oxidized ore in diabase, the veins of oxidized ore in the quartzite of Copper Hill, the oxidized North vein in diabase in the Old Dominion mine, the pyrite lodes in diabase in the lower levels of the same mine, the vein of the original Old Dominion mine in quartzite, and many others, particularly throughout the Globe hills. Some of these lodes, such as the original Old Dominion, the Keystone and the Summit, are nearly typical simple fissure veins. The ore fills a formerly nearly empty fissure with little or no replacement of the original walls. Others, like the Bobtail and Big Johnnie, are mineralized fault breccias. The ore has filled the interstices between the fragments of the breccia, and has frequently, to some extent, metasomatically replaced the latter, thus forming a link between the lodes and the other two classes of ore deposits recognized in this quadrangle.

Still other lodes, such as the pyritic deposits in the Old Dominion and Grey mines, might be classed as stringer lodes—that is, they consist of several irregular anastomosing fissures filled with ore. Where, as in these cases, the country rock is diabase, the mineralization is not confined with the fissures, but has penetrated into the diabase by the process of metasomatic replacement. Such ore possesses no regular vein walls, but grades gradually into altered diabase containing disseminated pyrite. Such a process, while it does not extend to a sufficient lateral distance to destroy the general lode-like form of the deposit, nevertheless tends to connect fissure veins through intermediate forms with the deposits belonging to the other classes. The pyritic lode of the Continental mine, which is in a granite-porphyry facies of the Schultze granite, is also a stringer lode and is accompanied by considerable metasomatic mineralization of the neighboring country rock.

When, as is the case in the I X L, Big Johnnie, Buffalo and Copper Hill mines, lodes pass upward from diabase into overlying quartzite, the latter rock usually shows the greater mineralization. The only known exception to this is the Josh Billings vein, in which the ore occurs principally in the diabase.

Although the lodes often contain excellent ore, it has not yet been found in such abundance as in the large masses of limestone, which have supplied most of the copper from the district for the last twenty years.

All of the important ore bodies thus far discovered in limestone, with the exception of one formerly worked in the Buffalo mine, lie on the southeast side of the Old Dominion fault, and have been worked through the Old Dominion and Hoosier mines. In the former property there is exposed in the hanging wall of the master fissure—the Old Dominion fault—a thickness of from 350 to 550 feet of Globe limestone resting upon the quartzites of the Apache group. The ore bodies occur rather irregularly throughout this limestone section from the top to bottom. In general they are rudely lenticular in shape and lie roughly parallel with the nearly horizontal bedding of the limestone. Some of them are directly connected with the Old Dominion fault, the ore forming the hanging wall and extending irregularly for 20 or 30 feet out into the limestone. Others, although never far from the Old Dominion fault, are completely inclosed within this rock, which, however, always shows more or less fissuring, such as may have given access to the ore-bearing solutions. Some of these ore masses must have been of large size, one in the Old Dominion mine having been about 200 feet long, 100 feet wide, and 60 feet thick. This, however, was not wholly within the limestone, but was partly in quartzite, and really falls also into the third general class of the ore deposits of the district. Other masses of ore not coming strictly within the definition occur in the Old Dominion mine at the contact of limestone with overlying dacite. The ore, however, occupies space formerly filled with limestone and not with dacite, and the form of such deposit is similar to that occurring wholly in limestone.

The ore of these masses in the Globe limestone is always oxidized and often accompanied by large quantities of hematite or limestone. It sometimes rests snugly against the limestone, and is sometimes separated from the latter by a shell of limonite. The limestone, as a rule, shows very little alteration at a distance of a few inches from the ore or from the iron oxides.

Ore occurring in the form of irregular mineralization of shattered or permeable rocks has contributed largely to the total output of the Globe quadrangle. Here belong the masses occurring in brecciated quartzite, always associated with one or more fault fissures, but not confined within their walls. Such bodies have supplied much of the ore of the Old Dominion mine, where a mass of the quartzite lying between the Old Dominion and Interloper faults has been extensively mineralized. Similar conditions exist in the Grey and Buffalo mines, and to some extent in the Buckeye mine. Such ore masses are usually very irregular in form, and often have no sharp boundaries, as workable ore changes gradually into less broken country rock only slightly stained with malachite or chrysocolla. The ore is usually wholly oxidized, and may consist of chrysocolla, cuprite, malachite, specularite, and native copper in varying proportions. Some chalcocite, however, occurs as residual unoxidized kernels in the ore of the Buffalo mine. The microscope shows that the shattering of the brittle quartzite is often exceedingly minute, so that it is not always easy to determine whether there has been any actual metasomatic replacement of the quartzite by ore. As a rule, however, the fact of such replacement can be ascertained, although the bulk of the ore has undoubtedly filled mechanically formed spaces.

The conspicuously stained but not hitherto productive schist breccias so noticeable along the road from Webster gulch as it descends into Pinto creek, and the green tinted granitic breccias of Liveoak gulch are similar in general character to the more richly mineralized deposits in quartzite just described.

In this class also come the ore bodies of the Black Warrior (Montgomery and Dadeville claims), Geneva and Black Copper mines. In the first two the ore, which is chrysocolla, occurs as a metasomatic replacement of dacite tuff lying between schists below and massive dacite above. All gradations may be traced from the solid chrysocolla resulting from practically complete replacement to tuff showing mere traces of mineralization or none at all. In the Black Warrior and Geneva the ore bodies are flat, blanket-like masses, passing gradually into tuff on their peripheries. They rest sometimes directly upon the schists, sometimes are separated from the latter by a layer of tuff. They are always associated with fault fissures, which are in part later than the ore. In the Montgomery and Dadeville claims is a strong east-west fault, which was apparently initiated prior to the deposition of the ore.

The ore body of the Black Copper mine, also lying between schist and dacite, is of rather irregular shape, and evidently formed at least in part by replacement of dacite or dacite tuff. It has an easterly dip of about 35°, and it is possible that it occupies a fault fissure opened prior to ore deposition, and might perhaps be classed with the lodes.

The plant of the Old Dominion, which is the big mine of the camp, is one of the finest in the West. The mine has been opened to the depth of more than 1000 feet. The bulk of the ore has to be concentrated. There is a very fine plant for this purpose, fitted with both jigs and tables, and a three-stack smelter that, within the last 18 months, has been brought up to date in every particular. The town, that for a quarter of a century has straggled, after the manner of its kind, for a mile or more along the banks of Pinal creek, in an unkempt and woolly way, is also in process of reconstruction and concentration, and will in time become even attractive. But the main feature of Globe at present is its genuine prosperity, resulting in part from the large and profitable operations of the Old Dominion Co., and in part from the steadily increasing output from the numerous less notable mines of the district, that, one by one, are being carried forward to self-sustaining and dividend-paying conditions.

Mining Outlook in Northern California.

TO THE EDITOR:—No year in the history of Siskiyou county has been more fruitful in discovery and development than 1905; this in the face of early failure of the season's water supply. This failure may have been an incentive to much of the prospecting that has characterized the summer and autumn months. In more than one hundred instances bona fide placer and quartz locations, showing returns which will warrant development, are the result of the last season's researches. The records vouch for this. They are distributed all the way from the Oregon line to the Del Norte, Humboldt and Trinity borders. Along the Klamath and its tributaries, and in the Happy Camp section, research has, as a rule, told for good. On the north and south forks of Salmon river and in the Etna district, rich prospects which promise to be lasting have been made matter of record during the year. In the northeastern part of the county good prospects have been reported. Siskiyou is rich in mineral and timber wealth and increasing prosperity is assured.

In northeastern Humboldt steady and unusual advancement has been made. The record of mineral and water locations has been broken and crowds that of Siskiyou closely. This has been most pronounced within a radius of 10 miles of Orleans and along the lower Klamath. Recent researches near the mouth of that stream are to be continued on a greater scale than ever, and bluff mining on the coast will receive new impetus. Many new placer locations have been filed along Trinity river from the Hoopa reservation to the Trinity county line, a stretch of territory in which productive placers are being operated. Indications of copper are not lacking in the north slope of the Humboldt–Mendocino range, and in one or two of these development is now under way. While mining is virtually a side issue in Humboldt county, the gold yield shows a steady increase when winter snows and spring rains do not default.

A more than usual amount of prospecting has been done in Trinity county this year, and, in some instances, with gratifying results. The mines of Trinity were among the first in the north, and if the latter days' output is diminished it may be in the main charged to reduced population and isolation. No one familiar with the county believes that mining has been more than fairly commenced in Trinity. True, diggings which were covered by the waterways provided forty to fifty years ago have been exhausted, but there are enough of higher deposits yet undisturbed, of gold-bearing ledges still uncovered and opportunities for the dredgers. There has been unusual activity, short season of water supply considered, in the Junction City, Indian Creek, Hay Fork, Deadwood, Coffee Creek, and isolated New River district during the year, and in some instances good paying new deposits have been encountered. La Grange mine, near Weaverville, has given out its accustomed yield and a number of other placers have maintained their reputation as liberal yielders. The dredger has also obtained a foothold in Trinity.

Trinity Center, Dec 16. OBSERVER.

Progress of Reclamation Work.

The Secretary of the Interior has recently approved two new reclamation projects. One, which will be partly in Texas and partly in New Mexico, is called the Rio Grande project; the other, which will be wholly in New Mexico, will be called the Carlsbad project. The two additional projects will bring the number of reclamation schemes up to twenty-four. Of these, eleven are well under way. They provide for the reclamation of 1,303,600 acres of arid lands at a cost of $37,028,571. These are big figures and they represent big projects.

On June 30, 1905, the total cost of construction and engineering work performed by the Reclamation Service, together with the administration expenses, amounted to $5,462,169. On that date the reclamation fund had reached a total of $28,028,571. It was estimated at that time that the receipts for the fiscal years 1906–1908 would amount to $9,000,000, so that the sum of money available for reclamation purposes up to the end of 1908 will be $37,028,571.

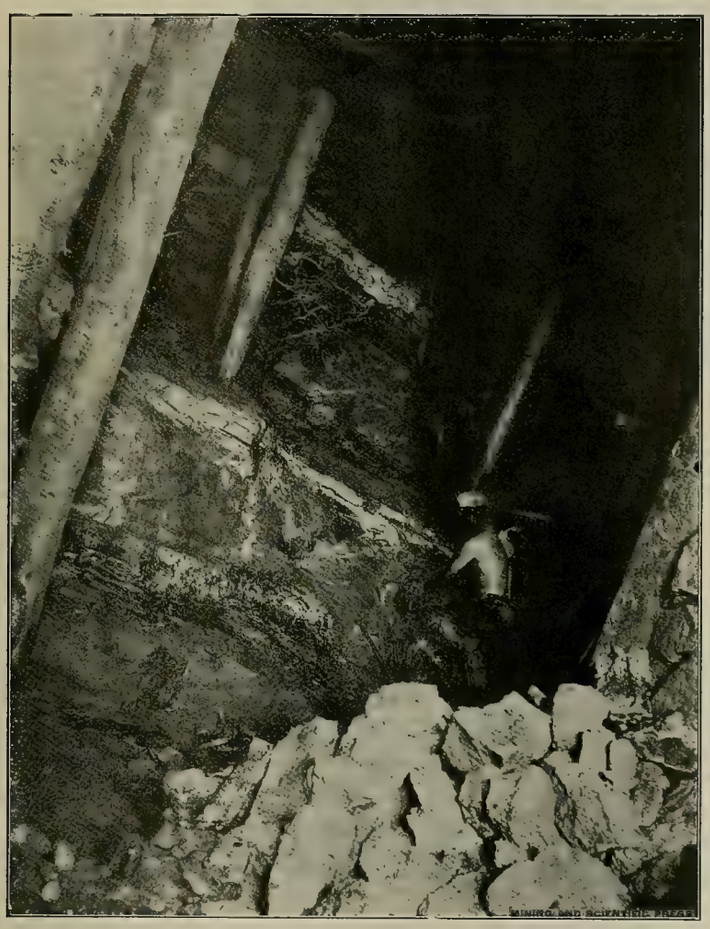
Since the work of reclamation began, 77 miles of main canals have been constructed and 54 miles of distributing canals, as well as 186 miles of ditches and 147 bridges. Over 9,350,000 cubic yards of earth have been excavated and 3½ miles of tunnel driven. The telephone lines installed have measured 250 miles and the roads built have covered 126 miles. It has been necessary to erect fifty offices and other buildings. One cement mill has been constructed, the product of which already amounts to 15,000 barrels. Besides the cement manufactured by the Reclamation Service, use has been found for 78,000 additional barrels of cement, which were purchased in open market. Over 2,800,000 feet B. M. of lumber have been sawed for the work of construction and 1,750,000 feet B. M. in addition have been purchased. The concrete completed amounts to 70,000 cubic yards, the puddling done to 4500 cubic yards, the riprap

completed to 12,000 cubic yards, and the paving to 190,000 square feet. The railroad iron used amounts to 130,000 pounds, the structural steel to 250,000 pounds, the cast iron to 600,000 pounds. The sheet piling driven has amounted to 150,000 lineal feet, the bearing piles to 10,000 lineal feet.

These figures will give some idea of the gigantic size of the enterprise which the engineers of the Reclamation Service have in hand in the reclamation of 1,303,600 acres of arid land.

The Brilliant Extended Mine, Charters Towers.

Recent improvements in the Brilliant Extended mine, Queensland, have served to call special attention to this Charters Towers property, says the Queensland Mining Journal. With the exception of the deep level mines, the workings in the Extended are the deepest on the Brilliant line of reef; so that the operations at the latter mine are of great importance to other deep mines in the vicinity, and consequently to the field generally. The grade of the ore obtained from the Brilliant Extended is low, but this is compensated for by the extent of the stone being operated upon, and the fact that it is being increased as the lower development work is proceeded with. This work is being prosecuted on a comprehensive and systematic scale, and the large area of the lease (seventy-five acres) affords the company ample scope for their extensive operations.



2200 Level of the Brilliant Extended Mine, Charters Towers, Queensland, Australia.

During the year 1902, the Brilliant Extended Co. equipped the mine with an up-to-date winding plant, with steel poppet legs, new boilers, air compressor, cooling tower, etc., at a total cost of £13,475. The engines then supplied are capable of raising an unbalanced load of five tons from any position of the cranks, and maintaining an average speed of winding with the maximum load of 2000 feet per minute. The poppet legs, which cost £895, are 80 feet high, and adapted to serve two winding engines of equal power drawing from opposite sides. The cooling tower is of the open type, having all surfaces exposed to the air, and proportioned to deal with cooling water necessary to condense 1500 pounds of steam per hour. The method of treatment adopted is that of crushing and amalgamation, followed by concentration. In the following year (1903) very important work was done in proving the deep ground; and, although the grade of the ore fell off, two dividends were declared, totaling £12,500. The total quantity of ore raised that year was 17,013 tons, and its value per ton was £3 1s 7.5d.

Last year the company purchased, on terms, at a cost of £25,000, the Enterprise Mill & Cyanide Works, then owned by the Craven estate, and situated about 300 yards from the Brilliant Extended mine. The mill was of fifteen head of stamps, and the plant included three Huntington mills. During that year, also, a number of changes and improvements in the mode of working the mine were adopted, including improved ventilation, haulage, means of transport, and electric lighting; while more than usual attention was given to development work. In opening up the various levels, work of this class averaged during the latter half of the year 450 feet per month, operations being chiefly directed to the extension of the levels in the lower ground. During the year 1904, 28,654 tons of stone were treated, for a yield of 9447 ounces of gold from the mills, with an addition of 1903 ounces of bullion from 11,712 tons of tailings cyanided; while the mine was employing 160 men. No dividends were declared. In the early part of the year returns were disappointing, but in the last six months the grade of stone treated considerably improved, the returns being about 14 dwt. to 17 dwt., exclusive of sands, which assayed about 2½ dwt. A vigorous system of opening up the mine was carried out, and at the end of the year the warden reported that its future development depended chiefly upon the deep ground being opened up by the No. 3 underlie, the sinking of which had been resumed during the year. The vertical depth of the No. 11 levels was then 2300 feet, and the workings were the deepest then being operated on the field. The accompanying engraving is an illustration on the 2200 level of the Brilliant Extended mine.

During the first six months of the present year the output was 13,054 tons, yielding 6703 ounces, including the return from cyanide treatment, so that the average of the preceding year was more than maintained during that period. In May last a decided improvement was reported in the mine, and some promising looking stone was struck in the crosscut from No. 10 east level, while a prospecting drive west was being driven on from 3 feet to 4 feet of good-looking quartz. The June report showed that the mine continued to work well in the deeper levels, and the crushing was above the average. In the following month it was stated that there was an improved appearance in Nos. 9, 10, 11 and 12 east levels, and in August these levels continued to open up satisfactorily. In the latter month it was reported also that No. 7 west and No. 12 west levels were carrying a strong and payable reef; that there was a general improvement; and that the directors had paid half the entire cost of the mill purchased during the previous year, and had given notice that the balance—£12,500 and interest—would be paid in three months. Both in July and August there was a marked increase in the quantity of stone treated, and a fair improvement in the yield. The gross value of the August crushing was £9203. At the time of writing the official report for last month (September) is not to hand, but on the 23rd of that month it was stated in the Press that the various workings of the Brilliant Extended Co., from their No. 1 level at a vertical depth of 1846 feet, down to No. 12 levels at about 2400 feet, showed from 1 foot to 6 feet of stone, some of it very heavy mineral stone. In the No. 7 west level there was still a strong reef of mineral stone. The mill and cyanide works were working constantly, and it was expected the output for September would be equal to that of the previous month.

MANY mines which show no trace of zinc in their upper portions are found to carry this mineral, usually as sulphide, in depth. For this reason a mine should be developed to considerable depth to determine the character of the ore before building a reduction plant, or there may be much unnecessary expense in aiming at a satisfactory method of ore treatment. When a mill is built it is very necessary to know that it is adapted to the ore of the mine, not only at the surface but in depth as well.

Department of Mines and Mining.

Early in the present session of Congress, Congressman Van Duzer of Nevada introduced a bill to establish a Department of Mines and Mining. The full text of the bill follows:

A bill to establish the Department of Mines and Mining: Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, that there shall be at the seat of government an executive department to be known as the Department of Mines and Mining, and a Secretary of Mines and Mining at the head thereof, who shall be appointed by the President, by and with the advice and consent of the Senate, who shall have a seat in the Cabinet, and who shall receive a salary of $8000 per annum; and Section 158 of the Revised Statutes is hereby amended to include such department, and the provisions of title four of the Revised Statutes, including all amendments thereto, are hereby made applicable to the said department.

SEC. 2. That there shall be in said department an Assistant Secretary of Mines and Mining, to be appointed by the President, by and with the advice and consent of the Senate, who shall receive a salary of $4000 per annum. He shall perform such duties as shall be prescribed by the Secretary and required by law. There shall also be appointed by said Secretary one chief clerk, who shall receive a salary of $1800 per annum, and such other clerical assistance as may from time to time be authorized by Congress.

SEC. 3. That the said Department of Mines and Mining shall have general jurisdiction over all matters pertaining to mines and mining industries and the Geological Survey, and over all the matters committed to any of the bureaus, offices, departments, or branches of the public service by this Act transferred from other executive departments of the government to the said Department of Mines and Mining as fully as the same is now possessed by any of the said bureaus, offices, departments, or branches of the public service from whence the same is so transferred, and that the official records and papers now on file in and relating to the business of any such bureau, office, department or branch of the public service in this Act transferred to the Department of Mines and Mining, together with the furniture now in use in such bureau, office, department, or branch of the public service, shall be, and is hereby, transferred to the Department of Mines and Mining.

SEC. 4. That there shall be in the Department of Mines and Mining a bureau which shall, under the direction of the Secretary thereof, gather, compile and publish information in respect to the same, and it shall be the duty of said bureau to acquire and disseminate practical and useful information concerning the mines, mineral resources and mining industries of the United States; that the office of the Director of the Geological Survey and the Geological Survey Service, and all that relates to and pertains to the same, is hereby transferred from the jurisdiction of the Interior Department to the jurisdiction and supervision of the Department of Mines and Mining, to remain henceforth under the jurisdiction of the latter; and the Director of the Geological Survey is hereby made the director of said bureau.

SEC. 5. That the Secretary of Mines and Mining shall annually make a report in writing to Congress, which shall contain an account of all moneys received and expended by him in promoting and facilitating the development of American mines, mineral resources and mining industries, and such recommendations as he shall deem necessary to the further development of the same. He shall also make special investigations and reports on particular subjects whenever required to do so by either the President, the Senate, or the House of Representatives.

SEC. 6. That the Secretary of Mines and Mining shall have charge in the buildings or premises occupied by or appropriated to the Department of Mines and Mining, of the library, furniture, fixtures, records, and other property pertaining to it, or hereafter acquired for use in its business; and he shall be allowed to expend for periodicals and the purposes of the library, and for the rental of appropriate quarters for the accommodation of the Department of Mines and Mining within the District of Columbia, and for all other incidental expenses such sums as Congress may provide from time to time; provided, however, that where any bureau proposed to be transferred to the Department of Mines and Mining by this Act is occupying rented buildings or premises they may still continue to do so until other suitable quarters are provided for their use; and provided, further, that all officers, clerks and employes now employed in any of the bureaus, offices, departments or branches of the public service in this Act transferred to the Department of Mines and Mining, are each and all hereby transferred to said department at their present grades and salaries, except where otherwise provided in this Act, until otherwise provided by law; and provided, further, that all laws prescribing the work and defining the duties of the several bureaus, offices, departments or branches of the public service by this Act transferred to and made a part of the Department of Mines and Mining shall, so far as the same are not in conflict with the provisions of this

Act, remain in full force and effect until otherwise provided by law.

SEC. 7. That the jurisdiction, supervision and management and control of mines and mining lands and mining industries now vested in the Interior Department are hereby transferred to and vested in the Department of Mines and Mining.

Notes on Southern Nevada and Inyo County, California.—II.*

Written by H. H. TAFT.

FROM VEGAS TO ASH MEADOWS.—For about 90 miles the road follows a succession of desert valleys. The Las Vegas mountain, north, and the Charleston mountain, south, both of Carboniferous limestone, are little disturbed, but the small spurs west are considerably contorted. About 12 miles northeast of Ash Meadows, north of the road, the limestone beds are tilted and underlain by quartzite, and a little south of the road there is a small area of basaltic lava which has overflowed a recent volcanic tuff. For a distance of from 2 to 20 miles southeast of Ash Meadows there is considerable quartzite. Although prospectors report some lead and copper, the region is unattractive on account of the absence of eruptive rocks. On the northwest slope of Charleston mountain are two old mining districts, the Montgomery (now known as the Johnny) and the Stirling. These districts, abandoned for some years, have now taken on new life. The ore is gold quartz, with a little pyrite and chalcopyrite.

THE AMARGOSA DESERT.—This desert valley is about 100 miles long and forms with Death valley a long, narrow U, extending northwest-southeast. The upper end, 4000 feet above sea level, is formed by the joining of the Grapevine and the Amargosa mountains. The former is the northern boundary of Death valley and the latter contains the Bullfrog mining region. The Amargosa is cut through by the Oasis, a narrow valley, in which are numerous springs and a little running water. Opposite the Oasis the Amargosa is 12 miles wide; farther south it widens rapidly. Between the mouth of Forty Mile canyon and the Funeral range it is 30 miles wide. Here the road is so dry and sandy that freighters have to "double," and then can only travel at half the usual rate of speed. The roadside graves and skeletons of draught animals are mute witnesses of hardships here experienced. An enormous sand dune shows that the contour of the mountains has some peculiar effect upon the winds.

Forty-five miles southeast of the Oasis valley is a series of springs. The general locality is known as Ash Meadows. Here the valley is 15 miles wide from the Meadows to the Funeral range. In a distance of 6 miles there are four springs flowing about 50 miners' inches of water each, and a number of smaller ones. The temperature of the water in the larger springs is 76° F. and in one of the smaller ones 94° F. All these waters carry a large proportion of sodium carbonate, a remarkable amount of aluminum, a little borax and a small amount of sulphates. From the southerly spring a stream flows for a distance of from 5 to 20 miles, depending upon the season. Below these springs there are large areas of apparently good meadow land, but the rushes, salt and wire grass are of little value as fodder.

Pahrump ranch is 30 miles southeast of Ash Meadows, and 6 miles farther is the Manse. These ranches are veritable oases, and the extraordinary market which they enjoyed last winter for fodder, vegetables and fruit was a godsend to their owners.

BULLFROG MINING DISTRICT.—At the head of the Amargosa desert the Grapevine range, 3000 feet above the valley east and 7000 feet above Death valley west, is flanked east by recent volcanic tuffs. Along the summit occur limestones and quartzites dipping east, and a lime conglomerate, carrying granite, diorite and quartz, such as occur many miles north.

The Amargosa range, lying between the south end of the Ralston desert and the northwest end of the Amargosa, is formed by series of tuffs superimposed upon limestone. The various members of the volcanic series occur with the regularity of sedimentary strata, and the upper (consequently more recent) ones are highly colored. They dip 10° to 20° northeast. An extensive block faulting has exposed the edges of the various flows, particularly from the west, the escarpment being on that side. About 2 miles west of the Bullfrog mine is a small hill of gneiss, overlain by strata of chloritic slates, quartzites, limestones and tuffs, dipping flat to the east.

On August 10, 1904, two claims were located as Bullfrog No. 1 and No. 2. From August 10 to September 14, 1904, a large number of claims were located on what are known as Ladd and Bonanza mountains, about 3 or 4 miles southeast.

The Bullfrog Mining Co. was formed to take up a group of Ladd mountain claims, and later the first discovery of the district was transferred to a new corporation, The Original Bullfrog Mining Syndicate. A mile south of the original Bullfrog property some claims were staked off, surveyed and sold as lots under the name of "Bullfrog town." Amargosa, a mile farther south, aspired to be the metropolis. Out on the desert west of Ladd mountain the same thing was done, and the "town" was named Bonanza. Four miles from the latter place, in the Oasis valley, on the bank of a stream of running water, the town of Beatty, named for a ranchman living a mile above, was laid out, and soon became the most populous place. Three miles below Beatty a group of tents bore the name of Gold Center. In March, 1905, in a cove made by the desert in the Amargosa mountain, between Bonanza and Ladd mountains, Rhyolite was laid out, and Bullfrog and Bonanza moved to it. This place is 5 miles from water.

About 10 miles southwest of where Oasis valley breaks through the Amargosa range, the cliffs are of limestone, which pitches west and is soon buried beneath the soil and the volcanic tuffs that have probably borne it down. In several places the contact is exposed, and there are evidences of a flow of water not accompanied by a siliceous deposition, except in and near the Bullfrog claims. Between Ladd mountain and the Oasis creek there is a place where there has been a considerable spring on the contact. Boulders of granite 3 inches in diameter are scattered over an area 100 feet square. There is no silicification and no mineral. The Bullfrog claims cover an immense outcrop that can be seen for miles, and are only 3 miles from a spring that has been frequented by prospectors for 30 years or more. The white quartz lies like a crescent around a small dome-shaped hill, following the contact, which dips 30° north 60° west into the hill. The quartz has a maximum thickness of nearly 100 feet, and is generally massive, though sometimes there are large slightly amethystine-tinted crystals with a conchoidal base. A later cracking has occurred, and a flow of water depositing copper sulphides and the precious metals. Wherever a green stain occurs visible gold can usually be found.

The other properties of this district are entirely different, resembling somewhat those of Goldfield. There has been a nearly vertical fissuring, followed by a flow of water heavily charged with silica, filling the fissures and soaking into the country rock. One can find all gradations, from pure quartz to slightly silicified country rock. These are the so-called rhyolite dikes. The country rock itself had a slight mineralization, which this silicification did not increase. A secondary and much less extensive cracking and inflow of siliceous waters occurred, which deposited the gold. The veins are nearly vertical, strike north 10° to 30° east, are sometimes thin seams, sometimes several feet in thickness, and again wide zones of stockwerk. The better formed are calcareous and slightly stained with manganese. There are many of these veins and they were easily found; but to discover ore shoots in them is quite a different matter. The amount of work done in both this district and Goldfield during the past winter has been remarkably small.

An interesting and to the prospector a very important phenomenon is the covering of these veins. The older tuffs are mineralized and the more recent (upper) are not; the older are basic, while in the upper there is a flow of rhyolite. At Tonopah it is quite noticeable that the rhyolite is more recent than the "mineralized porphyry." The regularity of the eruptions and the exposure of the edges of the often highly colored strata make this an ideal place to study this phenomenon.

FUNERAL RANGE.—The Grapevine and Funeral ranges are practically the same. Old-timers do not agree as to the dividing line. With the mountains south they form the eastern boundary of Death valley. There has been much searching in this range for the lost Breifogle mine, one of the romances of the desert. Except in one place, both ranges are poor prospecting ground. The general formation is quartzite and limestone, overlaid by immense deposits of recent conglomerate. In the north end of the Funeral range there is a development of green shales, identified elsewhere as Cambrian. These shales usually carry white glassy quartz, which is rarely mineralized; but in this case there are ore shoots carrying sufficient gold to make the district attractive if wood and water were more available. One property has recently been thoroughly developed under bond in this district.

To the south the range ends abruptly, near where the wagon road from Ash Meadows to Furnace creek crosses. The division along the dry watercourses followed by this road is remarkable; they have large boulders of quartzite and limestone north, and on the other side black and brown lava. South, the topography is broken and mountainous, but not in a distinct range. The Green mountain, still further southwest, is another field for prospectors. One small stamp mill is running at the foot of this mountain on the Death valley side. Still farther south, the drainage of the Amargosa cuts through into the Death valley.

GOLDFIELD.—The tuffs (andesite) of this district probably lie upon limestone, elsewhere identified (e. g., at Bullfrog) as Cambrian. On the southwest side of Columbia mountain is an outcrop of dark limestone, evidently overflowed by eruptives. In the Tonopah Club claim the ore is a siliceous sedimentary that has the appearance of limestone, through which gold-bearing solutions have percolated and left enough of the precious metal to make it possible to sort out some shipping ore.

The country rock shows more mineralization than in the southern district, and has been much more disturbed since the mineral deposition. There are three large intrusions of alaskite, and a great many dikes of a green rock, probably decomposed trap, which is closely associated with the original andesite. Standing upon one of the intrusions, Vindicator mountain, one can see, both from the workings and the color of the country rock, that the mineralized area takes the form of a ring. It is yet a question whether the central part will prove of value or not. Outside, the field is completely surrounded by more recent tuffs, overflowed on the west side by dark basaltic lava, which forms a mesa some 4 miles square between Goldfield town and Montezuma mountain.

The topography presents simply hills with higher hills or low mountains around them, except to the north, which opens out to the San Antonio desert. Montezuma mountain (altitude 8000 feet) is 8 miles west. The old Montezuma lead-silver district is on the west slope of this mountain. The castings in the 10-stamp mill and 36-inch water-jacket furnace bear the date of 1886. At Lida, a boiler front recently reset was cast in 1866.

A very prominent geological feature is the reefs of silicified country rock, usually called rhyolite dikes, found all over the district, but more numerous to the south and east. They are sometimes very large (50 feet), but generally about 10 feet thick; and they extend in all directions without regularity, frequently crossing each other. They are sometimes 2000 or 3000 feet long, and again but a few feet, and exhibit all grades of silicification. On the surface they are hard and flinty; but underground, away from the weather, the rock, although harder than the andesite, which is quite soft, is not bad for drilling. The phenomenon of blackening, so noticeable in the desert and recently described by Prof. Blake, is very apparent.

The gold was deposited by successive flows of water in or near these reefs, as was the case with the dikes at Victor, Colo., but there are exceptions, as in the Velvet and Tonopah Club claims. Again, as at Cripple Creek, one often hears that the country rock shows value, and not the veins. At the surface the gold is very free, and is fine in both grain and grade. Below the zone of oxidation, the ores are not very thoroughly understood. There is probably considerable difference in the different properties. It is now certain that tellurides are present; but the principal accompanying mineral is, as usual, pyrite. Although there is no copper stain near the surface, there is considerable gray copper at depth. There is rather more antimony than arsenic, but both are present.

It is too early to say what will be the solution of the metallurgical problem. The low-grade ores, of which so little is known now, may be more simple in their composition. The Combination Mines Co. has provided plates, concentrators and a cyanide plant.

It is not at all easy to find the small rich streaks and lenses of ore that have given Goldfield its celebrity, and there is as yet no incentive to develop the low-grade or milling ores, which will later be important ones. The charges for freight and treatment are now $32 per ton.

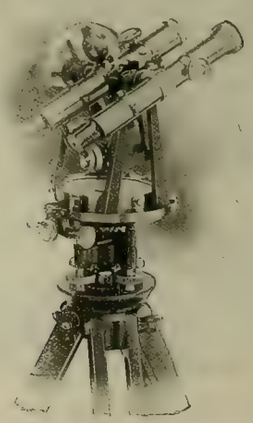
A New Mountain and Mining Transit.

Wm. Ainsworth & Sons of Denver, Colo., have just placed upon the market a new surveyor's transit that embodies several improvements in design and construction.

The accompanying engraving shows their Type B,



5-inch limb, transit for mine surveying as fitted with interchangeable top and side telescope (Dunbar D. Scott design), 5-inch full vertical circle, stadia, gradienter, variation plate, limb verniers at 60° angle with line of sight and extension tripod.

Among the more important improvements may be mentioned the ribbing of the vernier plate, which, by a change in design, has been extended nearly ½

inch nearer the outside of the plate, thus admitting of a re-enforcement under the standard feet and producing a more rigid plate with the same amount of metal.

The inside of the telescope tubes and outside of the draw tubes on both main and auxiliary telescopes, after being turned to size, are "lapped" on a machine specially constructed for this purpose, thereby producing surfaces which are truly cylindrical and of uniform diameter from end to end to within .0001 inch, which insures that the telescope, once adjusted, will remain in collimation with the draw tube in any position.

Either erecting or inverting telescopes are furnished and only lenses of the highest quality obtainable are used.

The spindle and socket are made of hard bronze alloys of different compositions, thereby eliminating friction to the greatest extent possible, and finished by lapping.

All parts are made of hard bronze and to limit gages insuring strict interchangeability.

Full description of this instrument is given in Bulletin BX–9.

Electrically Operated Ore Loading Plants and Wire Rope Tramways.

Written for the MINING AND SCIENTIFIC PRESS by FRANK C. PERKINS.

During the past decade the methods employed for ore loading have greatly improved and the aerial rope tramway has been developed to a remarkable degree, so that there is at present a great saving of labor and the ore is excavated and loaded with economy. The ore loading plant at Vivero, Province de Lugo, Spain, includes a bridge and tramrail plant for loading vessels with iron ore, operated by the Vivero Iron Ore Co., Ltd. The plant was installed to convey the iron ore from the Spanish shore to deep water, a distance of 200 meters for sea-going shipment and has a capacity of 250 skips or 250 tons hourly. A small rock a short distance from shore forms a suitable support for the tramrail bridge, 120 meters in length, with a free extension of 45 meters. At a platform at the outer end of the extension, the ore tubs are automatically discharged into a telescope chute for the direct loading into the bunkers of the vessel. The ore from the mine is transported to the shore by means of a railway 4500 meters in length, and it is automatically dumped into large storage hoppers located on the hillside. From these hoppers the ore is discharged into tubs of the ore loading plant, delivering the ore to the vessel at the rate of about four buckets per minute. The mine is located at an elevation of 220 meters above the discharging platform on the bridge, and this difference of level is sufficient for the loaded buckets to descend by gravity on the ropeway as well as the tramrail plant, no power being required to operate the installation. It is claimed that this plant, since it has been installed, has not only made a large saving in the cost of handling the ore but also in the time required for loading the vessel.

Tension Station on a Long Line of Aerial Tram.

The two main systems of ore handling apparatus include the traveling-cable hoist conveyors and the fixed-cable hoist conveyors. The former include two principal types, in one of which both towers are movable, and in the other one of the towers is movable and the other fixed. The fixed-cable hoist conveyors also include two classes, one of which has supports or towers and horizontal lines, or lines with but little inclination, two independent ropes being required to operate such plants. The other class includes a main or carrying cable which has sufficient inclination to allow the carriage to descend by gravity and but one operating or hoisting rope is used.

It is claimed by some mining engineers that the ideal system for handling ore is an overhead cableway. In mountainous mining regions a suspended cableway is not only cheap in first cost and quickly erected, but it is seldom, if ever, blocked by debris, snow, or ice, and is nearly an ideal transportation system.

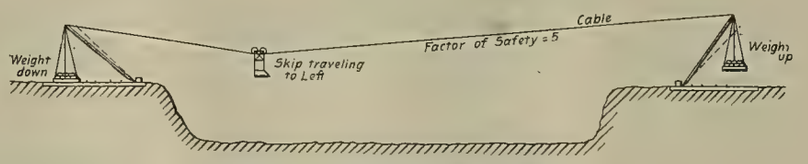

Fig.2. Skip moving towards Left-Hand Shears

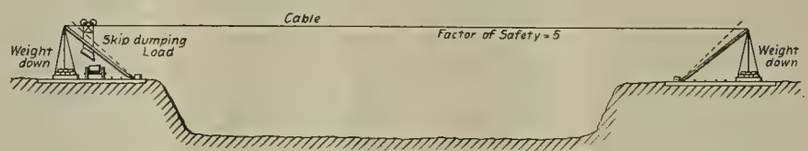

Fig.3. Skip at Shears and dumping Load.

The Balanced System of Aerial Transportation.

These cable-hoist conveyors are distinguished from ordinary wire ropeways in the fact that they are designed to move at any one time single loads of several tons over comparatively short distances. These plants may be either simple conveyors, such as used in transferring ore across ravines or materials across rivers, or they may partake of the nature of hoists as well, and in this adaptation is found their widest application for the loading and unloading of vessels and similar service.

Those installations adapted to hoist as well as to convey the load are of two types, one applicable to inclines only, in which the carriage descends by gravity, and the other applicable to either horizontal lines or lines where the inclination is not sufficient for the carriage to descend by gravity alone, in which the hoisting and conveying are done by separate ropes. The track cables rest upon saddles of hard wood or iron, forming the peaks of the supports in either case, and are anchored firmly at each end, a turn buckle, or "take up," usually being provided at one of these anchorages for maintaining the proper deflection. The supports are pyramidal towers of wood or iron, as preferred, although in many cases, especially if the loads do not exceed two tons in weight, there are "A" frames, or masts, guyed with wire ropes and in some cases these towers are mounted upon trucks so that the installation may be shifted, this being a desirable feature for some work. Electric motors, as well as steam engines, are utilized for operating the lines and towers of cable hoist conveyors and these labor-saving devices are coming more extensively into use. The accompanying diagrams show the arrangement of the balanced cable cranes for handling excavated material at Davenport, Eng., and Zambesi Falls, South Africa. It may be of interest to consider some of the details in connection with the balanced cable crane as well as some of the advantages claimed for the same over the old style cableway.

It is claimed that the balanced cable crane noted in the accompanying drawing is so designed that it offers no more resistance to the traveling car than if the cable were as straight as a string. The balanced cableway has suspended counterweights that take the place of fixed anchors, and it has inclined, oscillating towers, or shears, pivoted at the lower end, the weight of the cable and car with its load being held in equilibrium by the counterweights. It is held that in the balanced cableway equilibrium is automatically maintained by the counterweights and the oscillating towers, or shears, in some such a way

Supporting Tower of Wire Rope Friction Grip Tramway.

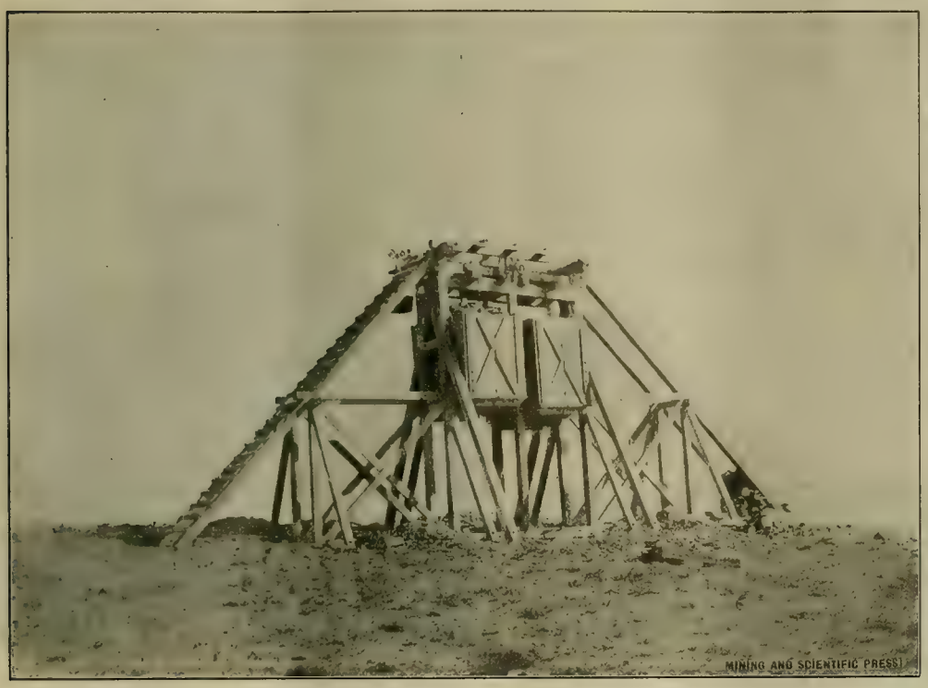
as a counterbalanced window, the electric motor conveying the load along the balanced cableway, there being very little resistance to the rolling car on such an aerial cable. It is held that the counterweights entirely eliminate the dead load as they descend with the shears, as the car moves toward them, while the opposite shears and weights ascend. As the loaded carriage reaches the shears, the opposite counterweight is at a maximum point and the cable is practically horizontal.

Steam, gasoline and other engines are utilized for power with the balanced cable system, and, also, electric power. In the latter the car that travels on the cableway is virtually a self-contained trolley car. The electric motor does not have to lift the weight in moving toward the shears, as the dead load of the car is entirely counterbalanced, and electric power is now almost universally available in mining installations, as it is utilized to advantage for not only electric hoists, but electric ventilators, underground pumping plants and other mining apparatus.

At the Zambesi river plant, in South Africa, just below the Victoria Falls, there is a balanced cableway having a span of 870 feet and a capacity of ten tons per load, the cable being 2⅝ inches in diameter. The electric motors used on the balanced cableways have a capacity of from 30 to 60 H. P., according to the size of the cables used and the loads to be carried.

There are a great many cableways in operation in the Western mining districts of the United States, which are of more than passing interest. At Ouray, Colo., there is an automatic system operated by the American G. M. Co., having a span 2100 feet in length, and another automatic tramway at Park City, Utah, operated by the Silver King M. Co. The accompanying illustration shows the supporting towers of the aerial wire rope, friction grip tramways. One of these automatic aerial wire rope tramways, with its towers and cables, is shown in the accompanying illustration as operated at Encampment, Wyo., by the North American Copper Co. This tramway is the longest in the country, having a total length of 16 miles, and passes over the continental divide, or watershed, at an altitude of 10,090 feet. The highest tower installed on this tramway is 69 feet high and the elevation of the rope saddle above the sea level is about 10,000 feet. These towers are spaced at intervals varying from a few feet to as great as 2300 feet, there being three long spans on the upper section of the tramway, ranging in length from 1800 feet to 2300 feet.

A similar aerial wire rope tramway is utilized at Telluride by the San Juan G. M. Co., also at Silverton, B. C., by the Wakefield M. Co. These automatic aerial cableways are of the double rope type, in which the carriers travel upon a stationary track cable and are propelled by an endless traction rope. The operation is automatic, thereby reducing the labor required in handling the material to a minimum and insuring a larger carrying capacity within a given time. It is customary in practice to divide a long tramway into several sections, depending upon various conditions, such as length, capacity and gradients encountered. The cables are usually supported on towers built of wood, although steel construction is sometimes employed and the number of the towers, their heights and the space employed depend on the profile of the ground. The track ropes rest on long bearing saddles placed on the tower while the traction rope is supported by guide sheaves placed directly below. The saddles are usually of special construction and arranged to prevent any sharp bends in the rope when the carrier wheels are passing over the tower, self lubricating phosphor bronze bushings being employed at the sheaves, requiring no oil. The grooves of the tower sheaves and the shape of the flanges are such as to accommodate the shape of the clip on the traction rope so that this rope always rests in the sheave, whether a bucket is passing over a tower or not. The grip used to attach the carriers to the traction rope is placed in a yoke in a pendant in such a manner as to allow the grip to revolve freely and follow the inclination of the traction rope in passing over a steep grade. In order to draw them together as the cable wears, the jaws are adjustable, so that a firm grip on the rope may be had at all times. A lever is so arranged for manipulating the grips that they automatically open at the terminal by means of a detacher frame. A double toggle, or cam, directly connected to the lever and movable jaw provides the means for clamping the rope tightly. It is stated that these grips will not slip on the cable owing to the enormous power developed, no matter how steep the grade or how heavy the load. At the upper terminal the track cables are permanently anchored, being con-



Tension Station on the Tramway of the Penn Copper Company, Encampment, Wyoming.

Building an Aerial Tramway.

Tower on Line of an Aerial Tramway.

Automatic Aerial Tramway of the San Juan Gold Mining Company at Telluride, Colorado.

nected by a rail over which the carriers travel from one cable to another. The traction rope passes around a sheave or series of sheaves of large diameter, to which brake rings are bolted to control the speed of the tramway when the downward tendency due to force of gravity of the loaded buckets is sufficient to operate the tramway. When power is required it is applied to the line by means of gearing attached to the terminal shaft. On the frame work of this terminal is placed a detacher and also an attacher frame, which either automatically detaches the incoming buckets from the line as they enter this station, or attaches them to the traction rope when leaving the terminal.

The track cables at the lower terminal are attached to weight boxes for keeping the tension on these cables uniform. The traction rope passes around a single sheave mounted upon a journal, which slides in a frame and to this frame is attached a weight box, in order to maintain the traction cable at a uniform tension. Connecting rail, attachers, and detachers are used at this station in a similar manner as at the upper end.

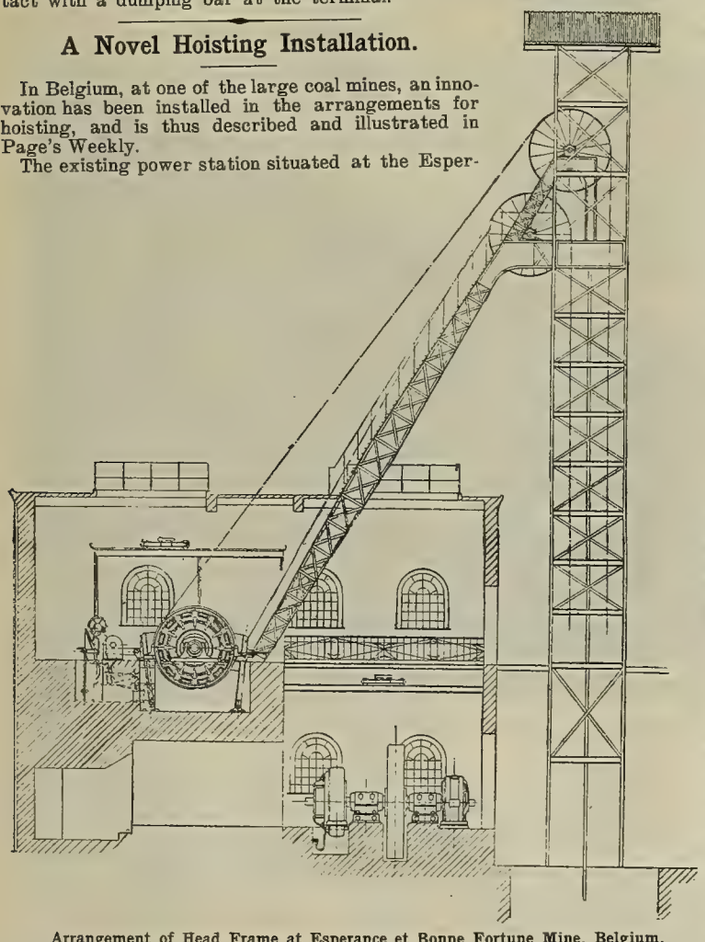
In long lines tension stations are provided, as may be found necessary. The track cables are parted, one section being connected to a weight box, or other means, for maintaining a uniform tension and the second section being permanently anchored. A short section of rail connects the two cables for the buckets to operate over. The traction rope continues by this station and is not parted but guided over the frame by guide sheaves. Buckets passing over a tension station do so at regular speed and without attendance.

Under certain conditions single line tramways are utilized to advantage and are recommended for light capacity, single endless wire rope being utilized, to which buckets or carriers are attached at intervals, depending on the capacity of the tramway. A single line wire rope tramway of this type is in operation at Chinese Camp, Cal., at the mines of the Eagle-Shawmut M. Co. The cables are supported on towers about 200 feet apart, longer spans being utilized where the contour of the ground requires it. The buckets have a capacity of 2½ cubic feet, two types being used, one having a drop bottom, to which is attached a counter weight, in order to again bring the bottom in its proper position after discharging, and the other being of the revolving type similar to those used on double rope systems, and being discharged by coming into contact with a dumping bar at the terminal.

A Novel Hoisting Installation.

In Belgium, at one of the large coal mines, an innovation has been installed in the arrangements for hoisting, and is thus described and illustrated in Page's Weekly.

The existing power station situated at the Esperance Pit consisted of three direct-coupled sets each of 225 kilowatts, the steam-engine output amounting to 300 H. P. per engine. The working voltage was 1,000 v. and the frequency 44 cycles. Connected to the power station were underground pumps at the Esperance and St. Nicholas pits, each of 125 H. P.; ventilators and sundry services absorbed another 250 H. P., so that altogether 250 H. P. was spare.



Arrangement of Head Frame at Esperance et Bonne Fortune Mine, Belgium.

The current was conveyed to St. Nicholas by two three-wire overhead lines of bare copper conductors.

In order to ascertain in the present case what would be the most favorable system, two complete propositions were worked out on different lines. In one proposition direct driving by means of a three-phase motor, and in the other proposition a motor-generator to supply a continuous current winding motor, were proposed. Similarly, the use of flat aloe-fibre ropes with reels, as in the existing steam plant, and an alternative of steel ropes with pulley, were considered for each case.

The decision finally rested with the latter, for its adoption permitted of the setting round of the winding plant, in reference to the shaft itself, by an angle of 90°. This course provided valuable space for erection of the new coal-washing plant, and, in addition, enabled the winding plant to be laid down in a space otherwise useless.

In the choice of electrical system, it was necessary to take into consideration the fact that the hoisting height was comparatively small, and that on account of the stop at an intermediate stage, starting of the winding motor would have to take place twice per journey. Employing a three-phase winding motor, therefore, the loss in the starting resistance would be proportionately higher than if winding from a greater depth, and from the lowest stage only. The plant in the existing power-station would have no longer been sufficient fo supply the necessary power at the starting and acceleration period of the winding motor.

For several reasons it was decided, in spite of the more complicated and more expensive arrangements of plant, to install a continuous-current winding motor with a motor-generator set and flywheel, or so-called Ilgner converter, interposed between the three-phase supply mains and the winding motor.

For the immediate winding requirements from 1200 feet depth, the conditions are as follows:

Effective load per journey	5,300 lb.
Weight of cage and attachments	4,000 lb.
Weight of the four tubs	2,200 lb.
Weight of flat wire rope, 3¾ in. by ¾ in.	3 82 lb. per ft.
Diameter to the Kœpe pulley	About 10 ft.
Winding speed	1,600 ft. p.m. (later to be 2,000 ft. p.m.)
Revolutions per minute of winder	51 (later to be 64)

The moment of inertia of the masses to be accelerated amounts to 31,000 foot-pounds.

When on the lowest stage two full skips are loaded and at the 1120-foot stage the second deck of the cage is also loaded.

In the determination of the design of the converter set it was decided that, in order to control the speed of the converter and flywheel, a fixed resistance should be inserted into the rotor circuit of the motor. Although the use of a variable resistance can control the power consumption from the three-phase mains so as to make the uniformity of the demand on the power station still higher, it was decided against, in the present case, in order to avoid all unnecessary complications, and it was also shown that the maximum current demanded would be within the permissible limits for the primary generator plant.

Filter Pressing Slimes.

In the issue of November 25, last, there appeared herein, on page 367, a brief description of the filter press designed by C. W. Merrill to treat the large amount of slimes from the Homestake mills at Lead, South Dakota. It should have been stated in that article that this filter press and several modifications of the principles and operation of the machine were patented by Mr. Merrill, and that the cuts illustrating the same were after the original drawings deposited in the patent office. Application for patent for the device described in the issue referred to was made January 2, 1904, and was numbered 798,200. Patent issued Aug. 29, 1905. The mention of this fact was an oversight, and has led some to believe that the Merrill filter press was subject to use by any one without restriction, when quite the contrary is the fact.

THERE are no dikes intruding the limestone strata in the lead zinc region of Missouri and Arkansas or of Wisconsin. The ores occur in flat sheets, irregular chambers, and fissures in the limestone.

Triumph Common Sense Elevator.

The cut below shows one of the Triumph common sense slow speed elevators, built by the C. O. Bartlett & Snow Co., Cleveland, O., used in the zinc mines of the Joplin district, Mo., for hoisting ore from the bottom of the mine to the crusher bins above. It is 300 feet between centers, 260 feet of which extends under the ground to the level of the mine floor. It is hoisting 500 tons of ore per day of ten hours. It is operated without any attendants. The ore is dumped into a hopper near the bottom of the elevator from the regulation mine cars, and is automatically fed to the elevator, and in turn discharged into the crusher bins at the head.

Triumph Elevator.

The buckets are of the overlapping type, made of malleable iron, 24 inches long, which are carried by two strands of Triumph drop forged steel chain with 1½ inch steel axles, to which are fastened chilled, dust proof, oil chambered track wheels, 6 inches in diameter, running on heavy T rails.

The elevator is driven by an alternating current motor, and is provided with an automatic safety brake, which prevents it from running backward in case the power is cut off.

The cost of raising ore by this elevator is said to be one quarter the cost of the old method. It is claimed to be less than ½ cent per ton. It can be built of different lengths and of any capacity.

THE PROSPECTOR.

The samples from Independence, Cal., are determined as follows: No. 1, micaceous (specular) iron, a variety of hematite; No. 2, same as No. 1, and is covered with an iridescent film, probably due to the presence of a small amount of copper. It resembles some varieties of bornite (copper sulphide), but contains little or no copper. No. 3 is quartz, somewhat corroded by mineral solutions, which have removed a portion of the original constituents, probably pyrite. No. 4 is jasperoid and siliceous iron ore. It also contains pyrite, which clearly indicates the origin of the siliceous limonite. Both Nos. 3 and 4 may be gold bearing.

The white rock from White River, Cal., is white quartz, probably from a coarse-grained granite vein—pegmatite. It is without value.

The sample of ore from the Three Friends tunnel, near Pony, Montana, is quartz, evidently occurring in granite or diorite. It contains sulphide minerals. Its value cannot be determined by "The Prospector." It should be assayed for gold and silver.

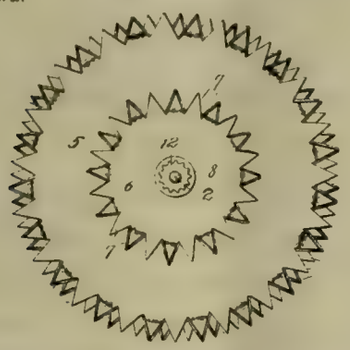
AN alloy of two parts of aluminum and one part of zinc is equal to good cast iron in strength, and superior to it in elastic limit, says the Lead and Zinc News. Its color is white. It takes a fine, smooth finish and does not readily oxidize. It melts at a dull red heat or at a heat slightly below, and is very fluid, running freely to the extremities of the mould and filling perfectly small or thin parts; in that respect it is said to be superior to brass, but is brittle, and hence unsuited to pieces which require the toughness possessed by brass. The tensile strength of the alloy is approximately 22,000 pounds per square inch, and its specific gravity 3.3.

Mining and Metallurgical Patents.

PATENTS ISSUED DECEMBER 5, 1905.

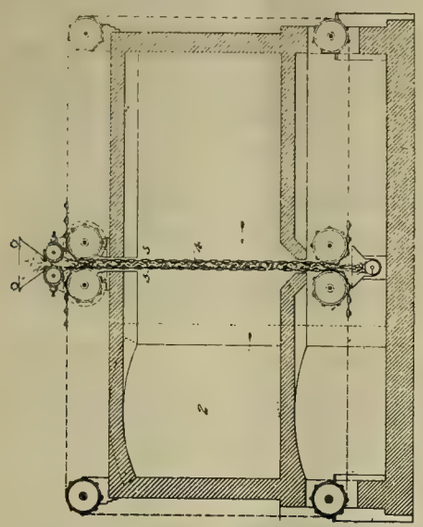
Specially Reported and Illustrated for the MINING AND SCIENTIFIC PRESS.

MINING MACHINE.—No. 805,685; J. Swanson, Mystic, Iowa.



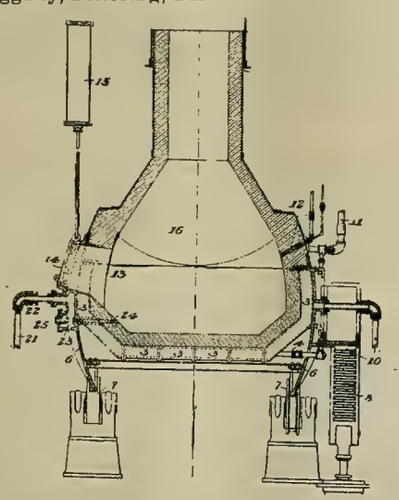
Device of character described, having pair of superposed cutting disks having toothed peripheries, teeth of each of disks being bent alternately in opposite directions and teeth of one disk being opposite spaces between those of other, alternate teeth of respective disks being parallel, and a small cutting disk disposed beneath lowermost of first mentioned disks and having toothed periphery.

PROCESS OF RECOVERING SULPHUR.—No. 805,701; R Baggaley, Pittsburg, Pa.



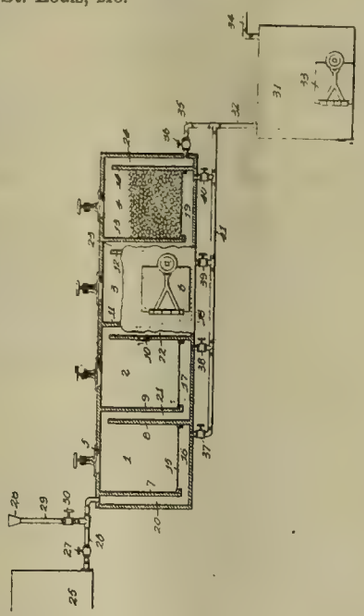
Method of obtaining sulphur, which consists in passing sulphur-bearing fumes from smelting furnace through combustible screen of waste material and depositing sulphur thereon, and then burning screen and subliming and collecting sulphur.

FURNACE FOR REFINING COPPER.—No. 805,834; R. Baggaley, Pittsburg, Pa.



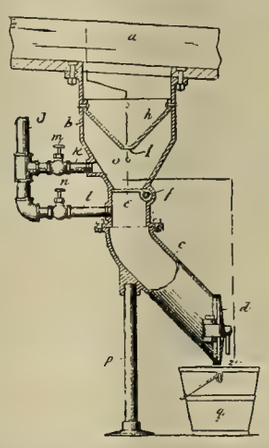
Oscillating water-jacketed furnace adapted to refine copper having removable roof-section, means for heating furnace, working door at one end thereof suitable for insertion of refining instrument, tuyere below surface level of charge to be refined, means for supplying hydrocarbon gas to tuyere, and means for oscillating furnace to empty refined charge.

APPARATUS FOR DISSOLVING AND SEPARATING VALUES CONTAINED IN ORES, ETC.—No. 805,880; C. H. Rider, St. Louis, Mo.



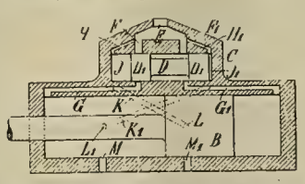
Device of class described, consisting of single closed tank divided into compartments by partitions arranged to admit passage of suitable agents, such as gas, fluid or air to bottom of first compartment upwardly through compartment, then to bottom of second compartment and upwardly through second compartment, and so on through series; air tight manholes in tops of compartments; air tight doors in sides thereof; and air tight tank arranged to receive liquid from compartments, there being connections between receiving tank and top of last compartment; and there being connections between receiving tank and bottom of each compartment.

METAL SEPARATOR FOR ORE CONCENTRATING PLANT.—No. 806 414; H. C. Krause, Point Mills, Mich.



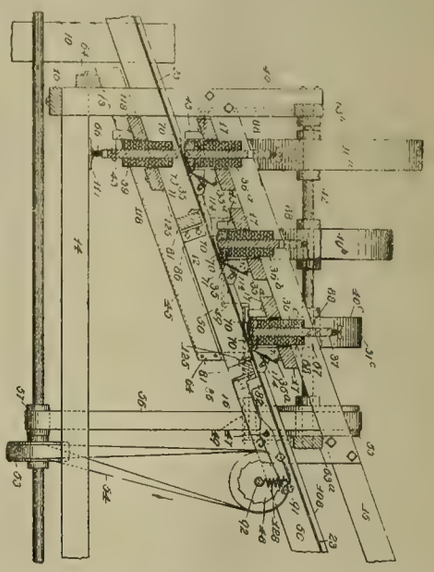
In metal separator for ore concentrating plants, combination of hopper having funnel-shaped partition which terminates at bottom in contracted discharge opening between top and bottom of hopper and forms with lower part of hopper, receptacle for metal and heavy concentrates passing through discharge opening when opening at lower end of hopper is closed, and trap connected with lower part of hopper and provided at upper and lower ends with valves, and water supply connection leading into hopper between partition and upper valve.

ROCK BORING MACHINE.—No. 806,128; H. Flottmann, Bochum, Germany.



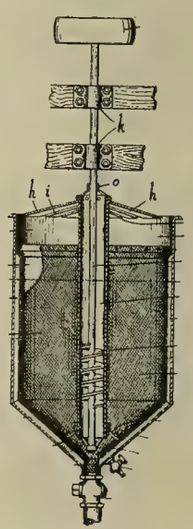
In valve gears for engines driven by compressed air and like driving mediums in combination with cylinder and single working piston therein valve casing, valve piston located therein and having enlarged heads at both ends and reduced middle portion, admission port, channels H, H′ leading from admission port to spaces at both sides of valve piston, other channels K, K′ leading at opposite sides into working cylinder space and exhaust openings M, M′ corresponding in position with openings L, L′ of channels K, K′ into working cylinder.

MAGNETIC SEPARATOR FOR ORES.—No. 805,448; H. F. Campbell, Melrose, Mass.



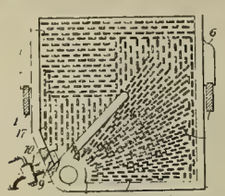
In magnetic ore separating machine combination of magnet, flat table composed of non-magnetic material located beneath magnet and secured against movement in plane of surface of table, means for jarring table without bodily raising and means for causing film of comminuted ore of substantially uniform thickness to travel along table and for presenting ore to action of magnet while separated from poles by intervening space.

APPARATUS FOR LIXIVIATION PROCESSES.—No 805,635; A. W. Constans, Nelson, Canada.



In machine of class described, in combination, receptacle for matter having suitable elevating means and filter of woven material therein arranged on slats having wire netting corresponding in surface area and covering filter and secured to slats, and means for distributing matter over said netting.

FILTER PRESS.—No. 806,491; R. Pick, Buffalo N.Y.



In filter press, plate having on sides horizontally arranged projections, vertically arranged projections, and angularly arranged projections, and arms extended at upward angle from lower front corners of plates.

Smelting of Magnetic Iron Ore by Electricity.

As the result of experiments in the concentration of black sands, which he conducted at the Lewis and Clark Centennial Exposition in Portland, Or., during the past summer, Dr. David T. Day of the United States Geological Survey, makes the noteworthy statement that conditions for the production of steel by electricity are fully as good in Oregon as they are in Germany, where pig iron has been obtained in similar electric furnaces at slightly lower cost than in ordinary blast-furnace practice.

A preliminary report on the subject of smelting by electricity the magnetic iron ores obtained from various points on the Pacific beach has been submitted by Dr. Day to the Director of the Geological Survey.

After considerable correspondence with the patentees of various forms of electric furnaces, arrangements were made with the Wilson Aluminum Company of New York for the services of C. E. Wilson, their expert in electrical smelting. Mr. Wilson arrived in Portland on October 11, and at the end of one week had erected a small but efficient electrical furnace, and was making steel. He had procured in the East 25 carbon electrodes—each 48 inches long and 4 inches square—such as are ordinarily used in electric furnaces. The rest of his equipment was obtained in Portland from materials kept in stock or easily made at a foundry.

In building the furnace a course of ordinary Carnegie fire bricks was laid upon the ground. Upon this single course was laid a cast-iron plate, ⅝ inch thick, 3 feet long and 3 feet wide. On this was placed an oval sheet-iron drum of No. 16 iron 3 feet long by 3 feet high. The sides of this drum were lined with fire bricks to form a crucible 18x18 inches and 24 inches high. The bottom of the crucible was covered, from the cast-iron plate up to the tapping hole, with broken carbon electrode. The carbon electrode to carry the current was suspended by a pulley above this furnace and connected with a balanced axle and wheel by which it could be readily raised or lowered. The top of the furnace was covered with two double plates of riveted wrought iron, between which cold water was run. In the center of this water-jacketed cover an opening was left sufficient to allow the free play up and down of the carbon electrode. This furnace is referred to as "Small Furnace," or "Furnace A."

POWER FOR FURNACE A.—Through the co-operation of the Portland General Electric Company, a special wire, bearing a 2300-volt alternating current, was run from the city supply to the smelter. This was carried into a series of six transformers and yielded a current varying from 50 to 20 volts by 1000 to 2000 amperes.

INITIAL RUN OF FURNACE A.—On the afternoon of October 17, a current of 57 volts and 1000 amperes was passed through the furnace and the arc established. The furnace was then fed with a mixture of magnetite, coke and lime. This consisted of 200 pounds of magnetite, obtained from the sand at Hammond Station, near Astoria, Or., at the mouth of the Columbia river; 44 pounds of "Fairfax" coke, which contained about 25% of ash; and 24 pounds of lime. About 50 pounds of this charge was slowly introduced into the furnace, and within an hour there was tapped from the furnace 70 pounds of steel, which contained 8% of iron and 53% of titanic acid.

On the following day the furnace was again heated and filled with a mixture similar to that used on the first run, except that it contained less lime. Steel was successfully cast twice, making, for that day's run of two hours, a product of 90 pounds of steel from 300 pounds of iron ore. This gives the furnace a capacity, on a continuous run, of 1440 pounds in 24 hours.

COMPOSITION OF CHARGE.—The iron ore fed to the furnace showed the following percentages of magnetic oxide, of titanic acid, manganese, and undetermined matter:

ANALYSIS OF COLUMBIA RIVER CONCENTRATES.

Fe_3O_4	79.06
TiO_2	16.00
MnO_2	2.45
Silica, moisture and undetermined matter	2.49

It will be noted that the heat was sufficient to keep the entire slag in a fluid state whether much or little titanic acid was present. It is evident also that no titanium went into the iron. Instead of the steel usually obtained, the charge of October 20, as shown by the analysis of that day, gave what was practically pig iron.

NATURE OF SLAGS OBTAINED FROM FURNACE A.—The slags first obtained consisted of fused iron silicates, fused oxide of iron, and silicate of titanium. Later in the experiments these slags grew lighter in color and in specific gravity. It became possible also to lessen the quantity of slag produced, which was unduly large owing to the great quantity of ash in the coke. The coke used showed on analysis 41% of ash. It is difficult to procure in this locality coke that is well adapted to metallurgical needs.

FURNACE B.—Experiments with the small furnace having been successful, it was thought desirable to build a larger furnace, with thicker walls, in which higher temperatures might be obtained and maintained. An iron plate 2 inches thick, 5 feet wide and 6 feet long was therefore procured and laid upon two courses of fire brick, to form the base of a furnace, on which was set a wrought-iron cylindrical shell ¼ inch thick, 5 feet in diameter and 4 feet high. This was lined with fire brick, the bottom having the usual lining of one course of carbon electrode bricks 4 inches in diameter. Two carbons clapped together with a water-jacketed head or clamp formed the electrode for introducing the current. The voltage was run up as high as possible—that is from 75 to 90 volts, the limit of the current obtainable over the wires. In all respects except these mentioned, this second furnace is identical with the first.

Iron ore from Aptos, Bay of Monterey, California, was smelted in this furnace on November 10. This iron ore is very fine grained and contains a notable percentage of manganese, much of which goes into the steel. It is not so rich in titanium as the other sands that had been used. From the start this furnace made a satisfactory run, maintaining easily a high temperature and turning out a very smooth product. After a few trials the slag became as light in color as that from any well regulated blast furnace. The later products of steel were much denser than those first made, which would seem to indicate that, at the higher temperature, the process of reduction is complete, even in the short time that elapses between the beginning of reduction and the tapping. In every case, however, small blow holes were observable in the steel. These were due to gases which formed wherever grains of magnetite were still entangled in the steel in process of reduction. The capacity of this furnace with a current of 125 volts, 1200 amperes, would be 2000 pounds in 24 hours.

Obituary.

H. H. OFFICER, formerly of Leadville, was suffocated by sulphuric fumes arising from ores which he was testing at Salt Lake City, Dec. 15.

J. D. MCGILLIVRAY, a well-known mining engineer and journalist, died in San Francisco, December 19, from cancer, aged 49 years. He resigned as editor of the MINING AND SCIENTIFIC PRESS at the time of the Klondike excitement to represent the New York Herald in Alaska.

Personal.

JAS. W. NEILL is in Shasta county.

GEORGE ROBINSON is at Vancouver.

H. VINCENT WALLACE is at Los Angeles.

THOS. B. STEARNS, of Denver, is in New York.

CHARLES BUTTERS is on his way to Mexico City.

F. P. ANDREAS of Boise, Ida., is in Chloride, Ariz.

IRA P. BOSS, Silverton, Colo., is in New York City.

A. F. HOLDEN of Salt Lake City is in San Francisco.

OLOF WENSTROM is on his way from Boston to Mexico City.

BERNARD CUNNIFF, of Prescott, Ariz., is in San Francisco.

ROSS E. BROWNE is in London, having returned from South Africa.

JOSEPH HYDE PRATT has gone to Arizona on an engineering trip.

F. W. BAKER, chairman of the Venture Corporation, is in New York.

F. LYNWOOD GARRISON has returned to Philadelphia from Santo Domingo.

C. L. SHAW is superintendent Arizona Mines Company at Casa Grande, Arizona.

REGIS CHAUVENET of Denver recently examined coal lands in southern Colorado.

W. L. AUSTIN of New York has gone to Clifton, Ariz., where he will remain for several months.

H. J. SHEAFE of New York City has finished an examination of mines at Searchlight, Nevada.

FRANK WOODBURY has returned to Beverly, Mass., from Silverton and Red Mountain, Colorado.

W. R. WADE has been made superintendent Azure Mining Company at Silver City, New Mexico.

C. MCDERMID, secretary of the Institution of Mining and Metallurgy, London, is visiting New York.

C. M. WOODS, manager Denver Fire Clay Co., Denver, Colo., is in New York City for a few weeks.

ARTHUR LAKES, JR., is superintendent Bullwhacker mine of Alturas M. Company, near Hailey, Idaho.

R. D. SEYMOUR, Denver, Colo., representative the Trenton Iron Company, is at Trenton, New Jersey.

FREDERICK GRUNDY is returning to Los Angeles after examining mines in southern Mexico and Chihuahua.

CARL DAVIS, formerly superintendent Centre Star and War Eagle mines at Rossland, B. C., is in South Africa.

COURTENAY DE KALB has left San Francisco to examine mines at Guadalupe y Calvo in Chihuahua, Mexico.

E. W. AVERILL AND W. W. TUXBURY of Amesbury, Mass., have returned there from the Red Mountain district, Colorado.

O. H. FAIRCHILD has charge of putting up the new cyanide mill of the Inter-Ocean Mining Company at Boulder, Colorado.

JOHN WEIR, president Nevada-Utah Mines & Smelter Corporation, has returned to New York City from Salt Lake City.

A. E. WEINBERG has finished examining mines in the Etheridge district of North Queensland and is at Sydney, New South Wales.

GEO. GUNN, with the American Smelting & Refining Company, has returned to Salt Lake City from inspecting properties at Ely, Nevada.

C. E. FRYBERGER, for some time past with the Colorado Iron Works Company, Denver, Colo., has been made manager of the mine and mill of the Wheeling Milling Co. at Mine La Motte, Missouri.

MINING SUMMARY.

Specially Compiled and Reported for the MINING AND SCIENTIFIC PRESS.

ARIZONA.

A canvass made of the copper producing companies of Arizona shows that the year's output for 1905 may aggregate 246,500,000 pounds. Montana heads the column with an output estimated this year of 325,000,000 pounds, giving Arizona second place with 246,500,000 pounds and Michigan third place with an estimated production of 225,000,000 pounds. The production as based upon the output for the eleven months of the year with December's production estimated gives the following results for each of the individual producers:

Company—	Pounds. 1905.	Pounds. 1904.
Arizona Copper Co.	30,000,000	29,000,000
Arizona Commercial Co.	750,000	.....
Calumet & Arizona	34,000,000	31,600 000
Copper Queen Co.	76,000,000	58,000 000
Detroit Copper Co.	18 000,000	18,000,000
Imperial Copper Co	6,500 000	2,500,000
Lake Superior & Pittsburg	1.700,000	.....
Pittsburg & Duluth	550,000	.....
Shannon Copper Co.	12,000,000	11,900,000
Old Dominion Copper Co.	30,000,000	16,000,000
United Verde Copper Co.	30,000,000	30,000,000
Miscellaneous.	7,000,000	4,000,000
Totals.	246,500,000	201,000,000

In the miscellaneous output are included the figures represented by those other enterprises that had occasion to ship their ores out to other smelters, principally to the El Paso plant in Texas. The Arizona Commercial Co. at Globe is planning to sink its main working shaft from the 600 to the 800-foot level. At present the company is shipping 100 tons of sulphide ores to the Old Dominion plant and thirty tons of silicon ores to the Phelps-Dodge smelter at Douglas. Within four months the property will be shipping 250 tons daily. At the Calumet & Arizona Co. much improvement was accomplished during the year; a new furnace was blown in, making four in commission, the latest addition having a capacity of 300 tons per day. The new furnace will be used largely on ore from the Lake Superior & Pittsburg and Pittsburg & Duluth companies, which are likewise included in the Bonanza Circle group of mines. The Copper Queen Co. has eight furnaces at Douglas, though the management does not expect to have more than six of these in commission at any one time. The company's output is now averaging over 7,000,000 pounds of copper per month. The Imperial Copper Co. plans a 300-ton smelter upon the company's mines at Red Rock. Both the Lake Superior and Duluth properties commenced their active careers this year after having been opened up in connection with the operations of the Calumet & Arizona Co. at Bisbee. The new Calumet & Arziona furnace is taking their ore at Douglas. The Shannon Copper Co. was delayed during the year through floods, and the output will be at least 3,000,000 pounds less than anticipated for 1905. The company intends putting in its own converter in 1906.

Cochise County.

It is reported that the Black Mountain M. Co., of Bisbee, will begin crushing low grade gold ore January 1. Mill and mine have been under construction since October, 1904. The cyanide plant, for treating tailings, will be ready in March next.

The 24x8-foot shaft of the Tombstone Con. Co. at Tombstone, being sunk by three eight-hour shifts, has been sunk 75 feet below the 800-foot level. They are making on an average from 8 to 10 feet per week. The pumping record has been increased, but the pumps have no trouble in handling the water, which so far has not interfered with the work. Most of the water is being pumped from the sump on the 800, the water collecting there from the various drifts on that level. The work at the mill is rapidly being completed and the management expects to be dropping stamps by January 1.

Graham County.

The Stevens Copper Co. has thirty men at work on its properties 2 miles from Metcalf. The country rocks are granite overlaid by Cambrian quartzite and Silurian limestone, with much faulting and intrusive porphyritic dykes, ores occurring near the fault lines. C. E. Stevens is superintendent.——A survey has been commenced for the tramway to connect the mines of the New England & Clifton Co. with the Clifton smelters. It is understood that construction work on the road will be commenced soon.

Mohave County.

A shipment of ore has been made from the Redemption mine at Chloride by R. J. Ferguson.——The Queen Bee and Keystone mines at Mineral Park, near Kingman, are being worked by J. Detar.——It is reported that ore has been struck in a crosscut from the 270-foot level of the West Gold Road mine at Vivian.——The Merrimac mine at Chloride is to be unwatered and work resumed.

Yavapai County.

J. F. Caspar, superintendent of the Redman M. M. & S. Co., near McCabe, intends putting in a gasoline hoist. The company is drifting from the 200-foot level.

After the recent stockholders' meeting of the Stark G. M. Co. at Massillon, Ohio, with mines in the Black Canyon district near Turkey, E. H. Smith, the president, telegraphed to the agent of the company in Prescott that it was decided to resume operations immediately and instructed him to perform the annual assessment work as well as to arrange other matters preparatory to resumption. The Stark Co. owns the Hidden Treasure gold mines, and has put up a 10-stamp mill and cyanide plant.——The Pittsburg-Arizona M. Co. has purchased a 60 H. P. engine, a compressor, two power drills, a pump and a hoist, which will be put in as soon as delivered. Operations will be resumed. The properties of the Pittsburg-Arizona M. Co. are in the Black Hills, near Jerome.

CALIFORNIA.

Butte County.

The Ohio Gold Dredging Co. of Los Angeles has bought 900 acres of land on Butte creek, 8 miles east of Chico, and have contracted for a dredger capable of handling 3000 cubic yards daily.

Calaveras County.

(Special Correspondence).—The smelter of the Union Copper M. Co. at Copperopolis has been started and is running successfully. This company has the Union, Keystone and Empire mines. G. McM. Ross is superintendent.

Copperopolis, Dec. 20.

El Dorado County.

Development work is being pushed at the Rosencrans mine, near Garden Valley. —— It is reported that another rich strike has been made in the Beattie mine at Georgia Slide. —— The Coloma M. Co. has been formed by N. P. Bailey, F. D. Parker, C. L. Whipple, F. B. Levitt and F. C. Farnell, all of Los Angeles. —— The Lone Star mine, 5 miles east of Placerville, is running under the management of William Rupley.

Mono County.

The Syndicate mine and mill, near Bodie, have been closed down indefinitely.——Lack of water has curtailed operations at the Standard Consolidated mine.

Nevada County.

The New York-Grass Valley M. Co. expect to resume work soon. Edwin Fernald has charge at Grass Valley. ——Work at the Chicago mine, near Grass Valley, is said to be promising.——The Union mine on Banner hill, near Nevada City, is being pumped out.

The Gold Flat Con. Quartz M. Co. will reopen and develop the Gold Flat mine, near Grass Valley, under the direction of Mark B. Kerr. A double-compartment shaft is down 370 feet, which will be changed to three compartments from the 370-foot level to a depth of 600 feet. A raise will be put through from the 370 level to the surface, enlarging that part of the shaft to three compartments also. There is a 10-stamp mill on the property.

At the monthly meeting of the Jenny Lind M. Co. of Grass Valley, A. J. Rowe was elected superintendent and F. J. Thomas to the board of directors. Retimbering the lower tunnel will soon be finished. During this period the mill will be put in shape to crush gravel. The tunnel is now in 1400 feet, whence a raise of 200 feet taps the gravel channel. From that point a shaft extends to the surface.

Shasta County.

The Bully Hill mine in the Pittsburg district has been opened to a depth of 900 feet, the upper levels being worked by tunnel and those below the 300 by shaft. It was first opened as a gold mine, but with the development of copper values operations were increased. The compressors and hoist are run by electricity.——The Rising Star and Copper City mines are also furnishing ore for the smelter. After heap roasting the ore is treated in two McDougal calcining furnaces and two 42x120-inch blast furnaces, giving a 35% to 50% copper matte which is converted to 98% blister copper and shipped to the De Lamar refinery in New Jersey. J. B. Keating of De Lamar is superintendent.

Sierra County.

(Special Correspondence).—The Sierra Buttes tramway at Sierra City has been finished and the new 40-stamp mill has been started. They will soon have the old 20-stamp mill repaired and resume crushing with it.——R. Phelan has his electric plant nearly completed and will soon be able to furnish power to mines in the Sierra City district.——The Mountain mine at Sierra City is running forty stamps on good ore.——The Sovereign Co. of Downieville is blocking out ore and preparing to build a mill in the spring.——At the Telegraph mine, near Downieville, the electric plant has been completed and sinking has been started.——The Gibsonville M. & Dev. Co. has begun work on the Gibsonville ridge to develop a part of the Thistle shaft channel. Power drills are to be put in. A mill to crush the cement is planned.

Downieville, Dec. 20.

Siskiyou County.

At the Drummer Boy mine, on Cherry creek, 8 miles southwest of Yreka, a 10-stamp mill is being put up. The property consists of eight claims—the Drummer Boy Extension, Antelope, Alice, Lily, Great Mogul, Ella J. Morton and Whitney quartz lode claims, and E. W. Emmons has charge of construction work. About 1000 feet of tunneling and raising have been done, chutes have been put in and track has been laid.——The Ball mine, near Etna, has been acquired by the Cons. M. Co., who will develop it under the direction of W. H. Young, superintendent King Solomon mine. ——At the Ethellium hydraulic mine on Horse creek, near Yreka, the 5-mile ditch and reservoir have been finished and hydraulic mining will be started by Manager F. C. Dilberger.

The demurrer to the complaint in the case of C. A. Mitchell and G. G. Skillen vs. G. V. Gray was recently overruled in the Superior Court and defendant allowed ten days in which to file an answer. This case involves the ownership of the Lanky Bob mine in the Sawyer Bar district. Skillen was the owner and gave an option to Mitchell for $10,000, half of which was to be paid in ninety days. Within a short time afterward he gave another option on the same property to defendant, Gray, for $12,000, Gray making a cash payment of $5000 and taking possession of the property. It is charged in the complaint that Gray obtained his option by misrepresentation. Before the expiration of the first option Mitchell tendered the $5000 stipulated in his contract and asked for possession of the property. Acting under advice of counsel Skillen accepted the money and then tendered the amount to Gray and asked for a cancellation of his contract. Gray refused and the present litigation followed. Mitchell & Skillen brought suit to annul the second contract and obtained an injunction against Gray, enjoining him from working, encumbering or disposing of the property pending the decision of the court. Defendant demurred to the complaint, setting forth that it did not state a good cause of action. The demurrer was overruled. Gray filed action to the complaint on December 6, denying all allegations of fraud and alleging that the first contract was a bare option, revocable at will by Skillen, and that the owner availed himself of that right when he gave the second option.

Trinity County.

Robt. Hicks, superintendent of the Hunter mine, in New River district, reached via Eureka or Denny, has six men at work.——The Mountain Boomer, in the same district, owned by the Bob's Farm M. Co., of which J. H. Byers is superintendent, has eight men at work. The mill has been shut down owing to the scarcity of water.

Tuolumne County.

J. H. Hall, superintendent Standard G. M. Co., plans an increase in the force at the company's mines, 5 miles southeast of Tuolumne. The track from the Hunter mill to the Hardtack mine has been extended to the Paymaster mine, and an air compressor has been put in.——The 5-stamp mill at the Los Angeles mine has resumed crushing.——The Confidence mill is running on ore from the upper levels. Drifting is being continued on the 900-foot level.——A 5-stamp mill has been put in at the North Star mine, southeast of Groveland. H. Argall is superintendent.

Yuba County.

The Marysville Gold Dredging Co. has bought 170 acres on the Yuba river, east of Marysville, adjoining lands now being dredged by the company. They have one dredger at work and expect to finish another soon.

COLORADO.

(Special Correspondence).—Arrangements are being made for building an electric line to be used for passengers and freight between Denver and Littleton, a distance of 12 miles. It is understood the line will extend to a coal mine which is owned and controlled by the company undertaking to build the road.——From now until next spring the usual number of fatalities may be expected as a result of snowslides. Already a number of deaths from slides have been reported.——A coal famine in Utah is helping many of the mines of Colorado dispose of their output and in many cases increasing the output of the coal mines. The railroads have been asked to assist in relieving the situation.——A large electric power plant is being projected for Summit county. It is the intention of the company to furnish power to Leadville, in Lake county, as well as the mines in Summit and adjoining counties. It is understood the Wilcox Co., operating near Georgetown and Silver Plume, are at the head of the scheme.

Denver, Dec. 18.

Clear Creek County.

B. J. Hatmaker of Buffalo, N. Y., a stockholder in the Covode M. Co., whose properties are on Miller mountain near Empire, accompanied by A. Sylvester of Georgetown, is inspecting the properties of the company and making arrangements to resume operations.

Eagle County.

The Pittsburg Gold-Zinc M. Co., working the Iron Mask group at Gilman, will build a zinc separating mill at the base of the tramway and across Eagle river. The waters of Fall creek have been appropriated and a ditch and pipe line surveyed.

Grand County.

A new mining district, at the head of St. Louis creek, about 5 miles south of Byers peak and about 14 miles southwest of Fraser, has been discovered by O. T. Bibb and John Troutt. It is tributary to the Moffat road and gives promise of developing large deposits of low-grade gold and copper-bearing ores. Owing to deep snow, nothing can be done there this winter, but as soon as it is possible to get there in the spring the discoverers will prospect the ground thoroughly.

Gunnison County.

The 30-ton Maple Leaf cyanide mill at Sillsville, near Gunnison, will soon be completed.——Beyond Sillsville at Cooper mountain, Colorado Springs people have put in a stamp mill to treat ores from property in that belt.

The Cleveland Mines Operating Co. has leased the Victor mine at Whitepine and has commenced development. The main shaft on the property is 835 feet deep. L. B. Stitzer is superintendent.

Huerfano County.

The Black Diamond coal mine, near Ruddy, has been purchased by George Dick, William Dick, J. R. Dick and F. R. Roof. The new owners of the property have changed the name to the Cucharas Coal Co. William Dick will have active control, and the general office and the company supply store will be in Walsenburg.

Lake County.

The 1100-foot drift connecting the Cloud City and the Home Extension shafts, in Leadville, has been completed and cars are running from one mine to the other. The connecting drift is 600 feet below the surface sloping towards the Cloud City, so its pumps can carry off the water. A cage is being built at the Home Extension. Hoisting is to be commenced. The north drift of the Cloud City is to be extended.

The Penrose people at Leadville have succeeded in placing the last large compound pump at the lower station of the shaft, and the mine is now in a position to control the water situation of the downtown section. There are three large pumps at the station, one triple expansion and two large compound, with a combined capacity of 2500 gallons per minute. With the setting of the pumps it is taken for granted that the water situation in the downtown section is controlled and that properties in the neighborhood which desire to sink to the depth of the Penrose can now do so without being bothered with the water problem. The Penrose will now start drifting toward the Coronado and to the south to the end lines of the property, to develop the

ore that has been opened in the Coronado. When the drift reaches the Coronado, nearly 1000 feet, it will be beneath the shaft about 100 feet and an upraise will be made to connect the two; the water from the Coronado will then be diverted to the Penrose and this shaft will be used as a pumping shaft to raise the water from the different properties owned by the Western M. Co. in the downtown section.

Two new furnaces are in course of construction at the Arkansas Valley plant, and when completed will give the plant eleven blast furnaces, which will help the condition at Leadville. It is understood that the smelting trust will enlarge the Eilers plant at Pueblo at the beginning of the year and bring it up to date. The Philadelphia plant will not be put into commission, as it would cost too much to remodel it. If the Eilers is enlarged it will be of great benefit to Leadville, as a heavier tonnage monthly will be the result.

Dolores County.

Preparations for sinking the Atlantic Cable shaft at Rico have been completed. The tank has been put at the 102-foot level to catch all surface water, and the shaft has been protected by connecting the various drifts in the 60-foot level with the watercourse which passes through the mine at that level. The building around the gallows frame has been enlarged.——Jumbo No. 3 vein, of the Enterprise group of the United Rico Mines Co., is making regular shipments of high-grade ore to the Durango smelter.

Gilpin County.

The Perigo mill in Gambell gulch, near Central City, has been running on ore taken from the Perigo mine by leasers.

Ouray County.

The forty-ounce gold ore recently struck on the Hultana, near Ouray, gives promise of continuing. The property is being worked by J. H. Henler under bond and lease.——A company is being organized to equip and work the Sutton group on Mount Hayden, near Ouray.

Work in the crosscut tunnel at the Bankers' National mine, near Ouray, has stopped, the breast being 2200 feet from the mouth of the tunnel and the Modoc and Babcock veins having been cut. J. R. McNeill is superintendent.——Ore has been struck in the Midnight, one of the Mineral Farm group, near Ouray, and owned by W. J. Lucas of St. Louis. The ore was struck in the shaft, which is 70 feet deep and was sunk at the breast of the 240-foot tunnel. B. H. Dupraw is superintendent.

Routt County.

In the the spring a dredger will be started at Hahn's peak, the first in the eastern end of the county. C. R. Hutchinson and Samuel Stevens of Cripple Creek, who have been developing a property near Hahn's peak, have a ten-year lease from Michael Condelin and Charles E. Blackburn on 425 acres of placer ground on Beaver creek, near Bugtown, and intend to put in a steam dredger with a capacity of 1000 yards a day.

San Juan County.

The Kendrick-Gelder smelter, north of Silverton, will be blown in the first of the new year, after an idleness of three years. Owing to the shut down, many of the smaller producers of the camp have been unable to operate because of the excessive freight rates on getting their mineral to the outside smelters for treatment. The smelter has been leased to a company headed by William Buecher of Denver and the work of overhauling the plant and getting things into shape for blowing in has been commenced. Manager Buecher is personally conducting operations. It is stated that the copper matte furnaces of the smelter will be changed into lead furnaces and that roasters will be built for the treatment of sulphide ores. Contracts are being closed with various mine managers to supply the plant with ore. The plant will be run independent of the smelter trust.

J. H. Terry & Sons, owners and operators of the Sunnyside mines, near Eureka, have started a tunnel which will be nearly a mile in length, to tap the Sunnyside at a depth 1000 feet below the present workings. The bore starts into Eureka mountain midway between the Sunnyside mill and the mine. It will probably take two years to complete the work.

The experimental 25-ton plant for the treatment of the iron-copper product of the Silver Wing mine, which has been under construction at the Silver Wing mill, near Animas Forks district, for the past two months, has been put into operation, and the results are said to be satisfactory. The method of treatment is known as the Waterbury leaching process, and consists of first roasting the ores, where sulphur is contained; second, by leaching with sulphuric acid, and third, the precipitation with sheet steel. The first run of the new plant was 10 tons of 7% copper ore, which was reduced to 95% pure copper in the operation.

San Miguel County.

Near Ophir the mines are receiving their customary winter development, and a few are making regular shipments of ore to the smelters.——G. B. Pickett, manager of the Carbonero group, near Ophir, is shipping one and two carloads a week to the smelter at Salida.——According to James Real, who has charge of the Suffolk-Globe group, near Ophir, owned by the Suffolk-Globe M. & M. Co., leasers are developing and blocking out ore in that property. The Suffolk 40-stamp mill will be started soon on ore coming down over the wire rope tramway.——Work on the Badger tunnel, which is in 2400 feet, is being continued with machine drills to cut the numerous veins traversing the Suffolk-Globe group at depths varying from 1000 to 2500 feet. It is hoped to cut the Golden Crown vein by driving 400 feet further.——The Telluride Gold Mines Co., through R. H. Wilson of Telluride, has let a contract for driving the crosscut tunnel on the Nellie Bly group 700 feet, when it is expected to cut one of the principal veins. This property is on Silver mountain, between the Suffolk-Globe group on the Ophir side and the Gold King mine on the Telluride slope.

Another rich strike is reported to have been made in King and Lindsey's lease on a portion of the Sheridan mine, on ths same vein and adjoining the Smuggler-Union on the north. They are making preparations to begin sinking the Mendota shaft, which is down a distance of 360 feet, 300 feet deeper. After the workings in the Sheridan are connected with the shaft, the product can then be handled and delivered to the surface for transportation over the tramway to the mill without any hoisting. The output of King and Lindsey's lease is supplying thirty stamps of the Smuggler-Union mills with ore. These mills, located at the head of the valley, 2 miles above Telluride, are treating from 400 to 450 tons daily. Robeson and Carter's lease on the Smuggler-Union is keeping sixty stamps pounding, and Wager Bros.' lease on the Smuggler and Sheridan dumps and the Seventy-Six claim on the Smuggler vein is providing thirty more with mineral. The ore incidentally encountered by the Goldfield-Rex M. Co. while prosecuting development, under its lease and contract, on the Smuggler vein 2300 feet vertically under the surface, supplies ten more stamps, and in a few days additional batteries will be started to dropping on the product of the Pandora Gold M. M. & D. Co., which is leasing the Pandora vein. The electric hoist which was recently put underground in the Union shaft, in place of the old steam plant, has been put in operation.

Summit County.

(Special Correspondence).—The Old Union M. & M. Co. concentrate returns show from 38% to 40% zinc and 30% to 40% lead. The steam-heating system in the mill has allowed running the plant in the coldest weather. The management is preparing to put in additional jigs. The main tunnel of the Old Union vein is in 1300 feet.——The first payment has been made by the Carrie M. & M. Co. of Breckenridge on the Carrie mine, on Wise mountain, near Breckenridge, to Westfall & Condon.——The Washington-Joliet M. & M. Co. are getting their water works into shape to resume milling.——The Wellington mine, near Breckenridge, operated by the Colorado & Wyoming Development Co., continues its shipments of high-grade lead and zinc ores.——The Masontown M. & M. Co. of Frisco is arranging to sink the main shaft to strike the main ledge of the mine in the sulphide zone. A hoist and pumping plant will be put in.——The main tunnel of the Square Deal M. & D. Co. is in 150 feet.——The North American Mines Co.'s main tunnel into the base of Peak 1 is in 520 feet.——The Mary Verne M. Co.'s main tunnel near Frisco is in 465 feet.——The King Solomon Tunnel & Development Co. has men drifting on the last ledge of ore cut through by the main tunnel.

Breckenridge, Dec. 18.

Teller County.

William Seallars and B. M. Morrell, lessees on the Geneva claim of Gold hill, Cripple Creek, have struck good ore at a depth of 150 feet. Sinking an additional 100 feet has been started.——Becker & Travell, who recently took charge of the Homestake mill, on Ironclad hill, Cripple Creek, expect to again have the plant running soon.——Superintendent D. J. Burt of the Henry Adney mine of Beacon hill gulch, near Cripple Creek, is making big shipments of high-grade ore from the 400-foot level.——A lease on the Agnes property, on the east slope and near the northern extremity of Beacon hill, has been obtained by Brown and associates. The lessees begin work in the north shaft, which has a depth of 200 feet. They propose to add another lift of 50 feet.——The granting of a lease to Sheehan, Day & Co. on the Bonanza Queen No. 2 causes the Jerry Johnson G. M. Co. to have all of its forty-one acres of ground under lease. The tract controlled by the company is 3500 feet long and about 850 feet wide, and beginning with the Jerry Johnson No. 2 and extending in the course of the exposed ore body to the Stratton estate at the base of Globe hill. The leases are for three years, with average royalties of 25%.——B. Shell, S. D. Crump and C. E. Harrison are crosscutting at a depth of 100 feet each from the shaft to cut a vein on the Little Joe claim of the Alert Co., on Ironclad hill. The prospects are very flattering for these lessees to get some good ore. They are located near by the W. P. H., Jerry Johnson and other well known producers.——The Hummer M. Co. of Loveland, operating on the Humboldt claim, on the north slope of Bull hill, is employing two shifts. A crosscut is being driven west.——The Ironclad Leasing Co., operating a lease on the Finn lode of the Royal Oak Co., on Ironclad hill, has made its initial shipment from the recent strike made at a depth of 200 feet. The drift has been driven west for 75 feet.——Another cyanide mill is to be built by the Exposition Mines & Leasing Co. on the site of the plant destroyed by fire several weeks ago. W. S. Walker is manager. The destroyed plant stood on the Los Angeles property of the Stratton estate, at the southwest extremity of Bull hill. It had been in operation but a few months when destroyed, along with the engine house and other buildings erected by the lessee. A new engine house is also to be built. The new plant will probably have a maximum capacity of 200 tons.

IDAHO.

Boise County.

The Black Pearl mill at Pearl has been in position for a month, most of which time has been devoted to adjusting the machinery. A loss of 2% of the values is reported in the tailings. The cyanide process is proving as successful as was hoped for. The main crosscut on the 400-foot level in the mine has not yet reached the large vein, but ore to supply the mill is being produced from the ledge already opened.——The Lincoln mill at Pearl has been in operation since the first of October, and during this time has demonstrated fully that the cyanide treatment is the best and most economical method of handling Pearl ores.——The Osborne at Pearl is preparing to put in a concentrating and cyanide mill of the same type as is in operation at the Black Pearl and Lincoln mines.

Idaho County.

The Syndicate M. M. & S. Co. has been formed, with R. H. Hillen of Weiser as president and James Potter as superintendent. The company will work the Syndicate group in the Mountain View district, 90 miles north of Weiser, on the western slope of Seven Devils range, and 1 mile from Snake river, on Three creeks.

Shoshone County.

R. H. Pascoe, superintendent of the Federal M. & S. Co.'s mines at Mace, has finished part of the shaft repairs. The shaft in the Mace mines is down 2300 feet vertical. This shaft had gradually become twisted and drawn so that portions of the wall plates had to be cut away to allow the cages to pass through. In 1904 the problem the management had to solve was the retimbering of 200 feet above the 400 station, and at the same time maintain the regular daily output. This task was accomplished without closing the mine for a single shift. A double-lined shaft was constructed, with an outer and inner lining. The inner opening, through which the cages are operated, has an open space all around it, and is braced with heavy timbers against the outer wall. Access to this space can be had at any time to repair or replace the braces. In case of movement these can be shortened on one side, thus relieving the shaft from any side pressure. This mine works nearly 400 men, and produces an average of 15,000 tons of ore daily. This season Mr. Pascoe is retimbering another part of the shaft between the 800 and the 600 levels. He is employing the same tactics he used in the work done last year, except he is enlarging the compartments 8 inches to give the cage more free space.

The Cœur d'Alene L. & S. M. Co. has been formed by J. M. Porter and Walter J. Nicholls, both of Spokane, Wash., to acquire ownership of the Kate, Helen, Hannah and Mary lode claims, in the Hunter mining district.

Nine Mile creek joins the South Fork of the Cœur d'Alene river at Wallace. There are on the creek three large concentrators. The nearest to Wallace is that of the Pittsburg Lead Mining Co. The next belongs to the Rex Co., the old Sixteen-to-One mine, and the third is that of the Success Co., the Granite mine. The Pittsburg Lead Mining Co., which owns the California and Black Cloud mines, also owns the Panhandle group, to the east, and a group of fourteen claims located during the past summer, to the west. At the California-Black Cloud group, eighty men are employed in the mine and mill. Two hundred tons of ore are produced daily and 600 tons of concentrates are shipped monthly to the smelter. The mill has recently been rebuilt, is operated by electric and water power, and has been connected with the Nine Mile branch of the Northern Pacific Railroad by a short spur. H. F. Samuels of Wallace organized the company working the Success. The ore carries more zinc than lead, and the Success mill now saves both the zinc and the lead.——The Rex is being worked under lease and contract by Theodore Anderson. The mill is not in operation. Among mines in this district being developed are the Tamarack & Chesapeake, the Custer, the Ruth, the Treasure Vault, the Shoshone and the mines of the Idaho-Los Angeles Co.

The Snow Storm mine, near Mullan, has been producing copper for eighteen months. The average value of the ore shipped has been 5% copper, seven ounces silver and $2 to $3 in gold. All of the ore shipped from the Snow Storm mine has so far come from the No. 2 tunnel. This level, with the ore bodies above it, is under lease to J. H. Howard & Co., who have developed and equipped it. The lower workings of the mine are being driven by the company, there being no lease on this portion of their ground. The No. 3 tunnel cut the ledge at a depth of 1072 feet and is being connected with the No. 2 level by an upraise, about half completed, the distance between the two levels being over 600 feet. The No. 4 level, which will open the ledge at a depth of 1700 feet below the apex of the ore body, has been begun and is now in several hundred feet. It will be over 3100 feet long. The leasers have equipped the mine with a tramway from the No. 2 tunnel to the Northern Pacific Railway siding of Larson, where their ore bins are located and where they have also put up a leaching plant, which is now making its preliminary trials. The company is arranging for the purchase of an air compressor.

Washington County.

The Iron Springs M. Co. has thirty men employed and will use that force the entire winter. Its new mill has been completed.——The Gold Coin Co., operating at Black Lakes, is well in with its 600-foot tunnel.

MONTANA.

Fergus County.

The Argus estimates that the metal production of Fergus county for 1905 will be $1,300,000, this including the gold from the two cyanide camps representing the Kendall, Barnes-King and Gold Reef Cos. In addition to this, a number of shipments to the Helena smelter were made by the Globe & Maginnis and War Eagle, at Maiden.——The Kendall shaft has been sunk nearly 700 feet, under the direction of H. H. Lang of Kendall. Drifting is to be started from the 700-foot level.——Ore has been proven in the Moccasin Mountain mine near Kendall by means of diamond drills, and the mine is to be opened up under the direction of W. G. Moore.——There are 85 men at work at the Gold Reef mine at Gilt Edge, under the management of H. M. Rae.

Granite County.

The Hope hoist, near Phillipsburg, has been started up and work resumed in the Hope shaft, which was abandoned several years ago on account of water. Since then the water has practically disappeared, there being scarcely 8 feet in the bottom of the shaft. When it was decided to abandon work, the water rose so rapidly that it flooded the pump and station before the machinery could be hoisted to the surface. A. J. Jose and J. P. Beaupre, former hoisting engineers at Granite, are in charge of the hoist. The company is experimenting with ore from the upper level in the shaft. It is base, but carries fair values, including some copper. It is stated that the company will make further tests with concentration and for this purpose the west end of the Hope mill is being reconstructed.——The Tussle M. Co., operating the Wahlgren property at the head of Little Gold creek, near Royal, is shipping regularly three cars of ore per week.——C. M. Schmille of Royal is running a tunnel on the Mollie Gibson claim.

Silver Bow County.

(Special Correspondence).—The fear that the copper deposits in the Butte district are growing poorer with depth, and that they might in time become exhausted entirely, has been dispelled by a strike made in the Anaconda mine at a depth of 2200 feet. For many months the company was running a crosscut to the vein at that depth, and recently cut into the ore body. The total width at that point has not yet been demonstrated, but it is believed to be between 30 and 50 feet wide. Much of the ore runs 15% in copper, and the whole vein characteristics are identical with those on the upper levels of the mine. The shaft of the Anaconda mine has reached a depth of 2440 feet, and the company will now run another crosscut from the 2400-foot level and open the vein at that depth.——The East Butte Mining Co., which has under option a number of small mines in the southeastern portion of the city, has secured 122 acres of ground additional, making between 300 and 400 acres in all now under option. The mines, which are being worked by leasers at present, are shipping about 150 tons of ore a day.——The Washoe smelter, operated by the Anaconda Co., produced monthly during 1905 copper to the value of $2,780,000; gold to the value of $95,000, and $432,000 worth of silver. Daily the smelter has received from the Butte mines 8000 tons of ore, and daily consumed 600 tons of coal, 400 tons of coke, 1600 tons of limerock, 190 tons of flue dust, and produced an average of 500,000 pounds of copper per day.——The North Butte M. Co. has completed the work of reconstructing its main shaft, and has begun hoisting ore through it again, but using the old machinery. The new hoist, which was promised for delivery on the 1st of December, has not yet arrived in Butte. For four months the North Butte hoisted its ore through the shaft of the High Ore mine, an Anaconda property, paying $10,000 a month for the privilege. That sum will now be saved. The output of ore has been increased from 550 tons a day to 900 tons, and when the new hoisting plant is installed the output will be raised to 1200 tons.

Butte, Dec. 18.

Zinc ore is being shipped by the Montana Zinc Co., which is operating the Alice mine under a lease. The ores treated thus far by the company are from the Lexington mine, but the plant will soon be in shape to run to its full capacity of 150 tons daily, and will be ready to treat the ores from other Butte mines. This is the only plant in the State treating zinc ores. Other experiments have been tried in the State, but this is the first to meet with satisfactory results on a large scale. The process is one of concentration and reduction, and the ores under treatment have shown values of 18% to 20% in zinc, running from $4 to $5 per ton. The plant has been operated on an experimental scale ever since its installation last August, and is now running about 80 to 100 tons of ore daily. The pay roll of the company at present numbers about forty-five men, and this number will be increased when the mill is run to its full capacity. C. B. Wisner is president of the company and B. T. Spaulding is general manager.

Teton County.

The Spokane Petroleum Co. intends to start drilling near Lubec siding, on the Great Northern Railroad. No oil has been found beyond seepages from the shales, but it is hoped to strike oil at a depth of 800 feet. W. C. Howell is superintendent. Three oil rigs are drilling at Swift Current and one at Lubec.

NEVADA.

Esmeralda County.

The Silver Peak G. M. Co., owned by the Blair estate, has entered a $160,000 damage suit against the Mohawk-Alpine M. Co., which is charged with having entered upon a ledge having its apex within the Silver Peak's Western Soldier claim, and taken out valuable ore. An injunction preventing the Mohawk-Alpine Co. from further operation on the ledge is being asked.

Work has been started on the Ridge lease on the Daisy No. 1 at Diamondfield, under the direction of W. Goepp.——Sinking has been resumed in the Portland shaft at Goldfield, and will be continued from the 250 to the 500-foot level.——A 25 H. P. hoist is to be put in at the Keystone mine at Goldfield, and the shaft will be sunk to a depth of 200 feet.

The Bullfrog district is 75 miles from Goldfield and 125 miles from Las Vegas, and freight rates are high. It costs $35 per ton to ship and smelt the ores of the district, and the mine owners feel that it is best to hold their ore and treat it on the ground. All the big companies are planning for mills as soon as the railroad gets there, and Humboldt Gates, president of the Bullfrog Townsite, Water & Ice Co., expects to put in a custom mill soon. There are three towns in the district—Bullfrog, Rhyolite and Beatty. At Beatty the Montgomery-Shoshone has been opened to a depth of 150 feet and has shipped ore worth $76,000, and has blocked out much high-grade ore. A 500-ton mill is to be built at Beatty. E. A. Montgomery is president and manager, and M. Hoveck is superintendent.——The shaft of the Shoshone-Bullfrog is down nearly 100 feet and crosscutting is to be started. A gasoline hoist is to be put in and the shaft sunk to a depth of 250 feet. It adjoins the Montgomery-Shoshone. T. F. Bonneau is president.

The Florence mine at Goldfield has been opened up to a depth of 350 feet, sulphide ore being struck at 130 feet. A 40 H. P. electric hoist, an electric blower and pump have been put in. The pumps have been handling 4000 gallons daily. A mill is being put up to treat ore from all the claims of the Florence group. In two years this mine is said to have produced $1,850,000, of which $1,500,000 was paid to leasers. F. Oliver is superintendent.——The Combination is credited with having produced $1,800,000. Work was commenced on the shaft in October, 1903.

Lincoln County.

Johnson & Morton, owners of the Last Chance claims, northwest of Moapa, have sold the property to McBride, Long & Wilberforce of Philadelphia. The purchasers intend making shipments of the ore already extracted, four carloads. They expect to put in a 40-stamp mill within 3 miles of their claims for the treatment of the ore blocked out.——Morris & Denny, owners of the Green Light claims, west of Caliente, have struck ore showing good values in silver and gold at 60 feet depth.

The Panaca mine, 16 miles north of Caliente, has been sold to Idaho people. McLain & Zimmermann, owners of the Windsor mines, southwest from Caliente, have sacked fifty tons of gold ore showing values of from $4 to $123 per ton, taken from a 3-foot ledge, on which they are drifting.

Nye County.

The Tonopah M. Co. is working through shafts on the Mizpah, Silver Top, Desert Queen and Red Plume claims, the principal work being done at the Mizpah. This shaft is 850 feet deep, the Desert Queen 1100 feet, the Silver Top 750 feet and the Red Plume is a new shaft 450 feet deep. The ore bodies are the largest in the camp, ranging from a few feet to 30 feet wide, the values going from $40 in milling ore to several hundred dollars in the shipping ores. F. A. Keith is manager of the company and B. W. Turner is superintendent. The company is putting up a 100-ton mill at Millers, 14 miles northwest of Tonopah. An electric power plant has been built at Millers to furnish power for the mill and the mines at Tonopah, where electric hoists are being put in. The company built the Tonopah Railroad, 60 miles from Tonopah to Sodaville, to connect with the Virginia & Truckee road. It has been changed to a standard gauge and connects with the Southern Pacific at Mina and has been extended to Goldfield, 30 miles south.——The Montana-Tonopah has been opened up by five levels, the deepest being at 765 feet, and over 14,000 feet of development work has been done. Much ore has been shipped and there are 12,000 tons of milling ore on the dump. A steel head frame and an electric hoist, good for 1500 feet, is to be put in. A mill is to be built in accordance with results of experiments being made on the sulphide ores. J. A. Kirby of Salt Lake City, Utah, is manager.——The Tonopah-Belmont is being worked through the Desert Queen shaft and is shipping 100 tons of high-grade ore weekly. The Jim Butler is being developed by the same company, but is not shipping. Milling ore is being piled up.——The McNamara is being prospected for the extension of the Tonopah ledge.——The Ohio-Tonopah is being opened up from four levels from an 800-foot shaft.

The Deseret News estimates the value of the Tonopah ore output during the past five years as $13,000,559, crediting the Tonopah of Nevada with $10,120,767, of which $3,000,000 was shipped by leasers, $863,927 was worked by leasers at the mill, $5,691,940 was shipped by company since expiration of leases, and $564,900 is milling ore on the dump. Similarly shipments and milling ore on the dumps credit Montana-Tonopah with $1,113,542, Tonopah-Extension with $926,700, Tonopah-Midway with $364,000, Belmont with $296,800, Jim Butler with $63,000, North Star with $64,250 and West End with $51,500.

White Pine County.

Ore carrying high values in silver, lead, zinc and gold has been struck by the National M. Co. of Cherry Creek in a winze sunk from the crosscut tunnel.

NEW MEXICO.

Sierra County.

At Shandon the Shandon M. Co.'s pumping plant is pumping 250 gallons of water per minute. They have a 7-inch pipe sunk down 60 feet, which taps the underflow of the Rio Grande river, and pump with a centrifugal pump into a cement tank and goes into the big pump, which pumps up the hill 2 miles into a large earth tank which stands 150 feet higher than the placer ground. This gives them a good pressure for their hydraulic plant. By pumping twenty-four hours they can have 750 gallons per minute for eight hours a day. The ground is rich and the company contemplate enlarging their plant. It takes about seven cords of wood per day to run the engine. J. H. Parker of El Paso is the general manager.——The Union-Esperanza Co. have a large pumping plant at the mouth of Apache canyon, near Shandon, using five pumps and pumping into an 8-inch pipe 2 miles in length, raising the water 400 feet. They have commenced to wash gold in the Union gulch, but they have not yet sufficient water to pump twenty-four hours. They are developing more water and will build a tank overlooking the Union-Esperanza ground.

OREGON.

Baker County.

Ten stamps have been running steadily in the new Tabor Fraction mill at Bourne. An additional extraction of 25% is expected with the cyanide plant to be put in. The Tabor Co. intends to spend $10,000 in extending the stamp mill early in January. The stamp battery is to be doubled and a cyanide section added. The ore for milling is being taken through the E. & E. tunnel under lease, which taps the Tabor vein at 300 feet. A tunnel has also been leased from the owners of the Victoria Co., and this is being extended to tap the Tabor vein at 700 feet.

Josephine County.

An additional 10-drill compressor, pump and electric transformers at the Granite Hill mine, near Grants Pass, are being placed by Superintendent Wickersham. Work is being done on the 500-foot level. The twenty stamps of the mill are operated continually, and sixty men are employed.

Lane County.

W. B. Dennis, owner of the Blackbutte quicksilver mine, 15 miles southwest of Cottage Grove, says that a number of important improvements have been commenced or are contemplated at the mines. Men have begun clearing ground for the new furnaces, which are Mr. Dennis' own invention and which will be put in next summer. A new surface tramway will be built from the 900-foot level of the workings to the reduction works, the present aerial tramway being of insufficient capacity to handle all the ore desired. The new tram will haul between 250 and 500 tons of ore a day. An extension of the flume for the hydro-electric plant will be 3500 feet long.

UTAH.

In some approximate summaries, the Deseret News estimates Utah's metal output of 1905 as follows:

Gold, 347,353 ounces at $20.67 per ounce	$ 7,180,786 51
Silver, 14,412,928 ounces at 59 76 cents per ounce	8,613,165 77
Copper, 57,267,706 pounds at 15.341 cents per pound	8,785,558 78
Lead, 96,661,605 pounds at $4 551 per 100 pounds	4,399,069 65
Zinc, 13,476,129 pounds at 5 828 cents per pound	784,984 52
Quicksilver, 1000 flasks at $45 per flask	45,000 00
Totals	$29,808,565 23

Juab County.

The Lower Mammoth at Eureka has contracted with the Murray smelters for the reduction of the ore bodies opened up on the 1400 and 1500-foot levels and below the latter level. A crosscut is being driven east on the 1500-foot level, at the bottom of the winze which was sunk from the 1200-foot level.

Salt Lake County.

The foundations for the American Smelting & Refining Co.'s new smelter at Garfield will be completed in two months. The excavations made necessary for the big plant have been almost finished. This work extends over several acres. The construction company is using eight locomotives, 125 teams and three steam shovels, and 350 men in addition to the 350 regularly employed by the American Smelting & Refining Co. and by the sub-contractors. The site of the smelter, on the narrow strip of land between the Oquirrh mountains and Salt lake, has made necessary a great deal of filling in, which is being taken from the grade of the new Western Pacific Railroad, as well as that taken from the west and southern portions of the smelter is being utilized. The company has not yet solved the water problem. Two boring outfits are at work, one near the lake and the other at a considerable elevation. No water fit for use has yet been struck and all drinking water is now shipped from Salt Lake City. The company is looking for a daily supply of 2000 gallons per minute. Common labor is paid for at the rate of from $2 to $2.50 per day of eight hours. Aside from the three office buildings now under construction, there will be nine big buildings. Of this number, the Minneapolis Steel & Machinery Co. has undertaken the construction of seven. The blacksmith shop, practically completed, occupies space 45x75 feet and is constructed of steel and brick; the machine shop, to be equipped with every modern device, is nearing completion. The dimensions of this building are 80x195 feet. The power plant will cover 130x256 feet and is to contain all of the steam and electrical power equipment; the building that is to contain the McDougall roasters will cover ground space of 60x222 feet; there will be two sampling mills, each of 70x82 feet dimensions, while the main building of the lot, to contain the reverberatory, blast furnace, converter and bullion departments, will rest on concrete foundations within the area of 360x305 feet. The carpenter shop, a wooden structure, is completed and in use. The building is 30 feet wide by 80 feet in length; the storehouse of the company is also finished and is 44 feet wide by 110 feet in length. In the construction of the foregoing buildings, 4000 tons of steel structural material will be used. The stack, which is to stand at an elevation above its base of 300 feet, is to be connected by a system of flues 2000 feet in length, to which will be attached bins for the collection of the dust. The inside measurement of the stack at the base is 30 feet, tapering gradually toward the top.

The New England Gold & Copper Co. intend to keep their mill at Bingham running throughout the winter.

The Deseret News describes Bingham as a camp of tunnels. In the Utah Consolidated mine six tunnels are in operation. Its No. 7 tunnel is the lowest one, and is the main avenue through which the ores are taken from the mountain. All the tunnels are connected and ore mined in the upper one is dropped through chutes to the main tunnel level to be moved to the surface. A winze has been sunk 200 feet below the No. 7 level to what is known as the No. 9 level, and late developments to this portion of the mine have added to the ore reserves. The distance between the upper and lower levels is 650 feet; the lowest tunnel (No. 7) is 2500 feet in length, while the others range from 1000 to 2100 feet. The total underground workings is estimated to be 12 miles. In the mine have been opened six distinct ore bodies, each independent from the other. The largest of these is 340 feet in length, 220 feet at its greatest width, and has been followed vertically over 400 feet. The top-slice caving system, common in the Lake Superior regions, is used in the operation of the mine, as well as the system of square set rooms and filling. The contract system in the employment of miners has proven satisfactory both to the company and its employes. The ores, on being mined, are carried to lower Bingham over an aerial tramway to the ore bins located there for loading onto cars of the Rio Grande Western railroad, whence the product is moved to the smelter, 17 miles away, for treatment. In July this year a smaller tramway was constructed and placed in operation. It was built across South Carr Fork canyon, connecting with a station on the Copper Belt railroad, and was put in for the purpose of facilitating the handling of lumber and supplies. This has proved to be decided convenience, and has done away with the uncertain service of teamsters.

The Parvenue, or deep tunnel, of the Utah Apex is being run and is to become the main exit for all ore extracted and will tap the ore bodies from 1000 to 1500 feet vertical depth. The adit is now in 700 feet, and it is figured it will be necessary to go 800 feet more to catch the first vein, when it will be continued on to other known ore bodies in the property, all of which can be cut by the same tunnel within a distance of 4000 feet. W. C. Orem is manager.——The 1800-foot Phœnix tunnel is in 500 feet. H. A. Gebhart is superintendent.——A 75-ton mill is to be put in to treat ore recently opened in the Silver Shield of Bingham. H. S. Joseph is manager.——The Ohio Copper Co.'s mill is handling 200 tons of ore daily. On the 400-foot level a crosscut has been run south for 450 feet, cutting the mineralized porphyry zone on which the Utah Copper has worked. This crosscut is still being extended, and is approaching the What Cheer vein. Werner Ziegler is superintendent.

——The 5-stamp test mill of the Boston Con. M. Co., at the mouth of the Tech tunnel at Bingham, is expected to be finished and in operation by the first of the year. It is hoped to finish the experiments by April, when a large mill will be built near Garfield, with an initial capacity of 5000 tons.

Work has been started on the first 3000-ton unit of the Garfield plant of the Utah Copper Co., 4 miles from the new Garfield smelter. It is planned to eventually build three more units of the same size, and which are to be supplied with ore from the company's mine in Bingham. The concentrator building will be 300x508 feet and is to contain the coarse and fine ore crushing departments, ore bin and table sections; the machine shop building is to be of steel frame, with the sides and ends lined up with brick and is to be 50x150 feet, while the warehouse is to be constructed entirely of steel and is to cover ground space of 50x105 feet. This unit is to be ready for operation not later than October 1, 1906, and the second unit will probably be ready to go into commission six months later. During the past year the company's mill now in operation at the mouth of Bingham canyon has been working on an average of 20,000 tons per month. Within the next year the Utah Copper Co. will have facilities for the treatment of 7000 tons of ore from its mine at Bingham and which will be transported direct from the mine over the tracks of the Rio Grande Western Railway. The Utah copper ores concentrate eighteen to twenty-four tons into one. Arrangements are being made to open the mine up by steam shovels, and opencut methods. The first big shovel to be employed in this great work is contracted for delivery before February 1. D. C. Jackling is the manager, Frank Janney is mill superintendent and G. O. Bradley chief engineer in charge of the mill construction.

Sevier County.

The B. W. & H. mine, near Richfield, shipped another carload of ore recently. This was taken from the winze in No. 2 tunnel. The vein has begun dipping to the south and east, instead of to the west, as was expected. An effort will again be made to tap this lead through the No. 3 tunnel.——H. W. Ramlose, president of the Lone Tree M. Co., is equipping the property at Gold Mountain for work during the winter.

Tooele County.

The Honerine drain tunnel at Stockton is in nearly 9000 feet.——Superintendent T. W. Galigher of the New Stockton mine, at Stockton, reports that the recently discovered shoots in the mine are showing up well. The shaft is being put in shape for more extensive development. An air compressor capable of operating eight drills is being put in. The new head gear on the shaft, which is 50 feet in the clear, will be completed within a month, and the new hoist will be ready for operation about the same time. The shaft is now down 850 feet, and the work of sinking it to a depth of 1000 feet will begin as soon as the new hoist can be operated.——Improvements during the past year at the Con. Mercur, at Mercur, include a new sampling mill and foundry. The Golden Gate shaft has been retimbered; the electric hoist was repaired at an expense of $2000 and the roof of the main building has been covered with corrugated iron. The mill handles from 600 to 800 tons of ore per day. The Manning mill was operated on ore from the old tailings dump during the summer. During the last fiscal year the Con. Mercur's Golden Gate mill produced $728,703.86 in gold. The ore values ran $3.95, while the extraction averaged $2.97 to the ton. The tailings averaged 98 cents. The company is employing 400 men at its mines and mills.

WASHINGTON.

Okanogan County.

(Special Correspondence).—The Grand View M. Co. has completed its 20-stamp mill, including the four Wilfley concentrating tables, but is awaiting the completion of a double-system aerial tramway and storage bins. The towers and upper terminal are up, ore bins have been built at the mine and timbers are being framed for the lower terminal and storage bins. Foundations have been made for the latter by cutting into the hillside at the rear of the mill, with faces respectively 30 and 40 feet deep. The cables and nearly all of the equipment have been delivered, after several weeks of delay along the railroads. The delays in transportation and sending some of the plans from Ohio have set back the completion of the tramway. The equipment has to be packed up a steep trail to the top of an elevation, about 1800 feet vertically higher than the mill. From the rail tower to the lower terminal will be a span of 3300 feet. A power house on Cecile creek, 6 miles from the mill, has been equipped for the generation and transmission of power and light and a pole line between the power house and the mill has been completed. The tramway, 1 mile long, will be used for carrying ore from No. 3 tunnel to the ore bins at the mill and also to deliver supplies from the mill to the mine. By the time that all of the construction is completed, the total expenditure by the company for mining, construction and equipment, also including ½ mile of a flume on Cecile creek, will exceed $100,000. The company owns twenty claims on one of the foothills of Mount Chapaca, 4 miles northwest of Loomis. The mill is near the north end of Palmer lake and is also 4 miles from the town. The gold occurs in iron sulphides distributed through the quartz gangue. No. 3 tunnel is in over 400 feet. It strikes the vein at 150 feet from the portal, where a crosscut has shown the vein to be 11 feet wide. This tunnel and lateral drifts and crosscuts will be continued.——The new Pinnacle tunnel is in 50 feet through slide rock and ten sets of timber are in place. It is intended to be driven 1500 feet to intersect several quartz veins. It will strike the principal one 700 feet below the apex.——The south crosscut of the Copper World Extension on the 200-foot level, in over 100 feet, has passed through several feet of hard and tough ground.——The Palmer Mountain Tunnel & Power Co. has received the first installment of machinery at the power house. The pole line is nearly finished.—— The Six Eagles M. Co. at its annual meeting at Nighthawk elected the following trustees for the ensuing year: C. A. Andrus of Seattle, M. Harman of Nighthawk, F. M. Dallum of Loomis, A. B. Lee of Wooster, Ohio, and J. A. Homer of Lodi, Ohio. Mr. Andrus is general manager. A new shaft will be sunk on the vein at the north end of the company's claims, to be connected later on with the tunnel, which is in 1800 feet. The original shaft on the Six Eagles group was sunk 225 feet on the vein. A shoot of ore was struck at the bottom and followed by a northerly drift.——The Mineral Hill M. Co. has U. S. patents for the Washington, Idaho, California, Oregon, Florida, New Jersey and Virginia mining claims and the New York millsite, in Salmon River mining district.——At the Douglas Mountain group good results have been obtained from shaft work and tunneling. The company is planning to put in power drills, work in the meantime being suspended. ——The Second Prize group, comprising the Columbus, Second Prize, Lorraine, North Star, Copper Dyke, Good Hope, United Verde and United Verde Nos. 2 and 3 claims, adjoining the Copper World and Copper World Extension mines on the north, is showing up well. A shaft was sunk on the Columbus and another on the Second Prize, both on the vein. The latter is down 190 feet, showing the vein dipping 60°. A tunnel follows the vein 70 feet at a depth of 50 feet. A crosscut lower down the hill has cut the vein where it is 12 feet wide. A drift will be driven from the point of intersection and an upraise made to connect with the bottom of the shaft, where the best ore was found. A discovery shaft has been sunk on the Lorraine claim and some quartz on the dump is mineralized with galena and chalcopyrite. On the southeast side of the ridge a hole 6 feet deep has been sunk in the cropping on heavy pyritic ore, which shows some copper. This will be intersected about 100 feet deep by a tunnel which has already been driven 128 feet. An easterly drift runs 43 feet on a stringer of ore which is rich in gold, copper, silver and lead, that may be assorted to good advantage. The main tunnel will be driven ahead and the bigger vein will be developed during the winter. —— The Kimberly group of fourteen claims in Golden camp, on Palmer mountain, has been bonded to a syndicate, through J. J. Bennett of Loomis. Two of the claims carry an extension of 300 feet of the Triune main vein. Another vein of silver-lead-bearing ore, 12 feet in width, has been traced 3000 feet through the Buzzard and one other claim of the group.——The Butcher Boy group of claims, in the Myers creek district, is reported to have been bonded by J. L. Cresson and J. J. Ritchie to parties from Greenwood, B. C., and the development of the property will be undertaken without delay.

Republic, Dec. 18.

Snohomish County.

The concentrator at the Ethel mine, near Index, has been started.

WISCONSIN.

Iowa County.

The Drybone or Centerville diggings, between Montfort and Highland, which have been worked for lead and zinc in a small way since 1836, are now to be worked on a big scale by the Red Jacket Lead & Zinc Co.——The Delta Lead & Zinc M. Co., in the same district, has a shaft down 50 feet.——The Consolidated M. Co. is building a mill at Montfort.

WYOMING.

Albany County.

The trustees of the Strong Copper M. Co. have ordered a concentrator for the ores of the Strong mine, 14 miles east of Laramie, and a mill will be put up in the spring. I. W. Swigart is general manager. The ore occurs in a fissure vein in pegmatite and contact veins between granite and limestone.

FOREIGN.

AFRICA.

Cape Colony.

The report of the DeBeers Con. Mines, Ltd., Cape Colony, for the year ending June 30, 1905, shows that there has been realized from the diamonds produced during the year $23,341,822, and after deducting expenses of $14,276,294 there was left a net profit of $9,065,528. Dividends paid absorbed $8,748,000, leaving $317,528 to be added to the revenue from other sources, making the total amount carried forward $415,370. The highest value per carat of the five mines producing diamonds was from Dutoitspan, which reached $16.98, and the lowest, from the Bulfontein, $8.48. The stock of blue ground and lumps on the floors on June 30, 1905, amounted to 4,474,259 loads. The contract with the Diamond Syndicate is still on a satisfactory footing, and the market for diamonds remains buoyant. The company's dynamite factory at Somerset West has increased its output considerably, 175,281 cases having been produced during the year, and there is every indication that this will be enlarged materially. The capital expenditure of the factory was entered at $3,645,000; but the company has actually spent, including stores on hand of $1,370,520, the sum of $6,358,158 out of earnings in bringing the factory up to its present state of efficiency. The litigation between the company and the Income-Tax Commissioners in England in regard to the assessment of the company's profit for income-tax purposes will be appealed to the House of Lords for a final decision. The company has a share capital of $21,870,000, of which $9,720,000 represents 800,000 preferred shares, and $12,150,000, representing 100,000 deferred shares. In addition there are outstanding $10,540,465 5% first mortgage debentures; $8,450,787 4½% South African Exploration debentures, and $708,977 4½% Bulfontein obligations; total, $19,700,229. Consequently the company is liable for shares and bonds to the amount of $42,570,229.

Transvaal.

Consul Snodgrass of Pretoria reports that the Premier Diamond M. Co. of the Transvaal has ordered an oil concentrator plant under the Elmore system to be used in the treatment of their diamantiferous ground. This comtemplated installation is interesting as being the first application of the Elmore process for the recovery of precious dumps of waste of the Premier, near Pretoria. A portion of this waste material was carefully re-sorted three times with a view to eliminating all diamonds from it as far as this was possible by hand sorting; then to this specially sorted waste was added a number of known weighed diamonds. The Elmore process was then applied, with a view to determine its efficiency for recovering the added diamonds. Not only were the added diamonds recovered, but, in addition, several other stones were also found. These trials were repeated many times, and proved that 100% recovery of the values was easily obtainable in every case. In addition to the advantages of the total extraction of the diamonds, the trials have shown that no preliminary sizing of the material to be treated is required, which is a distinct advantage over existing methods. Clean water, which is required in large quantities by usual methods, is unnecessary with the Elmore process. The plant lends itself to the prevention of theft of stones during treatment, because all the diamonds are finally collected in a small centrifugal separator, which can be easily locked up, to be opened only by the manager in charge, who from time to time can remove the precious stones from the centrifugal machine without their being handled by anyone else.

AUSTRALIA.

New South Wales.

In the half yearly report, dated October 9, of the Broken Hill Junction North, the manager states that the magnetic plant, which in its initial stages was operating on crude ore with negative results, was subsequently put through an exhaustive series of trials for the retreatment of middlings from wet concentration. High metallic recoveries could not be obtained, and it was found that a marketable zinc product could not be made, as the small quantity of zinc contained in the ore did not exist in a sufficient state of purity to suit the process. The magnetic plant was finally shut down on September 2, and is being dismantled. It was then decided to depend solely upon wet concentrating methods, and the change over was made with very little delay.——At Broken Hill Block 14 the diamond drill is boring westward between two legs of lode at the 500-foot level, in the vicinity of the southern shaft. It has already reached 140 feet in schist and massive feldspar. This bore will probably explore the ground for 500 or 600 feet.——The Mining Journal states that considerable interest is being taken in the Mines Amendment Act, recently introduced by the State Minister for Mines, and numerous suggestions are being made for its improvement, especially in the way of reducing the rentals of gold mining leases. It is also urged that any person who re-pegs an abandoned quartz lease should be exempt from rent or labor conditions. It is probable that a provision similar to that contained in the Queensland Mining Act will be adopted, to the effect that every mill owner should, within seven days after the expiration of each month, supply the Mining Registrar with a declaration of the tons of stone put through his mill during the month previously, the number of ounces of gold, whether such gold was retorted or smelted, when weighed, the office it was from, etc.; also, that every mine manager should do likewise as regards his output, and the number of men employed for the month, so that outsiders could obtain the fullest and most reliable information to enable them to judge if the industry was worthy of investment. It is likewise proposed that all gold buyers should be licensed, and compelled to keep a record of their purchases, with a view to checking gold stealing among a certain class of miners.

CANADA.

BRITISH COLUMBIA.

Boundary District.

W. C. Thomas, superintendent of the Dominion C. Co.'s smelter at Boundary Falls, expects to blow in the second furnace by the first of the year. The first furnace has been doing satisfactory work. Approximately 350 tons of ore a day have been smelted, all ore coming from the company's Brooklyn, Stemwinder and Rawhide mines in Phœnix camp, and Sunset mine in Deadwood camp, the latter being a flux. Sixty men are employed at the smelter. Matte from the plant is converted into blister copper at the British Columbia C. Co.'s works in Greenwood. With the blowing in of the second furnace the output of the mines will be doubled. The company has 160 men on its payroll. The monthly payroll is $10,000.——Early this year it was expected Boundary mines' ore output in 1905 would pass the million ton mark, and the total is over 870,000 tons, with shipments running over 3000 tons daily. November's output was not quite as large as in October. Following are the figures in detail for November: Granby mines, 67,246 tons; Mother Lode, 14,524; Brooklyn–Stemwinder, 1830; Rawhide, 930; Sunset, 360; Emma, 380; Oro Denoro, 30; Providence, 100; Last Chance, 45; Skylark, 65, and Crescent, 30; total, 85,540 tons.——For the first time in the Boundary's history the weekly ore shipments exceeded 25,000 tons for the week ending December 16. The output was: Granby mines, 19,703 tons; Mother Lode, 3296 tons; Brooklyn-Stemwinder, 1530 tons; Rawhide, 240 tons; Sunset, 600 tons; Emma, 287 tons. Total for the week, 25,636 tons; total for the year to date, 883,563 tons. The Boundary smelters treated ore as follows: Granby smelter, 18,622 tons; British Columbia C. Co., 2835 tons; Dominion C. Co., 2376 tons. Total for week, 23,827 tons; total treatment for year, 898,250 tons.

The directors of the British Columbia C. Co., Ltd., owning the Mother Lode mines and the smelter near Greenwood, have made definite announcement of the letting of contracts for the enlargement of the reduction works of the company. Three new blast furnaces have been contracted for, 48x240 inches hearth area, with a capacity of from 500 to 600 tons each per day. Charging will be done from side-dumping cars, which will be hauled by trolley, and molten slag will be hauled away from the furnaces by electric locomotives in cars of twenty-five tons capacity each. Each slag car will be provided with an electric motor for tilting the car. The new furnace building will be constructed of steel. Three

blowers have been contracted for, and will be driven by three 300 H. P. motors. At the smelter the ore bins will be reconstructed and made 10 feet higher. At the company's Mother Lode mine, Deadwood camp, it has been decided to substitute electrical power for the steam-driven compressor, and for this purpose a 500 H. P. motor will be put in. The ore crushers will be driven by the motors now in service at the smelter.

Vancouver Island.

(Special Correspondence).—The Tyee Copper Co.'s smelter ran eleven days during November and treated 2051 tons of Tyee ore, giving a return, after deduction of freight and refining charges, of $31,062.

Duncans Station, Dec. 16.

By the organization of the Howe Sound Copper Co., with a capital of $5,000,000, all the copper properties on Howe sound have been united under one management. The company will be incorporated under the laws of the State of New Jersey.

Yale District.

It is reported that platinum has been discovered in place at the Bear creek property of W. H. Armstrong and C. F. Law in the Nicola valley.

ONTARIO.

R. I. Jacobs, manager of the Jacobs cobalt mine, in the Cobalt mining district in the Temiskaming section, says that the seventeen mines comprising the Cobalt district are producing on a basis of $5,000,000 annually. The camp is a year old and the deepest level is 100 feet. The ore occurs in vertical fissures from 1 to 5 inches in width. The product is shipped to Newark, N. J. A committee of mine owners met at Cobalt on December 16th to decide as to the construction of a home reduction plant. The ore of the Jacobs property carries silver, 2% nickel, for which the smelter formerly allowed a small amount, but since cut off; 6% cobalt, for which they received 65 cents a pound, and as high as 70% arsenic, the allowance for which has been ½ cent a pound.

YUKON TERRITORY.

United States Consul-General Foster of Ottawa reports that a Canadian order in council abolishes for a period of ten years the royalty on gold produced from any quartz claim in the Yukon Territory in regard to which an expenditure of money has been made to the amount of not less than $25,000 within five years after the date of the order, or within five years after the date of issue hereafter of the patent. The royalty on copper mined in the Yukon is permanently abolished in respect to those claims upon which an expenditure of money has been made to the amount of $50,000 within ten years after the date of the order or after the issue hereafter of the patent. The royalties previously payable were 2½% on gold and 5% on copper.

Trade Treatises.

Bulletin 1047 from the electrical department of the Allis-Chalmers Co. at Cincinnati, Ohio, illustrates and describes the construction of the Bullock oil-insulated transformers.

The Bullock multipolar motors and generators are beautifully illustrated in construction in Bulletin No. 1046 of the Allis-Chalmers Co., Electrical Department, at Cincinnati, Ohio.

A. Leschen & Sons' Rope Co., 920 North First street, St. Louis, Mo., send their twenty-sixth wire rope list. This contains a condensed statement of facts pertinent to the construction and use of wire rope for all purposes.

Special Circular No. 55 from the Chicago Pneumatic Tool Co., Fisher Bldg, Chicago, Ill., presents pictures and descriptions of pneumatic appliances for foundry and concrete block work. It contains considerable practical information on concrete mixing.

The Abner Doble Company of San Francisco has issued an attractive treatise pleasingly illustrating the Doble tangential water wheel. Besides showing the details of construction, the booklet describes a number of typical installations. Useful tables and hydraulic data are included, making a valuable reference book for engineers.

Instruction Book No. 3022 from the Fort Wayne Electric Works, Fort Wayne, Ind., details the construction and operation of their Type M multiphase induction motors. Bulletin No. 1071 illustrates the varied uses to which small-power motors may be put; Bulletin No. 1072 shows the design and construction of Type S single-phase motors; Bulletin 1074 presents the multiphase induction integrating Tyke K wattmeters.

Commercial Paragraphs.

T. H. TRACY, formerly with Power & Mining Machinery Co., Milwaukee, Wis., is in Denver, Colorado.

W. J. SPENCER, Western representative Revere Rubber Company, is at the factory, Boston, Mass., from Denver, Colorado.

THE Cassel Automatic Water Motor Company of Seattle, Washington, report that they have now fifty plants running in different parts of the world under heads of water varying from 40 up to 700 feet. Among their installations on the Pacific coast are the following: Copper Mountain, Alaska, 350 feet head; Hedley, B. C., 400 feet head; Excelsior, Wash., 340 feet head; Gilligan Creek, Wash., 640 feet head; Loomis, Wash., 240 feet head; Kimball Creek, Wash., 300 feet head; Mineral Creek, Wash., 110 feet head; Stites, Idaho, 150 feet head.

Latest Market Reports.

SAN FRANCISCO, December 22, 1905.

METALS

SILVER.—Per oz., Troy: London, 30 1/16d (standard ounce, 925 fine); New York, bar silver, 65¼c, refined (1000 fine); San Francisco, 65¼c; Mexican dollars, 53c, San Francisco; 50½c, New York.

Silver is still higher than last week, a small fractional increase to 65¾c being quoted. If the demand for silver continues it is difficult to predict to what price the metal may go. The demand is at present chiefly from India, where the year has been a very prosperous one, necessitating the use of a largely increased silver coinage.

COPPER.—New York: Lake and Electrolytic, $18.50 @19.00; Casting, $18.12½@18.62½; San Francisco: $18.75; Mill copper plates, $21.00; bars, 21@24c. London: £79 5s spot per ton.

Copper still maintains its high price, being quoted in New York at $18.50@19.00. The visible supply has continued to shrink during the past three or four months, despite the heavy production.

Following are the figures of German consumption of foreign copper for the months January to October, 1905, as compared with the same period of time for 1904 and 1903:

	1905.	1904.	1903.
Imports, tons	92,187	95,797	70,958
Exports, tons	9,972	7,309	8,477
Consumption, tons	82,215	88,488	62,481

Out of the above, 77,172 tons were imported from the United States.

LEAD.—New York, $5.85; St. Louis, $5.15; San Francisco, $5.00, carload lots; 5½c 1000 to 4000 lbs.; pipe 7½c, sheet 8, bar 6¾c. London: £17 6s 3d ₱ long ton.

SPELTER.—New York, $6.60; St. Louis, $6.65; London, £28 12s 6d ₱ ton; San Francisco, ton lots, 7c; 100-lb lots, 7¼c.

TIN.—New York, pig, $36.25@36.37½; San Francisco, ton lots, 37c; 500 lbs., 38c; 200 lbs., 40c; less, 41½c; bar tin, ₱ lb., 42c. London, £165 2s 6d.

PLATINUM.—San Francisco, crude, $18.50 ₱ oz.; New York, ingot, $20.50 ₱ Troy oz. Platinum ware, 75@$1.00 ₱ gram.

QUICKSILVER.—New York, $40.00@$40.50, large lots; London, £7 5s 0d; San Francisco, local, $38.00@39.00 ₱ flask of 75 lbs.

BABBITT METAL.—San Francisco, No. 1, 10½c; No. 2, 8c; No. 3, 7½c; extra, 17½c; genuine, 32½c; Eclipse, 35c.

SOLDER.—Half-and-half, 100-lb. lots, 23.50c; San Francisco, Plumbers', 100-lb. lots 19.75c.

NICKEL.—New York, 55@60c ₱ lb.; ton lots, 40@47c.

ZINC.—Metallic, chemically pure, ₱ lb., 50c; dust, ₱ lb., 10c; sulphate, ₱ lb, .04c.

ALUMINUM.—No. 1, 99%, small lots, 37c ₱ lb.; 100 lbs.. 35c; 1000 lbs. 34c; ton lots and over, 33c, Pittsburg. No, 2, 90%, small lots, 34c; ton lots and over, 31c, Pittsburg.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, $18.35@18.85; gray forge, $14.60; San Francisco, bar, 3½c ₱ lb., 3½c in small quantities.

STEEL.—Bessemer billets, Pittsburg, $26.00@$27.00; open hearth billets, $27.00@$28.00; San Francisco, bar, 7c to 13c ₱ lb.

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 7¾c; less than 500 lbs., per lb., 8c; in 25-lb. tin pails, ½c ₱ lb. above keg price; in 1 and 5-lb. tin cans, 100 lbs. per case, ½c per lb. above keg price. Dry Lead.—In bbls., 1 ton and over, 7½c; do. in kegs, 8c.

LIME.—Santa Cruz, $1.35 country, $1.25 city ₱ bbl.

CEMENT.—Imported, $3.00@4.00 ₱ bbl.; California, carload lots, $1.80 f. o. b. at works; small lots, $2.10 ₱ bbl. in sacks, 4 sacks to bbl., 5c for each sack returned.

LUMBER.—(Retail): Pine, ordinary sizes, $24.00@25.00; extra sizes higher; redwood, $28.00@30.00; lath, 4 feet, $4.50@5.00; pickets, $21.00; shingles, $2.50 for No. 1, and $2.25 for No. 2; shakes, $13.50 for split and $15.00 for sawed; rustic, $28.00@35.00.

NAILS.—This week the basic prices are: Wire, $2.77; Cut, $3.25. Meanwhile the nominal quotations per keg (list prices) are: No. 20d to 60d, Wire, $3.35; Cut, $3.55; 10d to 16d, Wire, $3.45; Cut, $3.35; 8d, Wire, $3.50; Cut, $3.50; 6d and 7d, Wire, $3.60; Cut, $3.60; 4d and 5d, Wire, $3.70; Cut, $3.70; 3d, Wire, $3.85; Cut, $3.85; 2d, Wire, $4.10; Cut, $4.10. Special rates for carload lots.

GENERAL SUPPLIES.

ANTIMONY.—New York, Cookson's, 11½c; Hallett's, 12½c; San Francisco, 1000-lb. lots, 14c; 300@500-lbs. 12c; 100-lb. lots, 13c.

BONE ASH.—Extra No. 1, 5@6c ₱ lb; No. 1, 4@5c.

BORAX.—Concentrated, 7@8c ₱ lb; powdered, 9@10c; fused, 25@30c; crystal, 7c.

CANDLES.—Spear Brand, 16 oz. adamantine, 40s., 11c ₱ set; 14 oz. adamantine, 40s., 10c; 12 oz. adamantine, 40s, 9c; 10 oz. adamantine, 40s, 8c; 16 oz. stearic, 40s, 12¾c ₱ set; 14 oz. stearic, 40s, 11½; 12 oz. stearic, 40s, 10¾c; 10 oz. stearic, 40s, 9¾c. 100-case lots and over, ½c less. Not less than 50-case lots, ¼c less. Boxes of 20s, price ½c advance.

CAPS.—3x, $5.50@6 per 1000; 4x, $6.50@7; 5x, $8@8.50; Lion, $9@9.50, in lots not less than 1000.

CHEMICALS.—Cyanide of potassium, 98%–99%, jobbing, 23@24c ₱ lb.; carloads, 23@23½c; in tins, 30c; soda ash, $2.00 ₱ 100 lbs.; hyposulphite of soda, 3@3½c ₱ lb.; caustic soda, in drums, 3@3½c ₱ lb.; Cal. s. soda, bbls., $1.10@1.20 ₱ 100 lbs.; sks., 90c@$1.00; chlorate of potash, 12@13c; nitrate of potash, 6¾@7c; caustic potash, 10c in 40-lb. tins; roll sulphur, 2¼@2½c; powdered sulphur, 2¼@2½c; flour sulphur, French, 2¾@—c; alum, $2.00@2.25; California refined, 1¾@2c; sulphide of iron, 8c ₱ lb.; copper sulphate, 5¾@5¾c; chloride of lime, spot, $2.50@2.75; sulphuric acid, in carboys, 66% B, 1¾@2c ₱ lb.; nitric acid, carboys, 8c ₱ lb.

CHROMIUM,—90% and over, ₱ lb., 80c.

FIRE BRICK.—Domestic, carloads ₱ 1000, f. o. b., factory square, $25.00; soap and split, $22.50; arch and wedge, $27.50; skewback, $30.00; circle, $32.00.

FIRE CLAY.—Domestic, ₱ ton 2000 lbs. in 125-lb. bags double, and dry ground, f. o. b., factory, $8.50.

FUSE.—Triple tape, $4.00 per 1000 feet; double tape, $3.55; single tape, $3.10; Hemp, $2.85; Cement No. 2, $3.10; Cement No. 1, $2.75, in lots of 3000 and up.

COAL.—San Francisco, coast, yard prices: Wellington, $8.00; Seattle, $6.50; Coos Bay, $5.50; Southfield, $8.00. Cargo lot, Eastern and foreign: Wallsend, $7.50; Brymbo, $7.50; Pennsylvania, hd., $14.00; Scotch, $8.00; Cumberland, $13.00; Cannel, $8.50; Welsh Anthracite, $13.00; Rock Springs, $8.50, long ton; Colorado Anthracite, $14.00. Coke, $11.50 per ton in bulk, $13.00 in sacks; Sunnyside, $8.50, long ton.

BISMUTH.—Subnitrate, ₱ lb., $2.10.

LITHARGE.—Pure, in 25-lb. bags, 9½@10½c ₱ lb.

MAGNESIUM.—Pure, N. Y., $1.60.

MANGANESE.—Black oxide, ₱ lb., 2¾@4c.

MERCURY.—Bichloride, ₱ lb., 77c.

MOLYBDENUM.—Best, $2.75 ₱ lb.

PHOSPHORUS.—American, ₱ lb., 70c.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitroglycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1**, 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2, 35%, carload lots, 9½c; less than one ton, 11½c. No. 2**, 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2.00 per keg.

RED LEAD.—500 lbs. and over at one purchase, ₱ lb. 7½c; less than 500 lbs., 7¾c.

SILVER.—Chloride, ₱ oz., 90c@$1.00; nitrate, 54c

SODIUM.—Metal, ₱ lb., $1.

TUNGSTEN.—Best, ₱ lb., $1.20.

URANIUM.—Oxide, ₱ lb., $3.40.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market street, San Francisco, has official reports of the following United States patents issued to Pacific Coast inventors:

FOR WEEK ENDING DECEMBER 5, 1905.

806,090.—HOT WATER BAG L. Allenberg, San Francisco.
806,390.—BLACKING BRUSH DAUBER—B. Barbolla, San Francisco.
806,515.—SAW—J. Baumgartner, Silverton, Or.
806,628.—FURNACE—W. N. Best, Los Angeles, Cal.
806,732.—CONVEYOR—H. W. Blaisdel, Los Angeles, Cal.
806,392.—PHOTOMETER—B. B. Bolton, Wilmington, Cal.
806,235.—PENCIL RUBBER HOLDER—A. F. W. Bowen, San Francisco.
806,632.—WATCH GUARD—C. Breer, Los Angeles, Cal.
806,319.—SIGNAL—Burt & Vanatta, San Francisco.
806,524.—BOILER—J. M. Colman, Everett, Wash.
806,322.—DISK PLOW—W. S. Cook, Santa Maria, Cal.
806,470.—PRESSURE REGULATOR—A. J & N. Hodge, Pasadena, Cal.
806,245.—TOY—J. W. Hughes, San Francisco.
806,417.—BUTT GAUGE—F. H. Lockwood, Alameda, Cal.
806,277.—STOVE CABINET—W. W. McKee, Tacoma, Wash.
806,695.—WINDOW SCREEN—Monnin & Mecchi, San Francisco.
806,173.—FURNACE—R. W. Myers, Fruitvale, Cal.
806,426.—MAP HANGER—J. J. O'Leary, Sisson, Cal.
806,562.—SNATCH BLOCK—A Opsal, Kelso, Wash.
806,496.—FIREARM—E. E. Redfield, Glendale, Or.
806,188.—INJECTOR—D. W. Rees, Needles, Cal.
806,571.—BUCKET LOADER—B. C. Ribler, Spokane, Wash.
806,753.—FIBER CUTTER—A. M. Sheakley, Stockton, Cal.
806,372.—TELEPHONE—J. Silverman, San Francisco.
806,591.—PILE PRESERVER—P. S. Smout, Everett, Wash.
806,374.—WAGON—G. N. Spencer, Hillsboro, Or.
806,213.—FILTER—L. C. Trent, Vantrent, Cal.
806,214.—AMALGAMATOR—L. C. Trent, Vantrent, Cal.
806,219.—CLAMP—R. H. Walker, Tacoma, Wash.
806,444.—TROUSERS PRESS—H. H. Welch, Los Angeles, Cal.
806,225.—CAR FENDER—W. G. Winans, Spokane, Wash.
806,226.—SWEEPER—R. Wylie, Napa, Cal.
806,230.—SASH WEIGHT—O. F. Zahn, Los Angeles, Cal.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS United States and Foreign Patent Agency, the following are worthy of special mention:

STICKY FLY PAPER.—No. 807,040. Dec. 12, 1905. O. Mausert, San Francisco, Cal. This invention relates to improvements in fly paper, and especially in fly paper having a sticky surface acting as a lure for flies and other insects. The object of the invention is to provide a blank for sticky fly paper which can be folded into attractive shape and stood on shelves, counters and elsewhere and which, being covered with adhesive, will prove an efficient lure, having a considerable exposed surface, and which blank when so folded may be easily handled without soiling the hands, and can be compressed into a small compass for purposes of shipment and the like.

GOLD WASHING AND SEPARATING SCREEN.—No. 807,023. Dec. 12, 1905. C. W. Gardner, Oroville, Cal. This invention relates to an apparatus which is especially designed for the separation of gold and precious metals from sand, gravel or other gangue or material with which it may be associated. It consists of a revoluble inclined screen, made in sections of constantly decreasing diameter, from the upper receiving end toward the lower discharge end, and in water supply and mechanical devices used in conjunction therewith; all adapted to produce a new and valuable device.

ACCORDIONS.—No. 807,018. Dec. 12, 1905. Raffaele Carbonari, San Francisco, Cal. This invention relates particularly in the connections between the several keys and valves whereby an actuation of any single key may result in the production of a desired variety of tones or chords. It consists in an accordion, of a sliding part, pivoted members carried by said part and reciprocable therewith, a key, and connections between the key and said part to reciprocate the latter, means to rock said pivoted members, valves, and means connected with the valves interposable in the path of said rockable members to operate the valves.

WASHING MACHINE.—No. 807,007. Dec 12, 1905 M. L. Winegarden, Alameda, Cal. This invention relates to improvements in machines for washing clothes. Its object is to provide a simple, cheap, practical, easy-running machine, which will not tear the clothes, which will have a large capacity, and which is adaptable to take a greater or less charge at one time and handle it with equal thoroughness. The various parts of the mechanism are assembled and adapted to bring about the desired result.

WORD REGISTERING ATTACHMENT FOR TYPEWRITING MACHINE.—No. 807,022. Dec. 12, 1905. R. R. Fowler, Madera, Cal. This invention relates to improvements in means for counting and registering the number of words or symbols having the numerical value of words struck upon a typewriter. It consists in a counting attachment for typewriting machines, the combination with the keyboard, of a registering device, a sliding plate to operate said device, means for actuating said plate from the keyboard, and means engaging said plate to lock it against operation by certain keys on the keyboard; and other details of construction, all adapted to produce a new and useful device.

The Powell "READY" LEVER THROTTLE VALVE.

A first-class Valve—reliable, durable, no undue labor or friction in its operation. Always "Ready" for use; you will be surprised with its efficiency. Is easily operated, and when closed is absolutely tight; no sticking or jambing. Why waste your time with inferior makes? Try the "Ready" and you will use no other. Pacific Coast Jobbers.

MANUFACTURED BY

THE WM. POWELL CO.,
Dept. "H" 2525 Spring Grove Ave.,
CINCINNATI, OHIO.

Quicksilver

BY THE FLASK OR CARLOAD.
WEIGHT AND QUALITY GUARANTEED.

Mining in Arizona.

No region of the West affords a greater variety of mineral resources and conditions than are found in Arizona. The climate is dry and healthful, but the impression, entertained by some, that it is a vast stretch of sandy plain unbroken by mountains and destitute of verdure, is an error. There are high and beautiful mountains in Arizona, forest-clad, and in winter covered with snow. In the lower lands of the southern part of the Territory the sharp serrated ridges of numerous mountain ranges give beauty and even grandeur to the landscape. To see distinctly 150 miles in Arizona is an ordinary matter, and if objects were in view at greater distances there is no doubt that the vision of distant mountains might be extended to 300 miles.

Copper is the principal mineral at present produced in Arizona, the output for the past year being about 246,500,000 pounds, which makes Arizona the second in rank of production of copper in the United States, Montana being first and Michigan third. In addition to copper the output of gold and silver in Arizona is large and increasing. Besides these three

Congress Mills, Yavapai County, Arizona.

The United Verde, Jerome, Arizona.

important metals Arizona also produces lead, zinc, bismuth, antimony and tungsten minerals, molybdenite, structural materials and gem stones. The mineral industry in Arizona is of far greater importance than all others in the Territory, and it is annually increasing in its magnitude. There still remain large undeveloped resources—great copper deposits, gold, silver, zinc and lead ores—to develop when the necessary transportation facilities have been provided. There are three districts in the Territory isolated from the ordinary routes of travel, and as the mountains are rugged and often almost impassable the construction of roads is an expensive undertaking for individuals, and yet a great deal has been accomplished by private enterprise in the way of road building, and even in the construction of railroads. The most important copper mining camps are at Jerome, in Yavapai county, where the United Verde is the principal mine; Globe, where the Old Dominion is a large producer; Bisbee, in Cochise county, is the heaviest producer, however. Here are the mines of the Calumet & Arizona, the Copper Queen, and other large mines. Clifton and Morenci and Metcalf are other large copper camps.

In some of the districts there were found evidences of prehistoric occupation and the primitive working of the mines. It is known that in Yavapai county a preistoric race sunk shafts near the head of the Hassayampa river and excavated the quartz by means of stone hammers, which were used to break down the rock after building fires on the rock faces and then dashing cold water upon the rocks to effect their disintegration. Native copper occurs at a number of places in Arizona, and it was probably this metal that was used by the prehistoric races, as no remnants of their smelting furnaces for ore reduction have ever been found in the Territory.

The first record of copper smelting in Arizona is that at the Longfellow mine, near Clifton. This occurred in 1873 and the operation was perfomed in an adobe furnace.

Arizona has also furnished some remarkable examples of gold and silver deposits. All old timers in that territory remember the mule teams packed with thousands of pounds of native silver, which came from the Stonewall Jackson mine. The rich mines of Tombstone attracted thousands of adventurers nearly thirty years ago, and rich silver mines have been opened in a score of places elsewhere. One of the most noted was the Silver King in Pinal county.

On Rich hill in Yavapai county, lying on the surface of the ground and near the summit of the hill, thousands of dollars in gold nuggets were found strewn about. This gave rise to another stampede to that district. The Congress gold mine is the deepest in the Territory, being down about 3000 feet. A peculiarity of this mine was the honey-combed limonite.

Hail and Farewell!

For the first and last time in the history of this journal I obtrude my personality to state that I have transferred my entire holdings therein, but continue to have a warm interest in its enduring prosperity.

During the many years in which it has been my pleasure and my privilege to conduct the MINING AND SCIENTIFIC PRESS, my constant aim has been to make it of paramount value to mining men everywhere, and it is but the grateful statement of what is deemed an accomplished fact to say that such ideal has been largely realized.

None the less satisfactory is my consciousness that in the person of my successor the purpose of this journal in its career of honest and honorable usefulness will be ably continued.

The policy and purpose of such a journal as the MINING AND SCIENTIFIC PRESS is characterized less by what appears therein than by what does not appear, the intent being to serve the general good and hold the confidence and support of those whose good will is worth having. The MINING AND SCIENTIFIC PRESS enjoys the esteem and respect of mining men the world over, and the natural satisfaction occasioned by this fact is enhanced by the belief (I had almost said knowledge), that in the person of T. A. Rickard, my successor, the high standard set will be maintained, and that with increasing prestige the future of this journal will make it of correspondingly greater value to the basic industry of the nation, which it represents.

Mr. Rickard needs neither eulogy nor introduction to the mining men of America. He is well and favorably known and is thoroughly equipped for the work he assumes. In mining, metallurgy and mining engineering the horizon widens, the future grows broader, and as this is the oldest mining journal on the American continent, so, I confidently trust, it will ever be the best. For him who now assumes its guidance and control I have personal and cordial commendation to my readers, and I invoke for him the same meed of good will and support so kindly accorded me, and which I have ever cordially and gratefully appreciated.

To my colleagues and assistants in the editorial, business and mechanical departments I tender hearty acknowledgment of the zeal, fidelity and ability that have characterized their several efforts in making this journal successful.

More need not be said; less could not be said; "the rest is silence." J. F. HALLORAN.

Dec. 28, 1905.

Cost of Power in California.

Undoubtedly there are places where power generated by steam in a boiler, where oil is the fuel employed, would be as cheap as any other available power. It is largely a matter of situation. On the Pacific coast the extensive employment of crude oil as a fuel and the large development of electric power came about at nearly the same time. True, there had been numerous small plants of both kinds erected and in successful operation at various places years prior to the general advent and extensive development of these two competing sources of power, but within the past five years the competition has become active and has resulted in a material lowering of power cost in certain mining districts from about $6 per horse power per month to $4 for the same period, notwithstanding the assertion of a prominent official of one of the electrical distributing companies made about four years ago to the effect that the electrical companies were aware that oil as a fuel was being introduced in a few places, but it was in no sense considered as a competitor by the electrical companies. At that time the horse power rate was $6 per month. The fact that it is now but $4 is significant.

The crude oil of California and some of its products are peculiarly adapted to employment as a fuel, and wherever it has been introduced, and the installation made by an experienced engineer, it has been a success and has reduced the cost of steam making where the cost of oil was not prohibitive.

Ordinarily electric power is sold by meter measurement—a kilowatt—1000 watts being the unit of measurement. A horse power is figured as equivalent to 746 watts. When the amount of power required is known, it is a simple matter to figure its cost.

Wherever crude oil can be obtained in sufficient quantity at a cost not exceeding $1.50 per barrel, this natural fuel at once becomes a strong competitor to most other sources of power. Crude oil may also be employed in several of the numerous types of gas engines now on the market, and power produced in this manner is even cheaper than steam produced by using oil under a boiler. In some instances the cost of this kind of power has been found remarkably low.

Free water power, wherever obtainable, is undoubtedly the most desirable, because the least expensive, of any of those used at mines; but this kind of power is not as easily available as formerly, owing to pre-existing rights in the streams. Still, many places remain where a low head and large volume may be obtained and a moderately large amount of power developed. In some of the mountain streams of California water rights of this kind may be secured repeatedly along the same stream. If large power is required, the expense would naturally involve a much more expensive construction, but where power is required for individual mines it may usually be secured at reasonable cost for dam, flume and wheel equipment. This power may then be employed to run a dynamo and the current carried wherever desired. Numerous mines have availed themselves of these existing conditions to put in power plants of this description and they have been found satisfactory.

In some instances compressed air has been employed in lieu of electricity, of which type the large installation of the North Star Gold Mining Co., near Grass Valley, Cal., is a noted example.

Wood, which was formerly the only fuel used in California mines, has become in some districts so costly that coal brought from neighboring States can be employed to advantage, but the resort to coal at $12 to $15 per ton is only seen occasionally, notwithstanding it has, in some cases, been found preferable to pine wood at $6 to $7 per cord. The loss and cost in handling the wood make the difference between these two classes of fuel greater than is apparent at first glance. The coal may all be used advantageously, and with experienced firemen a ton of good coal is equal to more than two cords of good wood, as it is delivered in the yard.

Gasoline, as well as crude oil and distillate, is also largely employed as a means of power, particularly in the desert regions. The sources and kinds of power are many, and the mine managers in the several sections of the Pacific coast usually work out the problem along the line of existing conditions and of necessity, rather than along those of preference. Occasionally, however, the subject is not given the attention it deserves, and installations are made which are not the least expensive in first cost nor the most economical in operation after installation.

A BILL has recently been introduced in Congress providing for the location, development and operation of mineral lands on Indian reservations. This bill states that on some of the existing Indian reservations there are large and valuable deposits of copper, gold and other ores, and that as the Indians make no use of these mineral resources, and have no disposition to develop them, they should accordingly be thrown open to prospectors who may make locations thereon, etc. However desirable it may be to make available these mineral resources situated on Indian reservations, to attempt to locate and operate these lands for mineral without withdrawing the lands in question from the reservations by the Government and settling for them with the several Indian tribes, respectively, interested, will only result in serious trouble and loss of life to those who first attempt it. If the Government buys the land from the Indians or makes a satisfactory exchange with them, for other lands, the idea may be safely carried out to the advantage of all concerned, but any attempt to wrest these lands from them without just compensation will only meet with armed resistance, unless the nature of the Indian has changed within very recent years. All previous attempts of this kind have resulted in Indian wars and great loss of life, with heavy attendant expense to the Government.

THE ancient river channels in the mountains of California have been successfully worked for the gold they contain by ground sluicing, hydraulicking, and by the drift method of mining, but it is improbable that any dry channel known to-day will pay to work by dredging method, first stripping the heavy over-burden of non-auriferous, or only slightly auriferous, material by dredging, and then washing the pay dirt near bedrock.

THE year 1905 just drawing to a close has been one of the most prosperous for the mining industry that the country has ever seen. There has been a good and increasing demand for metals, and all of the most useful and common kinds are at an unusually high price. The year has also been largely free from the disturbances resulting from the conflict of capital and labor, and the outlook for the year 1906 is at this time certainly propitious.

COPPER maintains itself well in the market, selling in New York at 18.50 to 19 cents, and it is said that no large amount can be contracted for prior to April first next, and it is even suggested that the price may go above 19 cents. This is surely welcome to the producers of copper, but they seem unable as yet to make an over-production of the metal.

THE successful completion of the Simplon tunnel, connecting Italy and Switzerland, is to be celebrated next summer by an industrial exposition in the city of Milan, which is near the Italian portal of this great engineering feat.

CONCENTRATES.

SOLUTIONS of potassuim cyanide attack metallic silver slowly. The solution is required to be much stronger for silver than for gold.

THE most important consideration in stamp-milling gold ore is rather what can be economically saved, not what amount of ore can be crushed.

SALT lands and lands containing saline springs may, if unoccupied, be located as placers, but one person may take or enter no more than one claim.

THE Hornsilver mine at Frisco, Utah, was originally a large lead-silver producer. It now produces rich copper ores, and comparatively little lead.

THE stampede to Alamo diggings, in Lower California, occurred during 1889-90. It was followed later by a stampede to the quartz veins found in that locality.

COAL outcrops are not usually black and glistening, but rather dull and earthy, and brownish in color. In the West some coal croppings, lignite, look like brown shales.

CLOSED electric lamps (incandescent) are not dangerous in gassy or dusty coal mines, but open electric lights are as dangerous as any other open fire, and will cause explosions.

GOLD occurs with some copper ores in the free state. When gold is present in ores of this description, it is not infrequently seen, particularly with chrysocolla, a silicate of copper.

IN 1868 a 20-stamp silver mill erected complete in Nevada cost from $75,000 to $100,000, according to its situation. Transportation of heavy freight was a very important factor in this high cost.

CHROME IRON is found in more than half of the counties of California. It is always associated with serpentine, which is abundant in both the coast range and the foothill ranges of the Sierra Nevada.

GOLD occurs in calcite and in quartzite at Oro Grande, Cal., and in the same district lead-silver ores are found in limestone and copper ore in limestone and diorite. Zinc sulphide also is found in limestone in that district.

THE oldest copper producing district in Arizona is at Clifton, discovered in 1865. Ore from the Longfellow mine was reduced in an adobe furnace there in 1873, the blast being supplied by a leather blacksmith's bellows.

A BUCKET is generally used in sinking in a vertical shaft, and if the shaft have more than one compartment the bucket should be handled in the center one, as this admits of greater facility in loading and handling the bucket below.

ONE of the important features in the employment of locomotives of any type underground is the system of collecting the cars into trains to be hauled to a central point and from there in trains to the shaft. If this matter is systematized much time is saved thereby.

IT is not customary to give the posts of tunnel sets a greater spread than 1 foot in 7 or 8 feet of height, except in heavy, swelling ground, then the base of the set is sometimes 8 or 9 feet while the cap may be but 3 feet clear, and the height from floor to cap 6 feet or less.

OVERTURNED folds are not common, but are seen occasionally. One of the most noted instances is that of the Elk mountains of Colorado, where an entire mountain mass has been lifted and overturned, so that the older formations are seen superimposed upon the younger.

TURQUOISE mining in the United States has of only late years become an important industry. Prior to 1890 little turquoise had been mined. It is now known to exist in southern California, Nevada, Arizona and New Mexico, and many valuable deposits of this mineral have been opened.

THE mines of Randsburg district, Cal., are of several types—fissure veins, impregnations and fissured zones. The ore from the Butte mine is merely a silicification of the country rock along a fissured zone. Some of the richest ore in that mine looks little different from the barren rock of the vein walls.

SILVER chloride (horn silver) occurs in ores in masses, flakes and in dust-like particles, so finely disseminated as to be invisible to the eye. In color it varies through shades of gray to brown, violet, yellow, light green and black. Larger masses look like wax and can be cut like horn with a knife.

A MILLSITE cannot be taken on land known to be mineral, but a mining claim may always be used by the owner as a millsite. A citizen of the United States may take up a millsite on the unoccupied public, non-mineral lands, whether he may own mines or not. A millsite is sometimes required for custom reduction works.

SMALL veins of iron oxide occurring within a few feet of each other in a schistose or massive formation are not proof positive of the existence of large ore deposits below. Small fissures or gashes in the surface strata may be filled by infiltration of iron solutions from the walls, and have neither great depth nor longitudinal continuity.

A CONCENTRATING table is not unfrequently charged with doing inefficient work, when the real cause of the poor work is overload. It is as possible to overload a concentrating machine with water as it is with ore. A system of careful classification should be inaugurated prior to concentration if the best results are to be accomplished.

IN the early days at Leadville, Colo., the only surface equipment at many shafts, particularly those on Fryer hill, where the workings were not deep, consisted of a small hoisting engine, a tripod of stout logs and a trip-rope to handle the bucket at the collar of the shaft. Thousands of tons of ore were hoisted and handled in this manner.

EXTENSION track may be made in the bottom of an incline shaft, when sinking, by reversing T rails, and clamping their upper ends to the rails spiked to the timbers. The bottom of this improvised track may be held in place by a rod of proper length, provided with guides for the rails, so that they cannot spread and derail the skip.

TO THE uninitiated, mica and selenite, the transparent variety of gypsum, look much alike. A thin plate of mica is flexible and very elastic; selenite is somewhat flexible, but inelastic, it is also very soft. A piece of selenite subjected to even moderate heat, such as on top of a hot stove, will quickly turn a chalky white, while the mica remains unaffected by much higher temperatures.

MOST gold mines in California are below 2000 feet altitude, some of them being as low as 400 to 500 feet above the sea; but there are mines in the Sierra as high as 10,000 to 11,000 feet or more above sea level. Altitude bears no relation to the amount of gold or other metal contained in the ore, but it may have a direct bearing on the economic proposition of equipping and working the mine.

NO MINERAL LOCATIONS can be made on Indian reservations. In the past numerous Indian reservations have been thrown open to settlement by the Government and mines subsequently opened thereon. One of the most important is that of the Black Hills, South Dakota, which was originally a portion of the Sioux Indian reservation. It was opened to settlement early in 1876.

AMBER is an oxygenated hydrocarbon, but, strictly speaking, is not a mineral, as it is of organic origin, and is a fossil resin. In mineralogy it is known as succinite. The amber of commerce is mostly obtained from the Baltic sea, where it is mined, and also found strewn along the shores where it has been cast up by the waves. It becomes electrified upon being rubbed, and some varieties are fluorescent.

CASSITERITE occurs in veins of pegmatite, as in the Black Hills of South Dakota; in a fine-grained tourmaline rock, as in southern California, in quartz in feldspar, in greisen, in topaz rock, as at Mount Bischoff, Tasmania; in slates and granite, as on the Seward peninsula, Alaska; in gneiss, mica schist, chlorite and clay schist and in eruptive rocks. The most common minerals accompanying tin stone are feldspar, mica, quartz, tourmaline, wolfram, apatite and some others.

WHERE it is desired to recover water from mill tailings and the quantity is abundant, it is advisable to build a dam provided with a gate at or near the bottom, through which the sands will flow. This will free the water near the surface from the coarse material, and only slimes need be treated to remove the water, which may be done by passing the liquid through a series of boxes or tanks, the clear water being pumped or carried by flume to wherever it may be desired to use it.

THE principal diamond mines of the world are at present in South Africa, Brazil, Dutch Guiana and India. Diamonds are found at many other places, but in only small quantities. In the United States diamonds occur in California, Wisconsin, North Carolina and a few other places of less noted occurrence. The so-called diamond fields of Arizona are a myth, though an attempt was made many years ago to create a stampede to an isolated portion of that territory by the extensive publication of alleged discoveries of diamonds.

METHYL IODIDE, CH_2I_2, is a liquid having a specific gravity of 3.3243 at 16° C. and is insoluble in water. It is a yellow fluid, strongly refracting, miscible with benzole but not with alcohol or water. It does not attack metallic substances. The specific gravity varies with the temperature. This salt was used by R. Brauns for specific gravity determinations. Other solutions having a specific gravity of 3.00 or over—Rohrbach's barium mercuric oxide, Thoulet's potassium mercuric oxide and Klein's cadmium borotungstate — are miscible with water.

A DEPARTMENTAL regulation, No. 19, is to the effect that but one discovery of mineral is required to support a placer location, whether it be of twenty acres by an individual, or of 160 acres or less by an association of persons. The courts do not presume to say how rich a placer must be to make the discovery valid, nor how wide a vein shall be nor how much mineral it shall contain before it may be recognized as a valid and bona fide discovery. Neither size nor richness are material in such matters. A discovery of such indications as would lead the miner to believe that it would lead to a more valuable deposit in depth is sufficient. Pay gravel or pay ore are not absolutely essential to a legitimate discovery.

IT is rarely that large masses of white quartz constitute valuable ore, although outcrops of this kind are characteristic of many mining regions. Not infrequently these large masses of silica are associated with shoots of pay rock, while the pure snowy white quartz is valueless. In some instances only a portion of the mass is barren—the foot wall or hanging wall part being good ore. In other cases the pay zone lies entirely outside of the massive quartz, being separated from it by a layer of clay, gouge, or country rock. The bonanzas of the Comstock Lode, at Virginia City, Nev., occur wholly within large and nearly barren masses of white and bluish white quartz. These bonanzas are later than the large masses of quartz, having been deposited in fissures in the massive silica, which resulted from movements of the vein.

A RED, brown or black gossan does not always indicate payable values below, but such outcrops should be investigated. In the case of abundant manganese oxide in the gossan the indications are usually favorable for silver and lead. Where hematite occurs most abundantly gold is most likely to be the metal found, though where the vein beneath is gold bearing the gossan is usually auriferous also. In the case of limonite copper may be suspected. There are no hard and fast rules concerning this, for hematite may also be abundant in the gossan of a copper deposit, and manganese as well. Limonite deposits should be investigated to ascertain whether they are really the outcrop of a vein or ore deposit beneath or only a superficial deposit, formed by iron springs in the vicinity. In case of the latter it might be good business to investigate the source of the spring deposit. Not infrequently the water from large veins of pyrite and chalcopyrite deposit extensive masses of limonite on the surface.

THE coal land laws of the United States were extended to Alaska by act of Congress approved June 6, 1900. A single individual who must be twenty-one years of age and a citizen of the United States (or have declared his intention to become such) may locate 160 acres of coal land in one tract and no more. He can take but one claim. An association of persons may locate 320 acres in one claim and no more. An individual or association having improved a tract of coal land to the extent of $5000 may locate and enter a tract of 640 acres, including such mining improvements. No person or association of persons is permitted to sell, or bargain to sell, the coal lands he may locate, to another person or association until he shall have paid for the same and received a deed from the Government. It is to avoid this sort of thing, which has been practiced in timber land locations, that the laws are so definite as to the requisite acts to obtain title to coal and forest lands. After having paid for the lands claimed, and having received a patent or deed thereto from the Government, the owner may dispose of the land in any way he sees fit, but he is not permitted to again make a location, having exhausted his right.

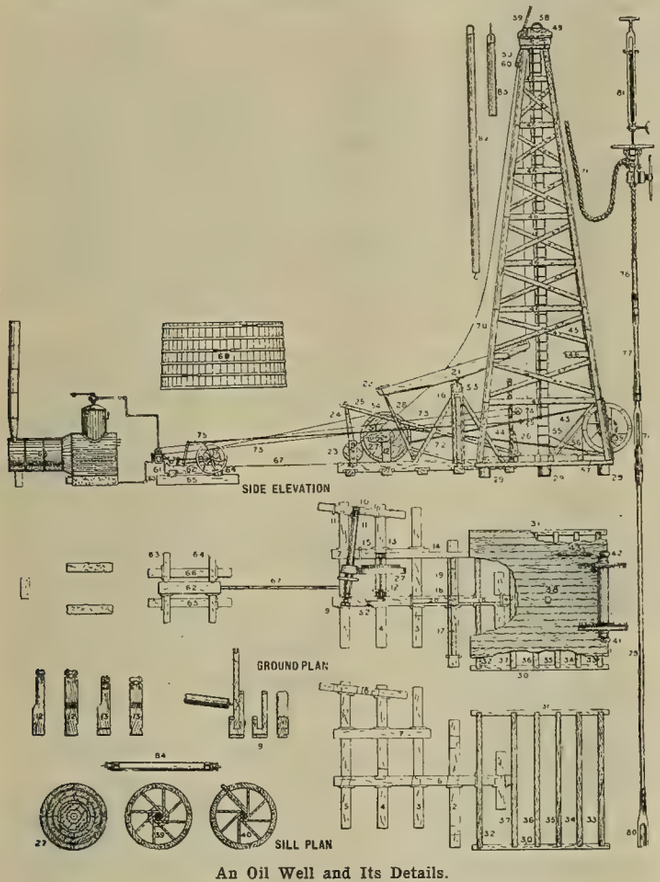
THE Montana law is explicit concerning annual assessment work and simplifies the matter of giving the work publicity when properly performed and thus securing title. It requires the owner of a lode or placer claim who performs, or causes to be performed, the annual work, or makes improvements required by the laws of the United States, in order to prevent the forfeiture of the claim, to file, within 90 days after the annual work, in the office of the county clerk of the county in which such claim is situated, an affidavit of his own, or an affidavit of the person who performed such work, or made the improvements showing: First, the name of the mining claim and where situated; second, the number of day's work done, and the character and value of the improvements placed thereon; third, the date of performing such work and of making the improvements; fourth, at whose instance the work was done or the improvements made; fifth, the actual amount paid for work and improvements, by whom paid, when the same was not done by the owner. The law further provides that such affidavits, or a certified copy thereof are prima facie evidence of the facts therein stated. Claim holders in any State who follow out the requirements of the Montana law are likely to have very little trouble over assessment work, as it leaves nothing undone to secure title as required by the Federal statutes.

The Boring of an Oil Well.—I.

Written for the MINING AND SCIENTIFIC PRESS by J. H. PIERCE.

A great many people have but a limited idea of what an oil well really is, viewed from the mechanical standpoint. They have a vague idea that it is a hole bored deeply into the earth in some manner, and is usually surmounted by a derrick, a tower-like wooden structure of curious design. What part this tower plays in the drilling of an oil well they do not usually know.

The following series of letters from a "green hand" at an oil well to his friend at home throws considerable light on the subject and is an entertaining recitation of the daily events occurring about a new well. The accompanying sketches and engravings give an idea of the paraphernalia about a well and the appearance of the proposition when in operation:



An Oil Well and Its Details.

A TOOLIE'S LETTER.

MY DEAR JOHN:—Replying to your request to write you all about my new "job," I'll just try—that's the best I can do—and if you find anything that I seem to be wobblin' on, you will have to excuse me, because my brain is like a deep-sea drag net. It's simply full of unknown things that I have jammed in there, waiting the day that I can bring them to light and dissect.

We arrived here Sunday and about all the two drillers did was walk about the "rig" and say things about the builder. I will postpone this part until I see you. A "rig" is an oil-country term for about 16,000 feet of lumber put together. I'll send you a photograph for you to study it out for yourself. We have a "bunkhouse" to sleep in, and a cookhouse and a "Chinee" cook. The bunkhouse is just big enough to let in four bunks. I have not measured it, but I think that it is about 14x16 feet. The cookhouse is about 14x20 feet, with a little room for the "Chink."

Monday morning we started to "rig up," and it appears that I am to run the morning "tower" with a big driller by the name of Slade. The other "toolie" is a little, stubby Irishman, and, of course, they call him "Ole" and they have dubbed me "kid." Think of it, 6 feet in my stocking feet, weight 195 pounds, all meat, and have to answer to the name of "kid." I started to call them Mr., and I wish you could have heard the remarks that they addressed to me. That part will have to wait until I see you alone. Now, don't think that I am working with a lot of ruffians, for manlier men I have never known. They remind me of our old Colonel in the fight at Cainte, when I started to salute, present the commanding officer's compliments, etc. He roared: "Cut it out! Tell me what you want. This is no place for formality." I am beginning to realize that a drilling rig is no place for formality, either.

Slade's people intended him for a minister; but he got sick and they sent him out to his brother, who was a contractor in the oil business; he never went back, and I don't think he would disappoint his mother if she could see him now. Ole is just a jolly "mick." The other driller has a name that sounds like Ikenbaugh, but he answers to just "Ike."

Ole and I after the boiler was "hung" proceeded to wall it in with brick. As I was a "greeny," all the really hard and unpleasant part of the work fell to me. I had to mix mud, carry brick and light Ole's cigarettes for him nearly all day Monday and until about 11 o'clock Tuesday. The two drillers in the meantime had built a forge, put the brake on the bullwheels and said more things about the man who had sent the tools out. It appears from their talk that the manager knows nothing about the oil business and has not even left the furnishing to a supply house. Fortunately, the boiler and engine fittings were all there, so we got them connected up Wednesday morning. They don't do things the way I learned at school, and I didn't make more than a couple of suggestions about the way it should be done, either. We got the belt on Wednesday, which, by the way, the drillers said other things about, because it was a "red" belt, when it should be a "rubber" for a drilling well, a "red" belt being all right for a pumping well.

They threw the "bull rope clamps" away and spliced "eyes" to connect it with, because they said clamps were out of date. Then we "lagged the bandwheel." This took us until Thursday morning. We had to cut the new cable, because old rope was not provided, and it took about 200 feet—quite an item, with rope 17 cents a pound. We nailed one end on one side of the bandwheel—8 feet in diameter—and then I turned that big wheel around while the other toolie held the rope tight with the bullwheels, and the drillers nailed it on. After doing this eight hours, I was rather glad when the last nail was driven. This is done to give better friction surface for the friction pulley on the sand reel and to preserve the bandwheel.

Then they sent—me, of course—under the derrick floor to dig the place for a "slump" box. We have to make a tight box to dump the drillings into and let it run away, for it appears to be a serious thing for any to get in the "hole." Why I don't know—I'll tell you later.

I had been wondering how they would tie the rope onto the drills, and it was the easiest thing imaginable. They had a thing that they called a "woodpecker socket." It's a big piece of iron with a hole in the top that runs out at the side and really reminds you of a woodpecker's hole. They put the rope down through this hole and out at the side, and then took some pieces of rope about a foot long and then wove them in the end. I think they took two-thirds of the size of the cable.

Then they put a lot of tallow on the rope and pulled it back in, which was not very far. I was getting pretty well interested by this time.

Thursday night, they said, was their last night in "the hay," for Friday would see them "spudding." I understand that there is some superstition about spudding in on Friday, but these drillers did not seem to care.

I thought that I had worked hard, but Friday morning the way I was jumped around was a caution. They run the rope socket out through the side of the derrick about 30 feet up and then screwed it on to a 24-foot 4¼-inch stem. This stem seemed to please Slade greatly, while the other driller thought he could "dig more ditch" with a longer and heavier stem. If you get tangled up with the terms I write, you'd better go out and get a little air. The only thing that I can liken my brain to is the side of a house against which a lot of kids have been throwing mud balls. The mud balls drop off at odd times, and these names and sentences drop off my brain the same way, even in the middle of the night, and I find myself lying awake trying to get them back in their proper spot.

We took two wrenches—sounds easy, don't it? but those wrenches weigh just 200 pounds each—and tightened the joint, and then they had me pound on the end of one of the wrenches with a 16-pound sledge. I found it was different from the sport of "hammer throwing."

In the meantime the other toolie had been heating a bit, and when we got the stem pulled up in the derrick we dressed it. That is done by pounding it with two 16-pound sledges, and I can almost hear now the constant admonition of Slade to "Get off that corner!" and "Strike to dull it, man; strike to dull it!" As near as I can explain to you, we hammered a head on it the size of the outside of the first casing to put in, making it perfectly round, except that there is a letter U left in each side, called a "water course," to let the mud work up in.

I thought that we had tightened up that rope socket enough to hold anything; but they got a notched track that set on the floor and then another thing that they called a "jack" that runs on this track and works by a 5-foot lever. The power is enormous, and, with two big men working it, I was a little afraid that we would break something, but we didn't.

Then we hitched a jerk line on the wrist pin and run it into the derrick, and put a spudding shoe on the cable where it came off the bullwheel shaft, hooked the jerk line into this shoe and Slade started the engine. Every time the crank went over it lifted the tools and dropped them, and when you realize that the stem, rope socket and bit weighs about a ton, and that ton was hitting on a surface 12 inches across, you may imagine that it made an impression. They had water running down in where the bit was pounding, and the way it mixed mud was a caution. After they got down about 6 or 8 feet the mud began to get very thick; so they pulled the tools out and run a bailer down and bailed it out. A bailer is just a joint of casing with a bail on one end and a valve in the bottom.

Slade and I went home to get up at midnight and relieve the other two. We work from midnight until noon, and it is called the "morning tower." From noon until midnight is called the "afternoon tower."

When Slade and I got back at the well the rope socket was just at the floor; so we "broke" the joint, washed it, scoured it and set it up with the "jack" and I began to realize what I was doing. Besides watching the boiler, keeping up steam, oiling the engine and other points of the rig, I had to put the bullrope on the bullwheels when Slade had run the tools long enough to be ready to bail, guide the bailer into the "slump box" and numerous other things.

By noon on Saturday we were ready to "hitch on;" but as the manager had not provided any rope or pulleys for the temper screw, we intend to go on spudding until he can get them here. A string of tools on a cable is somewhat like the "return ball" that the boys play with. If you would take a rod of iron on a piece of rubber and spring it up and down, you would have the principle of the tools and the cable. The deeper one gets the slower one has to drop the tools, on account of the increased elasticity of the cable.

This being Sunday, we are all resting up, and one needs it after a week at this business.

Will try to write more next Sunday. Yours,

JIM.

The Titration of Molybdenite.

Written for the MINING AND SCIENTIFIC PRESS by J. OHLY.

Many methods have been devised for this purpose, and some pretty good ones, but the following seems to be most reliable in the opinion of the writer.

The first condition of success is to have the ore thoroughly pulverized, because the flakes of the mineral have the unpleasant property of oxidizing themselves superficially if brought into nitric acid and heated, and then to stick to each other tenaciously, so that the mass looks thoroughly decomposed from MoS_2 to MoO_3. On shaking the casserole or flask, in which the operation is made, and touching the white mass with a glass rod, the brilliant unchanged surfaces of the molybdenite appear again, and the operator realizes that he must proceed in a different manner.

The subdividing of the ore, used for analysis, must therefore be brought about in an agate mortar, when the dissolving in nitric acid by heating will offer no further difficulties. Cool the solution, and add 15 c.c. concentrated sulphuric acid, evaporate to white fumes of H_2SO_4—to be sure that all nitric acid is driven off—and cool again. Dilute, filter into a beaker, add three or four pieces c. p. zinc, and let the reduction proceed until the condition of Mo_2O_3 is reached, when the solution assumes a chocolate color—which takes at least half an hour.

Now titrate with permanganate solution, that is usually present in any laboratory, standardized on iron, which answers this purpose very well, but which is standardized besides on a solution of MoO_3 in concentrated sulphuric acid, made by dissolving 0.2 gram MoO_3 in 15 c.c. sulphuric acid and heating, cooling, diluting with water and reducing with zinc.

As iron is always present, the result of the titration will give the amount of iron and molybdic acid together. If copper is present, it should be removed beforehand by sulphuretted hydrogen.

In order to determine the iron a separate solution of the molybdenite is prepared in the same manner as described before, cooled, diluted, and treated with an excess of ammonia, and the ferric hydrate formed filtered off and washed. This precipitate is dissolved in hydrochloric acid, the solution changed at boiling

heat into the sulphate by adding 20 c.c. of concentrated sulphuric acid to it, heated till white fumes of sulphuric anhydride appear, cooled, diluted to a certain volume (always observing the same volume) and titrated.

Subtracting this result from that of the first titration leaves the amount of MoO_3 present, which is calculated for the metal Mo or for MoS_2 if desired.

The whole work can also be reduced to one operation by adding sulphuric acid to the filtrate from the ferric hydrate to neutralization, reducing with zinc to brown color, and titrating with permanganate, until the color becomes permanent, as in iron.

Fine Grinding in Metallurgy.

TO THE EDITOR:—In response to Mr. E. E. Wann's invitation, I send you a contribution to the general fund of information on the preparation of gold bearing ores for the extraction of values therefrom.

In the preparation of ore by present up-to-date methods, sliming is, as far as possible, avoided, because of the damage to the mill and the difficulty of working slimes by the present methods.

A few questions arise here: Do slimes offer resistance to the profitable recovery of gold from its ores? Can a higher percentage of gold be recovered from ores if it be all reduced to slimes? Is there any intermediate treatment of gold ores that will give a different character to the slimes, whereby the recovery of values may be made less difficult and costly, less time taking and more efficient?

When entering on any proposition of this kind, it is advisable to learn all that we can about the material to be treated. My microscope showed me that metallic gold, in its ores, is in various forms and conditions, which may all be classed under two heads, massive and filmous. The minute microscopic particles in the massive forms have length, breadth and thickness, the filmous have length and breadth without perceptible thickness. Some of the massive forms are round like shot and have the extremes of weight in proportion to size, and by virtue of both form and weight are very sensitive to the slightest slope, and will often run ahead of the angular sands in washing. In another form the particle is porous; and, in proportion to its size, may have very little weight, and when round in form I have seen it run over the top of the sands to a lower level. Where the particles are solid and angular, or flattened, there is no trouble about its sinking in washing. The filmous gold is very deceptive in appearance; it is often found in volcanic regions. A few days ago I was invited to examine some ore from Goldfield, Nev., which appeared to be very rich; it was expected to assay into the thousands. I found that it was filmous; the assay returns were $12. A sample of gold ore was brought to me that milled satisfactorily, but gave nothing in the pan. I ground a portion and panned carefully and got nothing. I ground another portion, put it in the pan with water, stirred it well, and poured off two-thirds of the muddy water into another pan, then put on more water, stirred and poured off as before until the water no longer became muddy, then panned the sands, and got no gold. I took the other pan and stirred up the slimes well, then let it stand quiet while I slowly counted ten, then poured off the muddy water into the other pan, and continued this as before, each time counting ten before pouring off. On gently panning the exceedingly fine sand left, I got a good string of gold.

The muddy water was then stirred up and left quiet while I counted sixty, and repeated as before. On panning this, I had another string of gold. I went down a stream from a mine to a reservoir, where the muddy water was caught from sluicing and so given time for partial settling, got some of the settled slime, and found it carried $16 per ton gold. These tests show that some slimes do carry values, and brings the question: Is it advisable to reduce everything to slimes? I say, certainly not, with present machinery and processes. Then, how far can present machinery be utilized for the production of slimes? The present machinery, in all its varied forms, may be regarded as perfection in saving what I have termed massive gold; let it continue its work. Its work can even be lightened by coarse screens and passing the unslimed tailings to a purposely made sliming mill.

Now comes the question of treating the slimes. Shrewd minds are busily occupied with the subject. My idea is, that the final process will be continuous motion of ore from mill to dump; and that idea is based on actual work done, but by means too costly for profitable use on a large scale. I have seen filmous metallic gold dissolved in cyanide in ten minutes, and returned to the metallic form in another ten minutes, twenty minutes covering the whole time of both consecutive operations.

But, all gold is not alike. I have had filmous gold floating on a solution of cyanide for three weeks without being dissolved. Not only the mechanical treatment of slimes to get mercury or cyanide into contact with the contained gold, but the chemical treatment, to insure action on contact, has to be appropriate to each ore to obtain, at a profit, the results desired. I have frequently had gold immersed in mercury, and stirred about in it, that came out of the mercury without a trace of mercury on it.

The ancient miners heated the rocks by fire, and when hot enough threw water on it, thus softening the rock, making it easily broken. May we not take a hint here, and use fire in some economical way, say crushing to a small size, then passing it through some form of roaster, and dropping the hot ore into water, not only make it more easily ground into slime, but obtaining a more quickly settling slime, and producing a favorable chemical change that will enable both cyanide and mercury to act on the gold that without roasting is not taken up by these methods?

The cyaniding of ordinary slimes in a tank is costly, and often unsatisfactory; the roasting gives a more quickly settling property to such ores as I have tested in this way. A continuous process of both cyaniding and amalgamating gold-bearing slimes may be employed by using revolving tubes, the slimes from the plates or concentrator going in at one end of the tube and out at the other, the tube being set at such an angle that the discharge will permit a certain thickness of slime on all the length of the tube, thus causing every particle of ore to travel a very long distance in contact with the cyanide or mercury. Quick separation of solution or amalgam from the slimes is merely a matter of mechanical detail.

In testing the oil process, I found that petroleum oil has a strong affinity for gold. Water was put in a glass vessel, on the water was put a thin film of the oil, on the oil was scattered sand containing fine gold. The sand passed through the oil, the gold remained suspended in the oil; the heavy particles of gold pressed the thin film of oil down into the water like a sack. On agitation the sacks were detached from the film and sunk, and, on being brought together, the sacks with their contained gold formed one mass that kept separate from the sands, and thus showed its usefulness for separating gold from finely ground ores.

Now, a word as to the supposed absolute reliability of ordinary crucible assays, as a guide to what is being done, especially where values are very low. I have found that in some crucibles, after a clean pour, the glaze on the sides of the crucible contains numerous minute, microscopic beads of gold. Some crucibles taken from the dump of the assay office assayed higher than the ore did. This shows that a crucible assay of tailings may be an unsafe guide, no matter how skilled and careful the assayer may be. This indicates the advisability of some kind of quick analysis, or a method of assaying without the use of unglazed clay vessels, for guidance of mill work by values in the tailings. Evidently we don't yet know all there is to be known about gold and its extraction from its ores.

San Francisco, Dec. 23. JOSEPH VOYLE.

An Important Pelton Contract.

As indicating the strides being made in hydro-electric development, a recent order for Pelton water wheels is very significant. The California Gas & Electric Corporation has closed a contract with the Pelton Water Wheel Co. for a 10,500 H. P. water wheel unit, to be located at the Deer creek station, forming a part of their system of electric distribution. This establishes a record, as there has never before been built an impulse wheel of such great capacity. The unit in question is to operate under an effective head of 765 feet, and will be direct connected to a 5500 k. w. 300 r. p. m. generator. The "double overhung" type of construction will be employed, and the unit will consist of two Pelton wheels, one mounted on each overhanging end of a single shaft which carries the rotor of the engine-type generator. Some idea of the magnitude of this unit will be gained by noting that the rotor of the generator will weigh in excess of 45,000 pounds, and will be carried by a hollow nickel steel shaft 20 inches in diameter. The journals and supports are correspondingly heavy. The wheel centers will be of disc construction of open-hearth cast steel, and fitted with steel buckets secured to the rim by means of turned steel bolts hydraulically pressed into reamed holes. All pressure parts, such as gates, nozzles and connections, will be of cast steel. The gate valves will be provided with roller bearings to take the thrust from the nickel steel spindles, and the valves will be normally operated by electric motors, with provision for hand control when necessary. But a few years ago 1000 H. P. was considered as the limit of capacity for an impulse wheel, and the contrast with the present equipment is most striking.

ZINC is a peculiar metal. When cold it is hard and crystalline, but if slightly heated it is very soft and is susceptible to any treatment that brass may receive. In drawing zinc sheet in a press, the difference between the melting point and that of the temperature at which the best drawing takes place is so small that the problem of heating becomes serious if one is not conversant with the fact that zinc may be heated in oil. Attempts are made to heat by other means, but much waste occurs. To heat in this manner a heavy oil with a high flash point should be used, and a thermometer employed to register the temperature. This instrument will obviate any over or under heating, and prevent waste from such means. In addition to acting as a heating agent, the oil has a good effect on the drawing dies.

Stamp Mill Capacity.

TO THE EDITOR:—In regard to stamp milling capacity it has been suggested in reference to the use of primary and secondary crushing that the revolving trommel, or the impact screen, should be used to separate the sands from 20-mesh pulp for recrushing or grinding to 30 or 40 mesh.

I think that it is now generally recognized in concentration practice that the use of the revolving trommel is, as a rule, limited to the separation of sand sizes above 3 mm. (about ⅛ inch) and, more rarely, under the most favorable circumstances, to sizes above 2 mm. (about 1/12 inch). Working below these sizes the capacity of the trommel is small, and the wear and tear is great—so hydraulic classification is usually depended upon to separate finer sand sizes.

The impact screen is the result of the desire to carry the exactness of screen sizing to greater lengths than is practicable with the trommel. I do not know how effectively it accomplishes this on wet material, and I think that milling men generally would be very glad to see published results on this class of work.

Apart from this, however, it is certainly open to several commercial objections that the hydraulic classifier is not. The first cost is probably greater and the bill for repairs and renewals would certainly be greater, owing in some degree to wear of moving parts, but principally to abrasion of the screen by the ore particles. Then there is a necessary loss of head room in both the coarse and the fine pulp streams over the impact screen, whereas in the classifier there is no loss of head in the fine pulp stream passing over it. Again, the impact screen requires a certain amount of force, while the classifier requires none—the pressure of the water supply does it all. On the grounds of ease and cheapness of handling, the classifier easily has the best of it, and it only remains to decide whether in the work mentioned it will effectively accomplish the desired result. Now, of course, no one claims that the upward current classifier will give a uniformly sized product unless, perchance, it is working on a pulp whose constituents have the same specific gravity, for it sorts out the grains of approximately equal weights, and which have the same velocity in an upward current of water. If a 20-mesh pulp were being treated, the classifier could be so regulated as to remove completely all particles that would be retained on the screens of the secondary battery and with these would be a considerable number of smaller grains of whatever heavier minerals there may be in the ore. The return of these smaller grains would not materially affect the capacity of the secondary battery, but, if subsequent table concentration is carried on to receive these heavier minerals, there might result a loss from sliming in the secondary crushing. A little closer regulation of the classifier by cutting down the water might result in these grains being thrown over into the fine-ore stream, and, at the same time, some of the more barren particles of coarse material (lighter because of its barren condition) might also be thrown over, thus effecting an increase in the capacity by decreasing the amount to be recrushed, and saving the cost of crushing such worthless material. So, here, by being capable of better regulation and by being more delicate in its action, the classifier might score a point on the impact screen.

The only other source of trouble that suggests itself to me in using the classifier in this work is the possibility that the addition of the classifier water might render the pulp passing over it too dilute for good amalgamation. The amount entering the stream from a 10-stamp battery, after allowing for the amount drawn off with the coarser sands, should not exceed twenty gallons per minute. It will vary, however, under varying conditions of crushing and of ore constituents, as well as construction of the classifier, and I think that in most cases it can be counted upon to be less than the figure mentioned.

C. M. EYE, E. M.

SINCE American occupation, miners and prospectors have often preceded the troops. The American mining bureau at Manila now has reports from almost every one of the very many islands in the archipelago. In many cases samples and specimens have been furnished to the bureau. Through these sources the fact has been established that gold, copper, lead, iron, coal, sulphur, granite, marble, petroleum and other metallic and non-metallic minerals exist in paying quantities. The influence of the miner and prospector is making itself felt, repeating the experiences of the pioneer days of the mineral producing American States of the West. More than that, mining operations in the Philippines, when once they really begin, will have all the present day advantages of the latest devised electrical and other mining apparatus.

Something More of Head Frames.

In a recent issue was illustrated and described a number of types of head frames, built at various places, under varying conditions, and representing several ideas in construction and somewhat of expediency.

What there appeared is not all that could be said on this interesting and important subject, nor does this addition of the several types here illustrated include all of value in the matter. The conceptions of the practical mine carpenter and those of the mechanical engineer often differ widely. The former builds for solidity and endurance and it is rarely that he builds a structure of this sort which collapses under the strains of the work it was designed to perform. The engineer scientifically designs with a view to assured strength but with the employment of "A" type and, although built of timber, is designed on engineering lines to operate under peculiar conditions. It is a frame which could be copied to advantage at many places where more elaborate and expensive constructions are in use.

the minimum of material, therefore less expense. In the accompanying illustrations are types of head frames which represent simplicity, economy and strength, but without due regard to the engineering features—for instance, the rectangular two-post frames of the Montana type—one at a California mine, the other at Leadville, Colo.

In one of the illustrations we see the steel construction at the collar of a Cornish mine, but, aside from the fact that it is of steel, it offers little, if any, advantage over the four-post wooden frame situated at an inclined shaft in California. This frame is built over a smaller temporary frame, as seen in the illustration. Another type, and a somewhat unusual one, is seen in the peculiar construction at the Oregon mine.

In the steel frame at the Gwin mine, Calaveras county, Cal., is seen a type of modern two-post frame. It is designed to hoist from a depth of 4000 feet, through a vertical shaft, and shows that when material is properly distributed it is not necessary to build as massively as some seem to think.

The frame at the Congress mine in Arizona is of the

Gem Stones of Australia.

Written by JOHN PLUMMER.

For those conversant with the various methods of obtaining diamonds and other gems, this Commonwealth affords an inexhaustible field for the exercise of energy and enterprise. Nearly all the known kinds of gem stones have been found, but the attention of prospectors and miners has hitherto been concentrated on diamonds and noble opal. The former are met with in New South Wales, Queensland, Victoria and South Australia. In the Mother State, until recently, the stones were found mostly by miners engaged in the washing of alluvial for gold. Lately, however, several, including the largest yet obtained in Australia, have been discovered under circumstances wholly different from those characteristic of diamond fields in South Africa, South America and elsewhere, and pointing to the possibility of their being derived from Tertiary deposits. The existence of diamonds in New South Wales was known for years before an attempt was made to work the localities in 1872. In the course of the following year several deposits of diamondiferous wash were discovered at Bingara, in the New England district, and in later years at Boggy Camp, Copeton. The output has never been very considerable, the largest value realized in any year being £15,375. In 1899 the value amounted to £10,350; the output declined in the next two years, but increased to £11,326 in 1902, falling to £9987 in 1903. The total value of the diamonds produced up to the end of 1903 was £86,604; but this amount is believed to be considerably understated. At the diamond mines great care is exercised in the washing of the diamondiferous gravels, the process being somewhat complicated and tedious, but it is so efficient that even the smallest diamonds, no larger than a pin's head, are secured.

Some of the finest opal known is obtained in the Upper Cretaceous formation at White Cliffs, near Wilcannia, New South Wales. During 1895 good stone was found at the depth of 50 feet, and as the lower levels are reached the patches of opal appear to improve in quality and to become more regular and frequent. On one block a patch of stone was found which realized over £3000. It is difficult to state with exactitude the value of the production, but it is believed that stone to the value of £816,600 has been sold up to the end of 1903. In 1901 a special commission was appointed to inquire into matters connected with the opal industry at White Cliffs, and their investigations tended to show that the annual value of production for some years had amounted to £100,000. Despite the fact that operations were hampered in 1902 by lack of water, the production for that year was valued at £140,000. In 1903 the estimated value was £100,000. The number of men engaged in the opal industry was 1115. The opal bearing country embraces an area of several hundred square miles, the great difficulty experienced by miners being the limited rainfall. In Queensland magnificent opal is found in rocks of the desert sandstone formation, sometimes on the surface, but generally at a depth of about 14 feet. The chief fields are at Cunnamulla, Paroo and Opalton, in the far western and northwestern parts of the State, but the scanty water supply has been a great barrier to the progress of the industry. At Station Creek, in the Paroo district, a deposit of opal, valued at £2000, was unearthed during 1903. In that year the production was valued at £7300, and the total up to the end of the year, at £146,145; about 170 men being engaged in the industry.

Sapphires are found in all the States, and at the sapphire fields of Anakie, in Queensland, there is a population of 150 persons. The fields are extensive, but the gems are of a peculiar color, quite distinct

from those of any other country, a characteristic that somewhat detracts from their value, despite their extreme beauty. The value of the gems produced in 1901 was £6000, but owing to the low prices and the lack of sufficient water supply on the field, the returns fell to £5000 in 1902. The season of 1903 was more favorable, the production being valued at £6500. Many of the sapphires found in the Commonwealth are of a blackish color, occasioned by the presence of iron. Could this be removed they would become an intense blue, and extremely valuable. There are extensive emerald deposits in New South Wales, but the hardness of the matrix in which the gems are found forms a source of difficulty, as it is almost impossible to break down the rock without injuring and frequently destroying them.

Among other gems may be mentioned the Oriental topaz and Oriental amethyst, both found in New South Wales. The ruby has been obtained in Queensland and New South Wales; turquoises in Victoria; chrysoberyls in New South Wales; spinel rubies in New South Wales and Victoria; white topaz, in all the States; and yellow topaz in Tasmania. Chalcedony, carnelian, onyx and cat's-eye are found in New South Wales; and it is probable that they are also to be met with in the other States, particularly in Queensland. Zircon, tourmaline, garnet, and other gem stones of little commercial value are found throughout Australasia. Garnets of a rich color and luster are obtained in South Australia, where at first they were mistaken for rubies.

How Oxygen Assists and Retards the Dissolution of Gold in Cyanide.*

Written by H. Forbes Julian.

A doubt has for some time existed as to the accuracy of the generally accepted idea that free oxygen is primarily essential for the dissolution of gold in cyanide solutions, according to the equation—

$$4KCy + 2Au + O + H_2O = 2KAuCy_2 + 2KOH.$$

Experiments are described which go to show (1) that free oxygen plays no primary part in the reaction, (2) that any assistance given by free oxygen is of a secondary nature, and (3) that free oxygen exerts a retarding influence.

The experiments show that the galvanometer points to the presence of free oxygen as having a retarding influence on the dissolution of the gold, whereas the balance points to it being of material assistance. The cause of the two instruments not agreeing is discussed, and is attributed to the formation of local voltaic circuits. These, in the first instance, deposit hydrogen and oxygen which, it may be assumed, become occluded at their respective electrodes until the systems are in equilibrium. It is pointed out that cyanogen leaves the solution to combine with the gold rather than that gold particles pass into the solution, and it is shown that cyanogen does not leave the solution until the deposited oxygen has been occluded to a certain degree of concentration. The reason for this is that the expenditure of energy necessary to remove oxygen from the solution is less than that necessary to remove cyanogen, but when oxygen is occluded to a certain concentration, the expenditure of energy then necessary to cause the metal to occlude a further amount becomes as great as that necessary to begin to remove cyanogen from the solution. The available energy is obtained from the metal and solution, and it follows that when the solution is very dilute the available energy is too small to remove cyanogen, oxygen being then alone deposited. From this it may be conjectured that no metal actually combines with cyanogen until the solution has a certain minimum strength.

The presence of dissolved oxygen in the solution has a secondary effect in the process of dissolution, by oxidizing the occluded hydrogen, produced through the action in the local votaic circuits. This results in upsetting the equilibrium, and introducing into the circuits concentration gas cells, which soon bring about equilibrium again, but this time with oxygen at both electrodes at different concentrations, instead of hydrogen and oxygen. If, now, excess of dissolved oxygen diffuses to either of the electrodes the equilibrium is again upset, and an E. M. F. is generated by the gas cell in opposition to the E. M. F. generated by the metal couple; the net result being, of course, a current in the direction of the greater E. M. F. As the strength of the solution increases after a certain point, the E. M. F. due to the metal couple increases rapidly, whereas that due to the oxygen concentration cell remains constant or increases only slowly.

The increase in the E. M. F. of the metal couple appears to be largely due to the formation of AuCy —a compound having a high potential which acts as an electrode. This deposits in films, varying in density or thickness to a maximum with the strength of the solution. A couple results of Au—AuCy. After this stage of the process, when AuCy is formed, oxygen ceases to exert an influence. That is to say, the metal passes into solution by the AuCy dissolving in the potassium cyanide solution, as one salt dissolves in the solution of another.

The effect of the gas cell is best observed in highly dilute solutions at ordinary or low temperatures. After a certain strength is attained, dependent on temperature, the effect of the gas cell is entirely masked. At the higher temperatures the E. M. F. of the gas cell diminishes, with a corresponding increase in the E. M. F. of the Au—AuCy couple.

An "A" Frame at Congress Mine, in Arizona.

* Abstract of paper read before the British Association in South Africa.

Notes on Southern Nevada and Inyo County, California.—III.*

Written by H. H. TAFT.

The Jumbo was sampled many times and "turned down." It was bonded and a shaft was sunk, with no results. On the Quartzite a shaft was sunk and trenching done and the property was given up. On November 10, 1902, H. Stimler and W. A. Marsh camped at Rabbit Spring, where Goldfield now gets its water, and soon after made locations in the Sand Storm section. In the spring of 1904 the Sand Storm and Kendall claims were carefully explored, with no results. In the Jumbo gold was found by panning the soft rich country rock close to the reef which was rich; but the vein was found later in the reef, through which it takes a zigzag course.

After the incorporation of the Jumbo Mining Co, leases were let for the last seven months of 1904, according to the custom of the district, in blocks 200 feet long by the width of the claim, royalties being set at 25% of the gross yield. These leases yielded over $1,000,000. The best piece of ground, 200 feet long and 200 feet deep, yielded in round figures 2000 tons of $350 ore and 3000 tons of $50 ore. The Quartzite and the Sand Storm are now among the active shippers. One lot of 14.5 tons from the Kendall claim of the Sand Storm group yielded on the plates of a stamp mill $45,785 and is said to have left tailings valued at $1000 per ton.

The Combination Mines Co. is the only corporation in the district that is carefully preparing for regular future production. Good buildings are under erection, a pipe line has been laid 10 miles to a spring, and a well-built mill has been completed. The principal vein is parallel to that of the Jumbo. Just to the northwest, on a cross vein, is the January, which has a dump of several thousand tons of milling ore awaiting treatment. The Florence mine, one of the best, is on another cross vein east of the Combination. This group of four mines is the most important in the district.

Four miles north of Goldfield town is Diamondfield, about 1 mile north of which occurs another group of promising mines from which some shipments have been made. One of these is the Black Butte, a prominent topographical feature. On this property has been developed ore of probably the lowest grade ($20) mined in the district. A short distance north, on the slope of the butte, is the Quartzite "fraction," one of the most promising properties now shipping ore. Half a mile north is the Vernal, which has also shipped some ore. To the northwest are two very strong quartz reefs, in which very limited prospecting has not yet developed any important ore bodies.

The explorations near the Sand Storm, 3 miles west of Diamondfield and a little farther from Goldfield, have not been specially fortunate, except in the Tonopah Club, which is in the low ground lying between Diamondfield and the Sand Storm.

Northeast of Goldfield town some important discoveries have been made; and ore has been shipped, notably from the St. Ives, a claim covering a very prominent reef near the Jumbo, and from the Cimerone. The latter was found during the summer of 1904, and the finder literally camped on it, putting his tent and bed over the rich place, until he had succeeded in buying the fractional claim from the original locator. Then he made the discovery public, and in a few weeks sold out, it is said, for $60,000 cash.

In March, 1905, the town of Goldfield, lying between the Combination mine and the mesa at the foot of Montezuma mountain, had an estimated population of 10,000, and Columbia, practically an extension 1 mile northwest, had 2000, and Diamondfield about 500. Goldfield and Columbia are supplied with excellent water by two 2-inch pipe lines. The water comes from under the mesa immediately west. The Combination Mines Co. has a pipe line from the Warm Springs. Twenty miles west of Goldfield is the Silver Peak marsh, where there is an open lake.

Both at Bullfrog and Goldfield the situation is somewhat discouraging. In March last scarcely fifty men were working at Bullfrog and about 200 at Goldfield. While actual development was thus neglected, the industry of transferring to new corporations groups of claims, good, bad and indifferent, of selling the stock of such corporations, was active. All American mining districts have passed, and will doubtless hereafter pass, through such a period.

TONOPAH.—The veins in this district are much stronger and more condensed and possess the regularity of silver veins, which they should be deemed to be, since the values are about two-thirds in that metal. The railroad has only been in Tonopah a year and has been overwhelmed by freight for the newer districts. One small mill, owned locally, is operating. The owners of the developed properties do not seem to think that the time is yet ripe for large reduction plants.

About 1500 tons of high-grade ore is shipped weekly to the smelters, and, incidentally, an enormous amount of milling ore is blocked out. It is said that one company has $35,000,000 in "positive ore." In one of the mines 60 feet thickness of $28 ore is reported. The maximum depth reached is 1000 feet. This district has, therefore, long passed its doubtful stage.

The country rock is andesite, so overflowed by more recent volcanoes that very little of it is exposed. The explorations of the past year have gone through this overflow and found ore by drifting in the "mineralized porphyry" below.

The development of milling, always an expensive and interesting problem, will be unusually so in these three districts. Their ores, though different, are all typically milling ores, consisting of quartz with very little base metal. Should smelting be necessary, there are several flux-producing districts, now idle, which could be drawn upon.

BORAX DEPOSITS.—South of the Funeral range, in the region drained by Furnace creek and on the Amargosa side of the mountain, is a large development of recent sedimentaries—shales, clays, sandstones and thin sheets of gypsum. There are a few intrusions of later andesite and a heavy flow of black and brown basaltic lava. In these sedimentaries immense deposits of calcium borate occur, conformable with the strata. The most common mineral is colemanite. As one might expect from an element possessing the peculiar solubilities of borax, there are many combinations of boric acid, lime and soda under various mineralogical names. There is some question as to the origin of the deposits. The Pacific Coast Borax Co. first obtained title under the placer law, but now favors lode locations. That company has the region pretty well "corralled" for borax. The rocks are highly colored. The country is bare of vegetation and water is scarce.

The borax deposits are remarkable in size and purity. In one place there is an outcrop of calcium borate 30 feet thick. At the Lila C. mine, on the Amargosa side of the range, 35 miles from and in sight of Ash Meadows, is a deposit, from 3 to 17 feet thick, dipping about 45° E., and explored on the surface for a mile. The underground workings are in the vein (?) for a quarter of a mile. This is the property that will bring a railroad to this section.

DEATH VALLEY.—Much has been written about this valley and a strange amount of romance is attached to it. The prospector could easily find a more promising field and a less expensive place to work a mine in. It is a long, narrow valley, very deep and surrounded by high mountains. The Panamint and Sentinel peaks reach an extreme elevation of 11,000 feet, while Death valley, hardly 10 miles west, is 200 or 300 feet below sea level. A similar difference of elevation occurs 80 miles northwest, between the summit of Mount Whitney and Owens Lake valley.

Under one general name there are three connecting valleys: Death valley proper, Lost valley and Mesquite valley. The upper end of the latter is only about 30 miles from Goldfield. Instead of being the horrible region usually reported, it is the best of the desert valleys. Lying so low and being shut in by surrounding mountains, it is hot in summer; but the winter climate leaves little to be desired, particularly by those who require a dry atmosphere. It is but a few miles west to an elevation in the Panamints, where in the shade of the pines the traveler can be comfortable and look into the sweltering valley below, while a battery of abandoned charcoal kilns might make him fancy he was summering near Lake Superior.

The name Death valley comes from the loss of an emigrant train in the lower end of Lost valley. The party was on the way from Salt Lake to southern California, and, becoming exhausted, stopped to rest in what appeared to be a meadow. The salt and wiry grass is not nutritious; the water is saline and carries enough sulphates to disarrange promptly the human digestive system. The spot, where it is said about fifty people perished, has been dug over for buried treasure, and last winter many of the pits were in brackish water. Some prospectors, also, have lost their lives in the south end of the valley.

At the mouth of Furnace creek the Pacific Coast Borax Co. maintains a ranch, having 200 acres in alfalfa and wheat. Twice a month a 16-mule team arrives from Dagget, 160 miles away on the Santa Fe Railroad. Three miles from the ranch are the old Coleman Borax Works.

Furnace creek and several streams south, usually dry, bring down borax in solution. For a few miles in width and a length of about 30 miles, the lower part of this valley looks like a mud flat with the tide out. These places are locally called marshes, although they have no vegetation. The borax is here a double borate of lime and soda, commonly called "cottonball."

A peculiar phenomenon, better seen in this than in the other valleys, is the "self-rising ground." The soil carries a large proportion of soluble salts, sodium carbonate, sodium chloride and various sulphates and borates. Evaporation is excessive; the subsoil is moist, being constantly supplied by springs; and capillary attraction brings the salts to the surface. This does not go on evenly, but forms hummocks sometimes 2 or 3 feet high, hard on the surface and soft beneath, making a bad and sometimes dangerous ground to walk across. The same natural laws have caused the surface enrichment of some mineral veins in the desert, particularly veins of copper ore.

The atmosphere in the valley is remarkably clear and possesses the resonance so noticeable above timber line. There is no truth in the story about birds and animals dying in attempting to cross the valley. The Indians and the Borax Co. keep several hundred cattle and some mules and horses about the mouth of Furnace creek, and rabbits, quail and other small game can be found.

PANAMINT RANGE.—This range is unusually high and precipitous, starting at sea level instead of several thousand feet above, as most other high ranges do, and having no foothills. The rock is green slates, mica schist, quartzite and limestone. On the west side is an intrusive granite which has tilted the whole formation, the larger part of it to the east. The green slates carry fine-looking quartz, but so far it has not been found to carry values. On top of the range are large areas of recent conglomerate and basaltic lava.

Panamint City had once 6000 people and is now reduced to a few old-timers, who say it will soon start again and make "the greatest camp on earth." The ores are of silver—refractory and heavy, with a pyritic gangue. The railroad is 90 miles away.

On the west side of the mountain every gulch for 46 miles has some sort of a mining equipment, usually a small stamp mill and owned by some Los Angeles company. The first question asked of strangers is: "Are you from Los Angeles?" It is best to answer: "No."

LEAD MINES.—South of the Amargosa there are some lead ores and two large deposits of iron ore. They are too far from a railroad to have anything but speculative value.

The mountains between the Panamints and the Sierra Nevada were once the scene of great activity in lead-silver mining. Old roads constructed at great expense, smelting plants at the mines and charcoal kilns many miles away in the timbered mountains are mute evidences of this former scene of activity.

Cerro Gordo, Darwin and Modock produced between 1870 and 1880 approximately $25,000,000. The first-named was the heaviest producer, furnishing the largest quantity and lowest grade of ore, while the last produced the smallest tonnage and the highest grade. They are all at or near the contact of granite and limestone. Unlike the deposits at Monarch, Colo., along a similar contact, these ore bodies are from a few feet to 300 feet away from the contact, in cracks and crevices of the limestone.

At Darwin there is an anticlinal about 6 miles long, the west side of which dips about 45° and the east side more steeply. The latter carries some copper, while the former shows none. The oxidized surface ores contain roughly one ounce of silver to 1% of lead and the galena ores two ounces of silver to 1% of lead. From the old books left at some of the works it would appear that the average ore contained from 40% to 60% of lead. The gangue is iron and lime, with some silica. There are four smelting plants near this place, one of which is in good condition, and twenty persons are still living in the town.

The "on dit" of the country is that the ores became too poor to work at a depth of 800 feet. While these mines were working Mojave, Cal., was the nearest railroad point, and wood and charcoal had to be hauled long distances. From the charcoal kilns in the Panamints to Darwin is 50 miles. The altitude of the kilns is 8000 feet, that of Darwin 6000 feet and that of the intervening Panamint valley 1100 feet above tide. The price of fodder must have been high. The nearest farms are now 50 miles away.

Cerro Gordo is 7 miles from and 3500 feet above Keeler, the terminus of the Carson & Colorado Railroad, 334 miles from Reno, and by wagon road 120 miles from Mojave. Here are located the soda works of the Inyo County Development Co. With diminished treatment charges at custom smelters, lower rates of freight and the flood of siliceous ore now going on to the market, it would not be surprising if these lead ores, with their useful fluxing character, should be again mined with profit.

OWENS LAKE VALLEY.—Owens Lake valley, about 75 miles long and 20 miles wide, is drained by Owens river, which flows into the lake of the same name, about 18x12 miles in area. The water of the lake is a nearly saturated solution of sodium carbonate and common salt, with a little sulphates and borax. There is no verdure around the edges.

The river is fed by streams from the west, having their origin in the Sierra Nevada, a very high, narrow and well-timbered range. All the older settlements are on these streams, but the railroad follows the east side of the valley. A large ditch has been carried by an irrigation company down the east side of the valley to within 12 miles of Keeler, and the newcomers are settling along this ditch.

While this valley is fertile and well watered, particularly at the north end, the farmers have not as a rule been prosperous, because the market was too distant. Now a sudden change has come. From Laws station, opposite Bishop, in the upper end of the valley, to Tonopah is 113 miles by rail. It is fortunate both for the farmers and the miners that there should be an agricultural region so near.

All the streams coming from the Sierra Nevada

*Trans. Am. Inst. Min. Engs.

furnish opportunities for developing water power; already a company is preparing to generate and transmit electric power from Bishop creek to Tonopah and Goldfield.

All the grains and fruits of the temperate zone are raised here. The apples, peaches, pears and certain varieties of grapes are better than those raised on the coast side of the Sierra.

SMALLER MINES TRIBUTARY TO OWENS LAKE VALLEY.—In the south end of the Argus range and in the Coso mountains are many veins, usually only a few feet in width, of white quartz in granite, occasionally carrying gold, low in value and in spots rather than in regular ore bodies. Most mining men dislike these conditions. The Congress mine in Arizona is the only large and successful enterprise working this class of quartz.

The Beveridge and Lee districts, northwest of Darwin, have argentiferous ores. At the latter place there was formerly a stamp mill, which, judging from the amount of tailings, did not run long.

The Ubaheba district, lying between the Saline and Butte valleys, is a large, undeveloped region of low-grade copper ores in contact deposits between limestone and some acid eruptive. These valleys are very deep and would be a continuation of the Panamint valley but for an east and west mountain that looks like an enormous dam. The west end is granite; but the larger portion of the mountain is recent conglomerate overflowed by basalt.

In the mountains facing Owens Lake valley on the east side, both in the granite and the chloritic slates, quartzites and limestones, which the intrusive has thrown on edge, there are numerous veins of white quartz, carrying occasional gold values.

Between the stations of Alvord and Citrus, 3 or 4 miles from the railroad at the foot of the mountain, and well located for economic reasons, is a new stamp mill and outbuildings, now idle.

Farther up the valley, at Poleta, there is a plant running.

FROM OWENS VALLEY TO GOLDFIELD.—From Alvord station, 5 miles from Big Pine, 20 miles from Bishop and 54 miles by rail from Keeler, there is a wagon road 61 miles to Lida and 96 miles to Goldfield. This road is now much used by freighters and farmers hauling produce to Lida, Goldfield and Tonopah. Three ranges of mountains and two valleys are crossed. Between Deep Spring and Fish Lake valleys there is a gold-copper exploration near the road. In the mountains east of Fish lake are two old mills.

About Lida and between Lida and Montezuma mountain the formation is light-green slates overlain nonconformably by limestone. In the slates are dikes of porphyry and rhyolite and many quartz veins. At Lida the veins are exposed on the surface and show remarkable persistence in length; but when worked thirty years ago they were found to lose their values at a depth of from 200 to 300 feet. The ore is quartz, with little galena and zincblende. The principal values are in silver.

From Lida east to the Kawich range the rocks are all volcanic, from rhyolite to basalt inclusive, but rarely are there any of the earlier tuffs or andesites.

Gold Center is a small area, similar to Goldfield, but the ores are not particularly high grade or continuous. The soft, aluminous country rock seems to have moved too much after the ore was deposited.

Quartz mountain, 24 miles south, is of rhyolite, with veins similar to those of the Bullfrog district.

It is remarkable that so many mines have been found of late years in the volcanic tuffs, now generally known as andesite. A very large portion of them carry gold. One can not but wonder if there are not more. This is not a formation which prospectors have liked until lately; and as yet it has been but imperfectly studied. The fact that the mineral-bearing tuffs are basic, and are overlain by the acid rhyolite, is perhaps significant. Cripple Creek has a rhyolite mountain in which much money has been spent without satisfactory results. The nature of the veins, too, is new. They may often be called freaks. Mineralizations of country rock are to be expected rather than "text book" veins, such as used to be sought for.

THE use of gold in exchange and adornment, and copper for utensils, was common among the natives of the Philippines upon the first landing of their Spanish conquerors 400 years ago, but the Spaniards never encouraged the systematic mining of metals. Placer washings, and the most primitive methods of mining and working quartz were, and still are, in use by the natives. Revolutions, burdensome laws, and the scarcity of skilled labor discouraged foreign mining enterprise in the long line of Spanish days.

Testing of High Power Gas Engines.

Written by WILLIAM H. SPILLER.

The modern gas engine has to undergo prolonged and severe test in the factory, far more critical than the majority of steam engines ever pass through. The duration of these tests varies from one week to fifteen days, according to the size of the engine, the work it has to perform and the distance it has to be shipped.

It can readily be seen that in a piece of mechanism weighing from twenty-five to fifty tons some of the parts will weigh from one to five tons, and that these various parts must represent a great deal of money expended for making and the high-class labor of finishing, to say nothing of the cost of the splendid grade of material required for this type of power machinery.

As these engines are sold under a positive guarantee covering consumption of fuel per horse power per hour, workmanship, material and general efficiency under actual operative conditions, the reason for the excellent exhaustive testing is at once apparent.

The manufacturer cannot afford to run any risk of a shut-down of a plant from any cause after installation on the customer's foundations.

The expense of shipping, the services of the erecting engineer and his expenses from the factory are considerable; therefore, the manufacturer takes the trouble and expense of assuring himself, as well as protecting his customer, that there will be no flaws, no trouble or vexatious delays, but a perfect working, economical and absolutely reliable up-to-date power, placing the engine in a field distinctively its own, acknowledging no competition, bowing to no other power.

The first tests are made by the chemist when he analyzes the pig iron or steel as received from the mill, and this analysis must tally with the specifications calling for the particular grade required for certain parts of the machine.

Then when a heat is run, a test piece is made and put under test until it is fractured and the ultimate or breaking strength is known, and then the unit stress per square inch, with a proper factor of safety for the material, is determined.

The factors of safety in gas engines are very high, for the strains are exceedingly complex, there sometimes being not only compression and tension strains, but also cross and traverse strains in the various parts.

When a casting has been made in the foundry it is gone all over with powerful blows delivered with a heavy hammer, to ascertain if the casting is perfect; and if any chambers have been cored, this will show if there are any thin or weak spots in the walls.

If any defects are developed the piece is immediately rejected.

After the cylinders have been finished, and before assembling the engine, they are tested under a high water pressure with a special device, and the pressure, number of the cylinder and engine recorded.

The various materials and parts of the engine having passed these preliminary but systematic tests, and then being assembled, forming the completed engine, the cams and gears set correctly for the proper timing and igniting of the gases in the cylinders, the valves in proper position for admitting and exhausting of the gas, the engine is then ready for its initial run.

The indicator, so familiar to steam engineers, is used, and a card is taken from each cylinder on the engine.

It might not be out of place to state here that these large engines are started by means of compressed air, admitted through an automatic starting valve to one cylinder, and the engines operate by this means until gas has been drawn into the other cylinders upon the descent of the pistons, compressed and ignited, and then upon shutting off the compressed air and admitting gas to the first cylinder it immediately assumes its cycle of operations upon gas, giving its power also.

The compressed air is supplied by means of a small 2 or 3 H. P. gas engine, air compressor and air receiving tank, furnished with every plant.

The indicator cards taken from the engine show to the trained testing engineer the exact amount of compression in pounds per square inch of the mixture of gas and air; the pressure of the burning gases after ignition, the pressure of the exhaust, and also whether the intake and exhaust valves are set properly for the highest economy, and whether the igniters are timed accurately for igniting the gas at the proper point of the stroke to gain the greatest power.

The valves on these large engines are operated positively by mechanical means, and as they are provided with a device for adjusting to the one-thousandth part of an inch, it can be understood what an excellent opportunity is presented to the engineer for securing efficiency and economy.

Some manufacturers have been in the habit of cataloguing their engines under the indicated horse power, and we have seen records of test runs having been made of gas engines and the fuel economy per horse power credited as being a great deal higher than that of other engines.

Had these same engines been tested under a brake load and that test been published, it would have been the correct way to list and sell an engine, as the purchaser would know how much power he is going to have actually delivered to the belt after consuming a certain amount of fuel.

As the brake test is the most important test from the purchaser's standpoint, we will now consider it in detail. In making this test of the boiler horse power or delivered horse power, the determination is made by means of a type of dynamometer, known as the "prony" brake. This consists of a large cast iron ring, having both inwardly and outwardly projecting flanges, the inner flanges serving as a trough to hold the water necessary to keep down and absorb the excessive heat developed when the engine is delivering a great amount of power.

A small pipe standing at the proper height allows the water to flow into the ring, maintaining a constant amount of water necessary to supply the loss from rapid evaporation, and the heat is partially dissipated in the form of steam and the excess of water carried away by means of an overflow pipe. The accompanying engraving shows a test being made of a 300 H. P. producer gas engine, operating upon pea coal and consuming less than one pound of brake horse power per hour, in the manufacturing establishment of the Weber Gas Engine Co., Kansas City, Mo.

At the time the picture was taken the engine was delivering about 350 H. P., and the clouds of steam from the brake obscured part of the view.

The outer flange on the ring serves to hold in position the brake strap of steel to which shoes of wood are riveted. This strap is provided with two powerful hand wheels at the back for tightening and increasing the friction on the ring or drum. Lubrication is supplied from pieces of tallow placed between the blocks of wood. The band or strap has a lever rigidly attached and firmly braced to it at different points. The drum is bolted to the fly-wheel and revolves with it; the brake arm resting upon a knife edge on top of the wooden stand on the platform scales prevents the brake from revolving when the strap is tightened, and allowing the downward push to be weighed in pounds and fractions on the scale.

The engine is run at normal speed, and the strap is tightened until the speed of the engine remains constant and carries the proper load in horse power, as indicated by the weight necessary to balance the scale.

The brake horse power is computed by multiplying the pressure upon the scale in pounds by the length of the brake arm in feet, times the revolutions of the drum per minute by the decimal .0001904.

The length of the arm is taken as the distance from the center of the engine shaft to the knife edge on top of wooden stand on the scale.

The weight of brake arm and wooden stand is deducted from the total weight as registered by the scale.

Testing of a Gas Engine.

PYROMORPHITE is a lead phosphate and chloride. It is rarely in sufficient quantity to be of commercial value. Its beautiful crystalline structure, and occurring as it does in a number of colors, makes specimens highly prized and priced. The old Phœnix mines of Phœnixville, Pa., produced some of the world's finest specimens.

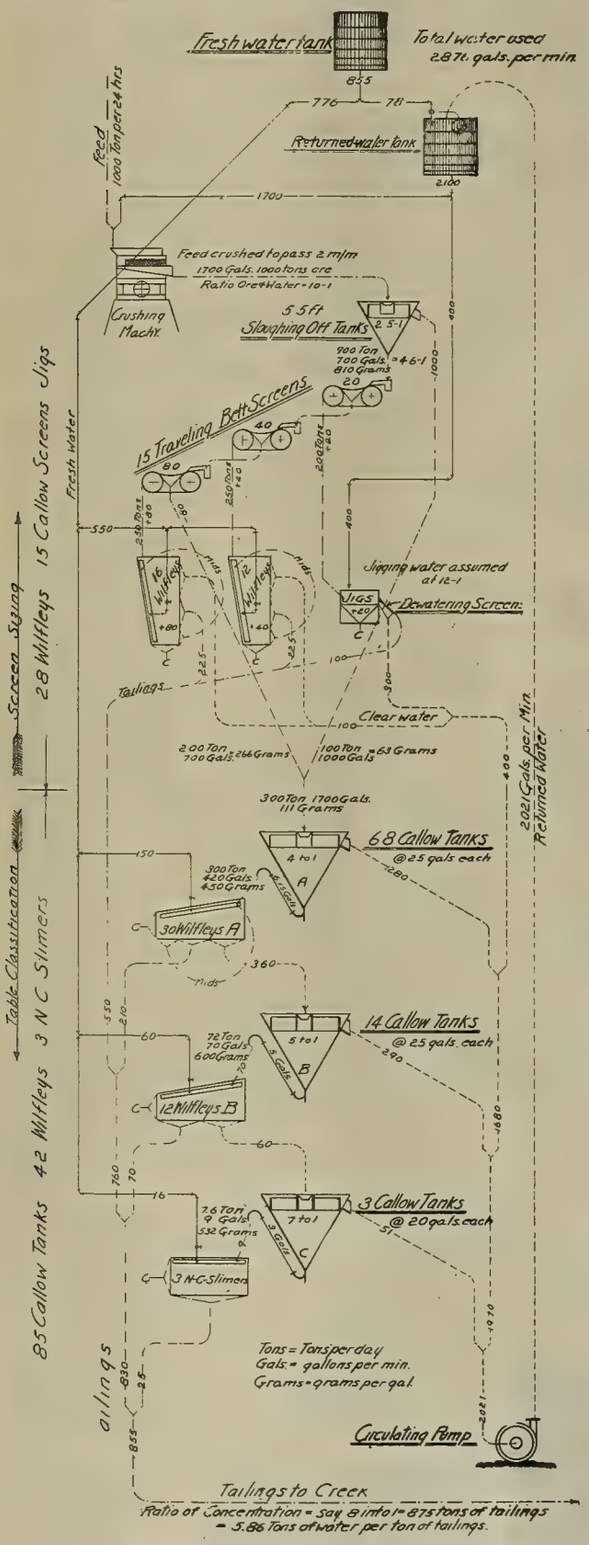
THE Castle Dome district in Yuma county, near the Colorado river, was at one time a noted producer of lead-silver ore. Tiptop is an almost forgotten, but at one time, rich silver camp, in southern Yavapai. The hornsilver and native metal found there were at one time famous.

LARGE masses of moss agate have been found in abundance in the foothill range of the Black Hills, in the Hartville mining district of Wyoming, about 130 miles north of Cheyenne. The material occurs in lenses from 5 to 6 or more inches in thickness, and varying in width from 2 to 3 feet.

Classification as Applied to the Concentration of Finely Crushed Ore.

By J. M. CALLOW.

It will be generally admitted that the greatest problem in ore dressing has been the proper and accurate sizing of finely crushed material. Hitherto the limit of exact sizing—in other words, screen sizing—has been in the neighborhood of 2 mm. The Callow screen has enabled screen sizing to be carried to any mesh, 200 inclusive, but while on a certain grade and character of ore this will be found perfectly practical and feasible, yet on other ore, less complex and of lower grade, it may be considered an unnecessary refinement. But whether 80, 100 or some finer mesh may be determined upon as the practical limit for a particular ore, there is still left in any case a wide range of undersize particles on which it is equally as important and profitable to practice some form of sizing or sorting. Any contrivance calling for additional water for this purpose is inconsistent, since these pulps are already too dilute, and if surface or whole current classifiers are used, the sorting performed by them is so crude and their several products so badly contaminated with slime that they offer no practical advantage over a simple settling scheme. Therefore, for any improvement in this department some fresh element must be sought for. This is found in the percussion table, which both concentrates and classifies, stratifying its feed not only into bands of gangue and mineral and their intermediate products, but also separating the sand from the slime more effectively than any other apparatus, and this without the addition of any water other than that necessary for the regular operation of the machine.



Fresh water tank
Total water used 287t. gals. per min
Returned water tank
Feed 1000 Tons per 24 hrs
Feed crushed to pass 2 m/m
1700 Gals. 1000 tons ore
Ratio Ore+Water = 10-1
Crushing Machy.

Ratio of Concentration = say 8 into 1 = 875 tons of tailings = 5.86 Tons of water per Ton of Tailings.
202 Gals. per Min. Returned Water

Callow's System of Ore Classification, as Applied to the Concentration of Finely Crushed Materials, and the Recovery of Operating Water.

The practical limit of screen sizing having now been advanced from 2mm. to 80 mesh or finer by the invention of the traveling belt screen and with the Callow settling and pulp thickening tank at hand for settling and thickening the undersize and combining these with table classification, a thoroughly practical and perfect system of sizing is the result, which is fully set forth in the accompanying diagram. It will be noted, moreover, that the recovery of water incident to this arrangement is no less important than the other features characteristic of the system.

The Fight for Le Roi.

Among the noted mines of British Columbia, the copper-gold producer known as Le Roi, at Rossland, is the most prominent. The mine was discovered on the slope of Red mountain, near where the city of Rossland now stands. In its early history it attracted but little attention, but the owners believed in it and spent considerable money in its development. Pay rock was eventually found, and the obscure prospect rapidly developed into a mine and attracted world-wide attention. It was floated in England for a large sum and for a time produced handsomely. In time the large and easily available ore bodies were extracted—faster than new ones were developed—and evil days came upon the property. Expenses were reduced, equipment extended and new ore bodies discovered and developed. The character of the ores in the Rossland district has made a mixing of the ores of the several mines advisable, and even necessary, to obtain suitable smelting mixtures. This led to the proposition to consolidate several mines of the district. To this some stockholders strongly objected, while others favored it. At a meeting held in London on the 8th inst., the difficulties of the company were discussed at length. In his address to the stockholders, H. W. Tyler, chairman of the company, recited the difficulties of the past and, in part, spoke as follows:

"We are met here to-day to consider mainly two things—(1) to discuss the report and balance sheet, which we have laid before you, as to the working of the Le Roi mine during the year 1904–5; and (2) to decide the important question as to whether this company is to be worked in future as a separate company, or whether it shall be included in a new company to be formed by the amalgamation of several existing companies. In reviewing, at our meeting in January last, the history of the Le Roi mine, from the date of the special meeting in May, 1902, at which, contrary to our wishes, Mr. Hill, the former chairman, had resigned, I took the opportunity of reminding you that we had, under the able management of J. H. Mackenzie, recovered from the serious and apparently hopeless financial difficulties which had caused Mr. Hill to call that special meeting and to tender his resignation. And you will remember — (1) that Mr. Mackenzie realized for us for the year ended June, 1903, a profit of £80,242, after writing off £32,015 in respect of development, and £19,148 for depreciation; (2) that by the end of December, 1902, the previous deficiency of net assets, amounting to £40,000, had been converted into a surplus of net assets of £80,000; and (3) that in further working to June, 1903, the position had again improved until the excess of liquid assets reached at that date no less an amount than £92,621. In spite of ill health, Mr. Mackenzie, who had resigned in the Autumn of 1902 to seek the more congenial climate of San Francisco, was good enough, at my special request, to remain at the mine until February, 1903, when S. F. Parrish, who had been strongly recommended to us, succeeded him as general manager.

"Under the management of Mr. Parrish, the working of the mine and smelter showed losses in place of profits for the four months between June, 1903, and December, 1903; but Mr. Parrish cabled in February, 1904, that he had found a large amount of payable ore at the 1350-foot level, that future prospects were excellent, and that he was shipping from the mine 650 to 700 tons daily, with six furnaces in full operation at the smelter. Then began, in February and March, 1904, what I may designate as the Parrish troubles. We heard from the office manager that Mr. Parrish was ill, and might not be able to return to business for some time, and that Mr. Wilson had closed down all the furnaces at the smelter; and Mr. Fraser, the manager of the Rossland branch of the Bank of Montreal, also cabled to us, urging that we should quickly secure the services of Mr. Mackenzie. We at once, on March 31, 1904, cabled to Mr. Mackenzie, and informed the shareholders of the position. Mr. Mackenzie lost no time in acting on our request, and he had reached Rossland on April 3. On April 7 Mr. Mackenzie cabled to us reporting serious differences of assay between the mine and the smelter, suggesting a cleaning up of the furnace bottoms, and recommending a contract with the Trail smelter, but was then powerless in the matter, inasmuch as my colleagues on the board held contrary opinions to mine, which they strongly expressed here last January. Mr. McMillan reached Rossland on May 5, and Messrs. Bradley and Mackenzie acted as consulting engineers until August. Mr. McMillan cabled to us on August 30, 1904, that Messrs. Bradley and Mackenzie had resigned their position, as, according to Mr. McMillan, their views did not harmonize with his, and I heard from Mr. Mackenzie, in a letter dated September 20, that they did not consider it wise to keep the Northport smelter in operation under the then existing conditions. It has since been reported to us, the figures having been worked out by the accountant at Rossland, employed by Mr. McMillan, that we incurred a direct loss of $109,579 in one year, by continuing to use the Northport smelter against the advice of Messrs. Bradley and Mackenzie.

"It is, unfortunately, the fact that the monthly profits have been on a diminished scale. And these considerations have a direct bearing upon the subject, the all-important subject which we to-day have to decide: Can we go on working the Le Roi mine by itself, with a reasonable prospect of finding for ourselves, and providing for you, substantial dividends in the future? Or should we be subject, however good the management, to a continuance of the disappointment which has been experienced in the past? We have every reason to believe that all the best ore that could be collected from the mine was dealt with during the early part of the year, and we are since told by Mr. Mackenzie that development was not properly maintained, while it would appear that the ore reserves, according to Mr. Astley, were a diminishing quantity. Such results as these are by no means encouraging either as record of the past or promises of the future if the mine is to be worked by itself. The accounts before us show a profit of £50,000 in the year 1904–05, as against the serious loss in the previous year, and if a net profit of £50,000 in the year could be fairly earned, and if it could be depended upon for a permanency, it would no doubt be satisfactory.

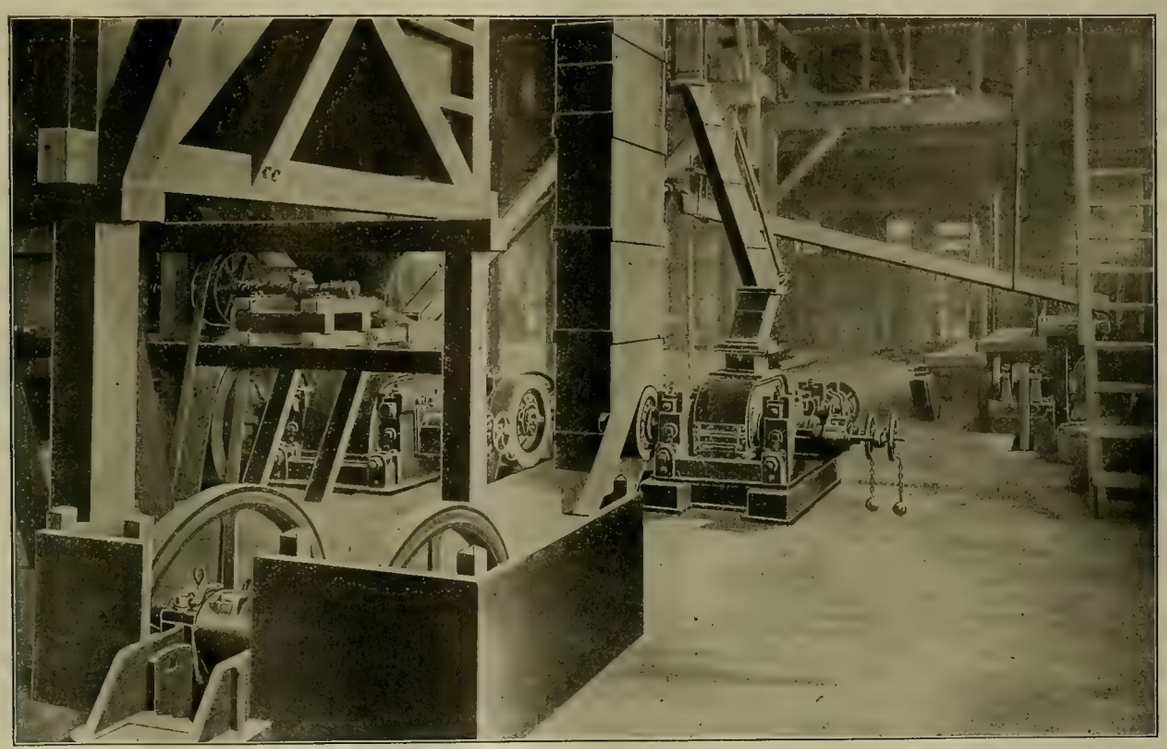
"I now come to the question of amalgamation with the Center Star (including the War Eagle) mines in Rossland, the St. Eugene Con. Mining Co. at Moyie and the Canadian Smelting Works (including the Rossland Power Co.) at Trail, all in British Columbia. Mr. Mackenzie recommends that the Le Roi Mining Co. should join in this consolidation on the terms which he proposes, and that he states emphatically that, in his belief, there is no question of doubt as to the result of such consolidation being beneficial to the shareholders of the Le Roi Co. He states that the manifest advantages of such an amalgamation are: 1. A reduction in the cost of mining and exploration. 2. A substantial saving in administrative and office expenses. 3. Reduction in freight and treatment charges. 4. Reduction in present cost of marketing copper. 5. Competent management and the skillful direction of exploration work under one head. 6. The prestige and advantages of a large and powerful corporation with sufficient capital and an assured future, backed by the support of a great transcontinental railway vitally interested in the upbuilding of a profitable mining and smelting industry in British Columbia. I think that the advantages so set forth must be obvious to the mind of any one who considers them dispassionately, and especially of any one who has been accustomed to consider such questions of working such companies under advantageous circumstances instead of working them separately. Mr. Mackenzie further instances advantages which might accrue from consolidation: 1. The Le Roi shaft, with its excellent equipment, is capable of doing all the necessary hoisting for three mines instead of one. 2. One manager, superintendent and foreman, with one office and stores department, would suffice for the three mines. 3. Smelter reductions, now impossible, could then be made; and, further, the erection of a converter and copper refinery at a cost of, say, £30,000, would be advantageous in saving the profits now made by others, and saving freight in sending the produce of the mines away for refining purposes. Coke and coal are cheaper at

Trail than at Northport, as no duty has to be paid to Trail. Trail procures larger varieties of ore than Northport, making it possible to provide a self-fluxing charge, without using a large percentage of barren flux in the form of limestone as is necessarily done at Northport. In receiving the ore and coke the facilities at Trail for handling material are either by gravity or mechanical, and that there is a mechanical system of charging. The labor at Trail is much more constant in quality, with a much better system of discipline, and there is a greater sense of security among those employed in holding their various positions, as against the constant changing of manager and men at Northport. The Northport furnaces being old in style and years require repairs at heavy cost, which is not the case in the furnaces at Trail. The cost of power at Trail, being electrical and generated by water power, is much less than the steam power used at Northport and transmitted by long line shafts and ropes. Mr. Mackenzie adds that the books of the company show a net profit at Trail of over $200,000 in 1903 and $137,000 for 1904, and he considers that the company will earn a similar amount in 1905. Mr. Mackenzie expresses the opinion that with Mr. Aldridge at the head of affairs of the amalgamated companies we could be assured of sound, safe and economical management. He allots 24% for Le Roi mine, 18% Canadian Smelting Works, 34.7% for the St. Eugene Con. M. Co., 16.9% for the Center Star, and 6.4% for the War Eagle Co. After studying the matter from various points of view, and with all information before us, we cannot but think that these percentages are fair and reasonable, and we recommend them for your acceptance, as they have been accepted by the other companies."

During the meeting Mr. McMillan spoke in his own behalf and that of his constituents. He said: "The main questions they had to consider were, first, the question of the removal of the managing director from the board by the remaining directors without reference to the shareholders; and, second, the question of amalgamation. The directors had said that he was removed because they were dissatisfied with his management and because he was opposed to amalgamation. If his management had been bad, they might have asked him to cease to act as managing director, but would not have been justified in putting him off the board. His alleged bad management was an afterthought, the real reason being that he was opposed to amalgamation. Last year's record spoke for itself, as they made a profit of £50,000 after writing off large sums. With regard to amalgamation, that had been in the air for nearly two years, and he disagreed with the scheme that was brought forward, on the ground that the Le Roi was not receiving a proper portion of its value, and because he was absolutely opposed to taking in the Trail smelter, the Trail concentrator and the undeveloped coal lands. He dealt at length with the various properties with which it was proposed to amalgamate, with a view of showing that their value was overestimated, and also spoke in opposition to the taking in of the Trail smelter. The point for the shareholders was that, on the one hand, they had Mr. Waterlow putting forward this scheme of amalgamation, and, on the other hand, they had the managing director, backed up by all the expert opinion in the service of the company, opposing it. Then Sir Henry Tyler and Mr. Waterlow proceeded to get rid of those who opposed the scheme, and brought in Mr. Mackenzie of San Francisco, who recommended it. It was for the shareholders to decide what was to be done."

J. H. Mackenzie said: "In the latter part of August the firm of Bradley & Mackenzie received a cable from the Le Roi board of directors requesting them to examine and place values on the properties included in the proposed amalgamation scheme. Scarcely had the examination begun before you were told in circulars that it would not be safe to follow our advice, as Mr. McMillan could not do so when in April, 1904, your company was face to face with assessment or liquidation; that I was prejudiced against Mr. McMillan, owing to that gentleman having made a success of the Le Roi when I had predicted failure. As to your not being able to follow my advice, I wish to state that I resigned from the management of your company in February, 1903, and on that date the surplus of assets over liabilities were £80,000. In April, 1904, I was called back by cable to investigate the shutting down of the Northport smelter. There were over 40,000 tons of refractory ore in the yards which, it was claimed, could not be smelted. Your account at the Bank of Montreal showed a deficit of £27,000 over and above liquid assets. From April until September—a period of five months—I was in Rossland the greater part of the time directing the affairs of the company, and when I turned it over to Mr. McMillan the deficit of the bank had been reduced to £3000, the stores were free from debt, the mine was producing 275 tons daily of high-grade ore, the smelter was in operation with two furnaces running, the large stocks of ore in the smelting yards had been treated, and it was found that you possessed 5285 tons of ore in excess of what had been carried on the books of the smelter, and the accounts of last year have had the benefit of this extra tonnage. The property was earning a monthly profit of £3500. Regarding the dismantling of Northport and the injunction suit which was begun, the following are the facts: The Trail smelter requested the loan of a blower until such time as they should receive a new one, which was then en route. My arrangement with Mr. Aldridge was that he should pay all the expenses of removing the blower, afterwards to return it to Northport or pay for it, as the Le Roi Co. might choose. An injunction suit was immediately begun to prevent the dismantling of Northport. As there were several idle blowers at the Northport smelter, I felt that no damage could be done by loaning one of them to a neighbor.

"As many misleading statements have been published regarding the War Eagle and Center Star properties, which are included in the proposed amalgamation scheme, I wish to state that recent discoveries in the War Eagle mine have greatly enhanced its present and prospective value. For instance, on the fifth level a new stope has recently been opened up which contains about 40% of the total estimates of tonnage given that property. In the Center Star mine a winze below the ninth level has been sunk some 200 feet, 160 of which is in ore of a good shipping grade. The bottom of this corresponds with the 1550 level of Le Roi. The width or length of this ore has not been determined, but it promises a large tonnage. I may say also that the bottom of this winze is also on the same horizontal as the 1550 level of Le Roi, and I consider the showing in the bottom of the Center Star equally good as that of the Le Roi. It will be asked why I recommended the Le Roi Co. to accept 24% of the amalgamated company, which will earn the Le Roi shareholders only £37,000 per annum, when the earnings of your company for the last year were £49,000. The explanation is that the monthly profits have been gradually diminishing, and until the development work exposes new ore bodies or new extensions of known stopes, your profits will not reach the figure of £49,000 per annum if you continue to operate the Le Roi as a separate company. For the six months ending December 30, 1904, the Le Roi Co. earned average monthly profits of £3725; for the six months ending June 30, 1905, the average monthly profits were £2370 only; while for the last five months the average monthly profits have fallen to £1550, or at the rate of £18,600 yearly. The average monthly earnings of your company for the last eleven months have been less than at the rate of £30,000 per annum. I am not personally interested in this amalgamation in any way, nor am I urging it upon the shareholders. I was called upon to place a relative value of these properties, and have done so honestly and fairly, and I challenge any one to show where I have sacrificed the interests of the Le Roi shareholders, or have done an injustice to any of the concerns interested in this amalgamation."



Testing Plant of the Colorado Iron Works.

The resolution adopting the report and accounts was carried unanimously, but when a second resolution was put to the meeting to agree to the scheme of amalgamation, it was lost by a large majority.

The chairman thereupon demanded a poll, which he said would be taken by voting papers being sent to shareholders, who would be asked to return them within a fortnight.

The motion to re-elect Mr. Waterlow, a director, was also negatived, and resolutions reappointing Mr. MacMillan and the three gentlemen mentioned by him as directors were carried, the chairman demanding a poll in each case.

A. J. MacMillan, who was re-elected a director as shown above, on the 21st, secured a temporary injunction from the court restraining the directors of the Le Roi M. Co. from making any use of the proxies sent in by the shareholders since the meeting of two weeks ago.

The Testing of Ores.

The value of tests, preliminary to the installation of reduction works, has never been questioned. It is regrettable, however, that many so-called tests are of such an incomplete and uncertain nature as to offer no sound basis upon which to determine the method of treatment, and it is not uncommon that, owing to lack of facilities, or to incompetence upon the part of those conducting the test, the gravest errors have been made in the selection of the process to be used and equipment to be provided.

That these conditions should obtain at the present time is generally due in great measure to the absence

of testing plants equipped on a sufficiently comprehensive scale to treat large quantities of ores by various processes and make direct comparison between different methods. The composition and characteristics of ores vary so widely, and there are so many methods of treatment available, that the most painstaking investigation is required to determine the process which, all things considered, will make the maximum saving of the contained values.

To sufficiently meet the requirements of a complete ore testing plant, there must be a combination of machinery and equipment of large capacity and perfect suitability, and a corps of experienced, practical experts of unqualified ability in the technique of the different processes.

The Colorado Iron Works of Denver has installed a well appointed mill, arranged in such a manner that tests can be carried out by any process without handling the ore during any part of its course through the machinery in the same manner as it would be treated in a mill under actual service conditions. Especial precautions have been taken to guard against the lodgment of ore in the crevices of hoppers, launders, elevator housings, etc., to mix with the ore of a subsequent test and influence the results in any way. Every machine through which ore is passed is made easily accessible for inspection and thorough cleaning out, both before a test is begun and after its completion. The laboratory and assay office are supplied with every detail necessary, and is in charge of a metallurgist of experience in research work on ores of the most varied character.

Preliminary laboratory tests are made to indicate the most promising lines upon which to conduct the mill tests, after which a considerable quantity of ore is run through to determine definitely whether or not the method adopted in that case will prove the best for milling treatment on a working scale.

Not being wedded to any particular process, and having no special ideas which we wish to exploit as against the recognized methods of treatment in their highest state of development, they operate the plant under the direction as to metallurgical methods of any competent engineer representative of the parties for whom the test is conducted.

The tests are conducted by the following methods or by any combination of them:

Crushing by rolls followed by concentration by jigs and tables. Crushing by rolls followed by concentration by tables and slimers. Crushing by rolls and cyaniding direct. Crushing by stamps, amalgamating, followed by concentration. Crushing by stamps in cyanide solution followed by concentration. Crushing by stamps, amalgamating, followed by cyanidation of the tailings. Sliming of the entire ore in pebble mill.

In shipping ores for treatment it is very important that a large quantity be sent. A carload, say fifteen to twenty-five tons, costs but little more to ship than a smaller lot, requires but little more time for treatment and no more cost for assaying, while the results are far more reliable. In all cases where a salable product is obtained from the treatment, credit will be given, thus materially reducing the cost. Great care should be taken at the mine to obtain an average of the ore to be treated. The ore should not be the best nor the poorest, but an exact sample of the regular run, which will be treated at the mine. Should the ore vary much in the mine it will be advisable to ship 50 or even 100 tons.

The cost of treatment cannot well be estimated in advance. It will depend on the nature of the treatment, the amount of assaying required, and many other things which cannot be anticipated. In all cases, however, the charges will be made as low as consistent with good, reliable work, and undoubtedly lower than in custom plants.

Shipments should be consigned, freight prepaid, to the Colorado Iron Works Testing Plant, Denver, Colo. Different lots should be plainly marked.

Books Received.

In contradistinction to the demands of the specialist, the student requires a text embracing a wide scope. Fortified with the fundamental ideas gained from the study of such, he is prepared for latter-day specialization. This fact will necessarily temper the criticism of an "Economic Geology of the United States," by Heinrich Ries. This work is intended to cover the ground gone over in an elementary course. Its most notable difference from similar texts is the mode of arrangement, whereby the non-metallic minerals are discussed first and the metallic minerals last. This logically leads from a discussion of the simpler to the more complex forms of mineral deposits, and also indicates the predominating economic importance of non-metallic minerals. Of these, coal is given the first place. A detail of this chapter will give an idea of the method used in treating other substances. After defining the different kinds, and giving proximate analyses, the author discusses the origin and conditions affecting the transition through various stages. the structural features are indicated, and the geologic distribution in the United States described in a cursory manner. The chapter is concluded with statistics of production and an extended bibliography. The latter is one of the most valuable features of the book, and is maintained at a high standard throughout. The description of petroleum, natural gas and hydrocarbons is supplemented by a number of fine illustrations. This feature is also noteworthy, the pictures indicating structural conditions with remarkable fidelity. Various building materials, stone, clay, lime and calcareous cements are generalized. The parts devoted to explaining the uses to which the materials may be put are evidently the result of considerable personal investigation; salines. gypsum, fertilizers and abrasives conclude the list of major non-metallics. As of minor importance, he describes the varieties, distribution, uses and production of asbestos, barite, fluorspar, fuller's earth, glass sand, graphite, lithographic stone, lithium magnesite, mica. mineral pigments, monazite, precious stones, sulphur and pyrite strontium, and talc and soapstone. Important occurrences only are described, and these in a popular manner. Mineral waters and soils conclude Part I. Numerous references are given for detailed study if the student should so desire, but in the text the mode of occurrence is not described with detail now required by specialized geological instruction. Part II, metallic minerals, is introduced by a brief discussion of the theory of ore deposits, the author apparently favoring a modified view of Van Hise's theory, and thinks "that most metalliferous deposits, aside from ores of iron, have resulted by deposition from ascending waters in regions of igneous intrusions, the waters being, in part at least, of igneous origin." Weed's classification is used, "not because it is considered entirely satisfactory or especially simple, but because it embodies the results of more modern studies of ore deposits and their genetic character." Seven chapters are devoted to the metallic ores—iron, copper, lead and zinc, gold and silver, silver lead, aluminum, manganese and mercury, and minor metals. In each case the author names and briefly describes the various ores of the metal in question, discusses the geographical distribution of each, and gives a generalized statement of the manner of occurrence in the more important districts. This latter is practically a summary of the folios of the United States Geological Survey, and is valuable chiefly for the excellent illustrations accompanying it. The abstracts serve as a guide for intelligent study of any particular ore deposit, and will undoubtedly prevent the hazy ideas that are often the result of indiscriminate reading. The author is to be commended for his care in giving proper credit to other writers where such is due. In this section, as in the preceding one, the reader is impressed with the reason why these minerals are sought, the uses to which they are put, and why they are fitted to such uses. Statistics are brought up to 1903. Unfortunately, there are a few instances where the author has necessarily had to depend upon others, and in the transmission of ideas a few errors have been introduced. Yet these are few and of minor importance. They should not impair the general usefulness of the work. The author has a pleasing style that makes easy reading. The student's mind is not distracted from the subject by the author's mechanism of expression. Characterized in brief, this is a college text, broad and elementary, yet serving as a general introduction to a field where personal observation should confirm or disprove preliminary reading. The geologist should never be hampered with preconceived ideas that bias his own judgment. The MacMillan Co. of New York are the publishers. The book will be sent postpaid by the MINING AND SCIENTIFIC PRESS for $2.60.

Recent development of mines in arid regions has demonstrated the value of the gas engine for power requirements. Nevada's new mines are now reached by the gasoline-propelled automobile and hoisting and pumping is largely done with gasoline engines throughout the arid West. In consequence there has been a demand for an explanation as to the how and why of their construction and operation. This demand seems to be well met in "Gas, Gasoline and Oil Engines," by G. D. Hiscox. The book treats on the theory of gas, gasoline and oil engines as designed and manufactured in the United States. After a brief introduction, largely historical, the author gives a concise exposition and discussion of the theory of gas and gasoline engines, developing the fundamentals for efficient design in accordance with the underlying physical conditions. Next follows a brief account, elaborated in succeeding chapters, of the various materials of power—illuminating gas, natural gas, producer gas, gasoline, kerosene, acetylene and alcohol. A particularly valuable account is given of producer gas and the various processes of production. Each of the essential parts of the engine is illustrated and described in the construction and operation. These include carburetors, cylinders, governors and valve gear ignition devices and the various details of construction. This section includes diagrams of most of the types produced by leading American manufacturers and is eminently practical in its details. The remainder of the volume is occupied mainly with descriptions of the many types of motors on the market, including stationary, marine and automobile motors. A chapter on the management of motors contains some valuable information. Heretofore the English literature on this subject has been behind recent advances of the explosive motor in recent years. This book brings the subject up to date and forms the foundation for an intelligent study of existing models. There are recent developments in crude oil engines which are not noticed. It is evidently not written for the designer and omits some details essential to his work. But, as a comprehensive and practical treatise for the operator, it should be in the hands of every progressive man interested in running gas engines. It is published by N. W. Henley, 132 Nassau St., New York City ,and will be sent postpaid by the MINING AND SCIENTIFIC PRESS for $2.50.

"Register of Mines and Minerals of Yuba County, California," issued by the State Mining Bureau, Ferry Bdg., San Francisco; price 25 cents, postage 8 cents. It contains a topographical and an economic geological map of Yuba county, a map of dredging fields near Marysville, and a list and brief description of mines.

As an extract from "Mineral Resources of the United States," the U. S. Geological Survey has issued "The Production of Precious Stones in 1904," by G. F. Kunz. This is a succinct summary of the condition of this industry throughout the world.

Personal.

W. H. WILEY is at Greenwood, B. C.

WILLIS LAWRENCE is in San Francisco.

W. A. PRICHARD is at Zacatecas, Mexico.

J. F. HALLORAN sailed for Tahiti this week.

LYTTLETON PRICE of Bellevue, Idaho, is at the Palace Hotel.

JOHN B. FARISH is in New York on his return from London.

F. M. DRESCHER is in Denver, Colo., from Prescott, Arizona.

F. W. BAKER sailed for London from New York on December 12.

GEORGE W. EVANS has returned to San Francisco from Denver.

F. J. H. MERRILL of New York is doing geological work in Idaho.

E. J. WILSON is building a smelter at Val Verde, near Prescott, Arizona.

R. C. TURNER has returned to San Francisco from Chihuahua, Mexico.

W. H. DALY is manager Durango M. Co., near Velardena, Durango, Mexico.

ALBERT V. JOHNSTON of New York is visiting San Francisco and Los Angeles.

FRANK H. PROBERT has returned to Los Angeles from Hanover, New Mexico.

H. VINCENT WALLACE of Nogales, Arizona, is visiting San Francisco and Bakersfield.

R. F. PEARCE is at Denver from the mines of the Andes Tin Co., near Oruro, Bolivia.

GEO. S. BINCKLEY has returned to San Francisco from a professional trip to Shasta county.

LEE GLOCKNER returned from Western Australia on the "Ventura," which arrived this week.

L. S. AUSTIN, professor of metallurgy Michigan College of Mines, is visiting Anaconda, Montana.

W. E. WADE has resigned as manager Globe M. Co. at Lead, S. D., and F. Icker has succeeded him.

R. H. CHANNING, general manager Utah Con. M. Co., has returned to Salt Lake City from a trip East.

R. S. BAVERSTOCK of Los Angeles is in Kern county getting ready for shipping a carload of scheelite.

STANLY A. EASTON, manager of the Bunker Hill & Sullivan mine at Wardner, Idaho, is visiting San Francisco.

JOHN C. MONTGOMERY, Denver, Colo., has been appointed resident manager of the Venture Corporation, London.

W. H. WEED has returned to Washington, having concluded a geological investigation of mines at Butte, Montana.

D. C. TOBIN of Leadville, manager Continental gold mines of Vulcan, Colo., has returned from a business trip East.

DUNCAN MACVICHIE, general manager Bingham Con. M. Co., of Salt Lake City, is spending the holidays in Los Angeles.

GEO. HALL has been made superintendent Mount Masonic mine at Park City, Utah, succeeding J. C. Hasson, resigned.

JAMES HOOPER has been appointed superintendent Veta Grande mine at Altar, Sonora, Mexico, vice Arthur Houle, resigned.

ARTHUR HOULE has been appointed superintendent Calumet and Arizona smelter at Douglas, Ariz., succeeding James Wood, resigned.

ROBERT L. TOZIER has been appointed district sales manager of the Power & Mining Machinery Co.'s gas machinery department, with headquarters at 52 William street, New York.

O. O. MCREYNOLDS, who has charge of the construction work of the Gold Prince mill at Animas Forks, Colo., has returned to Denver for the winter, as he claims they are unable to deliver material.

ROBERT T. HILL, mining geologist, has purchased the entire capital stock of the Hill-Cunningham Company, 25 Broad street, New York. The corporation will be put into liquidation and Mr. Hill will hereafter continue business under his own name at the Trinity Building, 111 Broadway, New York.

Trade Treatises.

Bulletin 1202 of the Allis-Chalmers Co. of Milwaukee, Wis., shows their Reliance friction clutch.

The Trump Mfg. Co. of Springfield, O., send a nicely illustrated catrlogue of their boilers and self-contained side crank steam engines. The design and construction are well shown.

The Chicago Pneumatic Tool Co. of Chicago, Ill., sends Catalogue No. 17, a comprehensive compilation, picturing and describing the various air-driven tools handled by them. In addition it contains interesting cost comparisons.

MINING SUMMARY.

Specially Compiled and Reported for the MINING AND SCIENTIFIC PRESS.

The supply of silver from all available sources in 1904 was 176,840,014 ounces, as against 173,222,088 in 1903. This was an increase of 3,617,926 ounces, or a gain of 2.1%. Mexico was, as usual, the heaviest contributor, with an output of 60,808,879 ounces, although this shows a decrease of over 7,000,000 ounces from the output in 1903. The United States was second with a total of 57,786,100 ounces, as against 54,300,000 a year earlier, a gain of 3,486,100 ounces, which is almost equal to the entire world's gain for the year. Australia was third, with a record of 14,558,892 ounces, against 11,909,040 ounces in 1903, drawn principally from the great mines of Broken Hill and Barrier Range. Germany claims a production of 12,532,938 ounces, against 5,830,000 ounces the previous year, which would entitle the Teutons to third place; but as no discrimination is made between silver extracted from foreign ores and that obtained by native mining, proper credit can not be assigned. Bolivia comes next, with 6,083,333 ounces, against 6,614,957 ounces in 1903, a decrease of 531,624 ounces, and is closely followed by Spain and Peru, with respective totals of 4,876,076 and 4,667,047 ounces, as against outputs in 1903 of 4,090,000 and 5,491,349 ounces respectively, which indicate a gain of almost 800,000 ounces for Spain and a loss of more than that amount for Peru. With the single exception of Argentina, which showed a slight gain of 16,153 ounces, all the other countries showed losses on a comparison with their output in 1903. Bolivia receded from 6,614,957 ounces in 1903 to 6,083,333; Chile, from 1,650,000 to 868,067; Columbia, from 2,000,000 to 946,066; Peru from 5,491,349, as above, to 4,667,047; Ecuador's figures are not available. Uruguay was practically stationary with 1093 against 1000 in 1903. In Europe increases were noted in five countries and decreases in seven. Those in which increases were noted, with their figures, respectively, are: Hungary, 643,000 ounces, against 619,877 in 1903; Germany (subject to the above explanation), 12,432,938 ounces, against 5,830,000 in 1903; Norway, 257,200 ounces, against 240,298 in 1903; Spain, 4,876,076 ounces, against 4,090,000 in 1903; Turkey, 564,685 ounces, against 486,297 in 1903. In the following decreases were recorded: Austria, 1,254,888 ounces, against 1,279,972 in 1903; Greece, 895,172 ounces, against 1,090,367 in 1903; Italy, 757,777 ounces, against 784,084 in 1903; Russia, 172,912 ounces, against 260,776 in 1903; Sweden, 20,923 ounces, against 32,298 in 1903. The United Kingdom remained almost stationary with 174,517 ounces, against 174,896 in 1903. Canada showed a marked increase, with an output of 3,718,668 ounces, against 3,198,581 in 1903, and just takes eighth place from Japan, whose production was 3,208,620 ounces, against 1,770,152 in 1903, a far greater increase. The Dutch East Indies showed a gain of about 50,000 ounces, Africa 36,000 ounces and other countries 2000 ounces. In 1875 the total output of silver in the world was 63,317,014 fine troy ounces, a figure almost reached by the Mexicans in 1904 and exceeded in 1903. In 1885 it increased to 96,250,831 ounces, a gain of 60%. In 1890 it was 134,404,104 ounces, or more than double the yield of 1875. Five years later the world's record was attained in the figures 182,220,228 ounces—almost three times the output of 1875.

The United States supplied more than one-half of the petroleum produced in the world in 1904. A statement of the world's production of petroleum, prepared by the British Board of Trade, which has reached the Bureau of Statistics of the Department of Commerce and Labor, puts the petroleum production of the world in 1904 at 9,303,000,000 gallons, of which 4,916,000,000 gallons were produced in the United States, 3,650,000 gallons in Russia, 202,500,000 gallons in Austria, 206,500,000 gallons in Java and Sumatra, 135,000,000 gallons in Roumania, 105,500,000 gallons in British India (principally Burma), 49,000,000 gallons in Japan, 20,000,000 gallons in Canada, and 18,500,000 gallons in Germany. In 1903, which made the highest record of any year prior to 1904, the total was but 8,504,000,000; in 1902 it was 7,588,000,000. This increase in 1903 and 1904 occurs chiefly in the United States. The figures of production in the United States show an increase of about 697,000,000 gallons in 1904 over the figures of 1903, while those of Russia, our chief competitor in oil production, show an increase of but 103,000,000 gallons over 1903, and the increase in the United States in 1903 is also much larger than that of Russia. In the four years 1898, 1899, 1900 and 1901, Russian production of crude petroleum exceeded that of the United States, but in all other years for which the record is shown by the publication in question, extending from 1883 to 1904, the production of the United States exceeds that of Russia, and by far exceeds that of any other country. Indeed, it may be said that the United States and Russia produce practically nine-tenths of the petroleum of the world, the total production in 1904, as above shown, being 9,303,000,00C gallons, of which 8,566,000,000 was produced in the United States and Russia combined. Exportation of illuminating oil, or kerosene as it is familiarly called, is also much greater from the United States than from Russia, especially as American crude oil gives a much larger per cent of illuminating oil than does that of Russia. The total quantity of refined illuminating oil exported from Russia in 1904 was 455,000,000 gallons, and from the United States 761,000,000 gallons.

ARIZONA.

Cochise County.

It is reported that the Black Prince Copper Co. intends to put a hoist on its double compartment shaft, near Johnson. The shaft is down 50 feet.

Gila County.

The Globe & Pinto Co. at Globe are sinking their shaft from the 50-foot to the 100-foot level.

Graham County.

The Rex Cobre M. Co. is preparing to resume operations on its claims in the Lone Star district, near Clifton.——The Shannon Copper Co., at Clifton, in its annual report shows a production for the past year of 11,295,586 pounds of fine copper with a by-product of 592 ounces gold and 17,127 ounces silver. The average price of the copper was 14.24 cents per pound. During the year there was charged to the construction account $52,320.06, which, deducted from the total expenses of the year, left $1,368,020.04 as the total cost of the copper, or 12.11 cents per pound, a profit of 2.13 cents per pound. The net profit for the year was $271,153.65, or a little over 90 cents per share.

Mohave County.

The Elkhart mine at Chloride has been taken over by Douglas & Reeves and N. G. Douglas is at the mines. The new owners intend to put the mill in commission and work over the tailings and low-grade ore.——The Benedictine Co. of Cedar is preparing to start work after the first of the year. A tank wagon has been received at Yucca for hauling oil to the mine for fuel purposes.——A pumping plant will have to be put on the J. F. T. mines at Stockton hill, near Kingman. J. E. Carney is superintendent.

Pima County.

In the Tucson mountains, 15 miles from Tucson, there are five mining camps in operation. The Gould M. Co. has the main working shaft 300 feet deep. The Martin Ware mines are being operated by a good force.——The New State M. Co. has repaired its road from Tucson to their mines.——G. A. Hoff is developing his copper mines.——F. J. Sibley has men developing his mines on the northwest side of the mountains.——The Arizona Copper M. Co. is drifting to crosscut the main ledge from the 100-foot level.

Santa Cruz County.

T. F. Kelly has resumed work on his placers near Oro Blanco.——High-grade ore carrying values in copper, lead, gold and silver, is said to have been struck by F. Powers in the lowest level of the World's Fair mine, near Harshaw.

Yavapai County.

The Pine Mountain M. Co.'s 10-stamp mill on Lynx creek, near Prescott, has been started. Joseph Carmichael is superintendent.

G. W. Middleton of Prescott says that the Metals Milling Co., of which he is general manager, is to put in a 250-ton plant, consisting of crushers, rolls and concentrators. Work on the enterprise will be started at once.

CALIFORNIA.

In a recent report of the United States Geological Survey, C. G. Yale gives a succinct account of the centers of gold and silver production. In Alpine county there is practically but one producing section, which is at Loope. In Amador county the mines around Jackson exceed all others in yield, and include the Kennedy, the Argonaut, the Oneida and the Zeila mining companies. The largest producers in the county aside from these are the Keystone at Amador City and the Fremont at Drytown. The surface mines of the county are unimportant. The Kennedy is the deepest gold mine in the State; the vertical depth of its new shaft is 2863 feet (August, 1905), and sinking is progressing at the rate of 60 feet per month. If the vein maintains its present dip, it is expected to be cut in the new shaft at a depth between 3400 and 3500 feet. The hoisting works are built to supply a 150-stamp mill from a depth of 4000 feet. A 100-stamp mill is now in operation, and 3-ton loads are raised from the stopes on the 2700 level. The collar of the shaft is at an elevation of 1500 feet, so the bottom of the shaft is now 1363 feet below sea level. These notes are made concerning this particular mine because of the great depth of its workings and of its equipment for still greater depth—4000 feet. The original old shaft of the mine was down 2300 feet when work on it stopped, and the new shaft was put into use for hoisting, etc.

In Butte county the center of the producing properties is at Oroville, where some thirty dredgers are now at work and others are building. In Calaveras the largest producing mines are at Angels, including the Lightner and the Utica companies. The largest single producer in the county, however, is the Gwin at Gwinmine, and the Melones, at Melones, is also among those with a heavy output. The biggest producers in gravel are the Calaveras Dredging Co. at Jenny Lind and the Calaveritas Hydraulic Co. at San Andreas. In Del Norte all the mining work is done in the vicinity of Crescent City. El Dorado county has no special mining center, unless Placerville may be so considered. The most prominent quartz mines are at El Dorado and Placerville. Fresno county has few operating mines, but what there are are at Auberry, Pollasky, Tollhouse and Trimmers. Orleans is the only place in Humboldt county where any output of importance is obtained. More gold is coming out of Ballarat than from any other place in Inyo county. Randsburg is the most productive camp in Kern county, the Yellow Aster being the leading property and one of the large mines of the State. At Mohave, also, there are three large producers. Lassen county has only one mine of consequence, and that is at Hayden Hill. Los Angeles county also has only one district—that at Shoemaker. The only place in Madera county making any output of note is at Coarse Gold. Mariposa has but one large producer, at Bullion. In Monterey county what little mining is being done is at Jolon. Bodie is the center of the mining industry of Mono county, a very large proportion of the output coming from one mine alone in that camp. In Nevada county Grass Valley is the central point of production, and here is situated the mine having the largest gold output of any in the State—the North Star. The Empire is a good second, and there are other large producers; and Nevada City, close by, has also two producers of prominence. These mines are all quartz, the largest yield from gravel coming from the North Bloomfield region. In Placer county the largest output of quartz is from the vicinity of Auburn, but the principal yield of gold is derived from the drift mines of the Forest Hill divide at Michigan Bluff and Bullion. The most prominent quartz mine in Plumas county is at Johnsville, but there can not be said to be any special gravel mining center, mines of this character being scattered all over the county in great numbers. There are no mines of importance in Riverside county at present in operation. The dredgers near Folsom and Fairoaks represent the principal output of Sacramento county. San Bernardino has only one very large producer, the Bagdad-Chase property at Stedman, which yielded by far the largest proportion of the total output. In San Diego county the Golden Cross of the Free Gold Mining Co. at Hedges produced most of the yield of the county; the mines at Julian and Banner had no notable output. San Luis Obispo has only a few unimportant placers at La Panza. In Shasta county the Gladstone, owned by the Hazel Mining Co., at French Gulch, is the largest producer, followed close by the Midas mine at Knob or Harrison Gulch. The largest quantity of gold and silver from any one point came from the smelters of the Mountain Copper Co. at Keswick, where they purchase siliceous ores to form flux in copper smelting operations. Sierra county has one important quartz producer, which is at Sierra City; the principal gravel mines now producing are around Downieville. Siskiyou has a few prominent quartz mines at Gazelle, Gilta and Nolton; but there are many producing gravel mines scattered throughout the county. The few mines in Stanislaus county are at Knights Ferry. The largest quartz yield in Trinity is from a mine at Minersville, and the largest hydraulic mine yield is from near Weaverville; there are many good-sized gravel properties having yields in different parts of the county. The few mines of Tulare county are at Aukland and White River. Tuolumne is distinctively a quartz-mining county, with quartz mines at many points, the largest single producer being at Chinese Camp; but there are heavy producers at Big Oak Flat, Carters, Confidence, Groveland, Quartz, Rawhide, Sonora, Soulsbyville and Stent. The mines in Ventura county are at Lebec. In Yuba county the quartz interests are at present nominal; the main yield comes from placers, and especially from those worked by dredgers between Marysville and Smartsville.

Amador County.

The Wildman-Mahoney mine, at Sutter Creek, has been closed down pending adjustment of financial difficulties.——The Valparaiso pocket mine south of Jackson has been sold to D. Bora, G. Badaracco, E. Garibaldi and Demartini.

Ed. Lynch has brought suit in the Superior Court against the Keystone Con. M. Co. and M. Jasper McDonald for $20,000, for services rendered as an attorney and otherwise, and also for his monthly stipend. The company owns mines at Amador City. In March, 1901, McDonald, as president of the company, agreed that Lynch should be paid $20,000 for services rendered up to that time and $150 per month afterward. The $20,000 was to come out of the net profits of the mine. Lynch alleges that the accounts have been kept in a fraudulent manner for the purpose of concealing the net profits. In last July the company notified Lynch that he was discharged from its service, but he claims that he is entitled to pay for two months, as he received no allowance for June and July.

Inyo County.

The Coso Reduction Co. is building a mill near Darwin to treat ore from neighboring mines. R. B. Todd is superintendent.

Kern County.

In the Kern River fields the Grace Oil Co. has been sinking a deep well for the purpose of securing lighter oil which it was believed existed, beneath the heavy oil. Early in the week at a depth of 3148 feet a large quantity of salt water had been struck, which flowed up over the top of the casing. The water was struck in a stratum of sandstone which is believed to be several hundred feet thick. After the water had been reached the drill was sent down 18 feet farther, but as the water increased in quantity and as there was not the slightest evidence of oil the effort to bring in a well of light oil was abandoned, the casing was pulled, and the well shot at a depth of 2000 feet, at which depth it will deliver from 200 to 300 barrels of heavy oil a day.

Nevada County.

Work has been started at the Alta gravel mine, west of Grass Valley, by the Prospectors' Co. It is the intention of the Prospectors' Co. to continue the tunnel which has been run 600 feet and put through a raise. A. Hall is superintendent.

Sacramento County.

The Natoma vineyard of 2000 acres, below Folsom, is under bond for mining purposes by the Folsom Development Co., of which R. G. Hanford is manager.

Shasta County.

The Detroit M. Co.'s rich gravel lands in the Horsetown district, 12 miles southwest of Redding, has been acquired by the Shasta Dredging Co. It is proposed to put in a new bucket dredger. W. H. Dunn is in charge.

Trinity County.

It is reported that a 10-stamp mill is to be bought for the Point Lookout mine at Indian Creek. D. B. Fields is owner.——A new hoist has been put in at the Pœth mine on Coffee creek, near Trinity Center. Sinking from the tunnel will be continued through the winter.——The Minear tunnel on the Willey mine, near Deadwood, is being retimbered and is to be extended 200 feet to open up the Shafter mine, which is being leased by R. A. Skinner and R. E. Hanley.

Yuba County.

The Mining Bureau has issued a map and register of the mines and minerals of Yuba county. It has an area of 625 square miles, extending from the Feather river on the west to Sierra county. It is bounded on the north by Butte county and on the south by Placer county. It

had a population in 1900 of 8620, and for 1904 the assessed valuation was $5,995,537. About 50% of the county is valley land bordering on the Yuba and Feather rivers. The topography is diversified and elevations range from 60 feet on the Feather river to 4800 feet above sea level in the extreme northeast corner of the county, with corresponding climatic conditions. Marysville, the county seat, is a town of 3500 inhabitants, at the confluence of the Feather and Yuba rivers and at the head of shoal water navigation. Pocket mining is carried on to some extent and the river bars are worked in the summer, while placer claims afford employment to the miner during the winter months. A large area of auriferous gravel on the Yuba river near Marysville is being worked by dredgers. Two large dredgers are now at work and eight more are under construction and nearing completion. All of these dredgers are expected to be in operation by January 1, 1906. The dredgers are supplied with electric power and lighted by the Bay Counties Power Co. Bauxite and a pottery clay are found in the county; the bauxite is undeveloped. Occasional shipments of the pottery clay are made from Wheatland to Lincoln. Copper deposits and ledges of marble and granite exist in the county, but are undeveloped.

COLORADO.

(Special Correspondence).—It is given out at the United States Mint that $25,000,000 in bullion is now on deposit in that institution in this city awaiting coinage, which is expected to start the first of the year.——A new State road is under consideration between Canon City and Cripple Creek. The State has appropriated $10,000 for the building of the road. Owing to the toll road along the survey, work has been delayed until this obstacle was removed. Teller and Fremont counties have agreed to divide the expense in buying the franchise from the toll road company. The toll road has not been in use for some time past, although the company still holds the franchise.——The Big Five M. Co., doing business in different parts of Colorado, particularly at Idaho Springs, is again in the courts. G. A. Suffa of Boston, a stockholder in the company, has asked for a receiver for the company, on the grounds that the business of the concern is not being properly handled.

Denver, Dec. 25.

Boulder County.

As a result of successful tests on ore from the Wano mine at Jamestown, in the Dorcas mill at Florence, a 50-ton cyanide mill is being built at the mine. The ore is to be roasted before cyaniding, 98% extraction having been obtained in the test.

The Arapahoe Co. at Copper Rock, near Sunset, has leased and bonded its group to a Boulder syndicate. The deal also includes the Jordan tunnel, now in 1050 feet. An air compressor will be put in and the tunnel driven to cut the Cashier-Golddust, Maud S. and Medicine Man group.——The Kirk tunnel, below Sunset, is being overhauled, debris removed, track relayed and portal retimbered. It is the intention of McGown, Kirk & Smith to drive the main drift ahead.——The Lee S. Co. will resume operations near Sunshine after the holidays.

Clear Creek County.

The report of the Chamberlain-Dillingham ore purchasing agency at Georgetown for the year 1905 shows the purchase of 4204 tons of ore, the gross value of which was $385,195. The average value was $68.04 per ton. The value of the copper and zinc was $5000. As the zinc product of the various mills that have been in operation during the year was shipped directly to the smelters, it is estimated that the value was $50,000, and the value of the silver-lead ores sent direct to the smelter is placed at the same amount. The Silver Standard states that the average value of the ore handled is not as high as it has been in former years, but this is accounted for by the fact that the higher price of silver and lower treatment charges of the smelters has induced a larger tonnage of low grade ore and does not indicate a falling off in the value of the high grade ore from the prominent shippers. The largest producers were the East and West Griffith, Colorado Central, Sunburst, Rogers, Santiago, Dives-Pelican and Seven-Thirty, Stevens and Mendota mill.

A rich strike has been made in the Magnet mine, on Griffith mountain, near Georgetown, in the fourth level of the old workings 600 feet from the portal. This property was bonded and leased a few weeks ago to Thomas Rodda of Idaho Springs, since which time it has been sold to the X-Ray M. Co., which is cleaning out and retimbering the old workings, and early the coming year an extensive campaign of development will be inaugurated. Since Mr. Rodda secured the bond and lease he has the privilege of working through both the Doric and Eclipse tunnels. The heading of the Doric is now in Magnet ground.

Gilpin County.

The Pozo mine, in Nevada gulch, near Central City, is producing zinc and iron-lead ores. The ore is first shipped to Denver for magnetic treatment. The zinc product is sent to Iola, Kansas. A new shaft house and hoist are contemplated. A. W. Rucker is superintendent.——The Modoc mine on Quartz hill, near Central City, is taking out mill ore to be treated at the stamp mills in Black Hawk. John Lying is superintendent. The same company is sinking on the Gold Retort vein on the same hill and will put in a whim.

Sinking has been started at the Mackey mine of the Imperial M. & M. Co. of Apex at a depth of 250 feet.—— Operations are to be resumed at the Boston-Occidental Co.'s mine on Colorado hill before Jan. 1. The mill will start with a daily capacity of twenty-five tons. Boston capital is interested in this company and is figuring on a large reduction plant in Mammoth gulch next year, as well as a new road down Mammoth gulch for making future shipments over the Moffat road.

The Perigo mill in Gambell gulch, near Central City, has been started on ore being taken from the Perigo mine by leasers.

Gunnison County.

The new 100-ton cyanide plant being constructed by the Raymond Consolidated M. Co., at Ohio City, is nearing completion. The former difficulty experienced in operating the Raymond shaft was with water, which made development very expensive. The tunnel has eliminated this difficulty and the company will also operate at this point. A 2200-foot tramway has been completed which will convey all the ores to the new mill. E. M. Lamont is general manager of the big enterprise.

Near Tin Cup the West Gold Hill mill, with its ore-drying machinery, is running full capacity, handling seventy-five tons per day and cyaniding the output. On Cross mountain Charles Wahl is sinking on the Gold Bug.——The Jimmy Mack dump, near the Tin Cup, is being treated at the Brunswick concentrator.——The Gold Cup tunnel is being operated from Middle Willow creek and is pushed as rapidly as possible to intersect a number of lodes at great depth.

A 7-foot vein has been opened in the Ben Franklin mine in the Mineral Form basin, 6 miles northeast of Pitkin. A few weeks ago A. B. Clark of Butte, Mont., secured a lease and bond on the property from the Ben Franklin Co. and started operations.——The Double O lode, owned and operated by a company of the same name, under the direction of C. T. Snedakor, has a shaft down 100 feet.

Lake County.

The Rock Hill Mines Co. has a lease on the Nil Desperandum and other claims, near Leadville. The shaft is 750 feet deep and within 12 feet of the bottom of the lime, as shown by the drill holes—which makes it, geologically, the deepest shaft on Rock hill. There are only thirty gallons of water per minute. The drift to the southeast is in 130 feet and has an iron contact carrying silver and lead values. The north drift is in 90 feet and has contact with a streak of lead sand.——On Rock hill lessees have reopened the La Plata mine.—— Two sets of lessees are taking out ore on the Crown Point mine.——The Dome Rock lessees are sinking the shaft through hard, heavily iron-stained lime and will have the necessary depth in a couple of weeks to connect with known ore channels.

Ouray County.

A two years' lease has been granted on the Newsboy mine, near Ouray, to F. Herzinger, who now has men cleaning out the old workings and catching up some caved ground.

The Gold Lion Mines Co. will begin a long tunnel on its property in the Red Mountain district, near Ouray. The tunnel will be extended 1½ mile and will explore several large veins. Starting on the Alice vein, the company will drive 1500 feet, to strike the Mountain Lion vein at a depth of 2000 feet.

Park County.

In the Lower Tarryall district the Hayman M. & M. Co., of which Frank Clancy of Colorado Springs is manager, has sunk the main shaft during the last few months from the 200 to the 360-foot point, and will be continued to 400 feet.——The Apex Copper Co.'s shaft at Hayman is to be continued 200 feet from the 160-foot level. J. K. Vanatta is manager.——On the Sterrett group at Hayman a compressor and machine drills are to be put in. The shaft, which has a depth of 170 feet, will be continued to the 270 foot point.

San Miguel County.

High grade ore is reported on the Black Bear group, in Ingram basin, 5 miles southeast of Telluride, owned by the Black Bear M. Co. An air compressor, machine drills and an electric hoist are to be put in at the mine in the spring. It is the intention, also, to construct a mill during summer. L. Kaanta is president.——The Smuggler-Union 80-stamp mill at Pandora, 2 miles from Telluride, is being enlarged by the addition of 6 feet on the west end to make room for more ore bins to accommodate leasers on the Smuggler-Union mines, who must keep their concentrates separate, and also for eight new Frue vanners, now being set in place, for handling the Pandora lease product after it leaves the crushers and amalgamating tables. This mill is not running full capacity, but will be as soon as the Telluride Power Co. completes preparations for supplying increased power.

The Gold Run placer, near Telluride, has been leased to J. E. Wrightman and Lee Fillius of Denver. The placer is covered with tailings from the Smuggler-Union, Tomboy, Japan, Cimarron, Liberty Bell and other mills from a depth of a few inches to as high as 40 feet. A large portion of them accumulated before the milling and treatment of ores had been developed and improved into the perfection of recent years; before cyanide plants, rag and canvas plants were constructed in this district for the treatment of tailings, consequently it is known that this portion of the deposit, at least, carries sufficient values in gold, silver and lead to enable retreatment at a good profit.——About two years ago the Keystone Hydraulic M. Co., owner and operator of the Keystone placer, on the San Miguel river, 5 miles below Telluride, notified the companies operating the quartz mines and mills that unless measures were taken to prevent the tailings from washing down the river, injunctions would be sued out and lawsuits for damages instituted, for the sand and tailings in the water rapidly cut out the pipe lines, entailing heavy expenses. The Smuggler-Union, Tomboy and Liberty Bell companies then pooled together and purchased the placer, and Jacob Fillius of Denver and E. C. Howe of Telluride were appointed trustees. Above the eastern limits of Telluride a long dam of logs and stone was constructed across the river and valley, and the waters of the river impounded, permitting the sand and the heavier sediment to settle. Before the placer passed into the hands of the mining company, the tailings were being worked on a small scale by the Peck cyanide plant, but the sale suspended operations and this plant has been dismantled. The lessees will put up a large plant.

Summit County.

(Special Correspondence).—The Wellington, Morning Star, Gold Dust, Lucky and Carbonate mines, at Breckenridge, are shipping high-grade smelting ore.——The Washington-Joliet mill is temporarily closed down, but work in the mine is progressing.——The Pacific mine on North Star mountain, formerly owned by Mr. Benirose, has been purchased by a new company which is shipping ore to Alma.——The old Gould mine on Rock creek, 15 miles below Dillon, is being opened up by J. Gould.——The Senator mine, in the upper Blue, may be shipping soon. M. M. Howe of Breckenridge is general manager.

Breckenridge, Dec. 23.

The Carbonate and Little Tommie mines on Mount Baldy, near Breckenridge, have been consolidated and purchased by the Beaver Creek G. M. & M. Co., of which G. E. Moon of Breckenridge is superintendent. The Carbonate is developed by two tunnels, which are connected by a winze from the upper tunnel, which is in 500 feet. The lower tunnel is in 600 feet.

Teller County.

The Maud S. Gold Mining & Development Co. has resumed operations on the Red Bird claim of the National Co., south of Cripple Creek, on the west slope of Gold hill. A. P. Taber is superintendent.

The screens at the Montrose mine of Ironclad hill are being altered by Van Fleet & Co., lessees, after which ore will be moved at a greater speed. The shoot has been followed by drift on the 350-foot level for 40 feet. ——Ore has been broken in the W. P. H. property of the United Gold Mines Co. on Ironclad hill.——A depth of 100 feet has been made by Rollestone & Co., lessees, in a new shaft started recently on a block of the Arapahoe claim of the Jerry Johnson Co. A steam hoist is to be installed.

Chandler & Dean of Cripple Creek have a lease on the Cardinal claim of the Little Valeria Co. on Gold hill. They will drive a crosscut from the bottom of the 250-foot shaft.——J. S. Murphy and associates have put in a 4-drill compressor on the Magnet Rock claims on Beacon hill.——The Dillon shaft on Battle mountain is down 350 feet toward the 1000-foot level.

IDAHO.

Boise County.

E. E. Rodgers, president of the Black Pearl M. Co., at Pearl, says the mill, which was started November 17, has passed through the experimental stages, and is running twenty-four hours a day, giving satisfaction. The saving effected is said to be 98.5% of the total value. A small residue of chloride of silver is lost in the tailings. The plant consists of two mills having a daily capacity of 150 tons. The slime separating cones, invented by J. B. Eldridge of Boise, are giving satisfaction. A peculiar accident was met recently in driving the crosscut for the Leviathan vein. When the bore was in 1350 feet and supposedly approaching the lead sought, sulphuretted hydrogen gas burst forth with considerable violence, driving the men out and tearing out the ventilation pipes. As the gas will not support combustion, efforts to again reach the face and resume work have so far proved futile. A candle will not burn, it is stated, within 400 feet of the face. Hoods have been ordered. In addition to Black Pearl, the company is developing the Lucky Ridge.

Idaho County.

A rich strike has been made in the Hogan mine, at Oro Grande. One of the blasts in the glory hole shot back into a ledge of high grade free milling ore. The gold is coarse. Amalgamation plates are being put in below the sand tanks in the cyanide plant to catch the coarse gold. The Hogan mill has been running steadily since it started up and the company is treating 250 tons daily. The lower tunnel will be driven ahead to tap the new ledge and a stope opened up.

Shoshone County.

In the Bald Mountain claim, 3 miles west of the Monitor mine, Manager E. W. Conrad has run a tunnel in over 1200 feet, cutting through 9 feet of sulphides, and the face of the tunnel is still in ore.——The Monitor is getting out timbers to enlarge its shaft. The present shaft is small, and, as the managers plan to sink about 600 feet, they have to enlarge the opening.——An option running two years has been taken by New York people on the property of the Hunch M. & M. Co. and the old Wild Rose property, 4 miles east of Pierce.——The Ozark is working seven men and the stamp mill is running steadily. The company intends to put in a large mill in the spring.

The electric hoist and other machinery has been put in at the Sister mine, near Wallace, and work has been resumed.

Washington County.

The tunnel on the Flat Rock placer mine on Goose creek, 4 miles from Meadows, is to be driven 400 feet farther by April 1, giving a total length of 600 feet. An upraise will be made to the creek bed at the end of the tunnel. Lee Bunch is manager.

MICHIGAN.

Houghton County.

Another furnace is to be built during the coming year at the plant of the Michigan Smelting Co. at Houghton. This will make a total of six furnaces there. It will be larger than any of the furnaces already constructed, the plants calling for dimensions of 18x40 feet. The smelter now contains two 16x35-foot furnaces, two 14x23-foot furnaces and one 15x18-foot furnace. The new furnace will have a capacity of 100 tons daily. It will be assigned to use upon the mineral of the Stanton mines, while one of the Stanton furnaces will be turned over to the Copper Range Con. group. This will give to each group three furnaces.

MONTANA.

Granite County.

Jas. Patton is shipping ore from the Poorman mine, near Philipsburg, to the Butte and Helena smelters.

Madison County.

J. H. Panky is developing the Easton mine, near Virginia City, with forty men, and intends to open up the

Pacific. These are both silver producers. The 20-stamp mill is running.——It is reported that A. C. Burrage and associates of Boston will resume work on the properties of the Montana Milling Co. and the Jeanette G. M. Co. at Pony.——The Grant mine, near Virginia City, is to be prospected with a diamond drill.

Silver Bow County.

(Special Correspondence).—Two new producing companies were added to the list in November—the East Butte and Pittsburg & Montana—and the total copper production for the Butte district for the month was 29,881,650 pounds against 28,517,520 pounds in October. The November production was apportioned among the various Butte companies as follows:

	Pounds.	Tons of Ore.
Boston & Montana	7,102,080	98,640
Anaconda	8,156 100	130,550
Butte & Boston	1,023,750	15,750
Trenton	1,168,080	18,840
Washoe	865,200	12,360
Parrot	783 840	11 040
North Buttte	2,520,000	18,000
United Copper	3,264,000	48,000
Clark's Original	2,628,000	36,000
Pittsburg	390,000	4,650
East Butte	1,200,000	6,000
Miscellaneous	780,000	12,000
Totals	29,881,650	412,830

Butte, Dec. 23.

NEVADA.

Humboldt County.

President Bean, of the American Antimony Co., which has taken over the Sutherland antimony property near Lovelock, is making arrangements for a 50-ton smelter. The small test smelter which has been in operation at the mine for several weeks has proven a success.——The American Nickel Co., which owns the nickel mines at Cottonwood Canyon, near Lovelock, is putting in new pumping machinery and a new hoist, preparatory to deep mining.

Lincoln County.

The Nevada-Wyoming G. M. Co. is sinking on Calico hill, 1½ mile from Crescent. A gasoline hoist is to be put in. Geo. Zimpleman is superintendent.——Good ore is said to have been struck at a depth of 65 feet in the Gypsy shaft of the Colton M. Co., at Searchlight.——A hoist and Cornish pump are to be put in at the Sazarac mine at Dupont camp, 14 miles northeast of Searchlight. F. D. Howell is superintendent.

Nye County.

The Revenue M. Co. has bought the Wildcat claims, 1½ mile southeast of Beatty, and will develop them under the superintendence of R. I. Johnson.

Storey County.

During the past year work at the Comstock mines has showed that pay ores exist in the lower levels of the Ophir. The drift from the Seg. Belcher through to the Belcher has been completed and connected with the east crosscut from the Belcher incline 1400 level. This gives air and makes it possible to work in the Belcher. The Ward shaft is down 2320 feet. The Union shaft has been cleaned to below the tunnel level.

Washoe County.

The Southern Pacific Railroad has filed a land patent covering 3000 acres of mineral land in this county. This is the first grant made by the Government since 1873 that has not excluded the railroad from mineral lands. Strong indignation is expressed by prospectors throughout the State who as a rule have not patented their claims. They are all shut out of these lands now, and there will be no more individual development of this section on account of the monopoly possessed by the railroad. Four claims have recently been filed on this land in Peavine district, and notices of location filed. As the patents filed to-day by the railroad are dated November 23, it is doubtful if the locations are valid. Complications and suits are prophesied.

John Short and C. T. Short, of Reno, have consolidated the sale of their three claims in Olinghouse Canyon to a New Bedford, Mass., syndicate, represented by A. D. Kenyon.

NEW MEXICO.

Grant County.

The Hermosa Copper Co. is developing a number of mines near Central. The Wildcat shaft is down 400 feet and sixty men are at work blocking out low-grade copper ore. The Humboldt shaft, down 120 feet, is to be continued to the 500-foot level. The Treasure Vault shaft is down 325 feet and will be sunk to a depth of 1000 feet, a new hoist having been put in. The Ivanhoe shaft is to be continued to the same depth. The Empire mill has been bought and is being remodeled by the Hermosa Co.

Luna County.

The Luna Lead Co. has blown in the Deming smelter.

Sierra County.

The Union-Esperanza M. Co. is working the the Union placer at Shandon, Pittsburg district. A well has been sunk upon the bank of the Rio Grande from which water is being raised by five pumps and transported through 11,000 feet of 8-inch pipe. A giant has been put in and the capacity of the plant is placed at about 10,000 cubic yards per day. The work is in charge of W. L. Long, general manager, and Alexander Grace, superintendent.

Socorro County.

The Graphic Co. at Magdalena, in order to reduce the cost of mining, has commenced a 1600-foot tunnel to cut the ore, already blocked out, 200 feet below the sixth level. This tunnel has already been driven 700 feet and has cut two bodies of sulphide ore of better grade than the ore in the old workings of the mine. The tunnel has cut a stream of water furnishing 500 gallons per minute. The company is also putting in a large compressor at the mouth of the tunnel and will put in machine drills.——At Magdalena the Kelly mine put in a new hoist and has completed a shaft and power house. The shaft is being continued deeper to open up new ground.

OREGON.

Baker County.

The Buckeye crosscut tunnel, near Bourne, has cut the vein at a depth of 250 feet after being driven 300 feet.——The Colorado group at Cable Cove are to be reopened by C. F. Chatton.

Grant County.

The Thornburg placers on the north fork of the John Day, near Granite, are to be worked next spring. J. F. Lucas of Corning, New York, has charge. These placers comprise 3 miles of the middle fork canyon, the bars being mainly of the bench type, situated from 10 to 150 feet above the present level of the stream, and have been successfully worked with hydraulic elevator.

Five stamps of the Magnolia mill, near Granite, are crushing ore from the Snow Bird mine. The other ten will be started when more water is available.

Work has been resumed at the Fourth of July mine, near Granite, by Superintendent J. N. Ditmars.

Lane County.

The Bohemia Nugget gives the following summary of Bohemia mines during 1905: The Oregon Securities Co., in October and November, turned out 202 troy pounds of gold—the first large shipment this year. The Vesuvius mill has run a part of the summer, but the main part of the work has been in development and preparation for future work. The Oregon-Colorado Co. has been doing much work. The Crystal mill ran for a time this summer. The Hiawatha Co. has been developing, drifting and improving. They constructed a mile of trail and cleared for a wagon road to the main road during the summer. They also purchased three claims, the Woodman, Stump Tree and U. S. A., and located a new claim, The Merrill. The Riverside Co. has been pushing its development work. Considerable work has been done on the North Fairview.

SOUTH DAKOTA.

Lawrence County.

It is reported that the Clover Leaf M. Co. will begin to unwater the Uncle Sam mine, near Roubaix. A short time ago the underground workings were drowned out by water and a pumping plant is to be put in. The company has a 60-stamp mill. Pierre Wiebaux of Miles City, Mont., the president of the company, is in Deadwood.——J. W. N. Dorr is drawing the plans for remodeling the Kildonan mill at Pluma for the Horseshoe Co.

Excavation for the Homestake slime plant will be completed by the first of the year and construction will be started. The mill will have a capacity of 1750 tons of slime per day. The values in gold and silver reach 90 cents per ton.——The Globe shaft at Lead is being unwatered with skip and gasoline hoist. The station pump at the 500-foot level will be started when the shaft has been unwatered. Frank E. Ickes is manager.

Pennington County.

The Cumberland mine, near Hill City, is being developed by F. C. Crocker, who has sixteen men at work.——The American Tungsten Co. at Hill City will put in a new hoist. R. J. Truax is manager.

UTAH.

Beaver County.

A station has been cut at the 450-foot level of the Frisco Contact M. Co. at Frisco and a crosscut is to be driven to the Horn Silver lode.

Box Elder County.

Ground is being prepared for building the smelter of the newly formed Utah Smelting Co., 7½ miles north of Ogden. It will have an initial capacity of 400 tons per day with two furnaces. Bela Kadish of Baker City, Or., is manager and David Eccles is president.

Juab County.

Jesse Knight of Provo has secured control of the Black Dragon mine at Eureka.——Development work on the 800-foot level of the Star Con. at Eureka is reported to be satisfactory.

The Farragut M. & M. Co. has been formed to work claims north of Eureka. D. C. Harrington is president.——H. Gustaldi has charge of opening up the Balhinch mine north of Eureka. The tunnel is in 350 feet and the shaft has been sunk 200 feet.

Salt Lake County.

It is reported that work is to be resumed at the Last Chance mine at Bingham.

The annual report of the Boston Con. M. Co. to September 30, 1905, states that the company delivered to the Bingham Con. smelter 43,717 tons of ore from which a net profit was realized of over $4 per ton, and that before the termination of the contract 44,000 tons of ore remained to be delivered. The company has entered into a contract with the American S. & R. Co. for the delivery, beginning July 1, of 500 tons a day of the sulphide ore, and that the amount will be increased to 750 tons a day soon. The concentrator plant will be finished in the autumn of 1906. The report of President Newhouse says that during the year the workings have been extended 2719 feet. Work has been started in the hanging wall of the lode. Concerning the porphyry mine he states that there is at least 25,000,000 tons of 2% porphyry in sight. The plan adopted for the mining of the porphyry ore is one which is now in successful operation in the iron mines of the Mesaba Range in Minnesota, viz., open pit with terraced sides, from which the ore would be handled with steam shovels.

Summit County.

The Daly-Judge mill at Park City has been started by Foreman Kescel, after a month's shutdown for repairs.——It is reported that Jas. McGregor is to begin work on the June Bug mine, near Park City.

Tooele County.

Coal shortage has caused the New Stockton G. M. Co. at Stockton to shut down the mine and mill temporarily. A new compressor and hoist is being put in.

WASHINGTON.

According to a recent report of the U. S. Geological Survey, Washington, in 1904, had a yield of $314,463 in gold, $89,831 in silver, $69,937 in lead, $43,788 in copper, and $9 in platinum, a total of $518,028. The returns received indicate a decrease in gold production from that of 1903 of $193,422, occasioned by the idleness of several large mines in Chelan, Ferry, Okanogan, and Snohomish counties, Ferry county showing a decrease of over $162,000, Chelan of over $60,000, Okanogan of over $15,000 and Snohomish of over $43,000. King county shows a small increase, and Whatcom county production increased from $36,388 to $115,000. The silver product shows a decrease of $111,958, Ferry county showing a decrease of over $61,000, Okanogan of $14,000, Snohomish of $22,000, and Stevens of $14,775. The total decrease for the year of combined gold and silver was $305,380. The gold and silver come almost entirely from quartz mines, the total placer gold recovered only amounting to $9,823 from Asotin, Clark, Kittitas and Whatcom counties, the placers in Okanogan county being idle in 1904. As in 1903, Ferry county was the largest gold producer from deep mines, Whatcom county a close second in 1904. Stevens county was the largest silver producer. In gold production the rank of the counties is as follows: Ferry, Whatcom, Snohomish, Chelan, Okanogan, Stevens, King, Kittitas, Clark, Asotin. The rank in silver production is Stevens, Ferry, Whatcom, Snohomish, Okanogan. Stevens county produced the most copper and lead, and Clark county reports $9 in platinum.

Lack of transportation and the fact that nearly all ore requires smelting account for the relatively few producing mines; a very large proportion of the known properties in the State are in the development stage and many are held by annual assessment only.

Stevens County.

The Jay Gould silver-lead mine at Chewelah has been bonded and leased to G. C. Robbins, who will continue shaft sinking from the 100-foot level.

WYOMING.

The production of gold and silver in Wyoming in 1904, as reported to the United States Geological Survey by the owners and different companies, was: gold, $17,305, and silver, $2661, a total of $19,966. The value of silver is computed from the American R. & S. Co.'s average for the year 1904, which is $0.5725 per ounce. Copper was produced to the value of $440,876, computed at the average price per pound of $0.125. Wyoming increased in production in all three of the metals mentioned, especially in copper, the output of which very nearly equaled that of the banner year for copper, which 1900. This increase was caused largely by the production at the Ferris-Haggerty mine, at Encampment.

FOREIGN.

CANADA.

BRITISH COLUMBIA.

Lillooet District.

Mining in Lillooet district has been quiet this last season. The dredger of the Iowa and Lillooet Gold Mining Co., on the bed of the Fraser river, has proved a success. The occasional breakage of some part of the machinery and the difficulty of repairing or replacing it quickly has occasioned some delay in the working. On Cayoosh creek a company financed by Americans have staked and recorded the old Vancouver Enterprise location, their object being to mine the bed of the creek. To do this they have deflected the course of Cayoosh creek, and constructed a dam to carry the whole body of water in the creek. On Alexander creek, a tributary to Bridge river, a hydraulic plant is being put in. On the North Fork of Bridge river, Mr. Burkholder, representing Eastern capital, is doing the same. On the South Fork of Bridge river and Cadwallader creek, placer mining has been conducted the whole year with good returns.

Slocan District.

It is estimated that during 1905, the eighteen shipping mines tributary to the Kaslo and Slocan railway, including Sandon and Slocan lake, will have shipped 11,580 tons, valued at $273,700. The average zinc content was 42.6%. Work has commenced on the lease of the Whitewater and Whitewater Deep mines, at Whitewater on Kaslo creek, which has been taken for two years by S. S. Fowler and W. R. Koch of Nelson and John L. Retallack of Kaslo. The lowest level of the Whitewater is to be driven ahead and a contract will be let to drive the main tunnel of the "Deep" mine. There are two or three sets of subleasers in the old workings.

GREECE.

Secretary Wilson, of Athens, reports a movement in Greece to exploit that Kingdom's mineral resources. He says: Greece might easily become an important mineral-producing country, for it contains considerable mineral wealth in silver-bearing lead, zinc, copper, manganese, iron, emery, sulphur, and lignite, besides marble of many varieties. From 1861 to 1875 the Greek Government granted about 400 mining concessions, comprising an area of 190,000 hectares. Thirty stock companies were started to develop these concessions, but by 1896 only four of them still existed, viz., the French Laurium Co., the Greek Laurium Co., and the companies of Dardeza and Seriphos. By 1904 four more companies were started—the Greek M. Co. and the companies of Locrida, Atlanti, and Capsalo. The Greek Co. obtains silver-bearing lead from the scoriæ or refuse from the mines worked by the ancient Greeks. This material contains only about 3.50% of silver-bearing lead, but the production amounts to 7000 tons annually, valued at 3,500,000 francs. This lead is sent directly to Marseille, where it is smelted and the metals separated. The French Laurium Co. works the mines directly, and in 1903 produced 213,788 tons of metal, divided as follows: Lead, 72,594 tons; manganese iron ore, 60,071 tons; sulphur products, 42,380 tons; zinc, 28,292 tons; and various metals, 10,451 tons. All these minerals are treated at Laurium and are then exported for further treatment,

MADAGASCAR.

The decree making further regulations with regard to the gold mines in Madagascar has been published. It lays stress upon the essential differences between a prospecting permit and a mining permit, but reduces the area from a radius of 2 to 1 kilometres, and imposes a charge of 25 francs instead of 100 francs. So far as mining permits are concerned, the decree divides the mines into alluvial mines and reef mines. These two categories will be taxed as follows: The 5% ad volorem tax on the output is retained. In the case of alluvial mines, a surface tax of 2 francs per hectare will be imposed, and in the case of reef mines, a tax of 100 francs per hectare. The decree further provides for the retention by the Government of 5% of the net annual profit above 250,000 francs. On the other hand, the 5% tax on the output will be reduced or altogether suspended in the case of those reef mines where the expenditure during the earlier stages of working absorbs the whole of the profit. Finally, the interests of holders of the prospecting and mining permits have been safeguarded by temporary measures which provide for the progressive application of the financial regulations imposed by the new decree. The decree of June 27, 1905, which was admittedly a temorary measure to deal with a special state of affairs, is entirely superseded by the new decree.

MEXICO.

The President of the republic has signed a decree providing against the peril of contraction of the currency due to the higher market price of silver and the consequent exportation of silver pesos, which may go above a legal parity. The preamble to the decree states that the portion of silver pesos shipped abroad have been replaced by gold money imported from New York and London, but as gold cannot be immediately recoined and placed in circulation, the President authorizes the Exchange and Currency Commissioner to issue gold certificates for gold bars. The gold certificates will be backed by gold coin or bars.

Chihuahua.

The Monterde M. Co. has purchased mines at Monterde near Guazaperes. H. S. Gaine of Santa Barbara, Cal., is president.

It is reported that work is to be started on the Chihuahua smelter of the A. S. & R. Co. in January.—— The Isis Mining Co., J. D. Knotts general manager, is operating 30 miles west of San Julian on the trail to Guadalupe y Calvo in the district of Mina. The company is building a 5-stamp mill and cyanide plant.

Oaxaca.

The Resurreccion mine in the Tlacolula district has been purchased by the Associacion Compradora y Beneficiadora de Minerales of Tlacolula. The association owns several mines besides the Resurreccion, and these are now being developed. It is operating a 5-foot Bryan mill, with plate amalgamation, concentration and cyaniding. Another mill is to be put in. G. P. Mena is manager and A. L. Charlot director. The mill is in charge of E. S. Burrowes.——At the Placers mine in the Tlacolula district, of which J. Walsh is general manager, a 30-ton mill and cyanide plant is being put in.

Commercial Paragraphs.

THE Chicago Pneumatic Tool Co. of Chicago report that they have been awarded the gold medal at Liege for pneumatic tools and appliances and the silver medal for Franklin air compressors.

IT is reported that the efficiency of the new 100-stamp mill and cyanide plant recently installed by El Oro M. & Ry. Co., Ltd., at El Oro, Mexico, has so far exceeded the original estimates that the cyanide plant of their old 100-stamp mill has been put out of commission, and the new plant is handling the entire mine output of about 15,000 tons per month. The new mill is equipped with the Blaisdell system for automatically handling ore, sand and tailings.

THE Vulcan Iron Works Co. of Toledo, Ohio, reports the largest year's business in the history of the company. In the works many improved machines and high speed tools have been installed, and thereby the capacity of the works practically doubled. During the time that the improvements were in course of development the company ceased building the old type of steam shovel and orders were very much delayed. Old shipments are now practically all made, and, with the ability to build new model Vulcan steam shovels at the rate of almost one a day, they report receiving a volume of new business.

THE Pelton Water Wheel Co. report a contract with the Vancouver Power Co. for an additional 3000 H. P. Pelton unit of the "double overhung type;" to the same company 1050 feet of pipe line, varying from 42 to 48 inches. The Columbus Con. M. Co. of Utah has duplicated its order for a 750 H. P. Pelton wheel, the original of which was installed two years ago, while the United Light & Power Co. of Georgetown, Colo., is installing another 1000 H. P. Pelton unit, this being the second order received from the above company within the last three years. The Fremont Power Co. of Washington has ordered two Pelton wheels for direct connection to 400 K. W. generators. A recent contract with the Northwest Light & Power Co. of North Yakima, Wash., covers a Pelton unit for driving a 350 K.W. generator.

Obituary.

WM. LIDDELL, a pioneer mining man of the Pacific coast and superintendent of the Rawhide mine in Tuolumne county, Cal., was killed by a falling rock in the mine, December 27, aged 59.

Latest Market Reports.

SAN FRANCISCO, December 29, 1905.

METALS.

SILVER.—Per oz., Troy: London, 30 1/16d (standard ounce, 925 fine); New York, bar silver, 65½c, refined (1000 fine); San Francisco, 65½c; Mexican dollars, 53c, San Francisco; 50c, New York.

COPPER.—New York: Lake and Electrolytic, $18.50 @19.00; Casting, $18.12½@18.62½; San Francisco: $18.75; Mill copper plates, $21.00; bars, 21@24c. London: £79 7s 6d spot per ton.

Copper remains practically unchanged, though New York advices state that deliveries before April are nearly impossible to secure, and a higher price is predicted.

LEAD.—New York, $5.60; St. Louis, $5.95; San Francisco, $5.00, carload lots; 5¼c 1000 to 4000 lbs.; pipe 7½c, sheet 8, bar 6¾c. London: £17 6s 3d ℔ long ton.

SPELTER.—New York, $6.60; St. Louis, $6.65; London, £28 15s 0d ℔ ton; San Francisco, ton lots, 7c; 100-lb lots, 7¾c.

TIN.—New York, pig, $35.87½@36.00; San Francisco, ton lots, 37c; 500 lbs., 38c; 200 lbs., 40c; less, 41½c; bar tin, ℔ lb., 42c. London, £162 12s 6d.

PLATINUM.—San Francisco, crude, $18.50 ℔ oz.; New York, ingot, $20.50 ℔ Troy oz. Platinum ware, 75@$1.00 ℔ gram.

QUICKSILVER.—New York, $40.00@$40.50, large lots; London, £7 5s 0d; San Francisco, local, $38.00@39.00 ℔ flask of 75 lbs.

BABBITT METAL.—San Francisco, No. 1, 10½c; No. 2, 8c; No. 3, 7½c; extra, 17½c; genuine, 32½c; Eclipse, 35c.

SOLDER.—Half-and-half, 100-lb. lots, 23.50c; San Francisco, Plumbers', 100-lb. lots 19.75c.

NICKEL.—New York, 55@60c ℔ lb.; ton lots, 40@47c.

ZINC.—Metallic, chemically pure, ℔ lb., 50c; dust, ℔ lb., 10c; sulphate, ℔ lb, .04c.

ALUMINUM.—No. 1, 99%, small lots, 37c ℔ lb.; 100 lbs., 35c; 1000 lbs. 34c; ton lots and over, 33c, Pittsburg. No, 2, 90%, small lots, 34c; ton lots and over, 31c, Pittsburg.

STRUCTURAL MATERIALS.

IRON.—Pittsburg, Bessemer pig, $18.35@18.85; gray forge, $14.60; San Francisco, bar, 3½c ℔ lb., 3¾c in small quantities.

STEEL.—Bessemer billets, Pittsburg, $26.00@$27.00; open hearth billets, $27.00@$28.00; San Francisco, bar, 7c to 13c ℔ lb.

WHITE LEAD.—Per lb., in kegs: 500 lbs. and over at one purchase, per lb., 7¾c; less than 500 lbs., per lb., 8c; in 25-lb. tin pails, ¼c ℔ lb. above keg price; in 1 and 5-lb. tin cans, 100 lbs. per case, ¼c per lb. above keg price. Dry Lead.—In bbls., 1 ton and over, 7¼c; do. in kegs, 8c.

LIME.—Santa Cruz, $1.35 country, $1.25 city ℔ bbl.

CEMENT.—Imported, $3.00@4.00 ℔ bbl.; California, carload lots, $1.80 f. o. b. at works; small lots, $2.10 ℔ bbl. in sacks, 4 sacks to bbl., 5c for each sack returned.

LUMBER.—(Retail): Pine, ordinary sizes, $24.00@ 25.00; extra sizes higher; redwood, $28.00@30.00; lath, 4 feet, $4.50@5.00; pickets, $21.00;shingles, $2.50 for No. 1, and $2.25 for No. 2; shakes, $13.50 for split and $15.00 for sawed; rustic, $28.00@35.00.

NAILS.—This week the basic prices are: Wire, $2.77; Cut, $3.25. Meanwhile the nominal quotations per keg (list prices) are: No. 20d to 60d, Wire, $3.35; Cut, $3.55; 10d to 16d, Wire, $3.45; Cut, $3.35; 8d, Wire, $3.50; Cut, $3.50; 6d and 7d, Wire, $3.60; Cut, $3.60; 4d and 5d, Wire, $3.70; Cut, $3.70; 3d, Wire, $3.85; Cut, $3.85; 2d, Wire, $4.10; Cut, $4.10. Special rates for carload lots.

GENERAL SUPPLIES.

ANTIMONY.—New York, Cookson's, 11¼c; Hallett's, 12½c; San Francisco, 1000-lb. lots, 14c; 300@500-lbs. 12c; 100-lb. lots, 13c.

BONE ASH.—Extra No. 1, 5@6c ℔ lb; No. 1, 4@5c.

BORAX.—Concentrated, 7@8c ℔ lb; powdered, 9@10c; fused, 25@30c; crystal, 7c.

CANDLES.—Spear Brand, 16 oz. adamantine, 40s., 11c ℔ set; 14 oz. adamantine, 40s., 10c; 12 oz. adamantine, 40s, 9c; 10 oz. adamantine, 40s, 8c; 16 oz. stearic, 40s, 12¾c ℔ set; 14 oz. stearic, 40s, 11½; 12 oz. stearic, 40s, 10¼c; 10 oz. stearic, 40s, 9¼c. 100-case lots and over, ½c less. Not less than 50-case lots, ¼c less. Boxes of 20s, price ½c advance.

CAPS.—3x, $5.50@6 per 1000; 4x, $6.50@7; 5x, $8@8.50; Lion, $9@9.50, in lots not less than 1000.

CHEMICALS.—Cyanide of potassium, 98%–99%, jobbing, 23@24c ℔ lb.; carloads, 23@23½c; in tins, 30c; soda ash, $2.00 ℔ 100 lbs.; hyposulphite of soda, 3@3½c ℔ lb.; caustic soda, in drums, 3@3¾c ℔ lb.; Cal. s. soda, bbls., $1.10@1.20 ℔ 100 lbs.; sks., 90c@$1.00: chlorate of potash, 12@13c; nitrate of potash, 6¾@7c; caustic potash, 10c in 40-lb. tins; roll sulphur, 2½@2¾c; powdered sulphur, 2½@2½c; flour sulphur, French, 2¾@—c; alum, $2.00@2.25; California refined, 1¾@2c; sulphide of iron, 8c ℔ lb.; copper sulphate, 5¼@5¾c; chloride of lime, spot, $2.50@2.75; sulphuric acid, in carboys, 66° B, 1¾@2c ℔ lb.; nitric acid, carboys, 8c ℔ lb.

OILS.—Linseed, boiled, bbl., 50c; cs., 55c; raw, bbl., 48c; cs., 57c; Lucol oil, boiled, bbl., 48c; cs., 53c; raw-bbl., 46c; cs., 51c. Kerosene—Pearl, per gal., 17½c; Astral, 17½c; Star, 17½c; Extra Star, 20½c; Eocene, 19½c; Elaine, 26c; Water White, in bulk, 11c; Mineral Seal, iron bbls., 18c; wooden bbls., 20½c; cs., 24c; Mineral Sperm, cs., 26½c; Deodorized Stove Gasoline, bulk, 14½c, do., cs., 21c; 86° Gasoline, bulk, 25c; do., cs., 31c; 83° Naphtha or Benzine, deodorized, in bulk, per gal., 12½c; do., in cs., 19c; Lard Oil, E. W. S., bbl., 75c; cs., 80c; Neats-foot Oil, pure, bbl., 63c; cs., 78c; Sperm, crude, 63@68c; Natural White, 68c; Bleached, do., 68@73c; Whale Oil, cs., 52@67c.

BISMUTH.—Subnitrate, ℔ lb., $2.10.

CHROMIUM.—90% and over, ℔ lb., 80c.

FIRE BRICK.—Domestic, carloads ℔ 1000, f. o. b., factory square, $25.00; soap and split, $22.50; arch and wedge, $27.50; skewback, $30.00; circle, $32.00.

FIRE CLAY.—Domestic, ℔ ton 2000 lbs. in 125-lb. bags double, and dry ground, f. o. b., factory, $8.50.

FUSE.—Triple tape, $4.00 per 1000 feet; double tape, $3.55; single tape, $3.10; Hemp, $2.85; Cement No. 2, $3.10; Cement No. 1, $2.75, in lots of 3000 and up.

COAL.—San Francisco, coast, yard prices: Wellington, $8.00; Seattle, $6.50; Coos Bay, $5.50; Southfield, $8.00. Cargo lot, Eastern and foreign: Wallsend, $7.50; Brymbo, $7.50; Pennsylvania, hd., $14.00; Scotch, $8.00; Cumberland, $13.00; Cannel, $8.50; Welsh Anthracite, $13.00; Rock Springs, $8.50, long ton; Colorado Anthracite, $14.00. Coke, $11.50 per ton in bulk, $13.00 in sacks; Sunnyside, $8.50, long ton.

LITHARGE.—Pure, in 25-lb. bags, 9½@10½c ℔ lb.

MAGNESIUM.—Pure, N. Y., $1.60.

MANGANESE.—Black oxide, ℔ lb., 2¾@4c.

MERCURY.—Bichloride, ℔ lb., 77c.

MOLYBDENUM.—Best, $2.75 ℔ lb.

PHOSPHORUS.—American, ℔ lb., 70c.

POWDER.—F. o. b. San Francisco: No. 1, 70% nitroglycerine, per lb., in carload lots, 15½c; less than one ton, 17½c. No. 1*, 60%, carload lots, 13½c; less than one ton, 15½c. No. 1**, 50%, carload lots, 11¾c; less than one ton, 13¾c. No. 2, 40%, carload lots, 10c; less than one ton, 12c. No. 2, 35%, carload lots, 9½c; less than one ton, 11½c. No. 2**, 30%, carload lots, 9c; less than one ton, 11c. Black blasting powder in carload lots, minimum car 728 kegs, $1.50 per keg; less car lots, $2.00 per keg.

RED LEAD.—500 lbs. and over at one purchase, ℔ lb. 7½c; less than 500 lbs., 7¾c.

SILVER.—Chloride, ℔ oz., 90c@$1.00; nitrate, 54c

SODIUM.—Metal, ℔ lb., $1.

TUNGSTEN.—Best, ℔ lb., $1.20.

URANIUM.—Oxide, ℔ lb., $3.40.

New Patents.

DEWEY, STRONG & CO.'S SCIENTIFIC PRESS PATENT AGENCY, 330 Market street, San Francisco, has official reports of the following United States patents issued to Pacific Coast inventors:

FOR WEEK ENDING DECEMBER 12, 1905.

807,150.—FOOTWEAR—H. C. Boice, Hanford, Cal.
806,770.—EXCAVATOR—A. A. Booth, Spokane, Wash.
806,774.—TREATING ORES—H. F. Brown, Oakland, Cal.
807,018.—ACCORDION—R. Carbonari, San Francisco.
807,109.—HOISTING DEVICE—W. H. Corbett, Portland, Or.
806,957.—VEHICLE BRAKE—J. Curry, Vancouver, Wash.
806,783.—MOLD—A. Dayton, Tacoma, Wash.
807,362.—ELEVATOR—E. S. DeLong, Upland, Cal.
806,878.—FLUE CUTTER—J. W. Doyle, Seattle, Wash.
806,962.—RASP—R. J. Ellis, San Francisco.
807,021.—BAND SAW—E. Falk, Eureka, Cal.
806,880.—SUSPENDERS—F. Ferguson, Santa Rosa, Cal.
807,022.—TYPEWRITER—R. R. Fowler, Madera, Cal.
807,023.—GOLD WASHER—C. W. Gardner, Oroville, Cal.
807,371.—WASH BOILER—S. J. Gibson, The Dalles, Or.
807,074.—VALVE—H. L. Harbaugh, Seattle, Wash.
807,025.—NOZZLE—G. J. Henry, Jr., San Francisco.
807,382.—COMBINATION TOOL—E. Hogan, Portland, Or.
803,974.—LOOSE LEAF BINDER—J. W. Husing, San Francisco.
807,285.—FAUCET—A. J. Ketelsen, Seattle, Wash.
807,184.—HOSE SUPPORT—J. E. Mainburg, San Francisco.
807,039.—CANE AND STOOL—J. H. Martin, Riverside, Cal.
807,040.—FLY PAPER—O. Mausert, San Francisco.
806,901.—IRRIGATING SYSTEM—S. P. Mendenhall, Whittier, Cal.
806,904.—VALVE—R. J. Mullin, Seattle, Wash.
807,043.—DOOR OPENER—K. Nishimoto, Fresno, Cal.
807,127.—HAIR COMB—E. R. Powers, Los Angeles, Cal.
807,130.—BUTTER CUTTER—W. H. Roussel, San Francisco.
806,934.—TURBINE—D. W. Starrett, San Francisco.
806,852.—DERRICK—C. S. Smith, Clay Station, Cal.
806,940.—HARVESTER—G. N. Todd, Los Angeles, Cal.
806,941.—COTTON PICKER—G. N. Todd, Los Angeles, Cal.
807,221.—GUN—I. A. Tonnashi, Guadaloupe, Cal.
806,858.—HOSE COUPLING—J. C. Westrose, Winnemucca, Nev.
807,007.—WASHING MACHINE—M. L. Winegarden, Alameda, Cal.
807,100.—EXERCISING BAG—W. C. Wood, San Francisco.
37,720.—DESIGN—H. W. Tucker, San Francisco.

Notices of Recent Patents.

Among the patents recently obtained through Dewey, Strong & Co.'s SCIENTIFIC PRESS United States and Foreign Patent Agency, the following are worthy of special mention:

CAN EXHAUSTER AND COOKER.—No. 808,044. December 19, 1905. M. W. Groom, San Jose, Cal. This invention relates to apparatus for use in canneries and especially in fruit and vegetable canneries. The invention pertains to the exhausting and cooking periods; and its object is to provide an apparatus which will be simple, practical and economical and of large capacity, which may be used for either exhaust or cooking purposes, which will enable cans to be exhausted or cooked for any length of time within certain limits without changing the speed of travel of the cans and without losing time in making the change, and conversely, which will permit the speed of the cans to be changed without changing the time of exhausting or cooking and which will prevent the open cans filling with the drip from the condensed steam during exhaust and so diluting the syrup or causing the cans to overflow and foul the outside of the cans and the apparatus with syrup to the inconvenience of the solderer. It comprises various details of construction adapted to bring about the desired result.

INKING PAD AND HOLDER THEREFOR.—No. 807,988. December 19, 1905. John F. Ames, Portland, Oregon. This invention relates to a form-inking roller and removable pad therefor for use in cylinder presses. The object of the invention is to provide a removable inking pad and suitable holder therefor, the same holder to be used continuously in the press, while various pads may be substituted having inking surfaces of any desired shape or size. The invention is of particular value in multicolor printing, since by associating two or more of these printing rollers with the form cylinder each roller can be provided with a printing pad having an ink-distributing surface of different shape or size, each applying to different areas on the impression cylinder a different colored ink. It comprises the necessary details of construction adapted to bring about the desired result.

ANIMAL TRAP.—No. 807,969. December 19, 1905. S. H. Shelley, San Jose, Cal. This invention consists in a gopher trap comprising a box-like structure having a closed top, sides and one end, and adapted when placed in position in the animal's burrow to inclose a darkened chamber, said structure having its opposite end open, and having also a limited light aperture near its closed end, a mirror in the chamber of the box and supported relative to said aperture and arranged to reflect light into the darkened chamber, and suitable entrapping means between the open end of the box and the mirror.

GRAIN SEPARATOR.—No. 807,978. December 19, 1905. J. S. Walch, Roselawn, Cal. This invention comprises in an apparatus for cleaning grain, a semi-circular screen having a closed upper portion and a screen bottom, a second screen located below the first named screen, rocker arms upon the upper ends of which the upper screen is suspended and from the lower ends of which the lower screen is suspended, means connected with said arms by which they are oscillated, fans with discharge passages delivering air respectively through the front and rear ends of the screens, spouts into which the inclined chutes discharge and a transmitting auger revoluble in said spouts.

M-36

SHAW'S ECLIPSE AIR-HAMMER ROCK DRILL.

THIS CUT represents our No. 3 Water Machine complete except tank. This machine can be used with air or water, or without either. When used without either, it is used for stoping or any hole where the chips will fall from hole without assistance from air or water, and for this work uses common cross steels without hole through drill bit. In drifting or down holes it is used on column and the drill bits have a hole through them to either blow or wash chips from hole. In soft or talcy ground it is necessary to use water, and where dust is an objection, can be used to lay the dust. In fact, there are provisions for any kind of ground. This machine can be used with or without column. Weight 150 lbs.

Write Us for Full Information.

The C. H. Shaw Pneumatic Tool Co.

35th and Wazee Sts., DENVER, COLO.

W. C. HENDRIE, 26 CORTLANDT ST., NEW YORK CITY, N. Y.

COMPRESSED AIR MACHINERY CO., 24-26 FIRST ST., SAN FRANCISCO, CAL., PACIFIC COAST AGT.

TESTING A 3¼" EXCELSIOR DRILL

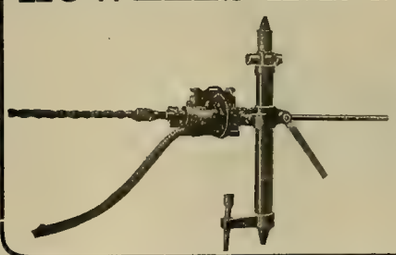
with our celebrated "AIROMETER," showing 86.4 cubic feet free air used per minute at 80 pounds pressure. This drill has been sold after competitive tests at the Homestake and many other large mines in the U. S. during year 1904.

WE OFFER $100 to any standard drill that this drill cannot beat 25%. Send for particulars with official reports of drill tests. Our drills are sold under absolute guarantee to cost less for repairs and to cut more ground than any rock drill so far made. Do you want more drilling than you are getting? Do you want an accurate Air Meter? If so, write

G. D. WARREN & CO.,
1520 --18th St., Denver, Colo.

HOWELLS AIR POWER DRILL

No. 2—For Medium Rock, Slate and Coal.



Just the thing to replace the hand drill wherever there is an air compressor. Entirely self-contained. Easily carried by one man. Any miner can operate it. It is simple, well built, and never gets out of order. In addition to our compressed air drills we make thirty-five types of hand machines. Our new catalog is full of information. May we mail you a copy?

SITUATIONS WANTED.

☞ *The cost of advertising in this column is 10 cents per line of seven words per insertion. Answers forwarded to any address without extra charge.*

COMPETENT ASSAYER, FAMILIAR WITH concentration and amalgamation, and with underground experience, desires position. Address A. R., this office.

EXPERIENCED ASSAYER AND CHEMIST DESIRES position. Many years experience in the best mines of California. Address "Assayer," this office.

EXPERIENCED MILL FOREMAN SEEKS POsition. Battery man, concentrator man, cyaniding and assaying. References exchanged. Address P. O. Box B, DeLamar, Idaho.

MINE AND MILL SUPT. WITH THE USUAL qualifications and testimonials to oversee mines, stamp mills and cyanide plants, wishes employment with reliable company; 25 years' experience. At present engaged with large company as mine and mill Supt and the erection of a cyanide plant. Address E. R., this office.

POSITION WANTED BY PRACTICAL MINE and mill Supt.; 25 years experience in California and Nevada. References furnished. Address K J.J., this office.

POSITION DESIRED BY MILLMAN FAMILiar with amalgamation and concentration. References furnished. Address Box 48, this office.

PRACTICAL METALLURGIST WILL BE open for engagement after Jan'y 1st. Has thorough knowledge of hypolixiviation and treatment of acid tailings by cyanide Speaks Spanish and can furnish best of references. Over three years in Mexico with same employers. Address F. K. L., care of Mining and Scientific Press.

WANTED—POSITION AS SUPT. OR FOREman, or will fill place of both; 35 years experience; familiar with mining of all classes, timbering, machinery, etc. Best of references. T.E.W., this office.

WITH MINING COMPANY TO LOCATE GOLD Dredging, Placer or Copper Property. Address F., this office.

YOUNG ENGINEER, COLUMBIA GRADUATE, wants work. Mining, milling, engineering, machinery or prospecting company, with chance to prove merit by hard, faithful work. Address "Mining," 1328 Marion St., Denver, Colo.

WANTED.

WANTED.—PLACER GROUND SUITABLE for dredging purposes Large property preferred. Address, with full particulars, "Rialto," care of Mining and Scientific Press.

Wanted—A Low Grade Property carrying low values in gold and copper. Preferably oxidized, and in location where conditions make shipment to smelter prohibitive. Address with full particulars, "Refractory," this office.

Wanted—By Pittsburg, Pa., capital a Developed Gold Mining Proposition in California, with or without Reduction Plant.

Must stand test by practical men as represented. Give details in full. Best of references furnished. Address A. F. MORGAN, 815 Jay St., Sacramento, Cal.

FOR SALE.

COMPLETE MINE AND MILL EQUIPMENT FOR SALE—A BARGAIN.

Comprising: Double Reel Water Power Hoisting Engine, capacity 2500 ft.; 2400 ft. 1½" Cable, 1500 ft. 1" Cable; 3 Skips, 1¼ tons; Water Tank; Sheaves, Pulleys, Water Distributors, Cut-off. 11 H. P. Donkey Engine, double cylinder. 20-Stamp Mill, Frue Vanners, Ore Feeders, Cars, Tools, Drill Press, Burleigh Drills—all in first-class condition. Apply JAMES E. DYE, Jackson, Amador Co., Cal.

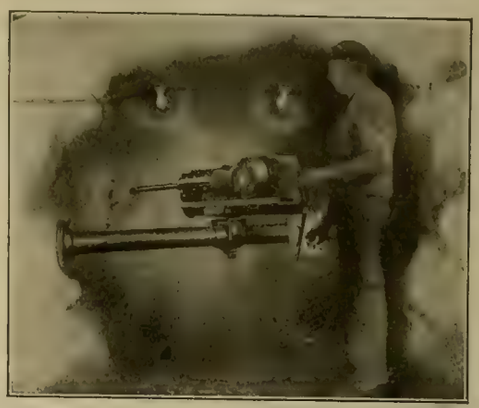
CRANE FITTINGS
ESTABLISHED 1855

BOX ELECTRIC DRILL.



Showing Model 6 Drill Mounted on Cross-Bar, this size operates on 1¼ H. P. and has cutting capacity equal to a 3" Air or Steam Drill using 8 H. P.

BOX DRILL SAVES 6½ H.P.

OUR MODEL 7 STOPING DRILL

Has no Equal, operates on ¾ H.P. and Weighs only 140 Lbs., including Motor.

THE BOX DRILL is the Most Durable,

Efficient and Economical Rock Drill on the market. Motor is attached direct to Drill Body, thus doing away with Flexible Shaft. No springs are used in operating mechanism.

Write for Catalogue BD 10.

JACKSON HAND POWER DRILL

will drill hardest rock. One or two men will accomplish work of three to six men using hammers. Heaviest part weighs 100 lbs. Total weight 145 lbs. Especially adapted for use in isolated districts, and for operation by unskilled labor. Made entirely of steel and guaranteed against breakage for two years. May be mounted on tunnel column, shaft bar or tripod.

Write for Catalogue D 17.
